We now come to the final question of preparation. There is no difference of opinion as to the absolute necessity of ample withering space and the general deficiency in regard to it. A good wither is essential to the manufacture of good tea; and most estates or factories are realising this fact and making adequate provision. On the personal question, opinions seem to be fairly divided—some writers holding that as much care and attention are devoted to manufacture as ever before, while some are very strongly of opinion that the claims of sport are a bar to that earnest, habitual and close oversight of the factory, without which quality gradually deteriorates. Others again think that a more intelligent and better-paid class of tea-makers—preferably Europeans—are called for; but in this climate, continuous work in a heated factory is not what the European would choose; and we see no reason why local talent should not be rendered equal to all factory needs. Of course, there must be strict and conscientious supervision. On the whole, nothing contained in the interesting correspondence we have dealt with is calculated to cast doubt on the soundness and the permanency of the tea industry of the island, and, so far as we can see, it depends on proprietors and superintendents whether it shall take front rank in the competition with other countries. We should not despise the aid of science; we should not be above attention to the details of work, whether in field or factory; and, provided our labour supply does not fail us, we need be in no fear of overproduction or of fluctuating exchange, though these may incommode tea, off and on, as they do all Eastern enterprise and chiefly agricultural enterprises.

DIGESTED TEA NOTES.

IV.

PLANT CONSTITUENTS AND NUTRITION.

I SHALL find it more difficult than usual to present the contents of this chapter in an interesting and clear form. In truth, as the first part deals only generally with tea, and is consequently common to agriculture generally, I shall be as brief as may be in my remarks.

All plants consist of 14 elements, four of which are organic, and the remaining inorganic. The most important, and practically the only ones to be considered—being those frequently exhausted in soils—are: nitrogen, phosphoric acid, potash and lime.

Nitrogen.

This occurs free in the atmosphere of which it forms $\frac{4}{5}$, and combined as ammonia and nitric acid. Certain leguminous plants possess the power of fixing the free nitrogen of the air by the aid of certain bacteria in their root nodules. Certain soils also have the same power of fixing this free nitrogen by means of soil bacteria. Small quantities of combined nitrogen, in the form of nitric acid

and ammonia, are given to the soil by rain. This rarely exceeds 4 to 5½ lb. nitrogen per acre, even in the tropics.

Tea, not being a leguminous plant, must depend for its store of nitrogen on the organic matter (decaying vegetable and animal matter) in the soil. The nitrogen in this organic matter cannot be used by plants until converted, first into ammonia and secondly into nitric acid. Both these changes are due to certain organisms in the soil, which can only thrive under certain conditions: warmth, moisture and air; also the presence of lime. Frequent cultivation is thus of great use in adding to the fertility of the soil. Though on peaty soils, there is a danger of the easily soluble nitrates of lime being thus slowly lost by reduction to nitrogen gas and nitrous oxide; this loss is caused by different species of bacteria. It is evident that nitrefaction, i.e. conversion of useless organic matter into plant-food, takes place chiefly on the surface. The importance of nitrogen to tea may be shown by the fact that the nitrogenous compounds comprise nearly one-third of the prepared tea.

This process of enrichment of the soil goes on most rapidly in fairly dry, warm weather. If such a period is followed by excessively heavy rains, the tea roots, deep and wide though they penetrate the soil, cannot take up the soluble nitrates fast enough. This results in a serious loss to the soil. Mr. Bambo, doubtless having no experience of the steep soils so common in South India, fails to point out a lesson to be learnt, i.e., the importance of so draining and cultivating the soil that the major portion of the rainfall should soak through, instead of flowing over, the surface of the soil.

To render my meaning clearer: rain water flowing rapidly over the surface must take with it a large percentage of the soluble nitrates into the drains. These again convey them to the rivers, the loss being thus irreparable. The fewer the drains, the less time the surface water will have to soak in the soil. Numerous drains at gentle gradients, say 1 in 40, would result in a very slow escapement, the nitrates being allowed time to soak in the soil, a large proportion being subsequently recovered by the deep water-roots of the tea-plant.

Humus.

Closely allied to and frequently mistaken for, nitrogen is humus, i.e. decaying vegetable matter. The value of humus depends almost altogether on the nitrogen it contains, which varies in peat from 1% to 4%. Until converted into nitric acid, tea can make no use of the organic nitrogen. The process of conversion has already been described. Peat soils are frequently acid, and thus dangerous to apply without previous aeration.

Potash and soda.

Potash forms nearly 40% of the mineral constituents of tea. In its usual form it is insoluble, but frequent cultivation and addition of humus converts it into available plant food. Clay soils are usually richest in potash, but sandy mica soils are also very rich in the mineral.

Lime.

This forms about 7% to 8% of the ash, but does not seem to be of special importance to tea. Abundance of lime tends to increase the seed-bearing, but retards the flush. In moderate quantities it does much good in sweetening the soil and rendering soluble inert forms of plant food.

Magnesia.

Of indeterminate value, usually present in all tea soils.

Iron.

Is essential to all plants, but is found in all soils in abundance. Its lower form, i.e., iron with a minimum amount of oxygen in combination, is distinctly poisonous. The blue or pale yellow colour of some subsoils is due to these poisonous oxides; after cultivation the colour is changed to dark yellow or red.

Phosphoric acid.

This is second in importance only to potash, forming 12 to 16% of the ash of tea. In fact, as soils are usually far poorer in soluble phosphorus

potash, it is generally recognised that in manuring, phosphates should rank before any of the other minerals.

NUTRITION.

This section is written in a very technical style, and I shall describe only those points a practical planter can seize of. To begin with germination. This requires air, heat and moisture; light is not needed. The moisture penetrating the seed envelope together with the oxygen of the air, ferments the starchy contents of the cell, and forms a strong solution thereof. This solution converts the starch in the cells into soluble sugar. This new solution passes through the other cells, causing them to distend, new cells being formed, and the root and first shoot emerge from the seed. When the first true leaves have formed, the food supply of the seed is generally exhausted, so that the plant has to rely on the soil and air for its future development. The whole variety of vegetable products in the vegetable cell are produced from the carbon of this carbonic acid, with varying proportions of oxygen and hydrogen from water, of nitrogen from ammonia, and of sulphur from sulphuric acid, together with phosphates, alkalies and salts.

Of the non-nitrogenous compounds, carbonic acid and water only are required for their formation without the addition of ammonia. The first products formed are probably the least complex organic acids, like tannic and boheic acids.

The next group are the neutral carbo-hydrates [in other words combinations of carbon (charcoal) with water], such as cellulose, sugar and gum. Then come certain volatile oils and acids; then resins, and finally the volatile essential oils.

The first compounds contain a very large proportion of oxygen. This element decreases gradually until the last stage, where, as the volatile essential oils, it is altogether absent.

The flavour and "body" of tea depending on the presence of the aromatic resins and essential oils, it is obvious that in very thick flushes, sufficient time for their development is not allowed. This is borne out both by practical experience and chemical analysis.

For these changes to take place, the plant must be of course well supplied with all the mineral matter and other food necessary for its growth, and time must be allowed. Chemical changes are of course most active in the youngest shoots, and these contain the most concentrated sap in the plant.

THE U. P. A. S. I. FAMINE FUND.

THE EDITOR,
Planting Opinion.

DEAR SIR,
I shall esteem it a favor if you will find space for the inclosed list of contributions to the Indian Famine Charitable Relief Fund, Madras Branch, received by the U. P. A. S. I. and paid over to the Hon. Treasurer of the Famine Fund up to the 26th instant.

In some cases, the details now given have not appeared in the lists published on behalf of the I. F. C. R. F., only the gross amounts remitted by various District Associations having been mentioned; in one instance, certain unimportant errors were made in the particulars furnished to the Hon. Treasurer of that Fund, and the present list puts these right.

Thanking you in anticipation,

I am, dear Sir,

Yours faithfully,

HARRY ORMEROD,

Secretary.

DISTRICT ASSOCIATIONS.

NILGIRIS.

PROCEEDINGS of the Annual General Meeting, held at the Masonic Hall, Ootacamund, on April 28th, 1897. Present: The Hon'ble Mr. H. Percival Hodgson, Messrs. H. Sheldrick, W. Hamilton, G. Oakes, H. D. Wilbraham, J. Stanes, Alexander, L. W. Grey, A. N. Groves, J. Hughes, F. W. Groves, W. Mullaly, F. T. Turpin, J. Harding Pascoe, J. T. Fellowes Wilson, E. R. Kindersley, L. C. Liebenrood, W. L. Edmiston, A. M. Kinloch, W. Rhodes-James, A. S. Cowdell, G. Romilly, (Visitor) J. H. A. Tremenheere (Honorary Member), C. A. Mackenzie (Visitor) and E. C. Windle, *Honorary Secretary*.

1. Read proceedings of the last meeting.
2. The Honorary Secretary read his Annual Report.

ANNUAL REPORT FOR 1896.

Mr. Chairman and Gentlemen,—Owing to the resignation of the late Honorary Secretary, Mr. W. L. Edmiston, who has worked long and ably in your service, it falls upon me to make the Annual Report for 1896.

During the past year five members retired from and two joined the Association, which therefore numbered at the close of 1896 68 members. Three new names have been registered since January and our total number is now 71.

	Accounts.	RS.	A.	P.
The Association began the year with ...		697	12	6 to its credit.
and received during 1896:				
Estate Subscriptions ...		921	0	0

	RS.	A.	P.
Interest ...	16	8	3
Sundries ...	6	10	0
Individual Donations and Subscriptions to U. P. A. S. I. ...	542	0	0
Total ...	2,183	14	9

Expenditure was as follows:—			
N. P. A. Donation to U. P. A. S. I. ...			125
Delegates' expenses to U. P. A. S. I. ...			200
Individual Donations and Subscriptions to U. P. A. S. I. ...			530
Coffee Stealing Rewards ...			70
General Expenses ...			382
Total ...	1,307		7

Leaving a balance in hand of ...			876
			2,183

The balance in hand is composed of U. P. A. S. I. Funds.			12
Coffee Stealing and Reward Fund ...			263
N. P. A. General Fund ...			600
Total ...	876		7

I should mention that no annual subscription to the U. P. A. S. I. appears in the year's account, that for 1895-96 having been paid November 1895 and that for 1896-97 in March, April 1897. The accounts, which have been audited by Messrs. Turpin and Cherrington, are laid on the table.

During the past year the commission of enquiry appointed by the Government of India began and concluded its sittings. The conclusions at which it arrived, and the action which will be taken by the Government, are matters in which all must take the deepest interest and we anxiously await the result. The U. P. A. S. I. held its Annual Meeting at Bangalore on August 17-20. The many subjects of interest discussed will be familiar to you all from the reports in the papers. What immediately interests us financially is that the subscriptions of all Associations were raised 50 per cent so that we now contribute Rs. 375 annually instead of Rs. 250. Of individual donations and subscriptions to the U. P. A. S. I. Fund including the Rs. 542 shown in 1896 accounts, Rs. 727 have been received from members of this Association up to end of March and a considerable amount more is promised. All sums received together with the N. P. A. subscription of Rs. 375 for 1896-97, have been forwarded to the Secretary, U. P. A. S. I. As the question of individual membership of the Central Association will come for discussion at their meeting, I will not touch upon it here.

Act XIII. of 1859 has been more troublesome than ever, and seems probable that it may shortly be rendered entirely useless so far as planters are concerned. In such a case, however, every planter in S. India will reasonably expect that the void shall be filled by special and more suitable legislation.

Famine subscriptions have been general, and in response to an appeal from the Chairman of the U. P. A. S. I. we have assisted this movement, not as an Association, but individually. The total sum raised up to the end of March and forwarded to the Secretary, U. P. A. S. I., was Rs. 1,412-8-0. We may, I think, congratulate ourselves on the increased attention shown by Government to planting interests, due no doubt to some extent to our having a Governor who has ably administered a Planting Colony, but also greatly to our own union, which has given the planters of S. India a representative assembly and a voice to make known their wants. Besides the commission of enquiry, we have to thank Government for stopping further extension of its Cinchona plantations and for authorizing the local purchase of bark; for applying for the appointment of a Medical Officer to enquire into the transmission of Malaria by the Mosquito; for its enquiry into the effect of sugar bug and introduction of lady-birds, and for its action in the matter of internal boundaries on estates. And it is not out of place for me to cordially acknowledge the interest evinced in planting matters and the care shown for planting interests by our valued Honorary Member, the Collector of the Nilgiris.

The past season has been a bad one for all planters. The long severe drought caused great damage to both tea and coffee. In the case of coffee, outturn both of cherry and parchment was seriously affected. In some cases 100 bls. cherry gave only 25 bls. parchment instead of about 50 bls. and parchment outturns commonly ran over 100 bls. to the ton, estimates on an average being 20 per cent. to 30 per cent. short. Quality, as might be expected, was generally inferior, but prices, though not high as they were when the first shipments reached home, were kept at a good level. I may mention that one large estate, though its produce was no better in appearance and quality than that of many others, obtained exceptional prices on account of the good liquoring quality of its coffee. From the sums paid during the year for coffee property, it is evident that its value has increased rather than diminished, and the area under cultivation has been greatly enlarged, chiefly by natives, whilst to a minor extent Europeans have followed their example. Black bug came on very severely in some parts of the district, but was speedily followed by a white scale which has hitherto escaped general observation, but which we have since noticed in places many miles apart. Its effect on the rubber was to completely destroy it by hermetically enclosing it. Leaf blight was prevalent in January and February on many estates, but has not yet entirely disappeared; I should call it the worst attack we have had for quite three years. With regard to tea, the prolonged drought was against free flushing. This, however, was to a certain extent compensated for in the last six months of the year, the rainfall during that time being fairly well distributed. Estimates were hardly realized, and prices in the London market towards end of year showed a decline, the average price of Indian tea sold in Leicesters Lane during 1896 being 8½d against 9d in the previous year, and the Nilgiri price being slightly under the average Indian rate. Brokers report that the Nilgiri teas are lacking in the flavour which was their distinctive characteristic, and this can probably be traced to the heavy pruning which is more general now than formerly. Exchange in 1896 averaged 1-2 13/32 against 1-1 20/32 in 1895. Cinchona planters are to be congratulated on the Government order authorizing local purchases of bark. I may mention that Mr. King, in Calcutta, is also buying, having doubtless been similarly authorized by the Government of India.

Increased police supervision has been provided at any rate in some parts of the district; in others I am assured that it has been less than usual.

Roads and communications have generally been maintained in good order, and in some places were noticeably improved during the year.

In conclusion, I beg to place my resignation with those of the Committee in your hands.

E. G. WINDLE, *Honorary Secretary.*

Proposed by Mr. Edmiston and seconded by Mr. Wilson that the report be adopted.—Carried.

III. The accounts for 1896 were passed by the meeting (having been audited by the two members appointed as auditors).

IV. Mr. E. G. Windle was elected Honorary Secretary for the current year.

The following Committee were elected:—

The Hon'ble Mr. H. P. Hodgson, Messrs. H. Wapshare, H. Sheldrick, L. W. Grey, J. Harding Pascoe, F. T. Turpin, R. Buchanan, A. G. Nicholson, W. L. Edmiston, Rhodes-James, T. Wilson, Eduljee, Murathachellum Mudelliar, H. D. Wilbraham, Fakir Mahomed, L. C. Liebenrood and W. Mullaly.

V. Act XIII. of 1859.—It was resolved that Mr. Rhodes-James' proposal, as follows, should be adopted. "That a form of agreement for general use by planters be drawn up by a legal authority as soon as the question of jurisdiction has been settled by the High Court."

(i) Read correspondence between the Hon'ble Mr. Hodgson and the Chairman, U. P. A. S. I.

(ii) Counsel's opinion on Act XIII. of 1859 was circulated.

(iii) Read Honorary Secretary's correspondence with Honorary Secretary, Wynaad Planters' Association, re form of agreement to come under Act XIII. of '59.

(iv) The Hon'ble Mr. Hodgson spoke on the subject.

VI. Famine Fund.—Read statement of accounts, showing balance received and forwarded to Secretary of the U. P. A. S. I. of Rs. 1,412-8-0 (to end of March 1897).

VII. Individual Membership of U. P. A. S. I.—Read circular

from Secretary, U. P. A. S. I., giving details of proposed scheme. Messrs. Hodgson, Rhodes-James, Romilly, Windle and Edmiston spoke on the subject. The feeling of the Association was taken on the question of individual membership, and was decidedly against it, only three votes being recorded for such membership.

VIII. Upkeep of internal boundary stones.—Read Board of Revenue Order, and provisions added to Section 14 of the Madras Survey Bill on April 10th, 1897. Recorded with satisfaction.

IX. Cattle Trespass Act of 1871.—Read Section 26 of Act and Notification No. 431, dated 19-11-91. The Collector intimated that this section only referred to such grounds as existed in 1893. The following resolution was proposed by Mr. Windle and seconded by Mr. Rhodes-James: "That the Collector be asked to extend the above Notification to all grounds now existing in the Nilgiri District." Carried unanimously.

X. U. P. A. S. I. Jubilee Address to the Queen Empress.—Read circulars from Chairman, U. P. A. S. I., dated 18-2-97, and 12-4-97; the Honorary Secretary intimated that he had collected from members of this Association Rs. 63, which he had forwarded to the Secretary, U. P. A. S. I.

XI. Engineering Workshop in the Nilgiri District.—Mr. J. Metford Thompson's proposal to establish a workshop in conjunction with a qualified Engineer was considered satisfactory.

XII. Purchase of Cinchona Bark by Government.—Read U. P. A. S. I. circular, dated January 29th, 1897. Recorded with satisfaction.

XIII. Adulteration of Coffee and Tea.—Extracts from report of Select Committee on food products and adulteration were circulated.

XIV. Read Mr. Turpin's resolution—"That in view of the large numbers (nearly 100,000) on relief works in Famine Districts of the Madras Presidency, Government be asked if they will encourage coolies to migrate to estates and defray their expenses to their destination, thereby effecting a considerable saving to Government itself, and conferring a benefit on planters in need of labour; and that a circular be addressed to all Proprietors and Managers enquiring:—(1st) How many able-bodied labourers they are prepared to engage at advance of some small amount per head (men or women) landed on the estate, and for what period of time they will undertake to give such coolies regular employment at the rates prevailing in the locality."

Mr. Edmiston seconded this resolution and Mr. Windle spoke in favour of the scheme, mentioning that he had spoken to several Members of the Association and had elicited that many hundreds of coolies would be given employment at once, if available. Messrs. Tremeneheere, Mullaly and Edmiston also spoke on the subject. Mr. Edmiston proposed "That a Sub-Committee composed of Messrs. Nicholson, Turpin, Rhodes-James, and the Honorary Secretary be appointed to arrange this matter." Seconded by Mr. Wilbraham.—Carried.

XV. Elect Delegates for the U. P. A. S. I.—The Delegates elected were The Hon'ble Mr. H. P. Hodgson and Mr. Windle. Proposed by Mr. Rhodes-James and seconded by Hon'ble Mr. Hodgson, "A hearty vote of thanks to Mr. Edmiston for his long and valuable service to this Association."—Carried unanimously.

A vote of thanks to the chair terminated the proceedings.

PAPERS LAID ON THE TABLE.

Agricultural Ledgers Nos. 23, 35, 39, 40 and 41. Agricultural Series, No. 5.

THAT MASTERFUL YANKEE.

THE writings of Mark Twain are full of instruction as well as humour. Possibly you have read that wonderful story of his called "A Yankee at King Arthur's Court." The hero is a skilled mechanic, the foreman of a great factory in America. He is accidentally killed, as we would say; but, instead of getting his body deposited in the grave, as happens to the most of us, he comes to life again, and finds himself at the Court of King Arthur in England in the sixth century, 1,300 years before he was born. That was a time of deep ignorance and superstition; people were but children then. So with his knowledge and his nineteenth century training he soon becomes master of everybody and everything. He controls the Government and runs the whole country—exactly as a college professor would be superior to all the children if he should take it into his head to join a class at a parish school. Now let us see what this idea may mean to you or to me.

In the autumn of 1873 Mr. James Murphy, of 49 Townsend Street, Dublin (present address 5, Synnott Row, Synnott Place, Lower Dorset Street) had a severe attack of rheumatic fever and was under treatment at the Sir Patrick Dunn's Hospital for three months. Then he left the hospital, but not the man he was before the disease fell upon him. Afterwards he was never free from it. For a while he would be comparatively well, then down on his back again. It would depend on the weather and other circumstances, you see.

Of his worst times he speaks in this way: "My ankles and feet were hot and painful, and would often swell to three or four times their natural size. Occasionally the pain extended to the hips, and I had to be swathed in wadding from the thighs down to the ankles. In this way—now able to get about and now confined to my bed—I suffered for over seventeen years. The joints of my fingers and toes became displaced, or seemed to be so."

We don't need to point out what a cripple this sort of thing makes of a man. If he were wounded and torn in battle or by machinery he couldn't be worse off. Yet the number of people thus disabled is immense, and while rheumatism is peculiarly the disease of adults and old persons, the young (even children) do not escape it. If the disease were only understood—but let us not get ahead of our story.

"At Christmas, 1890," continues Mr. Murphy, "I had a dreadful attack, and was confined to bed for seventeen weeks."

This took him clear through the rest of the winter and one month of spring up to the first of May. What a dreary, miserable season it must have been! There is no merry Christmas or jolly coming of the buds on the trees for a man in that situation. Still, it might have been prevented if he had known then what he found out later.

"All this time," he goes on, "I was in the greatest agony. I couldn't move myself in bed, and finally got so bad I couldn't lift my hand to my mouth, and had to be fed like a baby. Night after night I got no sleep, and often wished myself dead. As for work, I thought I should never do a stroke again. The doctor who attended me gave me medicines, but I seemed none the better for them. I had long since lost all faith in rubbing oils and embrocations; I had spent pounds for them without benefit."

"One day, whilst still suffering great pain, I came upon a book telling how cases like mine had been cured by Mother Seigel's Curative Syrup. Not knowing what else to do I bought a bottle of Mr. Mannin, the chemist in Brunswick Street. After taking this medicine a day or two I had less pain, and I was able to leave my bed, and fourteen days later I had not an ache or a pain of any kind, and got back to my work. Since that time—now two and a half years ago—I have had no return of my old complaint. I never felt better in my life than I do now, and I thank God that I ever heard of Mother Seigel's Syrup. You are at liberty to publish my statement. I have been in the employment of Mr. Robinson, coal merchant, for the past ten years. Yours truly, (Signed) James Murphy, Dublin, June 23rd, 1893."

The mysterious American at King Arthur's Court was powerful because of his knowing what nobody else knew. Had Mr. Murphy known years before that rheumatism is caused by impurity of the blood, and that Mother Seigel's Curative Syrup cures it, he could have defied and banished that agonising ailment. We print these facts in order that his present knowledge may also be everybody's knowledge.

MARKET SUPPLEMENT.

SATURDAY, MAY 29, 1897.

COFFEE.

R. J. Rouse & Co.'s Weekly Coffee Report (May 7, 1897) says:—A firm tone has again prevailed at Public Sale and the large quantities brought forward met a good demand at fully previous rates.

Over 4,500 bags East India were offered and attracted keen competition, the greater part being disposed of at 1/- to 2/- advance.

In spite of the heavy supplies of Central American catalogued prices have been well maintained except for common qualities which are rather easier.

Futures have continued quiet during the past week with only slight fluctuations and quotations are entirely unchanged since our last.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending May 5th, 1897, says:—Bank rate $2\frac{1}{2}\%$. Bombay Exchange closes at 1s $2\frac{1}{2}$ d. Brazil Exchange $7\frac{1}{2}$ d. Rupee paper $3\frac{1}{4}\%$. 63 $\frac{1}{2}$. Silver 27 $\frac{1}{2}$ d per oz.

This market has been steady throughout the past week: the full supplies at auctions continue to be well competed for at previous prices, especially the better kinds. At the close the tone is somewhat quieter, and the cheaper kinds more difficult of sale. Brazil markets are quiet but firm.

Daily receipts have averaged 6,286 bags in Rio, and 5,143 bags in Santos.

Futures, owing to smaller receipts of the past few days, and the absence of further favorable reports, have been steady, and close quiet at an advance of 1s to 1s 3d, viz.:—Good average Santos in Havre, May delivery closes at fcs. 49.25, in Hamburg pf. 40, and No. 7 low ordinary Rio in New York \$7.50.

To-day's London official quotations are:—

	May	July	Sept.	Dec.	March
Rio	38/9	—	39/6	40/—	—
SANTOS	39/9	40/—	40/6	41/—	41/6

We quote:—

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report of May 7th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1896-1897...	1,505,966 packages.	1,048,784 packages.	42,441 package
1895-1896...	1,438,577 „	928,831 „	51,400 „
26,290 pkgs. INDIAN	Total 69,012 packages were offered in publ		
41,513 „ CEYLON			
1,209 „ JAVA			

Movements of Tea in London as shown by the Tea Brokers' Association figures are printed below; the quiet trade ruling during the greater part of April is reflected in the deliveries.

Indian. Amongst the Indians a considerable number of last of the Season invoices were catalogued, bringing up the total to 311 against 32 to same date last year. The sale passed with good competition at above rates current last week.

Week's av. Tea sold on Garden Account, 1897, 10,578 pks., av. 7d. 1896, 6,766 pks., av. 8d. 1895, 15,955 pks., av. 9 $\frac{1}{2}$ d.

SUPPLEMENT TO PLANTING OPINION.

Comparative prices of Indian Tea in London :—

		1897.	1896.	1895.	1894.
ST.	(Fair ordinary, dark liquor) ...	4d	5d	4½d	4½d
NNINGS.	(Red to brown, strong rough liquor) ...	4d	4½d	5½d	4½d
BROKEN TEA.	(Brownish to blackish, strong liquor) ...	6½d	7½d	7½d	6½d
PK. SOUG.	(Blackish greyish, useful liquor) ...	7d	8d	8d	7d
PKOE.	(Greyish to blackish, some tip, useful liquor) ...	8½d	9½d	8½d	9½d
PK. SOUG.	(Blackish greyish, inferior liquor) ...	5½d	6d	6½d	5½d
PKOE.	(Blackish greyish, some tip, inferior liquor) ...	6½d	7d	7d	6½d

Ceylon. The 41,513 pkgs. were brought forward on two days, viz. Tuesday and Thursday. The sales passed with considerable spirit, fully to valuations current a week ago, the tendency being, if anything,

towards firmer prices, Broken Pekoes, however, showing here and there some irregularity. The official telegram from Colombo gives shipments to U. K. for April as 9,500,000 lbs., against 9,000,000 lbs. last year, and estimates the quantity available for May as 10½ to 11 million lbs.

Average for week rather under 7½d. against 8½d. last year.

Comparative prices of Ceylon Tea in London :—

		1897.	1896.	1895.	1894.
PEKOE SOUG.	(Ordinary leaf; fair liquor) ...	6½d	7d	7½d	6d
PEKOE	(Ordinary leaf, little twist; fair liquor) ...	7d	8½d	8½d	7½d
PEKOE SOUG.	(Rather bold leaf; indifferent liquor) ...	5d	5½d	6½d	5d
PEKOE	(Somewhat bold leaf; indifferent liquor) ...	5½d	6½d	7½d	5½d

Java. The 1,209 pkgs. consisted of Teas of poor quality, which passed quietly at about previous quotations.

N.B.—Remittances should be sent to the Managing Proprietor of this paper, Coonoor, Nilgiris, South India.

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 25th June 1897.

Central Travancore. PEERMAAD, 5th June.—*Weather.*—Rainfall for May 3·87. For June to date '86. Monsoon appears to be not far off. *Ten*—Flushing well. Large yields everywhere last month. *Labour.*—Still scarce, one or two new clearings are very backward in construction.

Coorg. POLLIBETTA, 9th June.—*Weather.*—S.W. Monsoon started on the 7th, 20 cents on that date, 50 cents yesterday. Week previously rain less. *Crops.*—Many of the berries which have swelled are black inside, so that there is an appearance of more crop on the trees than there actually is. *Plant diseases.*—Removing and burning borer has been commenced, and it is found that there is very little borer this season. *Labour.*—Plenty of contractors at work. Canarese not begun to come in yet. *Health.*—Fair. The cholera from Amutti and Siddapur did not come this side.

Nellampathy. *Weather.*—Rain for fortnight 2·50; total for year 14 inches. The last few days seemed as if the monsoon had started, but to-day it is as bright as ever. I expect it's not far off however. *Crops.*—Rice 9 edingalies per rupee. *Plant-diseases.*—Coffee bearing a lot of wood and hardly any "leaf" visible yet; some places are handling. *General Health.*—Still very feverish, and lots of men down with the "foul fiend." *Labour.*—Tamils are in on some places and not on others. No Moplahs available yet, and I expect they are waiting for the monsoon to start.

S. E. Wynaad. PUNDALUR, 9th June.—*Weather.*—Since the 31st May the monsoon has burst in; on the 1st, 2nd and 3rd June it cleared during day, and since we are having unceasing monsoonish weather. *Crops.*—Tea flushing bountifully. The ryots have finished sowing of ragi and chamay and have taken up the plough and are beginning to sow paddy in the nurseries for transplanting. *General Health.*—Fair. *Labour.*—Sufficient. *Interesting Item.*—Consent Act.—Among the Kurumbers, Naickers and Punniers above seven years' girls get married and have intercourse with their husbands before they come to maturity. The man never tries to live with one wife until death; as soon as the girl brings forth three or four children the man tries to give up the woman to bring another young girl, and the first woman with her children are entirely forsaken and the poor woman finds very hard to make up her living with the youngsters. I think the Government should introduce the Consent Act into the villages and prevent

the custom by allowing the Adigharry and Menon to open marriage register and let the aborigines know that their presence is required for the registry before their marriages, that they are not allowed to have intercourse with their wives, and that they will have to give up their old customs

GENERAL NOTES AND ARTICLES.

Famine labour.

We have been asked to contra the statement that appeared in papers that the coolies that Mr. Ewart, Shencottah, to get from Bellary were for Atchencoil Estate. They were for the Isfield Tea Coy. Ltd's Isfield Estate. The informant says he hopes soon to send us an authoritative version of the whole affair, showing once more how plan in Native States can be legally swindled. The Isfield Company lost well over Rs.1,000 over their venture "Famine Labour."

Planting esprit de corps.

Some men, when they find working of their District Association not going exactly to their mind, of leaving it. A slightly wrong-headed way of going work. The *Times of Ceylon*, in some trenchant remark the great lack of *esprit de corps* among Indian plant North and South, puts the matter tersely:—

How on earth is an Association to do any good if planters not join it? As we have before pointed out, when there has discontent in Ceylon, the way to put things right is not by leaving the Association, but by taking an active part in its work, and ag ing for what is wanted.

Superintendents and proprietors.

An interesting question has been raised in Ceylon on the treatment of superintendents by proprietors in the matter of granting them sick leave on half pay, paying their hospital and other incidental expenses. certainly pays the proprietor to treat his superintendent well, if he be a good man. And if he isn't a good man is dear at any price. While the supply of planter undoubtedly large, really good planters are as scarce as e and there is no better way of getting the best out of a than by paying and treating him well, and trusting hi

Natal tea.

The recent low prices fetched Natal tea at home, only confirm the impression we have gathered from private advices its poor quality. We were of opinion that the s of manufacture could be greatly improved were tra planters from India or Ceylon in charge of the fact This has received proof from the recent success of a Ce planter, Mr. John Fraser, in showing the natives ho set about it. At a recent agricultural show at Johannesburg he gained the first prize and the warm commendations of judge. Natal, by the way, began tea planting two y before Ceylon, and hasn't turned out a million pounds y

Kanan Devan Hills Produce Company (Limited).

This has been established, offices at 22, West Nile-st Glasgow, with a capital of £100 in £10 shares, to acquire certain tea, coffee, and cin estates and plantations, and certain tracts of land p cultivated and partly uncultivated or undeveloped, in

State of Travancore, India, and to engage in the cultivation of tea, coffee, cinchona, &c., in India, Ceylon, Burmah, and elsewhere. The signatories are:—Sir John Muir, of Leinster, Bart., merchant, 22, West Nile-street; Sir Robert D. Moncreiffe, Bart., Bridge of Earn; P.R. Buchanan, merchant, Darleith, Cardross; A. C. Blackwriter, 72, St. Vincent-street; A. M. Brown, merchant, 22, West Nile-street; R. H. Sinclair, merchant, 22, West Nile-street (all of Glasgow); and R. Scott, publisher, 12, Paternoster-buildings, London.

Labour in Ceylon.

The threatened scarcity of labour in the Island, a scarcity that has been threatening for a long time now, seems to be close at hand. Not that the local papers are in agreement on the subject. The planting paper proper, the *Observer*, declares that two years hence, 100,000 additional coolies will be required for plantation work. The *Times*, always eager to pick a quarrel with its contemporary, declares that 50,000 would be ample. Meanwhile there is no doubt that South India will be tapped for labour far more severely in the future than ever in the past. Still, it is satisfactory to note that Ceylon men are making strenuous endeavours to open up new recruiting districts. This means competition with Upper India, which is already sneaking down South for their coolies. We suppose a change to Japan or China is very probable in the near future.

Cinchona.

The figures that buyers of cinchona bark are now offering, are on a higher basis than the rates ruling in London a few months back, says the *Produce World*, and at public auction $3\frac{1}{2}d.$ and $3\frac{5}{16}d.$ per pound has been paid for fair stout quill, and $2\frac{1}{2}d.$ to a fraction over for chips. These prices refer to African descriptions. East Indian Crown, original stem, is commanding $2\frac{1}{4}d.$ to $4\frac{1}{4}d.$ per pound, according to quality, and chips $2\frac{1}{2}d.$ to $3\frac{1}{2}d.$ per pound. Perhaps it will hardly be believed that a London firm of self-styled merchants a short time back advised some East Indian planters that cinchona bark being so unsaleable in the European markets, the most prudent course would be to use whatever collection they might have as fuel rather than waste the cost of shipping it to London. Whether such advice was given through sheer ignorance of the markets, or for market manipulation purpose, we are not at present in a position to say. In the meantime we content ourselves by begging reference by any victimized shippers to the above-mentioned quotations, which are likely to be maintained.

A sad case.

A sad proof of the necessity for some Benevolent or Provident Fund to which all planters should be induced to join, may be instanced in the sad case of Mr. Adolphus Wright's recent death at the Gudalur, Nilgiris, Hospital.

Mr. J. W. Minchin, of Rocklands, Ootacamund, writes us under date of 1st instant:—

Mr. Adolphus Wright, of S. E. Wynaad, has lately died in the Gudalur Hospital, leaving his family destitute. The Apothecary at the Hospital informs me that there are ten in the family—that they are in extreme poverty and friendless. The eldest daughter writes me that the eldest son can earn money as a carpenter. There are two boys who know nothing, and there are three boys too small to do

anything. There is also the eldest daughter who may earn a living and two other small girls, nine in all, with the mother without a home to live in and no money at all. The rent of the cottage they occupy in Gudalur is Rs.12 a month. I am trying to raise a fund and committee to assist this old planter.

We shall be very glad to open a subscription list in this cause as soon as Mr. Minchin may desire. We may add that we are reprinting in pamphlet form a few copies of Mr. Wright's History of the Wynaad, to be sold entirely for his benefit, at Re.1-8 per copy. The book can be obtained from MESSRS. ADDISON AND Co., *Planting Opinion*, Madras.

Tanning barks: Acacia Decurrens.

We have done our best to draw the attention of our readers to the possible advantages attendant on the cultivation of this acacia. To those few who have taken the matter up, the following extract from the *Ceylon Observer* should be of interest.

At the recent Nuwara Eliya Show, Mr. A. J. Kellow exhibited Acacia bark on which he had a most favourable report from Colombo tanners, and a price which did more than cover expenses. But even here, the carriage of heavy bark must be the drawback, and "T" himself has pointed out to us the following paragraph which shows how that difficulty is overcome in Australia by the bark being 'boiled down':—

"The bark of the Australian 'black wattle' has been shipped from Ceylon experimentally from trees planted six years ago on estates as boundaries and break-winds. Each tree stripped gave 22 lb. dried bark. It is a question whether the value of this bark as a tanning substance will enable a price to be realised sufficient to do more than cover railway and steamer freight. In Australia the cost of carriage from the interior, where no water transport exists, is so heavy that the bark is there boiled down to a thick substance in a highly concentrated form, which of course reduces the cost of freight on the solid tanning principle. Were this system adopted in Ceylon, it might be found to effect a great saving in cost of transport."

Perhaps Mr. Kellow will give a trial to this plan in Ceylon and report the result.

Coffee vs. Tea cooly.

It is very desirable at times to make separate agreements with individual coolies, sturdy free-lances who don't appreciate the loving care of the maistry. These want to be the Doray's men, to be personally and not generally bound. Now a coffee-planter, under a special notification under the Stamp Act, can execute a legal agreement with individual coolies for the small stamp fee of one anna. The tea-planter on the other hand has to pay the usual eight annas. A not easily understandable distinction this, especially when it is remembered that the notification in favour of the coffee planter, above alluded to, was dated the 7th June 1894. This matter calls for the attention of the U.P.A., and we trust our Planting Member of Council will think it worth his while to take it up.

We append an extract from a recent letter of the Collector of the Nilgiris, who was referred to for information on the subject:—

By notification, dated 7th June 1894, the duty on agreements executed for service or for performance of work in a coffee plantation in the Madras Presidency, Coorg or Mysore, when the advance given under the agreement does not exceed twenty rupees, has been reduced to one anna. It is immaterial whether the agreement is executed by one cooly or a number of coolies, so long as the agreement itself is one, in other words so long as the advance is one and the terms of the agreement give a joint application to all the coolies.

Don't plant in Madagascar.

With the recent troubles, to use a mild term, in this country we should think few would care to embark in planting in the island. A Ceylon planter, who has started work there, writes the following pitiful warning to his confrères in Ceylon. Addressing the editor of the local *Times*, Mr. Lewis Way writes from Antananarivo:

I write you this letter in the hope you may think it of some service to tea-planters in Ceylon to publish, in case any of them should have an idea of coming to this country to start planting, in which case my advice to them is to go anywhere rather than to Madagascar. The soil is good enough, and land is very easily obtained, in most instances, but it is very hard to get anything beyond the land. Rice is now rising to appalling rates, labour is almost impossible to be obtained, and the Government throws every possible obstacle in a planter's way, especially if he is an Englishman. Last November the Government pretended that there was a flaw in the title to the estate I am managing here, and it took me two and a half months to get permission to continue working the estate, and, as soon as I got this permission, my labour force was taken for *corvée* on the roads, and I was unable even to get a cook or a kitchen coolie!

The natives, in fact, have told me down here that they dare not work for me, because they are afraid of the French! Consequently, I have been forced to practically abandon the estate for the time being, just as the crop is about to ripen.

The Governor-General declines to see me and discuss the matter with me in any way, and to request that I may be allowed to recruit labour from a neighbouring tribe gives no answer whatsoever.

Unless anyone wants to find out how far he can enjoy being boycotted, to the extent of having to buy his dinner in the market, and to cook it himself, he'd better not come to this country to plant.

Guayaquil cocoa.

The British Consul's review of Equador trade says that the total receipts of cocoa at Guayaquil during the years 1895-96 arrived in the following order:—

Month.	1895.	1896.
January ...	579 tons.	853 tons.
February ...	701 "	1,150 "
March ...	1,216 "	1,971 "
April ...	1,826 "	2,460 "
May ...	2,319 "	2,721 "
June ...	2,358 "	1,180 "
July ...	1,859 "	1,506 "
August ...	1,790 "	1,257 "
September ...	1,237 "	942 "
October ...	980 "	280 "
November ...	560 "	431 "
December ...	697 "	576 "
Total	16,122 "	15,327 "

The 1896 supply emanated from the following sources:—Arriba, 11,180 tons; Machala, 1,897 tons; Balao, 2,250 tons. The Arriba crop promised to be much larger, but was considerably damaged by a plague of caterpillars, belonging to the *Bombyx* family, which in many districts entirely stripped the leaves off whole acres of trees. The Machala and Balao crops showed a very diminished production on account of two years of excessive drought in those districts. As the rains of 1896-97 began early, and with unprecedented severity, it is hoped that the incoming crop may be a very large one. All the extra charges on cocoa and coffee have been sustained up to the present, notwithstanding the original decree that they would terminate in June 1896. Moreover, a new tax of $\frac{1}{2}$ c. per kilo. on all exports, except ivory nuts, has been imposed from and after December 5 to be applied for two years for the expropriation of lands to widen the streets of Guayaquil and form new streets.

Planters who succeed.

We noticed a bright little article on "Farmers who Succeed" in an American contemporary. Slightly paraphrasing it rendered it applicable to planters: Planters are divided into three classes. First, those who take up everything new in manure methods of cultivation, pruning, manufacture, produce and machinery without stopping to think or studying the demands of their market, the possibilities of their soil and the peculiarities of the climate. Invariably they make failures. The second class are those who never buy or produce anything new in the way of products, &c., use the same manure and machinery their predecessors did, never attempt any new methods of cultivation or trouble themselves at all about improved planting generally. They are like the bullock's tail, are always left behind.

The third class are those who think, study their market and soil, begin on a small scale and experiment until the problem is solved. This class is the one that is making money at planting, the other two are in the background. One and two are both bound for the same place, but seem to be going in opposite directions. One acts without thinking; the other thinks without acting. One is extravagant in buying unnecessary things; the other extravagant in not buying necessary articles. One has no fixed method of labour; the other's methods of labour fix him. The two classes are an anomaly, and as Lamartine said of Robespierre, are "shadowy, undefined—mixed." Not with those designated as the third class. They have an aim in planting, and as a result have a well defined plan and combine brain and muscle—theory and practice—know the old way but adopt the new, and are a success. They believe in the modern theory of advancement as applied to agriculture, and are bettering their condition by working along these lines. The methods of the past generation will not do for the improved order of things that marks the pathway of other men who are a great success in this work.

COMMERCIAL NOTES.

THE improved credit of the Government of India has been extolled by many newspaper writers, but it is doubtful if that credit is improving now. Since the 3% Rupee loan was issued, Calcutta and Madras Municipal Bonds have often commanded proportionately better prices than Government paper! And here are some interesting facts:

1. The London County Council called for tenders for 12 months for its six months bills to the extent of £600,000. The tenders amounted to £3,985,000; those at £99-10-0 would receive about 51 per cent., above that in full. The bills allotted will, it is said, yield an average rate per cent. of £1-1-11.

2. The Leeds Corporation, about the same time, placed £500,000 2½% stock. Tenders amounted to £2,083,400; those at £98-8-6 would receive about 46 per cent.; the bills above that in full. Average £98-9-1.

3. Similarly, the Brighton Corporation placed £337,000 of 2½% Redeemable Stock at an average of £97.

4. The Indian Sterling loan of £3,500,000 at 2½% placed almost simultaneously with the above, yielded an average of only £96-15-11, the minimum being £96-10-0.

So much for India's excellent credit!

The accounts of the Southern India Tea Estates for the year show a net profit of £1,193 after payment of interest on debentures. This enables the Directors to declare a dividend that brings the return for the year up to 10%, and steps are likely to be taken to enable the company to plant out the large area of valuable land that still has lying unproductive.

The event of the hour in this Presidency is the proposed conversion of the good old firm of Spencer & Co. into a Joint Stock Company under the Act. The capital is large—Rs.25,00,000—but it is almost all taken up already, and the complete success of this private “conversion scheme” is assured. From the prospectus issued a few days ago—an abridged version of which appears on another page—it is quite clear that handsome dividends may be looked forward to, and if the firm needed any additional security in regard to its hold on the public’s favour, it might reasonably expect to find something of the kind in the fact that many, perhaps most, of its present customers will, becoming shareholders, acquire a direct financial interest in the continuance of its success. Mr. E. P. Oakshott, the proprietor of the business, will retain a very large stake in the Company, and Messrs. A. W. D. Oakes and James Given, his partners, who assisted him in working the concern up to its present high level of prosperity, have also engaged to assist the Company. The combined efforts of these gentlemen have been so effective in the past, that we may safely say the future will show no falling off, but rather a continuance of steady, healthy growth. The figures given in the prospectus only show the general results of the working of all departments and branches together. Perhaps the best proof of the solid strength of Messrs. Spencer and Co.’s business is to be found in the fact that each and every branch, as well as the Head Office itself, shows the same grand record of increasing turnover and profits. It savours of affectation to wish success to an enterprise so fully assured of it as Spencer and Co., Ltd.; but we express the wish, heartily, nevertheless, and are glad to think that the royal celebration of Her Majesty’s Diamond Jubilee will be soon followed by a local event of such general interest and importance as the conversion of Spencer and Co. into a Joint Stock Trading Company.

JOINT STOCK TEA.

It is curious how little headway Joint Stock Tea Companies have yet made in Southern India. They are now coming into life, and bid fair to revolutionize the tea industry in this part of India. Yet even now there are few signs of *small* Companies, and apparently very little local capital is invested in the large ones that have commenced operations. That what we may call “Joint Stock Tea” is profitable, may be easily seen by a reference to financial papers. Some concerns are unsuccessful, but the average dividend yielded is a good one, and renders it the more surprising that private endeavours in the South should so long cling to old systems and to individual effort, when the North has made so pronounced a success with consolidation and co-operation. It might be worth the while of planters in Southern India to give more attention to this subject than they have done up to the present time; and we should be greatly obliged to secretaries and shareholders of any

existing companies if they would kindly send us particulars and, if possible, recent reports in respect to them. It is no uncommon thing for Northern Tea Companies to pay a steady 10%, and some of our leading planters might find it to their advantage to set the fashion here of ‘converting’ their estates into the property of Limited Companies.

U. P. A. S. I. LEAVES.

(GATHERED BY THE SECRETARY, U. P. A. S. I.)

THESE will not be leaves of the poisonous Upas tree, but leaves of the U. P. A. S. I.—a mere shrub at present, but one that promises to gain strength with years, and vie with its more famous and less egotistical rival in the stoutness of its trunk, the number and spread of its branches, and, let us hope, the grateful influence of its Leaves. Its roots are already striking deep into the soil, that soil which planters tickle without reluctance, and feed or impoverish, or feed and impoverish by turns, as the fancy takes them and science, prescience, or nescience dictates.

The above may serve as preface and—apology.

It is certain that the next Annual Meeting of the U. P. A. S. I. will be held at Bangalore during the Race Week, which begins on the 5th August next. Probably, the Meeting will open on the 9th idem. The Annual Planters’ Dinner is likely to be held on the previous Saturday evening, so that delegates from far countries may come to know each other as good fellows before they learn to appreciate each other’s powers as debaters and, as Ramasawmy might say, *cestatesmen*. [The poor joke is a dead leaf: it *would* fall.]

The Agenda paper has yet to be drawn up, but there is already promise of a more than usually interesting meeting; and this means a great deal. One proposal is to register the Association, as one working for purposes other than those of profit-making, so that the Association and its Executive may have a status in the eye of the law, and be able to deal with funds, Reserve and other, more freely than is possible now, when, in the sight of our busy Courts, the U. P. A. S. I. is a name, and nothing more.

Then there are some new proposals about the raising of Funds, the conditions of membership, the work of the Association, etc. One gentleman wishes Individuals to be admitted, with restricted voting powers, along with District Planting Associations; another desires to recast the system whereby subscriptions are raised; another would have certain sums set aside from time to time for the prosecution of scientific investigations into the causes of leaf disease and other bugbears of the planter. All these are points of grave importance.

There is yet another, as grave as these. The Government of Madras has been asked to express an opinion upon the report of the Planters’ Commission of Enquiry and, with true wisdom, has decided to first give the U. P. A. S. I. a chance of putting before the authorities the opinions of planters on a document that is of the utmost concern to them. After careful consideration it has been decided that this report shall be fully discussed at the Annual Meeting. True, a special Committee Meeting might be called earlier,

and this might help to impress the Local Government with a belief in the energy of the planting community and an idea of the importance it attaches to the subjects dealt with by the Commission of Enquiry. On the whole, however, thoroughness is preferred to undue speed; and when the Planters' remarks on this report are sent up to Government, they will have behind them the weight of many opinions, the combined strength of the intelligence of the various District Planting Associations.

The Address and Casket for Her Majesty the Queen-Empress have been despatched. Brevity is the characteristic of the former, simplicity and chasteness that of the latter, which represents in silver a hollow bamboo, supported by two kneeling coolies, whose bodies stand out in oxydized metal. The bamboo bears an engraved wreath of tea and coffee brands, with the inscription:

To Her Most Gracious Majesty
Victoria,
Queen of Great Britain and Ireland,
Empress of India.
The Humble and Loyal Address
of the
United Planters' Association of Southern India,
on the completion of the sixtieth year
of her most glorious reign
1897.

On either side of the wreath are engraved scenes from the planter's life—coolies at work, bungalow, &c., &c., and the bamboo itself is lined with velvet. Above the inscription, in scrolls, are the words Tea, Coffee and Cinchona.

The Casket stands on an ebony base, in the centre of which, in front, is a shield bearing an exquisitely chased design of the Royal Coat of Arms; and a handsome polished rosewood box gives protection to the whole.

As for the address, it runs as follows:—
To

HER MOST GRACIOUS MAJESTY
VICTORIA,
OF THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND,
QUEEN—EMPRESS OF INDIA,
DEFENDER OF THE FAITH.

MAY IT PLEASE YOUR MAJESTY,

We, the United Planters' Association of Southern India, through our Executive officers, desire most dutifully and humbly to approach Your Majesty with our respectful and loyal felicitations on the duration of a reign, not merely the longest but the most glorious in our annals, and marked by the growth of an Empire such as the world has never hitherto seen: by gigantic strides in the development of Industry, Science and Art: by a love of peace which has gone far to secure that blessing to Europe for the present generation: and finally by the example of Your Majesty's domestic life.

The vast Empire of India, in common with other parts of Your Majesty's dominions, has felt to the full the benefits accruing from a wise and peace-loving reign: and that Your Most Gracious Majesty may long be spared to rule over us, is the heartfelt prayer of Your Majesty's faithful and loving subjects in India.

Joining with earnest sincerity in this prayer, we ask permission to subscribe ourselves,

Your Majesty's most loyal, most obedient
and most devoted subjects,

THE UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA.

Each District Association has received copies of the Address, and photographs of the Casket will follow as soon as they are ready. These will form more or less lasting mementos of the year of Grace 1897, the year of the Diamond Jubilee of Her Gracious Majesty Queen Victoria, the Great and Good, the first British Empress of India.

THE CULTIVATION OF RUBBER.

We are glad to see that a start is shortly to be made with the planting on a really extensive scale, of para rubber in the Malay Protectorate. The climate and soil are peculiarly adapted to the growing of this product, the demand for which throughout Europe is increasing with formidable leaps and bounds. An idea of the huge profits to be obtained on this article, may be gathered from the fact that at this moment, pure para rubber can be sold in London at 3s. 7d. per pound, though it can be grown at 6d. It is therefore not surprising to find that the interest of keen commercial speculators is just now being enlisted throughout the Malay States, and in Kuala Lumpur in particular, in the formation of a syndicate to promote the development of so profitable an industry. Striking testimony to the very inviting character of this cultivation is borne by the *Ceylon Observer*, and although the remarks of that journal refer more particularly to Mexico, they will be found to apply with equal force to the Malay Peninsula. The *Observer* says:—"Nothing seems more certain than that the great rubber industry will be partially paralysed through exhaustion of present sources of supply, and that the fortunate owners of rubber plantations, be they few or many, will reap huge fortunes. It is this certainty, proved by the rubber statistics, which is at the bottom of the great efforts now being made to obtain plantations in Mexico and elsewhere, but chiefly in the former country. Mexico is the home of the *Castilloa elastica* acknowledged to be the best of the rubber-yielding trees from the planter's point of view. *Hevea brasiliensis* gives the most valuable rubber—para—now worth 3s. 7d. per pound, while that from the *Castilloa* only realises 2s. 4d. But the difference in value is greatly owing to the better methods of preparation which obtain in Brazil. When the *Castilloa* milk has been taken in hand by a skillful British chemist, as it shortly will be, we shall, without doubt, see a marked improvement, and the price will be levelled up to within measurable distance of that of 'fine' para. The prospects of the rubber planter in Mexico, even at present values, are more rosy than those of any other arboricultural industry. And this applies, more or less, to every country in which the *Castilloa elastica* will thrive. A profit of 300 per cent in the eighth year is what the experts are promising, and the figures are based in one instance on a selling price of 1s. per pound for the rubber, and in another on 2s., the first being less than half the market value of *Castilloa* rubber in London to-day and the second 4d. below it. That rubber can be grown cheaper than it can be purchased from the native collectors is an absolute fact, and it is obvious that the quality must be far superior to a wild product, except, perhaps, para, the method of preparing which does not seem capable of improvement. For joint stock enterprise the cultivation of rubber trees in Mexico offers a fine field, as there is no substitute for rubber worthy of the name and small probability of there ever being one. At present adulteration is rife, greatly to the detriment of the trade. We hear of powdered flint and cement being used to eke out the supply, and the demand for old worn out rubber goods is very great. The only apparent remedy for this disastrous state of things is cultivation on an enormous scale."
—*Malay Mail*.

BRITISH NORTH BORNEO.

ESTIMATE FOR LIBERIAN COFFEE.

The following interesting notes are from the *Ceylon Observer*:—

As we mentioned in our last issue, Mr. Henry Walker, Commissioner of Lands, British North Borneo, who arrived at Colombo by the German mail steamer "Preussen," makes a stay of about three weeks in the island, principally for the purpose of affording information

to planting capitalists regarding the prospects in that settlement. In the afternoon Mr. Walker left for Kurunegala on a visit to friends, before he took his departure he kindly favoured us with a few lines which we think will be read with interest by our readers. He mentioned that some very important enterprises are now being energetically pushed in North Borneo by monied Companies or syndicates, notably the Railway (by the Government) from the Coast to the, as yet, unopened interior. With regard to the tobacco enterprise he said that the crop of 1896 now going to Europe will be 12,000 tons of 188lb. each and the prices realized this year in Amsterdam are 50 per cent. higher than last year (which were considered high). The timber trade with China is increasing and the Bombay-Burmah Trading Company propose to lay down a large saw mill. As the soil there is suitable for tea boxes a large trade may be done with Siam. Petroleum oil is being sought for and the Bombay-Burmah Trading Company lately sent 100 tons of boring plant to North Borneo. Oil is known to exist at two places and it is hoped a large quantity may be found to exist. The exports of coal from Labuan and Bremer Bay are increasing—say 4,000 to 6,000 tons per month. It is used by the P. & O. Company who lately made a contract for 100,000 tons—and it is understood they are satisfied. From a circular prepared by Mr. Walker we are permitted to make the following extracts:—

We have a well divided rainfall, and consequently, although it is heavy, say from 70 to 120 inches per annum, the effects are not so disastrous as in those tropical countries where the rainfall is limited to a few months of the year and the daily fall is so great as to wash away all the humus, and, further, our rocks, including lime-stones, serpentines and conglomerates, are naturally rich in substances suitable to vegetation, and, when evaded, afford a suitable soil for tea, coffee, sugar, cinchona, gambler, coconuts, &c., all of which (except cinchona) have been tried with success either experimentally or on a large scale, and as our lands run up to a height of over 13,000 feet, we can offer the intending investor the prospect of making a home in a cool and invigorating climate.

We believe we now offer better prospects of financial success than any other tropical country. At present we are willing to make free grants of 500 acres on 99 years' lease to encourage the planting of certain products, provided that the intending investor has £2,000 capital and will make a *bona fide* commencement to bring such land under cultivation within 18 months from the date of selection of the land and that he will bring one-third of the 500 acres under cultivation within 12 years from the date of the agreement for a lease. Should he fail to cultivate one-third of the 500 acres he will be only entitled to remain on the 500 acres of jungle for each acre cultivated; but if he desires to retain the balance of the 500 acres he can do so by paying 20 cents rent per acre or purchase such land at three dollars per acre.

The Currency in use in British North Borneo in the Mexican dollar, which since 1894 has fluctuated in value between 1/11 $\frac{1}{2}$ and 2/1 $\frac{1}{2}$. The average rate of exchange on the estates, including the Mandore (cangany) is between 27 to 29 cents a dollar. The coolies employed are Javanese, with advances and Malays or varieties of the Malay race, with or without advances as the case may be. On Ulanpakad Estate, now being opened by Mr. E. R. Walker (late of Le Vailon Estate) the coolies employed are obtained on the spot, and the advances outstanding at the end of each month are under two dollars a head, and at Toritipan Estate with a force of over 200 coolies of mixed nationalities, the total advances are usually under \$1,000 or less than \$5 a head, which amount is not guaranteed by the Mandore, but is a debt due by each individual cooly. The Javanese and Malays from Singapore usually sign to work a year and receive \$12 or even \$18 a head payable in equal monthly instalments; the locally engaged coolies work on a verbal agreement terminable by a month's notice and receive two or perhaps three dollars advance, which is really a cash advance to obtain food, and is deducted at the end of the month if the Manager thinks fit.

Food supplies are paid for by the coolies, or each week a chit is granted by the Manager for a small sum which is accepted by authorized shops, where food is supplied at fixed rates, of which a scale in English, Malay and Chinese is hung on the door of the shop. The transport acquired by the Estate is done by the oppman.

In 1895 I constructed a trial path from the west coast to the interior, where there is a large native population, and since I left (in May, 1896) a Railway (metre gauge) has been taken in hand, following much the same line of country. The Railway line when finished will be about 52 miles long with the upper terminus (altitude 600 feet) at the foot of a range of hills running up to 3,400 feet with good soil and well watered. The Railway works now afford employment to a large number of Chinese and natives, and, when completed, a large body of well-disciplined labourers will be available for the planting industry. A planter can now obtain work-people—men, women and children—near the line of the railway. He must, however, be able to speak Malay, a language easily acquired, and he must follow the customs of the country: if he cannot accustom himself to these he had better not come.

I give below an estimate of the cost of opening 100 acres of Liberian Coffee which works out (at the end of the third year) at something less than £16 sterling per acre. The figures were given me by a Coffee Planter in British North Borneo, and are based on rates and wages as now paid. I have appended a few marks on the items showing where a managing proprietor may economise, and a little examination of the estimate will show that £12 per acre should suffice to plant a second 100 acres could be planted for about £10 an acre. I should mention the fact that the expenditure is becoming less and less each year. Estimate of cost (in dollars) of opening 100 acres of Liberian Coffee in British North Borneo.

Present rate of Exchange 2s. per dollar.	
Superintendence, say 12 months at \$ 150 per month	1,800
Felling 100 acres at \$ 2.50	250
Piling and burning „ 3.50	350
Lining „ 1.00	100
Holling 43,500 holes 2 ft. by 1 ft. 6 in. (10 ft. by 10 ft.) at 1 cent	435
Filling and planting at 1 $\frac{1}{2}$ cts. per hole	652
Shading 75 „ per acre	75
Supplying	100
Nurseries and seed—N.B.—The seed should be obtained from a high estate in estate in Ceylon or India	300
Weeding 6 months at 90 cents per acre per month	540
Roads and Drains	1,000
Lines, 2 sets	150
Bungalow	500
Tools	250
Contingencies	500

Cost at end of 1st year ... \$ 7,002

Superintendence	1,800
Supplying	100
Nurseries	100
Weeding at 90 cents per acre per month	1,080
Roads and drains	200
Buildings	100
Tools	100
Contingencies	150

Cost during the 2nd year ... \$ 3,730

Cost during the 3rd year exclusive of crop expenditure ... \$ 3,730

Total cost at end of 3rd year ... \$ 14,462

In the foregoing estimate the cost of weeding has been taken at a safe figure. Mr. E. R. Walker opened 36 acres in 1896, and his weeding for the five wet months, October 1896 to February 1897, averaged 80 cents per acre per month and the older coffee on Toritipan Estate costs 55 cents on monthly contract. The item superintendence is a heavy one, but that would be less per acre as soon as a larger acreage is taken in hand. As the actual cost of living is not more than one dollar a day for food, the intending planter may gauge his own personal expenditure on drinks, clothes, etc. The other items are based on the present cost of works in British North Borneo.

The yield of crop in the 3rd and 4th year should pay for the crop buildings and machinery, say a total of £200 to £300. Large stores are not necessary provided a small hot air drying shed be erected, in which the parchment can be dried in about 8 hours and be packed in bags and despatched the same day. The 5th year should give 5 cwt. and when the coffee is 6 years old the yield of coffee may be expected to be 7 cwt. per acre without manure, but with manure 10 cwt. or even more may be expected.

The expenditure on the estate on a crop of 7 cwt. per acre should be less than thirteen dollars per cwt., and the London expenses including freight are nearly 9 shillings per cwt., say at present exchange a total cost of about 35 shillings per cwt. As I have previously stated, we find that the estate expenditure is becoming less each year, according as the labour force becomes more skilled.

ENTOMOLOGY AND PLANTING.

WE make no apology for reproducing in full the following interesting notes from the *Ceylon Observer*:—

A recent number of that very useful publication, The Hawaiian Planters' Monthly, contained a special Report on his work as Entomologist, from Mr. Albert Kœbele. It is long and technical, and may be deemed too dry and scientific for perusal by the general reader; but we have reproduced it in our daily and *Tropical Agriculturist* for the benefit of our planting community. There are not a few thoughtful planters, we are glad to say, still in the island and to them the account of Mr. Kœbele's work among the "poochies" and other enemies of planting and agricultural industries, will not be uninteresting. Hawaii is as great a paradise for insect and fungoid life as is Ceylon; but there are striking differences, because we find Mr. Kœbele endeavouring to introduce such enemies of insects as rats, bats and toads. And without success, too, in the early trials, as regards the first and second, though there is hope that the batrachian introductions may get on. Now, we need scarcely say that there is no lack in Ceylon of such enemies of insects as are above detailed. Indeed rats were at one time a great enemy of the coffee-planter in certain districts. When their food in the jungle—the *nillu* plant for instance—failed them, rats sometimes invaded the nearest coffee plantation and nipped off the primaries

or secondaries of the bushes, thus inflicting a terrible loss on the owner. Such experiences however—as indeed, alas, coffee itself almost—are things of the past in Ceylon; for, we have not heard of a single case in which rats have attacked our later staple product, tea.

We naturally referred Mr. Kœbele's Report to Mr. E. E. Green, who has been good enough to supply us with a series of "Notes" pointing out the portions, and the enemies, which have a direct interest to Ceylon planters. This we append as an admirable summary for local use of the full Report. But, before doing so, we may quote from a very interesting letter accompanying "the Notes," which has remained by us too long:—

Eton, Punduloya, 19th April.—I return your copy of "The Hawaiian Planters' Monthly," containing the Report of the Government Entomologist (Mr. Albert Kœbele). This whole Report goes to show what can be done by an intelligent man—with a knowledge of his subject—who can give his whole attention to the work. Not that everyone would have succeeded as admirably as did Mr. Kœbele. He seems to have been the man most exactly fitted to the task.

It may be said by sceptics that this glowing account of his success is merely the man's own testimony. But there is ample outside witness to the value of his work. In a recent number of "Nature" (25th March '97), Mr. R. C. L. Perkins—the Naturalist deputed by a Committee of the Royal Society and British Association to investigate the Fauna of the Sandwich Islands—speaks in the highest praise of the results of the introduction of beneficial insects into the Hawaiian Islands.

I have just received a letter from Mr. Kœbele himself in reply to my question as to whether he would be in a position and willing to undertake a similar work in Ceylon.

It appears that the Madras Government has also approached Mr. Kœbele on the subject.

With respect to Ceylon, Mr. Kœbele writes:—"If the Ceylon people should want me my services would be required in India also It would suit me to introduce all enemies I know of for any scale pests you may have in the respective places. I could do it—alone—in about two, at longest three years. I may be able to come at the beginning of next year if so desired—not permanently, but only for the time stated."

Mr. Kœbele does not answer my enquiries as to the cost of the undertaking and the remuneration for his services. I am writing again to ask for some estimate. In one respect I think Mr. Kœbele misunderstands the position. We do not require such a general and varied introduction of different species as has been carried out in the Hawaiian Islands, covering a long period and occupying the continued attention of the specialist. All we want at present is to see the one or two species of lady-bird beetles that are most likely to help us against our dominant pest ('green bug', *Lecanium viride*) properly established in Ceylon. This could certainly be effected within a very much shorter time than that suggested by Mr. Kœbele. As I mentioned in one of my former letters, I do not advocate any very extravagant outlay in the experiment. I am now of opinion that the decay of coffee was not by any means entirely or even mainly due to the ravages of the bug, though the bug hastened the downfall by sapping the system of the trees already weakened by other—more deeply seated—causes, of which leaf-disease was the prime factor, backed up by a reckless waste of surface soil.—E. E. GREEN.

We quite agree with Mr. Green that Mr. Kœbele takes an exaggerated view of what is required in Ceylon, and indeed he must learn that the cultivation of "Coffee" has been so reduced in area in Ceylon—only a few fields in a few districts being left amidst the universal "tea"—that the support available for the introduction of the enemy of "green bug" is very limited. The same may be said of Southern India: only in Coorg and Mysore is there an appreciable quantity of coffee left." (III Ed., *Planting Opinion*.) "Our proposal was that the planters of Southern India and Ceylon should unite, getting aid from their Governments, in making up a suitable fee and the necessary expenses for Mr. Kœbele. If his mission proved successful with us, it is very likely that further profitable commissions might await him, especially from Java, Sumatra, and the Straits Settlements. But he must know that nowhere in the East is coffee "king" now-a-days.

The practical "Notes" with a local bearing, supplied by Mr. Green on Mr. Kœbele's Report, are as follows:—

NOTES UPON THE REPORT OF THE ENTOMOLOGIST OF THE HAWAIIAN GOVERNMENT.

1. *Dactylopius ceriferus*.—Not uncommon in Ceylon; usually in insufficient numbers to be serious. But I have quite recently noticed a really bad attack of this blight in Colombo, where the insect was so abundant on several ornamental shrubs that the plants were quite disfigured and parts of them actually killed.

2. *Dactylopius adonidum*.—Though it is doubtful if the species has been rightly determined (I believe its correct name to be *Dactylopius citri*); the "mealy-bug" long known as a coffee pest in Ceylon.

3. *Pulvinaria psidii*.—Very abundant in Ceylon. It has seemed to have considerably extended its range within the last few years. I first noticed the species some ten years ago upon cinchona. I next found it established upon tea; and I constantly find it now upon individual tea bushes which are completely blackened by the accompanying growth of fungus. Fortunately, it does not spread much upon tea. The species is almost constantly present upon garden trees. Orange and lime trees are much subject to its attacks. I could give a long list of ornamental shrubs in the garden and wild plants and jungle trees upon which I have noticed the pest. At present some *Aralia* plants in my garden are literally covered with the insects. In fact, the species is fast becoming omnivorous. Curiously enough the coffee plant, which is so badly affected by this pest in the Sandwich Islands, is one of the few Ceylon plants upon which I have not found the insect.

4. *Lecanium acuminatum*.—Under this name Mr. Kœbele is referring to a large triangular flat scale that is sometimes rather injuriously abundant upon mango trees in Ceylon.

5. *Aspidiotus aurantii*.—Present in Ceylon; but not so far noticed in sufficient numbers. Our climate appears to be too tropical for its comfort. As Mr. Kœbele points out, the species flourishes better in more temperate latitudes.

6. *Aspidiotum cydoniæ*.—Common on many different plants, especially upon fruit trees of various sorts, where it seems to appreciate the fruit itself. I have seen the rind of a pomelo fruit so thickly encrusted with the scales that the natural surface was completely obscured.

7. *Aspidiotus camellia*.—A common and distinctly injurious pest upon tea cinchona in Ceylon.

8. *Parlatoria zizyphi*, and *P. pergandei*.—It is surprising that neither of these two species has yet been recorded from Ceylon. They are both very common pests of orange trees and have been introduced into most countries where oranges are grown, being very easily imported upon the rind of the fruit. We probably owe our immunity to the fact that we rest content with the old original varieties that have been cultivated here from the earliest times, without attempting to improve the strain by the importation of plants or seed from other countries.

9. *Mytilaspis citricola*.—Common on orange trees in Ceylon.

10. *M. gloverii*.—Collected from orange trees in Kandy.

11. *M. pallida*.—Common on several wild shrubs in Ceylon. Found occasionally upon guava trees.

12. *M. pomorum*.—The only living examples of this insect that I have seen in Ceylon were upon the rind of imported Tasmanian apples. In England the species has become almost omnivorous. The species does not appear to flourish in the tropics.

13. *Chionaspis biclavis*.—This species is nearly always present often in enormous numbers—upon the stems of cinchona and tea plants. It is a very inconspicuous insect and escapes general observation from the fact that the colour and texture of the scale is wonderfully adapted to the surface upon which it resides.

14. *C. eugeniae*.—Some scale-insects found upon *Litsea zeylanica* and several other jungle trees were determined by Mr. Maskell as varieties of his species *C. eugeniae*. It is not a species that is likely to prove of economic importance.

15. *Diaspis amygdali*.—Very abundant on many trees and plants in Ceylon. It is a common pest of geranium plants—(see 'Coccidæ of Ceylon,' page 68.)—I have lately noticed that it has established itself upon the stems of one of our common shade trees, the 'Dadap' (*Erythrina*, sp.)

16. *Florinia camellia* (F. *florinæ*).—This species has been noticed upon tea in Ceylon this year for the first time. It is a minute insect, and though present in considerable numbers, it does not seem at present to have materially affected the health of the plants.

17. *Ceroplastes rubens*.—Occasionally present upon tea.

18. *C. floridensis* is also found (rather commonly) upon tea and other plants but does little or no harm.

19. *C. ceriferus*.—Quite a large species, measuring sometimes nearly half an inch in diameter; common upon many wild plants; and occasionally present upon tea stems. The insect produces such masses of waxy matter that experiments have been made to test its economic value. The wax was found to contain too much water to make good candles (they spluttered uncomfortably when burning); but this defect could doubtless be rectified by proper treatment.

20. *Lecanium coffea*.—Once our principal coffee pest is now quite in the background, having been ousted by the more dominant species *L. viride*. It has transferred its attentions to tea and is sometimes found in force upon individual trees, generally such as are under the shelter of some overhanging roof.

CENTRAL HOTEL,
INFANTRY ROAD, BANGALORE.
(Under English Management.)

The most comfortable and convenient for visitors.
TERMS MODERATE.

21. *L. longulum*.—A decided pest of some of our most valuable shade trees. We have found it upon the 'sau' tree (*albizzia*) and very commonly upon greas—often in such numbers as to stunt the plant.

22. *L. nigrum*.—Another quondam coffee pest, now seldom found upon that plant, but occurring abundantly upon many wild trees and shrubs, and also upon several garden plants, more particularly upon begonias.

23. *L. tessellatum*.—A widely spread species in Ceylon. It is often very abundant upon the fronds of the 'kitul' palm (*caryota urens*). I noticed it in the Palm House at Kew Gardens upon the same palm and found several of the gardeners engaged in picking off and destroying the scales.

24. *Triococcus arancarsæ*.—When I was at the Hakgala Gardens some few years ago, several 'Norfolk Island Pines' (*araucaria excelsa*) were badly infested with this species. The presence of the pest was noticeable at some distance by the slightly black fungus that followed the attack. The trees were greatly discoloured, and I believe ultimately seriously injured.

25. *Rhizobius ventralis*.—Of the "lady-bird" beetles, this is the species that seems most promising. It feeds principally upon that particular group of scale insects known as the *Lecaniidæ* of which our *Lecviride* is a prominent member. This bug being a soft-bodied insect it is particularly open to attack from 'lady-bird' beetles.

I am sorry to note that several of our indigenous "lady-birds" are retiring before the advance of a very pertinacious little ant (*Cremastogaster dohrni*). This insect is particularly fond of the sweet excretion from the bugs and frequents the buggy trees. As they distinctly encourage the bug, they naturally discourage any interference from predaceous insects, and that the discouragement can be most effective, can be readily proved by disturbing one of their nests. The occupants swarm out upon the intruder and give him a very unpleasant reception. These ants build large nests that have the appearance of being composed of masticated brown paper.

26. The Japanese beetle, or rather its larva—is evidently allied to the insect formerly known in Ceylon as "White Grab." Mr. Kœbele was most fortunate in finding such an efficacious remedy as the fungoid disease described on page 83 of this Report.

E. E. GREEN,

Punduloya, April '97.

QUININE PROSPECTS.

THE result of last week's public sales of cinchona-bark at Amsterdam fell considerably short of the expectations of most bark-holders, says the *Chemist and Druggist* of 15th ult. They all professed to anticipate a further heavy advance in the unit-price, and they were greatly disappointed with the actually realised average increase of 10 per cent. And as many of the importers were not disposed to accept a moderate increase on the previous market-rates, nearly two-fifths of the supply, representing some 625,000 oz. of sulphate of quinine, were bought in or withdrawn from the auction.

The result of the sale shows the powerful influence of the combined quinine-manufacturers upon the market. The position of cinchona-bark, so far as it can be judged by figures, is a strong one. The exports of bark from Java during the first four months of the year, as given on page 742 of our issue of May 8, show a decline of about 10 per cent. compared with those of the same periods of the four preceding years. The supply of cinchona-bark at Amsterdam is smaller than it has been for years, and that in London is constantly shrinking in bulk, and still more so in value. Moreover, the stock of quinine in the London warehouses, which used to be such a bugbear to the dealers in cinchona and quinine, has fallen to comparatively small proportions. On May 1, 1894, it was still 197,862 lb.; a twelve-month later it was 152,416 lb., and on May 1, 1896 and 1897, it was returned at 113,577 lb. and 84,331 lb. respectively. From the beginning to April 30 of the present year the quinine imports into the warehouses have been 11,160 lb., the deliveries 14,783 lb.

And while the supplies of quinine and quinine-material are thus diminishing in every direction, there is good evidence that the consumption of the alkaloid is again increasing. A few years ago it was feared that the competition of the new synthetic antipyretics would permanently cripple the demand for quinine, but some of the coal-tar remedies have shown themselves untrustworthy, others afflicted with disagreeable after-effects, and quinine now appears to have but little to fear from their competition.

All the elementary factors of a rising market are therefore in existence, but it does not suit the quinine-manufacturers, at this moment, to let the price of cinchona-bark go any higher than it is. The manufacturers are strong because they act in unison, while the planters and bark-consignees are weak, and fight each for his own

hand. But not quite so weak as they were. When, a year ago, the leading quinine-makers tacitly agreed not to buy at an auction, except at reduced prices, the importers were at their mercy, and accepted any offer made them rather than let their bark go unsold. Now they show a much better fighting spirit. Last Thursday their firmness was justified, for after the auctions some of the quinine-makers who would not bid at the sales tried to obtain several lots by private treaty. In no case, however, do they seem to have been successful, for there is a general belief that a higher unit is unavoidable, and must ere long be paid.

If the quinine-manufacturers should be forced to pay more money for their raw material, they may try to recoup themselves by an advance in quinine. But two circumstances stand in their way. In the first place, a goodly proportion of the quinine which was sold so cheaply during the short panic a few months ago must have found its way into the hands of speculators, who would harass the manufacturers by underselling them as soon as an advance in price set the market going; and, secondly, there are a good many independent manufacturers with whose competition the combined makers must reckon. We shall probably soon have Java quinine in Europe. On this subject there is an interesting passage in the annual report of the Agricultural Society of Soekaboemi, in Java, which has just been issued. With regard to cinchona, it is pointed out that, so far back as 1885, the Society decided to make experiments in the extraction of cinchona-alkaloids in Java. At that time, however, the intention did not go beyond the extraction of the alkaloids in a crude manner from the bark, the object being simply to save shipping expenses. At present, the report says, there are two well-equipped quinine factories at work in Java, of which one proposes to manufacture quinine only from the bark of the cinchona-plantations to which it is attached, while the other works entirely independently. The Government have undertaken to admit all materials required by the factories free of Customs duty. The Society points out how desirable it is for the owners of cinchona-plantations to send their bark to the Java factories instead of continuing to ship it to Europe in the quantities at present exported.

No doubt we shall hear more of these two factories soon. Altogether it looks as though an interesting time were in store for quinine and for cinchona-bark.

SUNDIALS.

PERHAPS, in the tea districts, says a writer in the *Planter*, there is nothing more variable than the time kept on various gardens, it being by no means uncommon to find an hour's difference between the clocks of two bungalows not ten miles apart. Sundials at each factory would do away with this at once, and making one is quite an easy matter. The first thing to do is to find the true north, and a compass is no use for this purpose, unless the variation for the place is known. The pole star is true north only twice in the twenty-four hours when it is either perpendicularly above or below the star ϵ (Greek sign) Ursæ Majoris. Everyone knows the Great Bear. The star referred to is the fifth from the "pointer" end, the third from the other.

The pole star crosses the meridian in the lower transit (*i.e.* below the Bear) on the 1st June about 9-28 P.M. (this is not absolutely correct), and four minutes earlier every evening after. The pole star is easily recognised as the first bright one in line with the pointers. The easiest method of getting the north by the pole star is to rig up two gallows with a plumb line on each, getting these lines true with the star at night, the line between them can easily be marked out at leisure. Having got the north line, a brick pillar should be built to receive the gnomon and dial, and should be carefully levelled off. The gnomon may be made of a piece of tin or painted wood being a right-angled triangle with one angle equal to the latitude of the place, *i.e.*, the latitude being $25^{\circ} 30'$, the angle at one end of the base should be $25^{\circ} 30'$. Any surveyor can mark this out, or a piece of wood or metal could be cut to the proper angles in Calcutta and sent up. A good length for the gnomon is $18'$.

The gnomon should now be placed on the pillar, the right angle lying at the north end and the "latitude" angle at the south, the side subtending the right angle being thus exposed to the sun.

The thickness of the gnomon does not matter, as it is only the outer edge that throws the shadow.

The gnomon being laid on the true north and south line should be fixed in with cement to the depth of, say, half an inch, and this carefully levelled off. Twelve o'clock (sun time) will now be shown by the shadow of the gnomon being exactly in line with its sides, and the easiest way of making the hour, half hour, and quarter hour lines, is to set one's watch at twelve, when the shadow shows that time, and rule off the shadow at each quarter of an hour. This will give the afternoon times, and if the watch is fairly correct the same game may be started at 6 A.M. the next day for the morning times. Another method is to work out the angles by logarithms—by no means an easy task for most of us.

This gives the sun time, and of course this is hardly ever quite correct, sometimes being as much as 14 minutes out. There are many tables published giving the number of minutes to be added or subtracted on each day.

For anyone who wishes to work the angles out by logarithms the following formula is given (from Surveying by J. C. Clancey):—

Let t = the distance from the meridian.
 l = the latitude of the place.
 h = the hour angle in degrees.

then

$\log \tan t = \log. \sin. 1 + \log. \tan h - 10 : h$, of course for 1 (or 11) 2 (or 10), etc. $15^\circ, 30^\circ, 45^\circ$ up to 6 o'clock, when it is 90° . Of course for the quarter hours these angles must be subdivided.

LETTERS TO THE EDITOR.

A CORRECTION.

DEAR SIR,—Your Printer's Devil has made a hash of my letter. For "one very like another in its fur" read "for one very like an *otter* in its fur." Instead of "such thieves" read "Becuficos" that come for figs.

AGRICOLA.

OTTERS IN S. E. WYNAAD.

DEAR SIR,—The following may interest some of your readers: I was working to-day among Waddee Cuddies on the side of my river, when hearing a splash I turned and saw an otter standing half-immersed on the tail of a pool. Presently a fish scooted down the stream, at which the otter made a dash but missed his prey. The fish was followed by 4 other otters. On joining forces they played about for some time, uttering faint cries and then started off down stream. I continued my work and soon the otters re-appeared. This time there were no less than *ten* of them. No wonder fish are scarce.

Yours truly,

W. HAMILTON.

GADBROOK, NELLACOTTA,
 3rd June 1897.

THE COOLY AND THE MISSIONARY.

SIR,—I was uncommonly well pleased to read in your last issue the remarks on Christian coolies by your "much disgusted correspondent." It is a subject that has remained too long unnoticed by the writers in your journal. In the particular district where I reside, we have what is facetiously called a Coolie Mission, the noble work of which and the dangers its missionaries undergo, are doubtless portrayed in the glowing style so common on Missionary platforms at home. Realities are somewhat different. The gentleman who undertakes the certainly arduous task of converting our coolies here, has a remarkably easy, not to say soft, time of it. His headquarters are in the station, where he and

his family reside in a style indistinguishable from that of another Anglo-Indian household. He himself rides about the district at intervals with generally about four times as much luggage as any planter would think necessary for the purpose. Putting up wherever possible at the bungalow, he obtains some times leave to preach to the coolies.

The way he sets about it is curious. The coolies' God is so and so Swami. Well, this Swami was an awful blackguard. He did this and he did that. And if they worship him, they must worship blackguards too. And in fact generally insults them and their religion to his heart's content. Naturally the better sort of coolies only get riled over it and want to chuck the padre down the khaddar. The only ones on whom he makes any impression are wretched lazy brutes who foresee easy work and lots of rice if they can get "converted." Before, as heathen coolies, they were bad enough but now they get infinitely worse. But I shall not go over the same ground as your former correspondent.

All I would suggest is that the Coolie Mission and Missions be forbidden the vote by all planters. It would stop a good deal of the mischief. Yet not all, worse luck.

There is a singular fatality about the Indian Missions. The religion of Christ is as pure as, if not purer than, any in the world. The Hindu converts to Christianity are generally among the most disreputable and scoundrelly members to be found in the country, and, indirectly, bring shame and contempt on the religion of the white man in this land.

ANOTHER DISGUSTED PLANTER

COST OF LIVING ON A PLANTATION.

SIR,—I have been greatly interested in several letters in the last few numbers of the "P. O." from planters, giving statements of their monthly expenses.

"Ex-Creeper" seems to have lived in an exceedingly cheap district, and I congratulate him on his economical living, though I am afraid I cannot do the same to "Indigo Assistant."

The following is a statement of my actual necessary monthly expenditure, and I think it is a fair statement of the usual expenses of superintendents in my district:—

Pay of butler (cook)	...	...	...	...	13
" " chokra	...	...	...	...	8
Bazaar 4 weeks	...	...	...	...	28
Dogs (4 as. a week for each dog)	...	...	...	...	2
Flour, tea, sugar, table salt	...	...	...	...	3
Milk 4 tins at 10 as.	...	...	...	...	2
Stamps	...	...	...	...	2
Dhoby	...	...	...	...	4
Tobacco	...	...	...	...	1
Sundries	...	...	...	...	4
Liquor	...	...	...	...	6

Total Rs. ... 76

Some may consider a chokra an unnecessary servant, and under ordinary circumstances, I think he is, but I happen to live in a district where there are a number of neighbours, and therefore having many visitors, I find a chokra indispensable.

Bazaar account includes fresh mutton (twice a week), for vegetables, sugar and salt for cooking purposes, bread, oil

My present income is, I may state, only just over Rs.100 per mensem.

The balance goes to club subscription, medicines, bungalow and toilet necessities, clothes, boots, stationery, &c.

A young planter can live comfortably on Rs.100 per mensem.

on less it is only existence. I quite agree with "Indigo enter" that planters are very badly paid (as a rule). My life a planter is a very pleasant one, and I should not like to change it; at the same time, under present circumstances, it is only vegetating. How is a man to save say even £100, at least how long will it take him to save it, on Rs.100 or Rs.150 a month? "Home" seems a long way off, does it not? And prospects look very black at present. However, let us hope that next year crops will improve, and that the prospects and pay of superintendents will likewise improve.

Yours faithfully,

A COFFEE PLANTER.

UTH MYSORE.

SHORT CROPS.

SIR,—It is distressing to see from the reports published in our last issue how general has been the failure of the coffee blossom this season.

It is the more disheartening, as last year was, generally speaking, far from a good one, notwithstanding which cultivation was in many cases increased, as a bad season is generally followed by a good one.

My object in writing is to get the opinion of other planters as to the cause of the wholesale loss of blossom, giving my own experience for what it is worth. The primary cause is in my opinion "leaf disease," which followed in my case a very heavy W. monsoon, and I may say a generally wet year, the rainfall being one-third more than the average. The disease showed itself in December and January, and in consequence only a very light pruning was given as the trees were all but leafless. In February—14th to 28th—we had 3.48 rain, and by the end of the month, such trees as had not given crop last season or had been heavily manured had set a small blossom, and the whole estate broke out in profuse growth of new leaf and wood. March passed with no rain at all, and April followed with four small showers at long intervals aggregating only 87 cents. The first week in May we got 2.45 inches, but the trees were in general unable to put out any more blossom, and the unopened buds either dropped off or just opened at the tip in the shape of "prush." Now for cause and effect: I am of opinion that the leaf disease we had in December is more likely to be the cause than the rain in February or the want of it in March and April. In October the trees looked grand: 18 inches of new wood and nearly every field and trees in good healthy leaf. At the end of January all this wood had perhaps one or two pairs of leaves left at the end, the rest having fallen from disease, and it is to be noticed that just where these leaves remained there a little blossom has set, which confirms me in my opinion that disease and not drought is the cause of the shortfall in crop. The effect of the February rains still further intensified the evil of the disease by depriving the tree of the rest it has in February and March and causing it to prematurely put on wood and foliage, when it should be naturally devoting its energies to the formation of fruit buds. Other places may not have had the disease as badly as my place and still lost the blossom, and it would be interesting to many, I have no doubt, if such men would give us their views.

Has anyone ever tried sulphate of iron as a remedy for leaf disease (*Hemeleia vestatrix*)? The increase in yield, and freedom from "sand" and other fungi in cereal cultivation, is very marked.

Yours faithfully,

PERSEVERANCE.

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contains per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.68	"	Phosphoric Acid.

Orders should be booked early for the present crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE.

COFFEE.

The San Paulo Coffee Company. This large company has been registered in London with a capital of £270,000 to obtain the Santa, Olympia, St. Joaquim and Chanaan Estates in the famous coffee district of Brazil. The vendors are a Hamburg firm. The Registered Office is 57½, Old Broad-street, E.C. When floated, some good billets ought to be going for enterprising Indian planters on the lookout to improve their prospects.

E. lithosperma: a caution. Mr. Nelson writes us, rather too late we fear, to warn planters who have this shade down, to lop them up before the monsoon bursts. As they grow so rapidly, they get knocked about by the wind in exposed situations. The best way to stop this is to by lopping and taking off superfluous leaves. Breakages by the wind, or even being blown over won't hurt them: lopping is only advised to get them as big as possible in the shortest time.

Umbrella pruning.

Surely there is something wrong about any one seriously advocating umbrella pruning on a young estate. Yet that is what we hear an old Indian Coffee planter is trying to impose on his brother planters in the Shiré Highlands. We always had an impression that it was to bad and scanty cultivation and manuring that so many old estates in this and other districts have been reduced to bear all their crop on the top. They seem to be still stumbling distressfully, do the plucky but raw B. C. A. planters.

Coffee in South India. They have some very funny ideas in Ceylon as to the extent of our coffee industry in South India. The *Ceylon Observer*, which sets itself up to be an authority on planting statistics the whole world over, gravely affirms that "nowhere is coffee King in the East." Further that "in South India it is only in Coorg and Mysore that an appreciable acreage is left." Extremely elementary notions must our contemporary have of the conditions that obtain in South India, where there are about 15 acres of coffee to every one acre of tea. It would probably surprise it to learn that the last

six years or so have witnessed an unprecedented rush for coffee land and so-called coffee land (thought formerly only fit for grazing) in every district—barring Travancore—in Madras. Coffee King no longer anywhere in the East! How about the Straits, and Java alone? Hide your diminished head, oh *Observer*.

Says the *Produce Markets Review*
of May 15th:—

The Market.

At the Dutch sale on Tuesday prices were rather irregular, but good ordinary Java sold at from $\frac{1}{4}$ to $\frac{1}{2}$ cent above the valuations. In this market the improvement of last week has continued, and although the auctions have again been very heavy there has been a good demand, particularly for export, and a further advance in prices has taken place. Low and Medium Costa Ricas have been in plentiful supply and have sold very freely, at again dearer rates, the advance for these qualities from the lowest point being fully 6s. per cwt. There have been very few parcels of fine Costa Rica offered, and it is now quite evident that, as over 100,000 bags of this description have passed the hammer this year, very little more of fine quality is likely to be received. East India has been in good demand, and has sold freely at the recent advance, Naidoobatum being about 3s. dearer than a month ago. In the terminal market little has been done, and quotations are hardly changed.

Missionary planters in Liberia.

There is not much danger of over-supply from the Missionary plantations in Liberia apparently, if the following letter by Bishop Hartzell, of the Methodist Episcopal Church, U. S., to the *New York Christian Advocate*, is as true as it seems to be. It has taken ten years to produce 200 dollars worth of coffee from 45,000 coffee trees originally planted!

The movement inaugurated by Bishop Taylor ten years ago for a great advance among the native heathen of Liberia will stand out in history as one of the really heroic movements in missionary annals. In ten years fifty stations were opened and eighty-eight missionaries brought from foreign countries, most of them being from America. In the effort toward self-support fully 45,000 coffee trees have been planted, and large expenditures made in the way of stock, fencing sugar mills, transportation, etc.

Of the fifty stations opened twenty-nine are now occupied. Two which had been opened on the east side of the Cavalla River were abandoned because of the French taking the territory. Of the twenty-nine now occupied fully one-half, for lack of workers and means, are doing but little.

Of the 45,000—probably 50,000—coffee trees planted, scarcely 15,000 have been saved, being choked to death by grass and bushes. American farmers can have no conception of the abundance and rankness with which vines and bushes grow in this country, or with what rapidity buildings will disappear. Leave a well cultivated farm to itself three or four years, and every vestige of the buildings, except the stones and the few hard native timbers used, will be gone,

eaten by insects; and the land will be one mass of vines and bushes so intertwined and tangled that to pass through them is impossible, except as natives cut the way before you. It requires much labour and expense as well as business push and judgment, to open and maintain a coffee farm in Liberia.

I have visited our best stations and made diligent inquiry of those in charge of others, to find out how much coffee will probably be sold from the twenty-nine stations now occupied this year. The amount will certainly not exceed \$200, and half of that from Barraka our best station.

Jamaica coffee seed.

We wish this to attract the especial attention of our readers. It will be remembered that some months ago we brought prominently to notice the urgent need of replacing our once healthy but now exhausted and diseased seed-strains with pure and sound stock. The Director of the Kew Botanical Gardens, to whom the matter was referred for advice, urged that we should import seed from the prolific and healthy growing trees of Jamaica, the produce of which was a finer and heavier bean than any in the market, fetching prices about fifty per cent. above the East Indian marks. Dr. Thistleton Dyer was also good enough to give the name and address of a reliable Jamaica planter: Mr. Beresford S. Gossett, Farm Hill, Hagley Gap. P. O., Jamaica. On writing to him this gentleman affords the following information:—

"I have had some enquiries about coffee for seed from India and Jamaica. We have no disease here among our coffee trees, and therefore do not care to import coffee seed, in fact it is prohibited by law to do so. I could send High Mountain coffee seed in 3 bushel barrels to Liverpool in June and July when I ship my coffee crop. My price would be £6 a barrel for parchment coffee and £5 a barrel for dried cherry coffee, cash on delivery. My best quality manufactured coffee netts from nine to ten pounds a barrel in Liverpool, so the price I name will barely pay me. The coffee would be selected from the best pickings and specially cured for the purpose."

It will be seen that the price per bushel landed in India would only be slightly higher than local seed, and in all probability the seed would be far better value, despite its lesser germinating power. We would strongly advise planters to make a trial: the cost is slight, and the possibilities are very great. Our readers will pardon us if we venture to sum up the position as we understand it. It may be taken as a generally accepted fact that coffee used to be planted (save the mark) in an outrageously crude manner, and yet despite all throve from the very start far and away better than the best opened clearings do now. To what is the impaired vigour of the seedling and mature plant due? Can there be any doubt that it is to be clearly traced to inherited disease: diseased progeny from diseased trees?

Jamaica coffee is, it is true, not immune to our dreaded leaf-disease, when grown under our local conditions. Yet the seed itself being healthy would almost surely produce a far healthier plant than that from diseased seed. Consequently it would throw off the attacks of leaf sooner and easier than indigenous plants.

Wherefore again we say: give the matter full consideration and a trial.

SCIENCE AND COFFEE.

BY THE LATE MR. WILLIAM PRINGLE, M.S.C.I.,
(SOMETIME AGRICULTURAL CHEMIST IN COORG, SOUTH INDIA,
TO MESSRS. MATHESON AND CO.)*

(Reprinted from the "Madras Mail.")

IV.

APPLICATION OF COFFEE MANURES.

HAVING selected the manure, or manures, intended for use on the coffee estate, the question is how to apply it, so that the maximum results may be produced at the minimum outlay. First, to ensure equitable distribution, it is necessary to dilute such concentrated manures as bones, fish, hindy, and other artificial manures with cattle manure or burnt earth. If cattle manure is procurable, it may be used with advantage at the rates of two or more bandy loads mixed with artificials per acre. Where there is not sufficient, burnt earth is the best substitute. The following analyses show the change produced by burning a soil:—

	Parts per hundred.	
	Conditions natural.	Burnt.
	A.	B.
* Organic matter and combined water ...	7.572	.623
Oxides of iron and alumina ...	10.369	14.345
Lime ...	.253	.499
Magnesia ...	.161	.196
Potash ...	.070	.389
Phosphoric acid ...	.026	.096
Sulphuric acid ...	.159	.289
Insoluble silicates, etc. ...	81.367	83.494
	100.000	100.000
* Containing nitrogen ...	.180	.005

The burning has practically destroyed all the organic matter and nitrogen. It is rather over-burnt, but has rendered some of the insoluble silicates soluble; the increase in potash in analysis B partly due to that and partly to the wood used in burning; so with the lime, etc. At least one cubic yard of burnt earth, or 1 ton of cattle manure, should be mixed with every 4 cwt. of artificials. This, at the rate of 4 cwt. of the latter per acre, gives about 21 lbs. per tree. To prepare the burnt earth select good yellow clay, or peaty swamp soil; cut it into six to nine inch clods; dry them in the sun. About six cubic yards should be cut for every ton of manure that is to be mixed. The clods when dry are built up into a heap with layers of brushwood (coffee prunings and shade loppings will do); a little heavier wood should be used at the bottom to start the fires. It is a mistake to use too much wood, or to allow the heap to burn too rapidly. Instead of actually burning it should smoulder gently. A heap ten yards long by two high, and five broad should take about three weeks or a month to burn. The earth should not be red when burnt, but just in part beginning to turn red; if of a nice warm brown colour when finished it is excellent. If the fires are going too fast plaster the outside over with mud. It is rather good than otherwise to have a fair percentage of charcoal left in the heap, especially if the manure is intended for poor sandy soils.

When the heap has cooled down break up all the clods and pass them through a screen with four meshes per linear inch; better results will be got if a 16 mesh screen is used, but the cost of pulverising will be considerably increased. It is now ready for mixing with the manure, and the following plan will be found best. Upon a clean, dry floor, or barbecue, spread a layer of two inches of the prepared earth (or dry cattle manure pulverised will do) upon it, over this a layer of bones or other artificials about half an inch thick, over this two inches burnt

earth and so on, earth, manure, earth, finishing with the latter. When the heap is about 12 to 15 inches thick, turn the whole over first from one end, then from one side, then the other end, and then the other side, finally from the four corners throw the stuff up into a heap in the centre, and carefully turn it over twice. Then pass it through a screen, and again turn it over. This is necessary to ensure an equal proportion of manure throughout the mass. If thoroughly well done, a sample drawn from any part of the heap should show on analysis the same composition as a sample drawn from any other part. It is now ready to cart out to pits which should be cut one for every five acres—a convenient size is $4\frac{1}{2}$ feet deep, 6 feet wide and $7\frac{1}{2}$ feet long. When these are filled with the mixed manure they should be covered with about a foot of dry earth and thatched over, a gutter being cut round to run off the monsoon rain. If raw bones are used it is sometimes advisable to sprinkle water over the manure as it is put into the pit to facilitate fermentation. Having the manures in pits obviates the necessity for cartage when the roads are soft. The manure can be prepared and carted out in the cattle manure weather. The manure should be got out as soon after the heavy monsoon rain is past as possible. If put out just after crop it is exposed for months to a blistering sun, followed by 20 to 25 inches of rain in June and July. With a monsoon of say 66 inches over 6,690 tons of water fall on an acre of land, sufficient, if all fell at once, to submerge the whole district to a depth of 5 feet 6 inches. Of this enormous quantity about 1 to 2,000 tons fall in June and 1,500 to 2,000 in July. During these two months the rain is generally so continuous that only a very small proportion is evaporated, the temperature only varying from 60° to 70° Fah., the barometer almost steady at 29.5 inches, and only about 3° between the wet and dry bulb thermometers. The bulk of the rain must therefore pass off by surface or subsoil drainage. In either case this heavy downpour will wash all the soluble salts down below the feeder roots, or carry them off with the surface wash; at any rate a very large loss must occur, and this is probably the reason why such a small percentage of potash is found in tropical soils. The following experiment proves that such is the case. 20 lbs. cattle manure, or rather pure dry gram-fed cattle dung, was placed in a basket which was buried in the ground up to the rain in such a way that it was not exposed to surface wash, but was as nearly as possible under the same conditions as the surrounding soil. To preserve the basket it was carefully washed with a solution of arsenite of copper and then tarred. It was left exposed for four months, viz., May, June, July and August. The dung taken out dried and weighed was found to have lost 22.5 per cent. in weight and deteriorated in quality over 50 per cent. The following analysis of pure dung before and after exposure make this clear:—

	Before.	After.
† Organic matter and combined water ...	65.86	62.51
Lime ...	1.87	1.49
Alkaline salts ...	1.31	.48
Phosphoric acid ...	.90	.83
Iron and alumina ...	1.08	1.39
Insoluble matter ...	28.60	33.03
Undetermined ...	.38	.27
	100.000	100.000
† Containing nitrogen ...	.547	.212

Should these figures fail to convince anyone, let him just look at the rush of water over and off the surface of a piece of flat land such as a tennis court, or a road, when a thunder-storm of an inch or more rain falls in an hour, or when there is a pucca burst of the monsoon rain registering 4 to 6 inches in 24 hours, and I think he will agree with me that it is necessary to supply the tree with easily assimilable food as soon as possible after the heavy rains are past to compensate for the monsoon loss. I cannot too strongly urge the planters of Southern India

to put out their manures during the first break at the end of July or in August. All other work should be subordinated to this, even supplying. It is the crop that pays for that and every other work. If labour is obtained there is plenty of time for supplying, but the time at which manure can be most economically applied to obtain maximum results is very limited. The coffee tree is a surface feeder, and unless the land has been deeply cultivated from the beginning, and is of loose and friable character few feeder roots are found below 6 inches, in comparison with those above that depth. This points to the necessity of surface broadcast manuring, by which I mean that in good coffee free from blanks, the manure should be evenly scattered over the surface up to within a foot of the stem or thereabouts, and lightly forked in.

An account of an interesting experiment first devised by Nobbe will, I hope, satisfy you of the necessity for distributing the manure evenly round the tree; any planter can make the experiment and so satisfy himself of the correctness of the following statements: Take a good sized tub, say 2 feet in diameter by 2 feet deep; bend a piece of tin plate (an old kerosine oil tin will do) at an angle of 90° and place it on end, the tub fitting so that it is possible to fill the tub with the well washed sand without encroaching on the enclosed fourth. Bore some holes in the bottom of the tub, fill in with clean, well washed pebbles or broken quartz, pieces about one inch cube will do; fix the tin in position, fill with the cleans and outside the tin, and in the enclosed fourth fill with first class soil, arranging in it three tubes vertically about three inches apart, and equidistant from the centre. The tubes should not be over two inches in diameter; they may be of tin, copper, glass or any other material, stiff paper rolled round a rod and glued so as to form a tube will do. Compact the soil gently round the tubes, and fill one with bones, one with fish, and one with cattle manure or hindy, all in fine powder. Now withdraw the tubes, leaving the columns of manures standing in the soil; and then withdraw the angle tin, leaving the soil and sand in contact; if the work is well and carefully done the manures will not be mixed with the soil, nor the soil with the sand. Having prepared the tub, or six of them to be prepared for accidents, plant a coffee seedling in each at the centre point of the junction of the sand and soil. The plant then has sand on three sides and soil on one. At the end of twelve months take the plant that appears most vigorous, knock off the hoops of the tub, and carefully wash the soil and sand away from the roots; you will find very few feeder roots in the sand, while the manures are surrounded by a mass of them. As far as the roots go the plant is quite lopsided.

Now, if manures are put in alavanga holes, or in trenches cut a short distance from the tree; the roots are prepared to grow and develop in the soil enriched by them. But that terrible weapon the mamotie comes into play, and often cuts through the roots just when the demand for plant food is greatest; when the tree is ripening crop I most unhesitatingly condemn all mamotie digging. I have taken clods of earth after a mamotie digging, carried them home, and washed out the fine feeder roots, often finding the clot to be one mass of them. Needless to say on many estates leaf disease followed a mamotie digging when the trees were carrying crop. Except a light forking over at the end of July or the beginning of August, when the manure is put out, there should be no digging from the time blossom sets till crop is picked. Every planter should do all he can to preserve his surface soil, and save his tree roots. When the soil is light and friable, and has been deeply and well cultivated from the beginning, the feeder roots will be found at a much greater depth than when it is stiff and hard a few inches from the surface. Deep fork digging once a year, just after crop sends the roots down and they are less affected by the sun and drought.

When the rain falls in the spring if the feeder roots are just

below the surface, a light shower will start the blossom, but may not be sufficient to set it, and if no more rain falls for a month or so to back the first shower up, the blossom runs a great risk of being burnt. With deep cultivation this seldom happens, as the rain which is sufficiently heavy to reach the roots and bring out the blossom will also serve to set it, the sun not having the power to evaporate the moisture which is well done in the soil. Superficial cultivation and want of manure are the main causes of failure of crops to come on after a good blossom, for the rain has run off and been evaporated before the trees had time to gather it to themselves. Cultivate deeply, but not excessively. Manure systematically, at the right time. Keep the surface soil up to the tree. Don't humbug the roots by mamotie digging while crop is on the tree. In fact, assist Nature, do not bully her, and good results may be depended on.

TEA.

Japanese Tea campaign

Perhaps the following item will rouse doubters of the value of the Indian Tea Fund to a sense of their duty:—

Taking a leaf out of the book of the enterprising Ceylon tea planters the Japanese have determined to spend 57,200 yen (dollars) in pushing their teas in United States and Canada, and 10,000 yen in Russia—advertising, free distribution of samples, &c., &c.

South Indians.

Messrs. Arbuthnot & Co. (P. Macfadyen & Co.) in their Monthly Report, dated London, 14th May, say:

South India.—About 1,900 packgs. were brought forward in April realising 7d. per lb. against 3,800 packgs. in the corresponding month of 1896, when the average obtained was 7½d. per lb. In March this year 2,600 packgs. also brought 7½d. per lb.

Travancore.—As usual the majority of the offerings were from this district. Some invoices with useful cup were included in the catalogues, but a good proportion consisted of poor liquoring sorts, drawing dull infusions which realized low rates owing to the full supply of these grades from other quarters. Several of the shipments also were somewhat mixed and brownish in appearance.

Neilgherry.—Only three invoices were catalogued and were all of ordinary quality as though flavoury in cup they were somewhat deficient in strength.

South Wynaad.—An invoice from Erramenvella represented all that was available from this district, and as usual the tea from this Estate was of a saleable character.

The duty in America.

The Yanks are going to follow the Canadian example of imposing a tax on tea, according to all accounts. Curiously enough it has escaped all taxation hitherto, despite it being termed a "luxury." The 10 cents tax proposed (about 5d. sterling) would bring in an income of eleven million dollars, so that it will be passed into law is scarcely to be doubted. What effect it will have on the consumption of tea is doubtful. As a whole, it will tend to restrict imports, but on the other hand will by all rules of logic act as a preferential duty on British-grown teas, inasmuch as a tea intrinsically worth 7d. gives a better value at a shilling than one worth 4d. and selling at nine pence. Yet as trade is not wholly governed by logic, it is too early to begin crowing.

Mr. Crole's Tea Book.

Through regrettable delay our copy of this work not yet being to hand we were interested in the perusal of an able review thereof in the *H. & O. Mail*. When we add that from interna

evidence the able pen of Mr. Christison, the well-known Darjeeling planter, bewrayeth the writer, it will be seen that the critique was entrusted to thoroughly competent hands. The book, (published by Crosby, Lockwood & Co.,) is illustrated throughout, and seems to be chockful of highly interesting and valuable matter, light and grave, theoretical and practical. The statistical portion is open to grave question, it appears, as Mr. Crole's estimate of 912,500 acres of British grown tea under plant seems well over the mark. A safer and more accurate estimate would be 850,000 acres at the present time. Mr. Christison very naturally falls foul of the author for his sweeping condemnation of the China plant, urging that in Assam it never had a fair chance, and points to Darjeeling as a proof if its inherent capabilities if properly treated. He mentions incidentally that the quality of the soil has much to do with the quality of the tea. A score, this, for the manurists. The critic also takes strong exception to Mr. Crole's ideas of what he considers modern machinery. His remarks on certain practical matters are worth quoting at length:—

In the interests of the tea industry we feel bound to notice a few recommendations which are fraught with danger. The best distance for planting a garden is said to be 4ft. by 4ft. = 16ft. (or even = 13.85 superficial feet of space per plant if planting triangularly as recommended). This is opposed to all sound principles of planting. On the contrary, for fully developing the capabilities of a garden, in the long run, for Assam we should say twice this space, at least 6ft. by 5ft. (and for the hills say 5ft. by 4½ft. on the base) should be allowed; and with a view to cultivating by machinery, as advocated by Mr. Crole, even lines wider apart would be an advantage. Mr. Crole remarks that hoeing should always leave the soil rough. Clod cultivation—or as in some cases as practised it might even be styled slab cultivation—is a great fallacy in tropical culture, especially when lengthened periods of dry weather may be expected. Pruning by measure is reprehensible (as well as antiquated, surely) and is not in some instances the leaving of heavily cut bushes unpruned next year, certainly the “slashing them across the top;” worse still to burn down root and branch as a remedy for mosquito blight, a cure certainly infinitely worse than the disease. The eliminating of all *banji* leaf, as advocated, not only unduly weakens all except the most robust bushes, but deteriorates the quality of the after flushes. In these days, when quality above all should be aimed at, it is objectionable and entirely unnecessary to handle all the tea, or any but the coarser, in sorting; and we cannot agree with the author (though the majority may yet do so) that tea deteriorates (but the very reverse) in properly constructed “bins.” Neither ought chests to be packed to contain so much as 150lb. of tea, but we would rather name 95lb. or at most 100lb. as the net limit. We are confident that tea ought to be bulked at the factory, not only because there it can be best done—considering the present methods and appliances at the London warehouse—but to curtail the warehouse charges as exemplified in the profits of 45 per cent. and 80 per cent. consecutive dividends from one warehouse company shown in some tea company's printed accounts.

Machine-made Chinas. A good deal of ridicule has been cast upon the recent attempts of China to improve her teas by adopting modern methods and machinery. So it is of interest to know what the *Grocer* thinks about it. In a recent issue it said:—

A few small breaks of machine-made Black Leaf were included in the auctions, this being the first consignment of Tea made in this form from the Northern ports. Considering that the leaf used was of an ordinary character, the experiment has demonstrated the fact that China is able to produce Tea of a really strong flavour, and we

look forward with a good deal of interest to see what can be done with first crop growths treated by the new method.

Again, in another issue:

Yet, notwithstanding all that may be observed to the contrary, there are still some old-fashioned people who like China tea, and, preferring it to any other, will have it while it is at all possible; and for this class of consumers at least the beginning of a new season is decidedly hopeful. Especially is this so at the present time, when ‘machine-made’ teas from China will be subjected to their severest test. Till now they have been regarded merely as an experiment, having first come under notice in November last, when we spoke of them as showing ‘an improvement on the old style,’ also as being both ‘strong and pungent,’ and seeming ‘to meet with approval.’ If half what one hears of these teas be true, they are likely to prove the great feature of the coming season, and should be the means of partly restoring China growths to a healthier position than they have stood in for many years past. In manipulating China teas for native use or exportation, the worn-out plan was to dry the leaves as they were plucked, first in the sun before finally preparing them for market; but it is said the new method recommended and adopted is to avoid the preliminary process of drying the leaf in the open air, and carry the freshly gathered leaves, full of their natural sappiness and moisture, straight to the pans or sheds for ‘firing,’ curing, and being ‘machined,’ preparatory to packing them for sale and shipment to foreign markets. China teas, which have become less and less a speciality with the home trade here, may, if made stronger by the new mode of manufacturing them, compete with the productions of India and Ceylon, the latter particularly; for, besides the newly-treated teas being more suited to the modern requirements of the British public of to-day, they are just what are wanted by shippers to the European continent and elsewhere, who must secure teas of some richness and strength, or they will not please the drinkers of the beverage there. Weak, flat, insipid, and thin-liquoring teas are, it appears, practically out of the running; and the smaller proportion they bear to the aggregate supply the livelier will be the demand and the more satisfactory the price for all teas of a finer and superior grade.

On the other hand, we have seen it stated by a jubilant Indian or Ceylon planter, that he recently submitted some of this very same machine-made tea to a bevy of ladies in London as arbiters of its quality. One and all pronounced it utter rubbish!

The Home Market. The quantity of Indian tea offered has only reached a total of 15,967 packages, against upwards of 25,500 last week, says the *Produce Markets Review* of 15th ultimo. A considerable portion of the supply still consists of the common kinds, including a number of parcels withdrawn from previous sales. The demand for these shows no improvement, and, although prices favoured buyers, a large quantity was withdrawn, the leaf being too red and the infusion very poor. Although the trade look for an increasing proportion of these teas at this time of the year, the quantity of the past season's crop is much in excess of any similar period, and it is evident that prices must further recede if holders desire to realise before the arrival of the new crop. There was good bidding for the better medium kinds, values being well supported, and unless there is a continuance of a fairly liberal supply, a firmer market for these appears inevitable. The finest sorts have been poorly represented, only about 570 packages out of the above quantity having sold at 1s. and over, for which firmer rates were realised. The extremely low prices which the medium and lower descriptions of broken tea and dust have touched have stimulated the

HYDROCELE & ASTHMA. Instant relief! Permanent cure guaranteed or the Price (Rs. 5) refunded. Don't despair even if in the last stages. Apply to—MANAGER, V. C. WORKS, Ranaghat, Bengal.

inquiry, and a larger business has been transacted than for some time past. Where these teas can be used for blending, the present would appear a favourable opportunity for securing a fairly good working stock, as values are so extremely low that it is questionable if there will be a further depreciation within a reasonable period. The market for Ceylon tea is steady, and continues to be well supplied, but there is a dearth of teas possessing both quality and strength, and in many cases this week a marked falling off was noticeable as compared with previous invoices. Broken Pekoes under 9d. are still in excess of requirements, and former prices have been barely maintained for these kinds, especially in the case of parcels which give an inferior infusion. The low rates for these descriptions are attracting more attention, as this class of tea is certainly the cheapest now offering. Pekoes and Pekoe Souchongs generally show no change, and were readily taken at last week's values.

DIGESTED TEA NOTES.

PROXIMATE CONSTITUENTS.

I BEGIN to feel as if my attempts at digestion were getting slightly dyspeptic: chemical food tries the mental stomach of a planter not a little. But to my "proximate constituents." These are defined by Mr. Bamber as the various substances formed by the chemical elements described in my last paper. To make my readers get a slight idea of what they are tackling when they attempt tea manufacture, I give the following table of analysis without compunction. The list shows the organic constituents of the tea-leaf, some of which are soluble in water either wholly or partially, while others are insoluble.

<i>Essential oil</i>	... 05%	Pectin	... 12.60%
Fixed oil	... 50%	Amides	...
<i>Theine</i>	... 4.10%	Cellulose fibre, &c.	... 21.20%
Volatile alkaloid	... trace.	Phlobaphene }	...
<i>Tannin</i>	... 18.15%	Resins, &c. }	... 7.85%
Boheic acid	... 2.34%	Mineral matters	... 4.50%
Gallic acid	83%		
Legumin	... 24.00%		100.00
Albumen	... 1.00%		
Waxy & gummy matters.	2.88%		

The names in italics: essential oil, theine and tannin, denote the most important constituents affecting the quality and strength of tea.

Essential oil.

This varies, but is always limited in quantity. Slowly grown hybrids or Chinas contain most, as a rule. When checked by cold or blight Indigenous also shows an increase. The flavour and aroma of tea being largely due to this oil, its importance is very great despite its minute proportions. Like all essential oils, it gradually dissipates into the air, explaining the loss of aroma in air-exposed tea, and emphasising importance of immediate packing after manufacture. Exposure to air also probably induces oxidation of oil to an insoluble resin. The oil is present in the green leaf but is greatly increased in quantity during manufacture. There is probably a slight chemical change during process of withering, as when the leaf is properly withered it has an aroma closely resembling that of the oil when isolated.

Theine

or Caffeine is the chief alkaloid in tea, and is also found in coffee, cacao, Paraguay tea, and Guanana. To theine is due the use of these articles as a beverage, owing to the refreshing properties of the alkaloid.

Theine forms white needle-shaped crystals of a silky lustre, soluble in water and spirits; are bitter, fusible and volatile. It apparently undergoes no change in manufacture. The quantity varies from 3.22 to 4.66% in Indian and Ceylon Teas. Many attempts have been made to discover a relation between the percentage of theine and its commercial value, but except in France, with no great success. Tea is now valued by colour, taste and appearance, none of which are appreciably attested by theine. Tea hair or fluff contains 2.50% of theine. Were some simple method of sublimation employed, the large quantities of Tea fluff now wasted in every factory could be profitably utilised. Some years ago theine was worth Rs.15 per pound in Europe, but the price has since been greatly reduced. It was and is usually obtained from damaged or waste Tea. The alkaloid is used medicinally.

Tannin

or tannic acid is the chief factor in the strength and pungency of Tea, and is found in greatest quantity in free-growing plants. Tannin gives a slightly acid reaction, and an astringent but not bitter taste. On exposure to air tannin combines with oxygen and forms insoluble compounds, thus "mellowing" the Tea in process of time. Dr. Hooper found that the quantity of tannin was not influenced by the quality of the tea, or by the altitude at which it was grown. It is probable that the "fulness" of Tea, as distinct from its "pungency," is due to the gums dissolved as well as the tannin and other soluble matter. The amount of tannin, however, varies with the light and shade given the plant, light and carbonic acid being the essential agents for its formation. Only green leaves are capable of forming tannin. On my own responsibility I would add that very light-coloured leaves (the want of green being due to bad soil) would by application of manure be rendered dark in colour. Consequently the tannin would be more abundant, as, I think, has already been proved by the Ceylon manuring experiments. The chief use of tannin acids in plants is said to be as carriers of carbohydrates from one part of the plant to another.

Other constituents.

Gallic acid adds slightly to the astringent taste and is partly produced in manufacture from a decomposition of the tannic acid. *Boheic acid* undergoes little change in manufacture, except by darkening in colour when nearly dry. *Legumin* is only slightly soluble in water. *Resins* are insoluble in water, consequently have no effect in the strength of the Tea. *Wax* is insoluble in water and its main use seems to be as a covering to the green leaves to prevent too repaid evaporation. Hence by tossing the leaf in the Chinese fashion withering proceeds more rapidly. *Mucilage*, i.e., Pectin, pectoses, &c., are present in comparatively large quantities and assist in giving thickness to the liquor. The creaming of Tea is apparently partly due to this mucilage.

Here, I am glad to say, and I fancy my readers will incline to agree with me, the chemical or strictly scientific portion of my Digested Tea Notes ends. My next paper will be on Cultivation.

DISTRICT ASSOCIATIONS.

SHEVAROYS.

PROCEEDINGS of the Monthly Committee Meeting held in the Victoria Rooms, Yercaud, on Monday, May 17th, 1897, at 1 P.M. Present: Messrs. R. Gompertz (*Chairman*) C. G. Lechler, E. H. King-Harman, Rev. J. M. Kempt, Messrs. C. Sice. H. W. Leeming (*Hon. Sec.*), and Mr. C. Dickins as a *Visitor*.

1. Notice calling the Meeting was taken as read.

2. Read Circular, dated 20th April, 1897, from the Secretary, U. P. A.S.I., re Individual Membership to U.P.A.S.I.

Resolved "that the discussion be postponed till next Meeting, when Members, wishing to say anything on the subject, are requested to bring their views in writing."

3. *Read* Circular, dated 28th April, 1897, from the Secretary, U.P. A.S.I., *re* Proxies for U. P. A. S. I.

Resolved "that this Meeting is entirely opposed to an 'open' Proxy, as it thinks that the Form of Proxy adopted at the last Annual Meeting is sufficient, provided that, as it supposes, more than one subject can be specified without invalidating the proxy."

4. *Read* Letter, dated 8th May, 1897, from MR. C. G. LECHLER, *re* the erection of Sheds for the Storage of Manures, etc., at the foot of the Salem Ghaut.

Resolved "that MR. LECHLER be requested to prepare a Scheme showing the amount of money required for the purchase of the land and for the erection of the Sheds, &c."

5. *Read* Letter, dated 27th April, 1897, from MR. J. N. BOSEN, on account of MR. A. G. NICHOLSON, complaining of the delay in sanctioning repairs to a Public Road.

Resolved "that the Honorary Secretary be requested to write a formal letter to the Collector, drawing his attention to, and deprecating, the delay in this and similar instances."

6. *Read and recorded* Circular, dated 12th May, 1897, from the Secretary, U. P. A. S. I., enclosing G. O. No. 464, dated 27th April, 1897, on the "Malarial Parasite."

7. *Read* Circular, dated 12th May, 1897, with suggestions from MR. S. A. HARRIS, Honorary Secretary, S. Mysore P. A.

(i). That a Scientific Investigation should be made into Hemeleia, Vastatrix.

(ii). As to the division of the Funds of the U. P. A. S. I. between the Tea and Coffee Interests.

Resolved "that these matters lie over till next Committee Meeting."

8. The following Papers were laid on the table:—

(i). A List of Agricultural Implements and Machines which have been tested in India during the year ended 30th September, 1896.

(ii). Report on the operations of the Dept. of L. R. and Agriculture, Madras Presidency, for the Official Year 1895-1896.

(iii). Proceedings of a General Meeting of the Central Travancore Planters' Association.

(iv). "Planting Opinion" for May 15th, 1897.

With a vote of thanks to the Chair the Meeting terminated.

ROBERT GOMPERTZ,

Chairman.

HERBERT W. LEEMING,

Honorary Secretary.

WYNAAD.

PROCEEDINGS of a Special Meeting at Meppadi Club on Wednesday, May 19th, 1897. Present:—Messrs. Day, de Fonblanque, Handley, R. Lamb, Mackinlay, J. R. Malcolm, Robinson, Taylor, Trollope, Waddington, Winterbotham, and Hockin, *Honorary Secretary*. MR. WINTERBOTHAM in the chair.

Roads.—Read correspondence between Honorary Secretary and Mr. G. Romilly. The meeting cordially approved of the letters read and resolved to await the result of the action taken thereon.

The Honorary Secretary was also requested to write the Malabar District Board Engineer requesting steps may be taken at once to temporarily secure the Talipoya Bridge.

Small Change.—The Honorary Secretary was requested to write the Collector of Malabar pointing out that no small change is now available at the Vayitri Sub-treasury and to ask that steps may be taken for the supply of at least 5% of small change on all Money Orders.

Treasury Drafts.—The Honorary Secretary was instructed to address the Accountant-General, Madras, requesting that he would grant drafts on the Vayitri Treasury on the same terms as he did for Coorg and other planting districts.

A vote of thanks to the chair closed the proceedings.

(Signed) H. B. WINTERBOTHAM,

Chairman.

(") J. WILLIAMS HOCKIN,

Honorary Secretary.

NATURE SLOWLY MAKES READY.

You have probably never seen a volcano in eruption. It is a magnificent spectacle. Where do all those torrents of red-hot lava come from? Nobody can tell, except that they come from somewhere down deep in the earth. But one thing we know, namely, that eruptions of any one volcano are far apart. Between whiles Nature is getting ready for them; she is preparing for the tremendous demonstration.

Just so it is with all her processes. In the cold of winter she is arranging the forces which are to make the heat and the harvests of the following summer and so on.

From May, 1890, to February 1892, is a period of twenty-one months. The two dates will long remain clear in the mind of Mrs. Martha Bowles, of 182, Llangyfelach Road, Morriston, near Swansea. For the first was the beginning and the second the ending of an experience which was bad enough in itself, yet only the introduction to something vastly worse. It was like the time of getting ready for a great trouble to come.

Her first sense of this was indefinite and vague, like the low muttering of thunder below the horizon while the skies are yet clear. She expresses it thus, in the very words most of us use on similar occasions, "I felt that something was wrong with me—something hanging over me."

Ah! dear me. How often we think such feelings are a warning sent to the spirit, when in fact they are caused entirely by the condition of our bodies. She felt heavy, languid and tired, and mentally depressed. This was not only melancholy to her, but new, as she had always been strong and healthy. Then came the discomforts which there could be no mistake about. They are common enough to be sure. Oh, yes. But isn't that all the more a reason why we should understand what they mean? "Certainly," you will say.

Well, then, there was that bad, offensive taste in the mouth, that so many of us have had; the failure of the appetite, and the pain in the chest and sides after eating. The worst pain was in the right side, where it was very heavy. That pointed to the liver, which is located on that side; and when anything ails the liver it is as though the big water-wheel of a mill had got fixed so as not to turn round. For the liver does half a dozen kinds of work, and when it strikes work the rest of the organs take a sort of rainy holiday.

Presently her skin and the white of her eyes turned yellow as autumn leaves. That meant bile in the blood; the liver was off its duty; that is a sure sign. The kidney secretion was the colour of blood instead of a clear amber, which meant that the trouble had already reached those important organs. Then the stomach was upset and refused to take kindly to food—as though the miller sent your grain back, declining to grind it. She vomited a sour, bitter fluid, which was acid bile, away out of its proper track. On and on along this line, constantly getting further and further from the happy land of health; this was the history of those twenty-one months—all bad enough, yet all preparatory for worse ones.

"One day in February, 1892," she says in her letter of August 18th 1893, "I began to have dreadful pain and cramp. It began in the right side, and extended across the stomach. For hours together I was in the greatest agony. What I suffered is past description. When the pain eased a little I was cold as death and shivered until the bed shook under me. I had hot iron plates applied to my feet, and held hot irons in my hands, but nothing gave me much relief. My stomach was so irritable that I could keep no food on it. I was now confined to my bed, and the doctor attending me said I was passing gall stones. He wanted me to go to Swansea Hospital and be operated upon, but I was afraid I might not live through it."

"I next had two other doctors at Morriston and also three from Swansea, who all gave me medicines, and said nothing more could be done for me. For six months I lay in bed undergoing the greatest agony; never free from pain more than two or three hours at a time. During the whole of this time I was fed on nothing but milk and water. I had scarcely any life or strength left in me. All who saw me said I never could by any chance get better in this world."

"I lingered on like this until August, 1892, when my daughter brought me a book telling of Mother Seigel's Curative Syrup. In this book she read of a case like mine having been cured by this

medicine. My husband got a bottle from Mr. Bevan, the chemist, and after taking a few doses I felt a little relief. I kept on with it and soon the pains left me, my appetite returned, and my food agreed with me. After taking the Syrup for three months I was a new creature and strong as ever. I can now eat anything, and nothing disagrees with me. After I was well our minister one day said: 'Mrs. Bowles, I never thought to see you alive.' I said, 'Mother Seigel's Syrup saved my life.' You may publish my case, and I will gladly answer inquiries. (Signed) Martha Bowles."

This case—one of acute indigestion and dyspepsia, with liver and kidney complaints—is well known in the district. The lady's husband is a gardener, well known and respected.

Do we need to point out the moral of this wonderful cure? No. You can see it for yourself.

MADRAS RAILWAY COMPANY.

SURPLUS STORES FOR SALE.

The Madras Railway Company have for sale a large quantity of useful stores, machinery and plant of various descriptions, some of which are specified below:—

Augers, screw and shell, of sizes.
Blocks, wooden, of sorts and sizes.
Blocks, iron, galvanized, of sorts and sizes.
Balances, Pooley's, to weigh 400 lbs.
Beak, iron, large.
Belting, Leather.
Bevils, Sliding.
Bolts, screw, with nuts.
Brushes, platform, with handles.
Chisels, of sorts and sizes.
Chains.
Cramps for drilling rails.
Compasses, proportional beam and Napier's.
Diving Apparatus.
Emerald green, ground in oil 28lbs. kegs.
Files, of sorts and sizes.
Forges, portable, with bellows.
Glasses for semaphore, of sizes.
Glasses, crown, of sizes.
Gauges, of sorts and sizes.
Hinges, brass and iron, of sizes.
Iron, angle, of sizes.
Iron, flat, of sizes.
Iron T, of sizes.
Lamps, of sorts.
Measures, Tin, Oil, graduated.
Nails, iron.
Paints and powders.
Planes, of sorts and sizes.
Paste, black, Torbay's, 28lbs. kegs.
Pitch, Stockholm.
Rulers, Rolling Parallel
Screws, brass and iron.
Steel spring, $1\frac{1}{2} \times \frac{3}{8}$ "
Winches, crab.

Wheels, cast iron, for trucks and wheel barrows.

A complete list of articles, with prices and other particulars, may be obtained on application to the General Storekeeper, Madras Railway, Rayapuram, and the articles may be inspected by intending purchasers within office hours.

MARKET SUPPLEMENT.

SATURDAY, JUNE 12, 1897.

COFFEE.

R. J. Rouse & Co.'s Weekly Coffee Report (May 21, 1897) says:—Large supplies have again been catalogued during the past week and the demand showing signs of falling off, the market was rather easier except for the fine grades.

Nearly 9,000 bags East India were offered, mostly in smaller lots and nearly all sold; good colory qualities were well maintained but the common descriptions sold slowly at rather easier rates.

Central American continues to be offered in large quantities, but values, except for desirable kinds, mark a decline of 1/- to 2/-

Futures have been rather easier owing to the continuance of large receipts at the Brazilian ports and quotations have declined 6d. to 9d. since our last.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending May 12th, 1897, says:—Bank rate $2\frac{1}{2}\%$. Bombay Exchange closes at 1s $2\frac{1}{2}\frac{1}{2}$ d. Brazil Exchange $7\frac{1}{2}\frac{1}{2}$ d. Rupee paper $3\frac{1}{2}\%$. 62 $\frac{1}{2}$. Silver 27 $\frac{3}{4}$ d per oz.

We have no change to report in this market, which remains very firm for the finer qualities, and steady for the ordinary and medium kinds. Brazil markets are lower, good average Santos being quoted at 39s cost and freight.

Daily receipts have averaged 5,286 bags in Rio, and 6,714 bags in Santos.

According to Messrs. Duuring and Zoon the European stocks on the 1st inst. shewed an increase of 6,400 tons, and the visible supply of 5,560 tons, the figures being 140,600 tons and 256,290 tons respectively, against 134,200 tons and 250,730 tons on the 1st April.

The Dutch sale, which was held on the 11th inst., comprised 19,582 bags 222 cases, and went off very irregularly, good ordinary Java selling at 46 $\frac{1}{2}$ cents, against 46 $\frac{1}{2}$ cents in the April sale.

Futures have been quiet, and close with a dull tone at a decline for the week of 9d to 1s, viz.:—Good average Santos in Havre, May delivery closes at fcs. 48.75, in Hamburg pf. 39 $\frac{1}{2}$, and No. 7 low ordinary Rio in New York \$7.45.

To-day's London official quotations are:—

	May	July	Sept.	Dec.	March
Rio	35/3	—	36/3	36/9	—
SANTOS	38/9	39/3	39/9	40/3	40/6

We quote:—

Landed last week 1,046 tons. Deliveries 1,015 tons. Stock 13,794 tons.

Do. last year 1,146 „ „ 1,173 „ „ 12,442 „

During the week ending Friday, 21st May 1897, the public sales went off very irregularly. Ceylon Plantations gave way owing to absence of competition, but there was a continued good demand for fine colory East India at very full prices. A large proportion of the supplies, however, consisted of cherry-dried and ends of crops in small lots, which chiefly sold at a decline of 1s. to 2s. per cwt.

Imports, Deliveries and Stock of Coffee in London were as follows:—

		STOCK.		IMPORTS.	
		1897.	1896.	1897.	1896.

Pulneys middling 93s. 6d., pea-berry 96s. Ceylon cleaned smalls 88s. to 90s., middling 92s. 6d. to 94s. 6d., bold 102s.

Tea.—Home advices of 21st May state:—

CHINA.—Trading in Congous is still restricted, black and red leafs being in very moderate request and at the auctions not much demand prevailed, prices realised showing, however, little change. Green teas were freely catalogued and sold somewhat irregularly, although no material alteration in values can be noted.

INDIAN.—Public auctions have been on about a par with the preceding week, viz.: 15,200 packages against 15,600 packages, while in 1896 only 3,400 packages were offered.

The chief feature of interest is the arrival of a small shipment of new season's from the Doom Dooma Tea Co.'s Hansura Estate, consisting of 44 half-chests of Orange Pekoe which realised 1s. 2d., and 21 half-chests of Pekoe 11d. per lb., quality being rather above the average of first arrivals from Assam.

Old season's were in fair demand, and previous rates fully maintained, except for low common descriptions.

Shipments from 1st April to 18th May to the United Kingdom were 1,095,000 lbs. versus 774,000 lbs. for the corresponding period of 1896.

Mail advices report that the weather had been more propitious for manufacture in nearly all the districts, particularly in the Dooars, where good rain had fallen.

CEYLON.—Catalogues included 26,400 packages, contrasted with 24,700 packages on the 11th May and 22,800 packages a year ago.

There was a good all-round enquiry and brisk competition for most kinds. Broken Pekoes however continued to sell irregularly, but Pekoe Souchongs and Pekoes were wanted both by home and export buyers, and were occasionally dearer. The selection of fine was again limited, among the highest quotations for broken orange Pekoes being the following:—Holmwood and Talawakellie 1s. 4d., Tillicoultry 1s. 3d., Hauteville 1s. 2½d. Campion and Mount Vernon 1s. 2½d., and Waverley 1s. 2½d. per lb.

The average is rather under 7½d. per lb. On the 13th May it was 7½d. per lb., and 8d. per lb. at this date in 1896.

JAVA.—Rather under 800 packages of direct import, representing the produce of five gardens, were brought to the hammer, and the greater portion was disposed of without much alteration in value.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London Warehouses, as per official returns were:—

From 1st to 18th May, 1897.....11,554,540 lbs.
 " " 1896..... 9,998,437 "

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India.....	12,240	2,983	15,223
Ceylon	24,623	1,750	26,373
Java.....	548	247	795
Total.....	37,411	4,980	42,391

Also 899 packages from second hands.

Cinchona.—London advices, dated 11th May, state:—

At the auctions on the 11th instant 1,977 packages were offered and experienced a good demand, but owing to the advanced views of some holders nothing like a clearance was effected. Values occasionally were rather dearer, but on the whole no alteration can be reported in the unit, which remains ¾d. per lb.

300 bales, &c., South American catalogued, but only 5 bales soft Colombian sold at ¾d. per lb.

Of 95 bales Ceylon Cinchona offered 32 bales sold:—Officinalis, chips and shavings renewed 2½d.; Hybrid, chips 2½d. per lb.

711 packages East India Cinchona brought forward and 200 packages sold:—Officinalis, chips and shavings 2d. to 2½d., ditto renewed 2½d. to 3½d.; Red, chips and shavings 1½d.; Succirubra, quill 2d. to 4½d.; Ledgeriana, chips 2½d. to 5½d. per lb.

309 bales, &c., Java Cinchona offered and 290 bales, &c., found buyers as follows:—Ledgeriana, chips 2½d. to 4½d., branch 4½d.; Hybrid, chips 6d., branch 4½d. per lb.

Of 557 bales African Cinchona catalogued 490 bales sold at 2½d. to 3½d. per lb. for Succirubra quill and quillings.

SULPHATE OF QUININE has met a good demand this week, and upwards of 80,000 ozs. B & S or HB in second hands have sold, 8½d. to 8½d. per oz. for old landed lots and at 8½d. to 9d. for newly landed. Manufacturers do not quote.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; and Quarterly, Five Rupees, including postage.

ADVERTISEMENTS.—Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

N.B.—Remittances should be sent to the Managing Proprietor of this paper, Coonoor, Nilgiris, South India.

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 2nd July 1897.

South Travancore. TRIVANDRUM, 17th June.—*Weather.*—Rainfall for year 32.80 inches. Rainfall for month 16.14 inches. *Crops.*—Tea flushing well. Trees looking very healthy. *Plant-diseases.*—*Heleopeltis* showing in places. *General Health.*—Health of coolies good. This has been a very healthy year, with little fever. *Labour.*—Labour quite sufficient for requirements.

Nellampathy. 23rd June.—*Weather.*—Rain for fortnight here 22.77 inches, but for the whole district I think the average will be about 35 inches. One place in Cochin Nellampathy got 35 inches last week. Total for year 36.77. *Plant-diseases.*—Leaf disease is showing in a number of places, and in one or two clearings of last year's planting it is in evidence already. Ringer has also been at work among the young plants in some clearings. *General Health.*—Fair. Coolies seem all right now, but a good few Europeans have fever. *Labour.*—Coming up rapidly. On most places three quarters of the labour is in, and the rest may be expected any time now. Moplahs are beginning to come up also. *Interesting Items.*—Jubilee celebrations were quiet, most men contenting themselves with dining together at a neighbour's bungalow. There was an enforced holiday as it was pouring rain all day. Hope they were better off at home.

Coorg. POLLI BETTA, 22nd June.—*Weather.*—Rain very heavy during last week amounting to 9.10 inches. About one inch the previous week. A regular deluge on the 19th amounting to 5.6 inches in the 24 hours. Lighter weather set in on 20th, rainfall about 1 inch, and 35 cents the following day. Hardly anything to-day. Weather favourable for planting which has been commenced. *Crops.*—Swelling nicely, and prospects a trifle more hopeful looking. Plenty of wood for next season. *Plant-diseases.*—Leaf disease beginning to show up in nurseries. Removing and burning borer in progress. Proportion of trees lost comparatively small. *Labour.*—Canarese beginning to put in an appearance. Estates fairly well off. Work pushed on with the aid of contractors. *Public Health.*—Fever and bowel complaints prevalent, but not to a serious extent. *Interesting Item.*—Proposed jubilee dinner at Club.

Kadur. MUDIGIRI, 21st June.—*Weather.*—Up to date monsoon not at all too heavy. Natives complaining of want of rain for their paddy work. Very heavy showers occasionally, otherwise a light monsoon and good planting weather. *Crops.*—A lot of our second blossom

has not swollen, and of course can come to nothing. This means a still further reduction of estimates and in consequence a reduction of expenditure. *Plant-diseases.*—Thank goodness we are free of these for the time being, but it won't be long, suppose, before we hear a lot about black rot. *General Health.*—Not at all good, every one being ill with fever, colds, &c. amongst coolies of course I mean. *Labour.*—Ample for requirements. Ghant maistries are up to time this year on account of high price and scarcity of grain in the low country. Moplah contractors are going about the country begging for work which nobody seems inclined to give out just now. *Interesting Items.*—Darbars are to be held at Chickmagalur and Mudigiri to-morrow, and those that cannot manage to get away to attend these will do honour in their own way.

North Mysore.

YEDAHALLI.—A rather belated correspondent writes on 16th June: We had a rum season here. 75 cents in mid April, which brought out a very partial blossom. All set on the 24th, 26th and 28th May. Another 75 cents, which brought out (on 2nd, 3rd and 4th June) a very good blossom. Of course it is too early to say whether that is going to set or not, but I "have me doubts." The monsoon set in "pucka" on 10th, and since it has been normal. The weather reports I've been sending you represent weather at Yedahalli, our post town, and headquarters of Sudu Taluq, six miles away. There they had splendid blossom show this year. Three of the Kola seed you kindly sent germinated and are growing nicely. The other three went bad. The Papaya seed came up well, and I'm going to put out the plants at once.

S. E. Wynaad.

PUNDALORE, 23rd June.—*Weather.*—Since my last report we are having continual pouring; during nights heaviest showers are falling which makes one to tremble of the buildings. When it was hot we wanted rains, and now we want the sun to shine a little to warm us, but it is hard to expect what we want from Nature. *General Health.*—Good. *Labour.*—Sufficient. *Interesting Items.*—In Wynaad many Companies were to open they should try to open a rice factory. About 30 years ago in Yanamand, Cocanada, I have seen the French people having rice factories, in which they baled cotton and tobacco, prepare rice, castor oil, gingelly oil, &c. and despatched to France and other countries; they moderately advanced the ryots whenever they want money on the standing crops and bought up the productions and were doing very well in those days; now I do not know how they are doing. Wynaad all the above grow luxuriantly, and so if any factory were to be opened, I think the Company will prosper and the ryots will be much induced to cultivate and sell the produce to the Company; from a rice factory by degrees coffee curing, baling and packing cinchona, etc., may be undertaken, as it will be convenient for planters if such steps are taken. The ryots whenever in need of money for rents, marriages and deaths, etc., run to a rich native and hypothecate their standing crops at Rs.45 per gulla of coffee and Rs.2 per pulla of paddy. During the harvest the money-lender comes and takes and sells at Rs.100 per pulla the coffee and paddy at Rs.4-4 per pulla. See and reckon the profit that the money-lender makes. Wynaad. When such is the case, why not open a factory? The French people were very charitable and loved their work-people very much (as the English) and were paying them regularly, and if any of their work-people get sick they sacrificed their leisure hours as an angel in the side of the bed, spent money and tried to bring up the patient, also taking very much care of the work-people's children.

Nilgiris.

PYKARA.—Finest planting south-west monsoon we have had for many a year although very wet the rain was not heavy and no wash speak of.

COONOR, 24th June.—The rain up to date has been a good deal more than usual, but since the evening of the 22nd "Queen's Weather" has set in. Talking of the "Queen, God Bless Her," the celebration was generally flat in the extreme. Coffee doing fairly. Tea still flushing well. Health good. Labour sufficient, also defaulting maistries.

SHOLUR, 18th June.—Rainfall 17.02 inches to date. Maximum and minimum temperature 90° and 60° respectively. Labour plentiful, tea flushing splendidly. Cholera in some of the Sholar villages affecting local labour only. The real monsoon burst on 15th inst., and though rain has been fairly heavy, the wind has been very moderate, and caused very little check to tea. Rates of grain rising, in sympathy with Ootacamund shandy. No local news at all.

NELLAKOTA, 21st June.—Our "dog days" have bid us farewell and the S. W. is now here. The change of temperature is simply delightful. A planter's life at present is about as enjoyable as they make them. *Crops*.—Berries swelling; rather a scarcity of those this year. *Plant-diseases*.—Borer noticeable, otherwise trees looking fit. *General Health*.—Fever prevalent. *Labour*.—Insufficient for requirements. *Grain*.—Ragi 18-20 seers per rupee, ordinary rice 9. It is interesting to see how the Coimbatore Tamil has adapted himself to circumstances. His race is essentially a rice-consuming one. In this district they have adopted ragi and thrive on it.

GENERAL NOTES AND ARTICLES.

OURSELVES.

IN view of a steadily increasing circulation and of the greater strength and influence that we hope to acquire from co-operation with the U. P. A. S. I., we have decided to convert *Planting Opinion* into a "weekly." Subscribers will, we trust, appreciate this change. They will not have occasion in future to calculate whether their paper will reach them on a particular date or only the following week. They will know exactly when to expect it, week by week; and if the management succeeds in its efforts to make the paper a comprehensive record of fluctuations of markets, and facts of interest, as well as a medium for the expression of planters' opinions on subjects connected with the planting industry, this paper should gain additional popularity. It may even hope to influence opinion in a small way, and the aim always in view will be to make it a veritable "planter's organ," having the best interests of the planting community at heart, and working hard to advance them. At the same time, this venture was started in no spirit of philanthropy, nor is it to be carried on otherwise than as a business concern. The proprietors are not grasping or greedy, but they invite planters to assist them with subscriptions, advertisements and information, so that the paper may be firmly established on a sound foundation as regards both finances and utility. It is not intended for the present to raise the rate of subscription, though the cost of postage will be doubled, and this extra charge will fall upon the proprietors. Though not invited to bear or to share this burden directly, however, all well-wishers of the paper are asked

to help indirectly, whether by subscribing and advertising or by lending a hand in the work of making it both useful and interesting, to planters. The smallest literary contributions will be thankfully received, the largest will not strike awe into the hearts of a staff enlarged by the admission of men accustomed to the demands of the *daily press*. *Planting Opinion* is but an infant as yet; but its growth has been so healthy, and its innocuous teeth have been "cut" so happily, that its parents and guardians have hopes of seeing it arrive at manhood, and in a position to look back to good work already done, as well as forward to the still nobler work of a more powerful frame and a more matured intelligence. Growing side by side, the U. P. A. S. I. and this little paper may be fellow-students, good friends and trusty allies; and even as the mouse has helped the lion in days gone by, so at some future time *Planting Opinion* may find opportunity to prove its usefulness, as well as its devotion, to the great cause of the advancement of the planting industry in India.

THE WAR AGAINST BLIGHTS.

WE take it that the destruction of blights, both animal or vegetable, that prey on his products, is perhaps the most important matter that can possibly engage the attention of the agriculturist. It is a war, the necessity for which has only been generally recognised in the present century, while the perfecting of old weapons and the forging of new ones has in the last decade proceeded with greater assiduity than ever before. And not only by trained scientists, whose lives and energies are devoted to this sole object, has the conflict against our myriads of tiny foes been waged. For practical farmers and horticulturists are working hand in hand with their leaders, putting to the touchstone of experience the theories formulated in the laboratory and experimental gardens. Many and great have been the victories thus won, yet still more numerous, alas, have been the disastrous failures, the crushing defeats. Great is still the work to be accomplished, and nowhere greater than in this land of Ind. Ryots and planters alike suffer from cruel scourges on their crops. For want of scientific guidance, of expert assistance in laying their plans of campaign, their struggles against their dreaded foes are rendered almost nugatory. The ryot, perhaps, is too conservative to quickly change his ways; all the more need therefore that he should be helped by all possible means. The planter is perhaps willing, but what can he do, what weapons is he to use in the fight?

There are happily signs of a slight change impending in the *non possumus* policy of Government towards the most important industry of the realm. We hear rumours of the establishment of a select band of scientific experts, whose

services will be exclusively engaged in the assistance of agriculture and its allied industries. None too soon, yet most welcome, are these signs. Here in Madras, great hopes are entertained of the assistance of the local Government in obtaining the services of a renowned German entomologist for the purpose of extirpating one of the lesser but still very serious plantation pests. May these hopes be realised to the full, and in the near future. It will be a beginning, and, we trust, a most encouraging one.

Unhappily, much has still to be done by the planter himself before he can hope to use with success the weapons given him. The most astonishing ignorance prevails as to the habits and lives of even the most common and widespread of our pests. Theories are advanced with the greatest disregard of the records of previous investigations, and often with openly expressed contempt of the methods used by science to establish rudimentary truth. The fault lies in the profound ignorance above alluded to, often united to a still deeper-seated indifference. Ignorance can be replaced gradually by knowledge, if only there is the will to learn. But indifference is a more serious evil, and to combat this feeling is no easy task. The agricultural *vis inertia* is a stupendous fact, and energy and perseverance of a rare order are indispensable to counteract this dead weight, obstructive to all progress and reform. In times of prosperity, there is thought to be no need of troubling to render perfection more perfect. In days of trouble, whence are the funds to come from? Such is the easy logic of the obstructionists. No care beyond to-day, no thought for the morrow: these are the sentiments shared alike by our objectionable species of planter, and the most backward of the human race.

On the other hand, they can be led, if they cannot be driven. It is to their leaders, therefore, that we would now urge to do all in their power to stimulate yet further that spirit of investigation and research, now happily asserting its bright presence in their ranks. The work often seems hopeless, to lead nowhere, to result in nothing beyond loss of time and energy. The rewards are very few, and are, nominally, insignificant. No great fortune will be theirs, no loud-sounding applause in the market-place, or its planting equivalent, the Club; even if they do achieve a sudden success. They must work for the work's sake, and in their work find their reward. And at least they will achieve the esteem and admiration of those kindred spirits who alone can appreciate their success. Let them not, too, be afraid of publishing their failures, as well as their successes. Others, eagerly working in perhaps the same direction, will welcome gratefully the warnings of those who have gone before. It requires rare self-abnegation to do this, a feeling of altruism not often met with. Yet working hand in hand, helping and encouraging each

other at every halting step or stumble, what may not an enthusiastic, brave-hearted band accomplish, what obstacles can they not overcome?

India rubber seed.

We have received many enquiries for this seed, with directions for planting, cultivation, &c. The tropical seed-firms are few and generally most unsatisfactory. We should advise our correspondents applying direct to the Director, Royal Kew Gardens, London, for information and supplies. Nearer are the Royal Botanical Gardens at Kandy, Ceylon, where experimental products are to be had in greater number and of better quality than anywhere else in the East.

Butter for planters.

If we ran out this heading to its full extent, it would be a paraphrase of the motto of this paper: *i.e.* Butter for planters made by planters. This is the preface. Now for the puff, for we are always glad to do what we can to help on planters in their little enterprise, especially if they are thoughtful enough to send specimens of their wares. Then of course we can speak with some nominal authority when addressed by enquirers, as we are pleased to be able to do with regard to the Oakland Dairy butter, (Yellahunka, Bangalore,) some pound samples of which were sent to our office. They reached us in excellent condition by post, and were a good deal superior to local butter at the price, *i.e.* one rupee per pound. Certainly far better than tinned European butter. We congratulate the Managing Proprietor of the Dairy, a planter be it noted, on the success he has attained, and hope he will get orders large and many from the readers of this paper.

Ceylon labour requirements.

Our readers will peruse the following with satisfaction. We trust Colombo will be soon proclaimed as a free emigration port:—

"A Ceylon Planter has kindly given us," says a Ceylon exchange, "a perusal of a letter he lately received from Calcutta, in which a coolie recruiting agent mentions a point of considerable importance to those who are contemplating securing a labour supply from India. In the course of that letter the coolie recruiter mentions that he called on the Emigration Agent at Calcutta and learned from him that 'Ceylon is not included as an emigration port, and therefore before sending coolies there, special sanction would have to be obtained from the Government of India, unless you ship the coolies as free emigrants and then the difficulty would be on arrival at Colombo, should they strike, you would not have the slightest hold on them, and I would have to pay their passages back to where they came from, which is hardly good enough. I am perfectly aware that the Ceylon Planters at present are handicapped for a good working jaf of coolies to be independent of the Madras labour supply. I am in a position to supply hundreds of a good agricultural class of coolies who I would not have the slightest difficulty in persuading to go, and I am certain they would give satisfaction on arrival there; but until the Ceylon Planters move the Government to proclaim Ceylon a free emigration port, I am perfectly helpless.'"

What is manurial value?

A big question this, to which many columns of our space might be profitably devoted. Yet the outlines are so simple that every planter should have a thorough grasp of it. These remarks are suggested by a query from a reader whether a certain peculiar soil he found on his estate was of any value as a manure. And yet the analysis he enclosed answered the query very decisively. What

should a planter look for in a manure for coffee or tea? Simply for nitrogen, phosphoric acid, potash and lime. The analysis sent showed only traces of ammonia (a combined form of nitrogen) and but 1 per cent. of magnesia and alkalis soluble in nitro-hydrochloric acid. Very obviously this soil is no good as a manure, *i.e.* for supplying food to the plant, for the simple reason that it is worse than even the most indifferent coffee soils, at all events as regards the *soluble* constituents. The analysis, by the way, only showed the soluble constituents: it would have been more interesting and valuable had it shown both the soluble and insoluble constituents. To use a soil profitably as manure, it should contain a large proportion of any of the above elements already mentioned. Generally speaking, jungle top-soil and swamp-soil are the only ones that can be so utilised.

Canaigre: A new product.

Fond as we are of drawing the earnest attention of our readers to the possible value of new planting products, yet it is with the weary conviction that scarce a quarter per cent. of our readers will ever take the matter up. The expense perhaps is not slight, and the trouble decidedly great. How easy and sure would not an experimental garden make things!

What has become of the canaigre, the plant which was introduced into Victoria a few years ago from Mexico, and which at the time was thought by many would become in a short while one of our most valuable products. The value of this root to the tanner is beyond all question; the numerous analyses made both in Europe and America have proved this, and we are now informed by the *Gardeners' Chronicle* that the result of the various investigations has been to create a great demand for it in the tanning trades of Europe, and more recently in the leather-making centres of the United States. The only supply now to be obtained is from the wild plants growing along the rivers and valleys of Western Texas, New Mexico, and Mexico.

Canaigre is the vernacular name in Mexico for the *Rumex hymenosepalum*, one of the family of docks. In Mueller's "Industrial Plants" its value is spoken of. But it was not until Mr. A. Johnson of Footscray imported at considerable trouble some half dozen years ago, a quantity of the roots from Mexico that much was heard or known of this valuable tanning plant. Some acres of land at Mornington were planted with the product of the imported roots, but either the soil was too poor or the situation too cold, the plants did not flourish as expected. In Gippsland and some other localities the canaigre is now being tried, and in a few of these the growth of the plants has been satisfactory.

There appears to be but little doubt that this valuable root will, in favourable situations, pay well to grow. Careful estimates show that an acre of these plants, properly cultivated, will yield from 20 to 30 tons of green roots, equal to 7 to 10 tons of the dried material ready for shipment. At the lowest estimate of both yield and price, an acre of canaigre would bring £35, but probably £45 would be a safe and reasonable estimate of the value per acre.

The old roots, as hard as wood and almost black, are especially rich in tannic acid. The stalks, stems, and leaves also contain tannin in sufficient quantity to pay for harvesting. Age adds to the roots an excellent colouring matter. The one-year-old roots yield from 20 to 25 per cent., the older roots 25 to 40. From 6 centners, or 112 lb., of fresh, 2 centners of dry, or 1 centner of extract, is obtained. By taking the extract from roots and leaves where the plant grows, much money might be saved, and losses due to transport saved. The refuse could be used to burn, or as cattle fodder, for which purpose it equals straw.

In extracting the tannin it is best to cut up the roots, and to use a diffusion method similar to that used in extracting sugar from beet or cane. It is necessary to use copper kettles, as the canaigre influences and is influenced by iron. It is well also, when extracting by means of lye, and when steaming, to use vacuum pans, otherwise the tannic acid runs the risk of becoming gallic acid. By steaming

under small pressure there is no loss of tannin, and an excellent extract of a bright colour, easily soluble in water, is obtained. Some of the advantages of canaigre over other materials are that it gives to leather a full, smooth, and good grain, and a soft bright colour. It is specially suited to uppers, saddles, and fancy leathers. It is said to have been used by the Jesuits in lower California, some 200 years ago, but as it was thought to contain too much tannin, and its proportions were scarcely understood, it did not become generally used.

Plants may be propagated from seed or from division of the roots. The plant is of rapid growth; in the space of about four months it starts into growth, matures, and is ready for harvesting. It does best in a rich sandy loam; a moderately moist soil suits it best. The tubers resemble sweet potatoes, there being from three to a dozen to each plant, varying from 2 oz. to 18 oz. in weight. The leaves are a wholesome substitute for spinach, and both leaves and roots are used by Indians and Mexicans as medicine. In the warmer districts of Victoria, and especially where water could be applied in dry seasons, the canaigre should pay well to cultivate.

COMMERCIAL NOTES.

YET another Tea Company, but not connected with Southern India. The Baraora (Sylhet) Tea Company, Limited, has been formed primarily to take over the estates and properties of the Baraora Tea Company (Limited) and the Rasetpur Tea Company (Limited) in South Sylhet, in the province of Assam, and also to acquire at a later period the Daragaon Estate adjoining the gardens of the Rasetpur Company. The estates to be immediately taken over comprise the Baraora and Rasetpur gardens, the former containing 1,350 acres planted with tea and 1,150 acres of reserve and waste land, while the latter contains 1,033 acres of tea and 1,777 acres of reserve land. The capital is £200,000, in shares of £10 each, of which 2,566 preference and 2,567 ordinary shares will be taken by the vendors in lieu of cash in part satisfaction of the purchase price of the Baraora and Rasetpur Companies' estates.

Now that tenders with respect to the use of the Periyar water-power are called for, will any planter or Tea Company try to turn that power to account, with electricity as an ally? Any experiment in this direction would be extremely interesting to the public, though it might easily be disastrous to the bold adventurer.

It would be interesting if planters in various districts would, from time to time, advise us of any change in current rates of freight, or any new "conferences" or agreements. The Freight problem is one with which the planter in Southern India has never yet fairly grappled: he is still largely at the mercy of the agent and the charterer, though probably both deal with him much more gently than a majority of planters think.

U. P. A. S. I. LEAVES.

(Gathered by the Secretary, U. P. A. S. I.)

THE shower of leaves in the last issue was plentiful because of Her Majesty's Diamond Jubilee and the loyal Address of the Association, in its silver case. This week, a leaf that might well have appeared earlier, may find a place. It tells how the Chairman of the U. P. A. S. I. has intimated to the Honorary Secretaries of District Planting Associations that arrangements have been made, whereby the Secretary of the U. P. A. S. I. will be able to gather these leaves and pile them up in the columns of *Plant-*

ing Opinion, and publish U. P. A. S. I. Circulars in this paper whenever he considers it expedient to do so. By this means he will be enabled to convey information to individual planters more rapidly than can be done through the medium of District Associations. If the experiment works well, and Honorary Secretaries of those Associations approve, he may continue to lighten their labour very considerably, for there must be busy times when the circulation of U. P. A. S. I. Circulars is anything but a labour of love to the Honorary Secretary who has to pass them round.

* * * *

No doubt, this innovation will be of use to the paper—always provided that it, and the Leaves, find favour with Planting Associations and Planters. On the other hand, as the paper makes no charge for placing a considerable amount of space at the use of the U. P. A. S. I., the Chairman rightly alludes to the arrangement as comprising “valuable concessions,” and expresses a hope that all Chairmen, Honorary Secretaries and Members of District Committees will do their utmost to induce the members of their respective Associations to accord the paper their hearty support by subscribing thereto, by advertising in its columns, and by sending in items of news and information concerning planting matters.

* * * *

There are thus three channels along which planters can send their donations of strength and support to the paper: subscriptions, advertisements, and literary contributions. All and all sorts will be welcome. If the appeal of the Chairman is heartily responded to, *Planting Opinion* will become what it has been steadily striving to make itself, viz., the recognised, respected and influential organ of the planting communities of Southern India. That there is room for such an organ—that there is even need of it—has long been evident, but no newspaper proprietor can, single-handed, supply such a want as this. He must have the co-operation and the sympathy of the public in whose behalf he works.

* * * *

The Madras Government has kindly allowed until the 25th August next for the consideration of the Report of the Planters' Enquiry Committee by planters, and the submission of a report by the U. P. A. S. I. This will allow time for the report to be properly digested, and carefully matured remarks thereon should be the outcome. No Committee meeting will be held until just before the Annual Meeting of the U. P. A. S. I., but every effort is to be made to deal with the matter thoroughly and expeditiously on that occasion.

* * * *

Statistics come in but slowly. If no changes are to be made in the old figures, Honorary Secretaries would confer a favour by informing the Secretary of the U. P. A. S. I. accordingly. It is a difficult task to collect them, of course, but if planters will only help by promptly sending the figures relating to their estates, work will progress speedily.

* * * *

Statistics or information on general subjects will be as welcome if sent in by planters who are not members of District Associations as they are when received from those

Associations. It is desired to make the statistics in the Book of Proceedings a complete and accurate record concerning all planters' estates in Southern India.

* * * *

By the way, a good many copies of the various books of Proceedings, from the “Planter's Conference” to the U. P. A. S. I. are still available. The price is Rs.1-8, or per V. P. P. about Rs.1-10-6. Considering the number of planters there are who take a real interest in the affairs of the community to which they belong, these books should be in better demand than they have been hitherto.

ABSCONDING MAISTRIES.

ABSCONDING maistries have too long been a source of loss and annoyance to planters. Registration, both compulsory and voluntary, have been proposed as remedies. Some day in the next century things may have progressed appreciably further in this direction. In the meantime we would invite those of our readers who are troubled with cases of defaulting maistries to forward us details for publication. If planters generally support this idea, a great deal will be effected in controlling the present well-nigh intolerable evil.

NOTICE.

Planters are advised not to give employment—or an advance to bring coolies—to one Narrain Maistry of the Pallar caste, son of Chendava, of Kulloomudday Village, Coimbatore District, as he is under an advance of Rs. 200 on a stamped agreement to the undersigned to work on the Southern Estate, Colacumbay, with 30 coolies from 1st June 1897 to 31st May 1898. He and his coolies came to work on the 17th June and absconded on 20th June after receiving the usual weekly rice money. The personal description of Narrain is as follows:—

Short, slim, straight nose, prominent eyes, dark speckled countenance. Wears a silver anklet on right leg, and dresses in a new scarlet soldier's jacket.

W. MULLALLY,

“Ibex Lodge,”

THE DROOG, COONOR.

THE SOUTH OF INDIA PLANTERS' ENQUIRY COMMITTEE.

THE report of the South of India Planters' Enquiry Committee has not, we think, been “laid on the Editor's Table,” but the veil of secrecy that shrouded it has been partially removed by the *Madras Mail*, which announces that the following are the recommendations made in the report with respect to the system of Advances:—

(1) That Madras Act V. of 1866 should be amended so as to provide a suitable labour law for all the planting districts in Southern India.

(2) That the question of declaring Act XIII. of 1859 to be inapplicable to contracts for labour governed by the amended Act should be reserved for consideration.

(3) That the Native States of Mysore, Travancore, and Cochin should be invited to adopt the amended law.

(4) That the execution of the amended law should be made reciprocal between the Madras Presidency and Coorg on the one hand and the Native States of Mysore, Travancore and Cochin on the other, by a convention or mutual agreement.

(5) In default of a convention—

(a) that British Magistrates should be empowered to give effect to orders of certain Magistrates in Native States in respect of fraudulent breaches of contracts under the amended law, or if there is no amendment under Act XIII. of 1859, or preferably

(b) that Magistrates in British India and in the Native States of Mysore, Travancore and Cochin should be empowered by their respective Governments to deal with persons found within their Jurisdiction who commit fraudulent breach of contract (as above explained) cross the border.

(6) That in the event of either of the above suggestions 4 or 5 (b) being accepted, the Mysore State should no longer be exceptionally treated in respect of British processes in breach of contract cases.

To supplement this information, we give our readers a copy of Act V. of 1866, which will enable them to see the exact character of the piece of legislation that has been selected as the basis of future improvements, &c. The Act is as follows:—

MADRAS

ACT No. V. of 1866.

PASSED BY THE GOVERNOR OF FORT ST. GEORGE IN COUNCIL.

Received the assent of the Governor on the 30th August 1866, and of the Governor-General on the 6th October 1866.]

An Act to regulate the manner of engaging and contracting with Native inhabitants within any of the Districts subject to the Government of Fort Saint George, for labor to be performed in any part of India beyond the territorial limits of the Presidency of Madras.

Preamble.

Whereas it is expedient to regulate the manner of engaging and contracting with Native inhabitants within any of the Districts subject to the Government of Fort Saint George, for labor to be performed in any part of India beyond the territorial limits of the Presidency of Madras; It is enacted as follows:—

Interpretation.

1. The following words and expressions in this Act shall have the meanings hereby assigned to them, unless there be something in the subject or context repugnant to such construction, that is to say:—

“Contractor.”

The word “Contractor” in this Act shall be taken to mean, as well a person who contracts for the supply of laborers to others, as a person who employs Recruiters to engage and supply laborers for the purpose of serving such person himself.

“India.”

The word “India” shall denote the territories vested in Her Majesty by the Statute 21 and 22 Vic. Cap. 106, entitled “an Act for the better government of India,” and also all Native States and Foreign Dependencies within such territories.

Contracts for labor in any part of India beyond the territorial limits of the Madras Presidency unlawful, except under this Act.

Saint George for labor to be performed in any part of India beyond the territorial limits of the Presidency of Madras; provided that nothing in this Act shall apply to any contract of any Native Seaman or other person who of his own free will shall contract to navigate or serve on board any vessel or who shall embark on board such vessel in pursuance of such contract, or to any person who shall contract to serve as a menial servant only, and who shall embark as such menial servant.

Appointment of Protectors of Laborers.

Protectors of Laborers to be deemed Public Servants.

be held to be a Public Servant within the meaning of the Indian Penal Code.

General duties of the Protector of Laborers.

4. The Protector of Laborers, in addition to any special duties assigned to him by this Act, shall, so far as is in his power, generally protect and aid, with his advice or otherwise, all laborers under contract in pursuance of this Act.

Protector of Laborers to license Contractors or Recruiters.

Duration of license and cancellation in case of misconduct.

Form of License to a Contractor, and fee to be paid.

Form of License to a Recruiter, and fee to be paid.

Recruiters to wear badge.

Natives engaging to labor not to leave their Districts without appearing before the Protector of Laborers.

Examination and registration.

Fee for registration.

Protector of Laborers a fee of one Rupee.

Laborers refusing to proceed to place of labor, not to be compelled to do so.

Proviso.

proceed to, or detain him at, any place against his will; but nothing in this Section shall be taken to diminish or affect in any way the legal liabilities, Civil or Criminal, of such laborer, incurred by him by reason, or in respect, of his refusal or neglect aforesaid. Every case in which a laborer is charged before a Magistrate of the Town of Madras with refusing or neglecting to proceed as aforesaid shall be heard and determined by such Magistrate in a summary manner; and every such laborer shall, on conviction, be punished in the manner provided in Section 492 of the Indian Penal Code for the punishment of offences under that Section.

5. The Protector of Laborers shall license so many fit persons as shall seem to him to be necessary as Contractors or Recruiters of laborers within his jurisdiction, and shall assign to each such Contractor or Recruiter a District or Districts wherein he may engage laborers; and no person shall act or be employed as a Contractor or Recruiter of laborers except under a license from the Protector of Laborers.

6. Every license shall be in force for a period of one year; but in case of misconduct on the part of any Contractor or Recruiter, the Protector of Laborers may cancel his license before the expiration of the period for which it is granted.

7. Every license to a Contractor shall be in the form set forth in the Schedule A. to this Act annexed. For every such license there shall be paid to the Protector of Laborers a fee of one hundred Rupees.

8. Every license to a Recruiter shall be in the form set forth in the Schedule B. to this Act annexed. For every such license there shall be paid to the Protector of Laborers a fee of ten Rupees.

9. Every person holding a license as a Recruiter of laborers shall wear conspicuously a badge bearing the inscription of Recruiter of Laborers in the vernacular language of the Town, District or Districts in which he is licensed to engage laborers.

10. Every Native inhabitant of India, who shall in the Town of Madras or in any District within the Presidency of Madras enter into any engagement with a contractor or Recruiter of laborers, shall, prior to leaving the Town of Madras or the District within which the engagement was entered into, appear with the Contractor or Recruiter before the Protector of Laborers of the town of Madras or of such District; and no Contractor or Recruiter shall remove such laborer from the said Town of Madras or District until he shall have so appeared. Upon so appearing, the Protector of Laborers shall examine the laborer with reference to his engagement; and if it appears that he comprehends the nature of the engagement he has entered into and that he is willing to fulfil the same, and if it appears that the Contractor or Recruiter has authority to enter into the engagement, the Protector of Laborers shall register, in a book to be kept for the purpose, in such form as the Government of Fort Saint George shall prescribe, the name, name of the father, and the age of such laborer, and the name of the village or place of which such laborer is a resident, the name of the District to which it is intended he shall proceed, and the rate of wages and period of service, if any, agreed upon between the laborer and the Contractor or Recruiter. If the Protector of Laborers shall be of opinion that the laborer does not comprehend the nature of the engagement, or has been induced to enter into the engagement by fraud or misrepresentation, or if the Protector of Laborers shall be of opinion that the laborer is in a state of health which makes him unfit to undertake the journey which he is about to commence, he shall refuse to register his name. A copy of every registration under this Section, on substantial paper which shall not require a stamp, shall be furnished by the Protector of Laborers to the laborer registered.

11. For the registration of every laborer, the Contractor or Recruiter shall pay to the Protector of Laborers a fee of one Rupee.

12. If any laborer shall without good and sufficient cause, refuse or neglect to proceed to the place at which the contract is to be performed, it shall not be lawful to compel him to proceed to, or detain him at, any place against his will; but nothing in this Section shall be taken to diminish or affect in any way the legal liabilities, Civil or Criminal, of such laborer, incurred by him by reason, or in respect, of his refusal or neglect aforesaid. Every case in which a laborer is charged before a Magistrate of the Town of Madras with refusing or neglecting to proceed as aforesaid shall be heard and determined by such Magistrate in a summary manner; and every such laborer shall, on conviction, be punished in the manner provided in Section 492 of the Indian Penal Code for the punishment of offences under that Section.

Contractors or Recruiters to establish depôts, and receive and maintain laborers therein.

13. Every Contractor or Recruiter licensed under this Act shall, if called on to do so by the Protector of Laborers by whom he is licensed, or by any Protector of Laborers within whose jurisdiction laborers recruited under the provisions of this Act may be detained previous to being conveyed to the place at which the contract is to be performed, establish a depôt in a place to be approved of by such Protector of Laborers. Every such depôt shall be kept up by the Contractor or Recruiter for the reception of laborers to be supplied or forwarded by or through him. All such laborers shall, on their arrival at or in the neighbourhood of the depôt so established by the Contractor or Recruiter by, through, or for, whom they have been engaged or forwarded, be at once taken to, and received into it, and shall be entitled to receive in such depôt, at the expense of such Contractor or Recruiter, suitable lodging, food, clothing, and medical attendance, until such laborers shall be declared by the Protector of Laborers to be no longer entitled thereto. Every such depôt as aforesaid shall be under the supervision of the Protector of Laborers, and shall be open to his inspection at all times, and shall be managed and regulated by the Contractor or Recruiter in accordance with such rules as the Protector of Laborers may, with the sanction of the Government of Fort Saint George, from time to time lay down in that behalf. Every laborer recruited under the provisions of this Act shall be conveyed with all convenient despatch to the place at which the contract for labor is to be performed.

Duty of Protector of Laborers prior to embarkation of laborers.

14. Whenever laborers hired under this Act are about to embark on board of any vessel, it shall be the duty of the Protector of Laborers who may be stationed at the port of embarkation, to satisfy himself that the vessel has sufficient accommodation for the number of laborers who are about to be embarked, and that reasonable provision has been made for their maintenance and comfort on the voyage; and thereupon he shall sign a written authority to the Master of the vessel to proceed upon such voyage, with the number of laborers specified therein. Any Contractor or Recruiter of Laborers who shall embark any laborers hired under this Act, and any Master of any vessel who shall receive any such laborers until such written authority has been obtained or in excess of such authority, or who shall afterwards receive on board such passengers or

Penalty for embarking without authority, and for receiving passengers or cargo tending to incommode the laborers on board.

cargo as shall unreasonably diminish the space necessary for the comfort or accommodation of such laborers, shall be liable to a fine not exceeding five hundred Rupees.

Fees received to be accounted for to Government.

15. All fees received by any Protector of Laborers shall be accounted for to Government in such manner as the Governor of Fort Saint George in Council may direct.

Penalty for making unlawful contract for labor.

16. Whoever shall, except under and in conformity with the provisions of this Act, make any contract with any Native inhabitant of India for labor to be performed in any place in India beyond the territorial limits of the Presidency of Madras shall be deemed to have committed the offence specified in Section 363 of the Indian Penal Code; and whoever shall aid in or abet the making of any such contract shall be deemed to have abetted the commission of that offence.

Penalty for recruiting without being licensed.

17. Whoever not being a Contractor or Recruiter licensed under this Act, shall act or be employed as a Contractor or Recruiter of laborers, or shall, contrary to the provisions of this Act, within the Town of Madras or within any District subject to the Government of Fort Saint George, enter into any contract with a Native inhabitant of India for labor to be performed in any place in India beyond the territorial limits of the Presidency of Madras, shall be liable to a fine not exceeding five hundred Rupees.

Penalty for Contractor or Recruiter failing to take the laborers he has engaged before the Protector of Laborers.

18. Whoever being a licensed Contractor or Recruiter under this Act shall remove any laborer whom he may engage in the Town of Madras or in any district or place from such town, district or place, without such laborer having appeared with the Contractor or Recruiter before the Protector of Laborers in order that such person might be examined and registered; and whoever shall, by means of intoxication, violence,

fraud, or false pretences, induce any Native inhabitant of India to enter into any contract within the Town of Madras or any District subject to the Government of Fort Saint George for labor to be performed in any place in India beyond the territorial limits of the Presidency of Madras, or to proceed to any such place without having entered into any contract, shall be liable to a fine not exceeding five hundred Rupees.

Penalty for forwarding laborers, or allowing them to go, without being duly registered.

19. Whoever being a duly licensed Contractor or Recruiter, shall forward or send any laborer from the Town of Madras or from any District in which he has entered into an engagement, without such laborer having been duly registered in accordance with Section XI. of this Act; and whoever, being a duly licensed Contractor or Recruiter, shall induce or knowingly permit any such laborer to leave the Town of Madras or any District in which he has entered into any engagement, without the laborer being duly registered as aforesaid, shall be liable to a fine not exceeding five hundred Rupees.

Prosecutions under this Act where and how to be instituted.

20. All prosecutions under this Act shall be instituted, on information laid at the instance of the Protector of Laborers before a Magistrate of Police or before a Magistrate of the District, according as they shall be instituted for offences committed within, or for offences committed beyond the limits of the Town of Madras.

Levy of fines.

All fines imposed under the authority of this Act may, in case of non-payment thereof, be levied by distress and sale of the goods and chattels of the offender by warrant of the Officer imposing the fine. When a warrant of distress is issued, the said Officer may order the offender to be detained and kept in safe custody until return can be conveniently made to such warrant, unless the offender enter into a recognizance, with or without sureties, conditioned for his appearance before such Officer on the day appointed for such return, such day not being more than eight days from the time of taking such recognizance; but if, before issuing such warrant of distress, it shall appear to the Officer imposing the fine, by the admission of the offender or otherwise, that no sufficient distress can be had within the jurisdiction of such Officer whereon to levy such fine or penalty he may, if he think fit, refrain from issuing such warrant of distress and in such case, or if such warrant shall have been issued and upon the return thereof such insufficiency as aforesaid shall be made to appear to the Officer imposing the fine, he shall, by warrant, commit the offender to jail, there to be imprisoned, with or without hard labor, for any term not exceeding two months where the amount of the fine shall not exceed fifty Rupees, and for any term not exceeding four months where the amount shall not exceed one hundred Rupees, or for any term not exceeding six months in any other case the commitment to be determinable, in each of the cases aforesaid on payment of the amount. The fine or any part thereof which remains unpaid, may be levied at any time within six years after the passing of the order imposing it; and the death of the offender does not discharge from the liability any property which would after his death be legally liable for his debts.

Commencement of Act.

21. This Act shall come into operation on the 1st day of November 1866.

SCHEDULE A.

Office of the Protector of Laborers at

A. B. is hereby licensed, under (Madras) Act V. of 1866, to be a Contractor for engaging persons in the District (or Districts) of to proceed to any part of India beyond the territorial limits of the Presidency of Madras, for the purpose of laboring for hire.

This license will be in force for one year only from this date.

Dated the day of 18

(Signed) E. F.

Protector of Laborers

SCHEDULE B.

Office of the Protector of Laborers at

O. D. is hereby licensed under (Madras) Act V. of 1866, to be a Recruiter for engaging persons in the District (or Districts) of to proceed to any part of India beyond the territorial limits of the Presidency of Madras, for the purpose of laboring for hire.

This license will be in force for one year only from this date.

Dated the day of 18

(Signed) E. F.

Protector of Laborer

LETTERS TO THE EDITOR.

ANSWERS TO CORRESPONDENTS.

[F. MEPPEN. Your idea of chess problems will be borne in mind, and, if feasible, will be carried out. "KULLAKAMBY." Sorry, we can't help you with wattle-seed. Certainly, leguminous cuttings will be of far more use than ordinary jungle. That yellow-flowering legume of which you speak is a dangerous thing to plant in coffee: it has very deep tap-roots so that you will find it almost impossible to get rid of it. Mustard should do well: allow three months growth before you allow a coolie on the ground, and dig in when it begins flowering. "YEDAHALLI." Glad to hear from you as soon as you can write your "yarns." L. MATHIAS AND MIRZA MAHDY KHAN. See para. on Rubber in "General Notes." Sorry cannot give more information at present.—Ed.]

"VEGETABLE TYPHOID."

SIR,—Looking through some T.A.'s., I came across the following signed "T Koko"—"Beware of the practice of burying prunings. No tree feeds on its own refuse, or the result would be as in animal life? (by analogy, and probably experience will prove the truth later on if men are not careful.) "Absit omen"! vegetable typhoid in tea would be a fell follower of *Hemeleia vastatrix* in Coffee."

Great Scott!! What am I to look for to find "vegetable typhoid"! I am a great believer in burying anything I can get hold of. I would like the opinion of some of our leading planters on this subject—men who have thought the subject out—because if "T Koko" is correct in his statement, all our forests must be suffering from "vegetable typhoid," for surely forest trees thrive well on their own refuse "made by decaying leaves," broken branches, etc. It seems to me a subject well worth discussing in P.O.

5th June, 1897.

Yours, etc.,
"KOLA."

[NOTE.—This "nom-de-plume" is registered, and infringements will be prosecuted. You have scored a point, O Kola, in your letter. T. Koko starts well, but comes a cropper in the open. But read his letter again, with the connected extracts and then write another criticism.—Ed.]

COST OF LIVING ON PLANTATIONS.

DEAR MR. EDITOR,—The luxurious manner in which a young planter can live on Rs.100 per mensem is most edifying and abundantly proves they are, if anything, overpaid. But there are several estates on these hills where Superintendents of several years' standing draw salaries varying from Rs.150 to 275. They are mostly married men with, say, an average family of 4. How can this income be managed to advantage? Food and clothing are of course absolute necessities, but where can the four be decently educated on this salary, and what chance has a man of providing for the future should the bread-winner lose this billet or any other disaster happen? Of course the answer is, married men should not be in such a position; but owing to the failure of coffee, the amalgamation of tea concerns and reduction of establishment, many men married when in good circumstances, are now reduced to paid Superintendents, and as capable and steady men proprietors take advantage of their circumstances and give them little more than a "living wage". By the bye, both the correspondents who live on Rs.41-10-0 and Rs.55, respectively, do not include a "dhobi" and soap in their accounts. I suppose these are able to be dispensed with when "living on the cheap."

"YAH."

MANURING TEA.

DEAR SIR,—In answer to "Pekoe," "extra quick flushes cannot fail to be inferior both in flavour or quality generally." The one ambition of an Assam planter is to get round his garden in 5 to 6 days during the season June to October; if he can't, he finds his bushes going ahead and leaf hardening. Remember

that in Assam the soil is more prolific—and a 6 days plucking would only equal 12 days to a fortnight here. I can also quote authorities as to the paying qualities of manure. There was a small patch of tea, at Tezpur, on the N. bank of the Bhramapootra, which obtained all the conservancy manure and managed to make 18 Bengal maunds an acre—with a fair average market price.

My own experience both on these hills and elsewhere is that manure not only increases yield, but puts "guts" into tea that cannot be obtained otherwise.

I certainly would not put manure into a long lanky unpruned China bush, but having cut it down, trimmed, cultivated and manured, both the yield and quality of the leaf are improved undoubtedly.

I send you, "Mr. Editor," a sample of roughly made tea (my tea house is not working, and it was made in a cutcha building, without withering or fermenting space), and if it has not both strength and flavour I'm a Dutchman—and its tappings from highly manured, deeply pruned tea.

Yours faithfully,
OLD EXPERIENCED PLANTER.

CHRISTIAN COOLIES.

SIR,—I have read with interest and some amusement the remarks of your "much disgusted planter" anent the Native Christian, and think I can say a few words on the subject. The Christian cooly and Boy of our Indian towns are not the result of Mission work, but of the very bad example too often set by the majority of European Christians to all classes of natives in this country, and are Heathen, Roman Catholic or Protestant, according to the supposed preference of the Master or Missis whose employment they seek.

"The Missions have much against them" says he. They have! and mostly in the walk and conversation of Christian Englishmen and women. It is a common thing for missionaries preaching at Hindoo festivals to be told, "Go and say all that to your English Officers and gentlemen—not to us!"—As to missionaries keeping their converts sober, the idea is too absurd for discussion. Can the Garrison Chaplain keep the officers attending his church sober, or hinder profanity among them?

Do planters (disgusted or not) and other highly educated Englishmen, reared in good Christian homes, set an example of sobriety and general morality to their native servants who have been brought up amid every disadvantage, and surrounded by the lowest Hindoos and Mussulmen?—If they did, the native Christian would be a far better man, and the missionaries' work much lightened.

The surprising honesty met with among out-and-out heathen alluded to by the disgusted planter is a psychological problem that has puzzled wiser heads than his or mine, so I will not attempt to explain it. But it is not the Native Christian alone who is dishonest. Highly educated Christian Europeans have embezzled money, &c., and gone to jail for it.

CROMLECH.

THE COOLY AND THE MISSIONARY.

SIR,—May I ask permission to reply to certain strictures passed on my last letter on this subject by a writer in the *Madras Times*. This gentleman edits a column called "Church Notes" in your contemporary. He makes capital out of the remark that I made about missionaries living in exactly the same style as any other class of Anglo-Indians. He asks if I want them to live like savages. No, I don't want them to live like savages or endure unnecessary hardships of any kind. But what I distinctly object to, and said in my letter, is that when these worthy individuals go home to collect subscriptions, a certain, and not small, proportion are in the habit of wilfully misrepresenting their position out here. They dilate on their hard-

ships, their exile, their moving adventures by flood and field, the dangers they run at the hands of fanatics, and what not. They dilate on all this, I say, as if their experiences were—those that are true—singular to the missionary and were not the common lot of all who came to the East to gain a living. Those touching missionary meetings at home, those stirring appeals to the pockets of the audience, do they not appeal powerfully indeed to the Anglo-Indian? Estimable men and upright, why should they not cadge for subscriptions to build them comfortable homes and carriages?

It is wonderful, indeed, when one reflects on their worthiness, their austere self-denial, that the cooly can learn anything but good from the missionary.

And yet, when we look into the matter more closely, we find that the missionary himself is extremely diffident about the virtues of the converted heathen. I know of many cases where Christian servants are religiously salved by missionaries. Perhaps it is, who knows? because they want to be able to add to their converts by engaging heathen domestics and turning them out as soon as they become Christians.

It must not be supposed that my remarks apply to Roman Catholic Missionaries. Oh, dear no. These are a lot of men, who so far forget their calling and dishonour the name of their Teacher, as to live not only among the heathen, but *with* them. They take all sorts of absurd vows to spend all their lives in India, never to enjoy an income over a fixed miserable pittance barely enough to keep body and soul together. Ridiculous men, these, surely. They actually attach a literal meaning to the word “minister,” and pretend that being padres or clergymen they should serve their flock and tend them in all ways, humble and otherwise. Somehow, Roman Catholic coolies can be kept fairly in hand by appeals to their padre. The other jât of cooly is under the control of no one.

A strange contrast, the lean ascetic priest and the beefy, portly Missionary! I confess to being neither a Roman Catholic nor Protestant, so my remarks should be taken as those of an unbiassed but still

ANOTHER DISGUSTED PLANTER.

SHORT CROPS.

I.

SIR,—Two small errors have crept into my letter in last issue: 18 inches of new wood *on* not *and* every field—and in the last para. referring to the use of sulphate of iron, it should read freedom from *smut* not sand.

If it would free our fish and other artificials from sand it would have a big sale!

Yours faithfully,
PERSEVERANCE.

Ooty, 19th June.

II.

SIR,—Herewith my experience of the above. So far as my estate is concerned, I put the short crop down to *untimely rain in February*. My annual rainfall is about 40 inches, and a dry December, January, February and a part of May as a rule, whereas last year my rainfall was as follow:—January 0, February 0, March 0.26, April 1.29, May 2.29, June 19.00, July 19.46, August 13.53, September 8.63, October 1.51, November 5.59, December 3.95 = 76.81, January (1897) Nil, February from 14th to 20th 1.67, and the last shower did the mischief; my trees were in splendid health and good bearing wood, little or no “leaf disease” all the year, BUT there was no chance for the trees to “winter,” and so when this February rain came, the whole place burst out into “wood instead of spike.” I certainly had no fall of leaf like your correspondent “Perseverance,” and I am now more convinced than ever that it was the “wet” year followed by too early rains that have given me a short crop,

and that, I think, is the opinion of most planters I have spoke to on the subject. Coffee, in my humble opinion, wants at least 2½ months dry weather before the blossom, and when I have had this I generally picked all the crop, and I speak from a experience of 18 years, but it would be interesting if others would give their opinion, and when you have received a certain number of letters on the subject you will, I hope, sir, sum up and give the “general” opinion formed by yourself after reading the several letters.

“KOLA.”

III.

SIR,—I was very glad to see the letter by “Perseverance” in your last issue, and consider that he has opened up a subject for discussion that every one interested in coffee ought to give his ideas on, and with this object in view I write to tell you what little I know about it and what my observations have been. To start with, can anyone suggest a reason for getting the leaf disease so late in the season as we do now? Ten years ago I can remember that we always had the worst of it during September and by the end of the month, say, hardly a leaf was on the trees. This of course meant losing *some* of the crop that was then on, but the fine growing weather that we get at this season of the year allowed the tree to put on new leaf quickly, and the coming blossom was not much affected, but nowadays we get it in December, and by the end of crop, say, in January, the trees cannot boast of ten leaves that are healthy; this being so, how is it to be expected that the tree being exhausted by the ripening of crop and loss of leaf can get through the dry weather and at the same time make new leaf and bud, &c. &c., in time for the rain that we expect such a lot from in March or April? It cannot possibly, and failure is the result. The poor old thing does its best, but flowers do not set on account of the severe shock the tree has sustained. If we cannot do away with it altogether, let us at any rate do what we can to help the tree through the very severe attacks that it has had to go through these two last years during crop. Three years ago I put down 2 oz. of nitrate of soda to every tree in about 15 acres of coffee, and 5 acres adjoining had none at all. This was put down in *October*, and ever since it has had very little leaf disease, and what it has had it has been able to throw off quickly. The 5 acres that did not get it has had it every year, and that badly. In the following *February* I put down the same quantity to 20 acres in another field. This made the tree throw out an enormous amount of dark green healthy wood which looked splendid until about crop time, and then the mischief began. It had a very bad go that year, but a very much worse one this year, and from what I have seen of these two experiments, if I may so call them, I am firmly of opinion that we can do a lot of good with the help of nitrate of soda when the place is free of weeds in October. You cannot have the place too clean, as of course you want to give medicine to the tree and not to weeds. I have heard of some men that have used it and pooh-pooh it as not worth the money, but it is quite possible that they have not given it a fair trial and have not applied at the right time of year, which is October or November and not just before the monsoon. It is certainly expensive, but a ton of it goes a very long way, and the effect of it here has lasted well; but had I my own way I should certainly give the whole estate another dose of it both to the old coffee and young, but of course reducing the quantity to the young coffee to an ounce.

CENTRAL HOTEL,
INFANTRY ROAD, BANGALORE.

(Under English Management.)

The most comfortable and convenient for visitors.
TERMS MODERATE.

Sulphate of iron I have not tried, but from what I have heard of it I should certainly do so if I had the chance, as I am certain that if we cannot manage to help our trees through these attacks that we now get there will be very little difference between this and Ceylon. Want of rain for a bit we can stand if the trees are in good heart, but not if they are wanting in foliage.

You, Mr. Editor, have at odd times pointed out to your readers the desirability of men giving their opinions. I have given mine for what it is worth, and do hope that others will follow suit and give theirs on this most vital of all subjects with us.

MUDIGIRI,
June 19th, 1897.

Yours faithfully,
EXPD. DT.

[Very much obliged, Mr. Expd. Dt., and we heartily wish other men will follow your example.—ED.]

OLD ESTATES IN MYSORE.

DEAR SIR,—I am still on the move, therefore did not see until now your correspondent *Enquirer's* letter in No. 10, p. 334 of P. O., consequently was unable to furnish earlier the information asked for about the big coffee trees mentioned by me in a letter which appeared in your paper of 3rd April last, p. 258. The period alluded to by me was fifty years ago, when the big trees were to be found in many of the original old coffee gardens in the following named localities:—"Palliar Mutt"—"Booden Nagar"—"Dundarabet"—"Bessigna Mutt"—"Mall"—"Jaggar Valley"—"Pundervulli"—"Jukenhully"—"Was-tara"—"Annoor"—"Joldal"—and some other old native gardens, the names of which I cannot just now remember. The original old native gardens consisted of 5 to 10 acres in extent and attached to the dwellings chiefly of the patel or head man of the village. The extensive two and three-hundred acre holdings now owned by native planters are of modern date, and came in with the advent of European planters to the province. In 1849 I was allowed by Patel Woorwollegay Davoy, Gonda of Joldal to take from his old garden six of these big coffee trees; I required them for Dr. Hunter, the Superintendent of the Madras School of Arts, who wanted to test coffee wood for the purpose of wood-engraving. I measured the stems of these trees before despatching them, and found them to be from 10 to 12 inches in diameter. Whether any of those stems have been preserved in the School of Arts or the Madras Museum, I am not aware. It is not unlikely that some stray old trees, or the stumps of some of those big trees may still be found in some of the localities indicated above.

I have heard of big coffee trees having been found in old native gardens in Ceylon with stems 12 inches in diameter. My impression at the time was—and still is—that those trees like that of Mysore were the first imported coffee plants into the island some hundred years ago, and were most probably found in some old abandoned temple land, as the priests of temples in Mysore as well of Ceylon grew the coffee plant for its fragrant blossom.

More recently, about 1871-72, I had occasion to clear out some old native planted coffee from the Mysore Coffee Co.'s "Kengregoy" Estate; the trees were about 80 years old, and the stems from 8 to 9 inches in diameter. The visiting Agent of the Company alluding to these trees in his report compared them to large apple trees. The stems at one time used to stand in the verandah of the Kelagoor Bungalow, but were afterwards consigned to the store room. What became of them ultimately I am unable to say.

When on the subject of large coffee trees, I may mention a very interesting circumstance of these coffee trees found growing in a wild state on the bank of a small pond in the "Kelagoor" forest when being cleared for planting; the trees were over 15 feet high and had stems of 8 inches in diameter, but it was not possible to say of what age they were. The trees were allowed to grow in their wild state and produced large crops, but in the

absence of the proprietor in England they were unfortunately cut down. There were some trees in 1871-72 on the "Kelagoor" estate, which were planted about 1851-52 with stems from 4 to 6 inches in diameter, which may be considered good growth for twenty years' old trees.

To return once more to the subject of Old Mysore Estates. The coffee was originally allowed to grow into *trees*, and not as at present reduced to 4 feet bushes; and I well remember seeing in 1845, and even some years later, ladders being used and boys being sent up the trees to pick the crop; there perhaps are at present very few, if any, European planters in Mysore who witnessed coffee berries being picked by the help of ladders! There was no cultivation whatever in those days; the weed from 3 to 4 feet high was simply beat down with sticks; the pioneer European planters used knives for slashing down the weeds before the crop was picked and the pickers trampled this down into a solid mass, and as the rains at that period were more regular and plentiful than at present, the mass of weed soon turned into fine vegetable mould and was the only manure the land ever got; nevertheless the crops were generally good and more regular than at present. I regret not having tested the average yield from these native grown trees, but in those days we did not trouble ourselves with statistics of the yield of coffee per acre. However, in 1846, when managing Monson's Annoor Estate, now known as Cannon's Mylemoney, the trees on which at that time were from 12 to 15 feet high and well loaded with crop, I was led more from curiosity than anything else to test the quantity of marketable coffee that a tree could yield. I selected a tree and marked it and had the berries picked separately (in those days the ripe and green fruit were picked together); the fruit of that tree was dried and pounded out separately, and the result was a little over 10 lbs. of clean coffee. The next year I had the crop of the marked tree again picked separately and treated in the same way as the previous year; the result however was only 4 lbs. of clean coffee. I much regret that I did not follow up this test on a more extended scale and for a longer time; for although the minimum yield of that tree gives an average of about 2 tons per acre, it is hardly a criterion to judge of the actual quantity of crop these large trees are capable of bearing. My belief however is, that if forced by manure and proper cultivation a coffee tree would be capable of yielding one year with another an average of 5 lbs. per tree, and it has often occurred to me that if practicable, the *tree* and not the mutilated *bush* would be the proper and most profitable mode of cultivating coffee.

At present the *bush* with high cultivation only produces an average crop of 5 cwts. to 10 cwts. per acre of 1,200 bushes, and the *tree* as shown above, without any cultivation, is capable of producing 4 lbs. per tree. What then may it not be brought to do with high cultivation? My impression is that an acre planted with only 800 trees receiving the same amount of care and cultivation as the *bush* would yield 5 lbs. of coffee per tree or a minimum average of $1\frac{3}{4}$ tons per acre. Compare this with the maximum yield of 10 cwts. or $\frac{1}{2}$ a ton per acre from 1,200 bushes. The cost of planting and cultivating 100 acres of coffee trees would not be more expensive than the ordinary cost for planting, but, according to the figures given above, 100 acres of trees would produce at the minimum average of $1\frac{3}{4}$ tons per acre, 175 tons of crop; to produce this quantity of crop from coffee bushes, would require the cultivation of 350 acres of land, which at the maximum average shown above of $\frac{1}{2}$ a ton per acre, would produce 175 tons. There would therefore be the saving in the cost for cultivating the extra 250 acres which would be by no means a small item in the annual expenditure of an estate. Then again there would be a great saving in the initial outlay of an estate in the purchase of land, and in the cost of planting a larger extent of land than necessary, for obtaining the same results produced by 100 acres.

The chief objection that may be raised to coffee tree cultivation would be the difficulty of crop picking and pruning, which however may be overcome in time in some way, if the cultivation was started by some enterprising planter if only on a small scale as an experiment. The trees in the old native gardens were never pruned, but a certain amount of wood was broken off during crop picking, and new wood and suckers would be the result, which in due course bore good crops. Another matter for consideration in favour of tree planting is the great saving of labour there would be in the cultivation of 100 acres of coffee trees, and in 350 acres of coffee bushes, both giving the same results at the end. This is a matter of very great importance in these days of labour difficulties.

Before closing this, I would like to dispose of some ungenerous remarks made by your correspondent *Chicory* in his letter which appeared in No. 33 of P. O. He there states that "the Cannons and the Greens who were officers in the Mysore Commission got their lands cheap, spent little on cultivation, so with a small outlay a small crop sufficed to give them a return which considerably augmented their joy."—All this is pure fiction! There was a Major Cannon and a Colonel Green in the Mysore Commission; the former retired from Mysore even before I came to the district, but the pioneer planters *Cannon and Green* did not belong to the Mysore Commission. If they got their lands cheap, it was simply because the land was of no value in those days. If they did not expend as much money in cultivating their estates, as is done in the present day—there were two reasons for it—first, the system of cultivation carried on in their time did not need much outlay—and second, the pay of coolies at that time was Rs.2 for a man and Rs.1-8 for a woman per month. The crop from their trees (not bushes) if not more was equal to the crops of the present day. If their coffee fetched good prices, it was because *Chicory* was unknown in those days, hence coffee in better demand. That was the time your correspondent should have come out coffee planting—cheap lands!—cheap labour!—cheap cultivation!—cheap living!—cheap everything!—and he would have made a big pot of money—as the pioneer planters Cannon and Green did, and that would be better than making unkind remarks which read like sour grapes.

FRED. D. MEPPEN.

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contains per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.68	"	Phosphoric Acid.

Orders should be booked early for the present crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE

COFFEE.

FIRE AND LEAF DISEASE.

THIS is not the recipe for a complete and infallible cure. It is only a suggestion, and not entirely novel; for we have already brought it forward in this paper, in treating on the subject of prunings and disease. Very little interest was then aroused on the subject, a great deal less than it deserved, however unworthily the matter was handled by us. But it is an idea we are going to boom, for all that, so be prepared for any number of recurring paragraphs. This preface is by way of making readers impatient to get at our meaning. Good sign, this impatience. This office

will now open. We start with two modest axioms. Firstly, that leaf disease causes a loss of crop every season of some hundreds of rupees on every acre. Secondly, that no cure has been yet discovered. We shall discuss the origin of the pest. It more than suffices that it is always with us. We also know that it has usually certain times for its greatest virulence, although these are by no means regular. That is to say, that the fungus, like all fungoids has periods of rest and periods of activity. We will momentarily dismiss the possibility of tackling it in its latter stage. But it should by no means be impossible to destroy it, at least in part, when it is in its comparatively unprotected state of rest. Catch it asleep, that's what we mean. But how to do it? Ah, that's where we come in. How does the following extract strike you? It is taken from a certain book on tea, by a Mr. Bamber, who has collected therein the opinions and results of experiments of a host of practical and thoughtful planters. "It was also found that burning the prunings immediately on being cut and better drainage, had the effect of keeping blight in check, causing it almost to disappear from an old clearing which previously suffered considerably from it." The writer was the manager of Sissubari Garden, Jalpaiguri, Dooars.

It is asked, is tea-blight the same as coffee leaf-disease and if not, what is the value of the extract? The answer to this is that the resting spores of leaf disease as well as the eggs or pupæ of blight must rest somewhere. They don't hang about in the air just above the trees to be caught in butterfly nets, though at certain stages they are undoubtedly carried great distances by the wind. The spores must rest either on the dead leaves, on the stem or the branches, or on the ground. We can't very well tackle the ground, and stem washes have been given up as of no use. So that if we destroy the fallen leaves and prunings we shall at least reduce the number of spores that could hatch out for the next attack. Wherefore, try the burning experiment.

No good of course doing this at once all over the estate for the result—good, bad or indifferent—would and could be put down to half a dozen other causes. Try first on a small isolated field, protected from infection from the rest of the estate as much as possible by intervening belts of forest. Have a gang of women and children following the pruners collecting in sacks and carrying away to be destroyed all prunings, while they are still green. This might also be done in handling time. A further step in the same direction would be to sweep up all fallen leaves every month or so, especially during and after a "go" of leaf. The best of all methods to destroy the leaves would be to burn them, but if this was found quite impracticable, large pits could be dug, and the contents could be thoroughly mixed, layer by layer, with liberal applications of quicklime.

The cost will not be great, if the clearing is at all small. A three-year's trial would soon prove or disprove its value. Of course we know that a hundred and one arguments can be advanced against this and any other experiments. We do not stake our reputation on its infallibility. We simply urge that it seems to stand a fair chance of success in a hitherto hopeless war against the most formidable of the foes to our coffee. The motto of the Royal Agricultural Society is "Practice with science." The particular motto for this and similar articles is that no knowledge (science) can be obtained without experiment (practice).

af disease in Nyassa-
land.

A correspondent writes us from Natal in reference to some recent remarks *re* leaf-disease not being known in Nyassaland: "I think you are quite wrong about leaf disease not being extant in British Central Africa. I am most sure I saw leaf disease there; if not 'leaf,' it was remarkably like it. I feel almost certain that leaf disease does exist there and is not dependent on the introduction of foreign or already diseased plants." The writer was planting some years in South India, and knows what he is talking about.

ogus Coffee.

"The enclosed cutting," says 'Cup-of-Coffee,' "from the *Madras Mail* some four or five years ago, may be of interest to some of your readers." Very certain it is that these illegal operations have in no way ceased in the Continent and England, though it is possible that the extremely low prices ruling at present for Santos may sensibly check their profitable accomplishment.

The arrest of two men at Lille for manufacturing coffee has led to an investigation of their methods. Their plant, estimated to be worth 1,000 f., and a large stock, were seized. The following is briefly the method of manufacturing this coffee. The raw materials are composed of chicory flour, and sulphate of iron in powder, the latter giving the necessary colour. The paste made with the mixture of these materials is enclosed in a cylinder and then pressed with an hydraulic motor. Through five different openings it comes out in pieces measuring 30 to 35 centimetres in length by 4 millimetres in thickness and 3 centimetres in width. These are again powdered with flour and immediately placed between two metallic punching plate before cutting each piece in such a way as to give it an almost perfect resemblance to natural coffee. The two men employed in their manufactory, eleven men and seven women, the latter having to separate the berries which were not properly moulded from the others. These producers have arrived at such perfection in France that some deputies have just laid a measure on the table of the French Chamber respecting the article which runs as follows:—"It is forbidden to expose, to place on sale, to import or export any manufactured product which, by its shape, colour, general aspect, is capable of being confounded or bought as coffee in green or terrified berries." The other articles set forth the penalties:—50 francs to 3,000 francs, five and three months' to a year's imprisonment; penalties to be doubled if the product is recognised as baneful to health, or if it has been fraudulently mixed with natural coffee, &c.

The Market.

There has been a very quiet tone this week, says the *P. M. Review* of the 29th May, the auctions have contained only about 11,000 bags, instead of from 50,000 to 60,000 bags, as was mostly the case until about a fortnight ago. The bulk too of that offered has been of common quality, for which there is little demand, and no inducement to dealers to add to their stocks. Consequently rates for the lower sorts have further given way, but on the other hand, anything at all approaching fine quality has sold well at rather dearer rates. The range of values between common and fine quality continues to widen, and as there has been such a small quantity of the latter there is every probability of a still wider range. It is very remarkable that all the countries from which fine coffee is received have this year shown, from some cause or another, a falling off. The crop of Vera Paz certainly does not show much reduction, but the quality is this year so bad, owing it is said to excessive rain at the time of harvesting, that it is quite useless for home consumption.

Abyssinian Coffee.

We learn from a London produce paper that Abyssinian Coffee has come in for a rather larger share of attention from buyers, and sales are said to have been concluded for ordinary quality at 60s. to 65s. per hundredweight. This information should carry a great deal of interest to planters, who have, we understand, become greatly disheartened of late in consequence of the bad accounts they have received of the rates being paid for their supplies in the London and other markets. The present stocks of 7,200 bags are smaller than existed a year ago, and we should say in no way excessive in view of likely demands. Good and fine qualities are particularly scarce at the time of writing, while the lower grades are freely offered, and in a few instances holders have been compelled to take lower prices in order to make progress.

It has been argued that the recent low prices of coffee may eventually prove a benefit rather than a misfortune, inasmuch as the greater cheapness of coffee by bringing it within the purchasing power of even the poorest classes will tend to make it an article of general consumption, by which the demand will be extensively and permanently increased. The Rio coffee baggers (*ensacadores*) although observing great prudence in their transactions were unable to avoid considerable losses in December, when, after a temporary tendency to improve, the prices on consuming markets again suffered a relapse. There has been a full demand for coffee, and the quality of the crop has been uniformly good both in Rio and S. Paulo. By the reports received it appears that the outlook for 1897 is more encouraging, although the opening up of numerous new plantations indicates a prospect of increased supplies in the near future, and the situation from the planter's point of view is not altogether bright. The stocks on exporting markets are large, but the approaching crop is expected to be much smaller than that of 1896-97, while consuming markets are provided with but average supplies. The crop for 1897-98, beginning in July next, is estimated at for Rio, 3,000,000 bags; Santos, 4,000,000; total 7,000,000.

LEGUMINOUS SHADE: A CRITICISM.

MR. B. NELSON's contributions on "Coffee cultivation without manure" form some of the most valuable literature extant on the subject of manuring coffee estates. But there is something which some planters find it difficult to acquiesce in, and that is Mr. Nelson's saying that by merely burying the twigs and leaves of *Erythrina lithosperma* in the ground, the coffee is supplied with nitrates ready made.

We fail to see how this can be. The bacteria in the nodules on the roots of the leguminous tree supply the host tree with nitrogen. This is built up in the tissues of the tree, and when the leaves and twigs of the tree are buried in the ground, all it does is to increase the store of humus in the soil. It is undoubtedly superior to ordinary humus owing to its being so rich in nitrogen; but it is not on that account any more available than is ordinary humus. What I am driving at is this: that it is just as necessary for what we may call the leguminous humus to undergo the process of nitrification before the nitrogen contained in it can be transformed into nitrates and thus be made available to the coffee as it is necessary for any other humus to do. Even cattle manure has got to undergo the process, as witness what Dr. Fream says:—"A good illustration of the difference between soluble and insoluble plant food is afforded by nitrogen. Organic nitrogen, as it exists in farmyard manure, is insoluble in water, and therefore the plant cannot make use of it. The same nitrogen, after the process of nitrification, takes the form of a nitrate—nitrate of lime usually—which is soluble, and, dissolved in water, can be taken up by the plant."

I suppose it will not be denied that the nitrogen in the humus resulting from the decay of the buried twigs and leaves of E. L. is "Organic Nitrogen," and, after the above quotation, it must be admitted that it is necessary for it to undergo the process of nitrification before it can be availed of by the coffee.

So it turns out then that the nitrifying bacteria are something that we cannot afford to despise, and something that we must concern ourselves very intimately with. Mr. Nelson, I think, said in one of his articles that this was a *poochee* that we need not concern ourselves about, but I think he meant by that they were bound to be so plentiful in the soil, and increased so rapidly under favourable conditions, that there was no need for us to trouble ourselves particularly about them. A very good plan of 'inoculating' a poor ridge with these bacteria is to top-dress it with jungle top-soil after a digging: and one way to promote their activity is to keep the soil constantly stirred.

In Mr. Nelson's plan of manuring his trees, the well-known danger of too much humus is bound to arise, and there is, therefore, one manurial substance which cannot be dispensed with, this is lime. It may be contained in large quantity in the branches and leaves of E. L. and in the humus resulting from the decay of these, but you see it is here in a combination in which it certainly cannot be available to promote the decomposition of the humus of which it forms a part; and it cannot be even available as plant food till the combination between the ingredients forming the humus is thoroughly broken up. Lime is wanted to promote the decomposition of the humus, more especially as the laterite coffee soils of S. India are deficient in this valuable ingredient.

A correspondent once asked whether lime should be applied slaked or unslaked. I think there is no necessity for applying it unslaked. Quicklime only loses its efficacy when it combines with the carbonic acid of the atmosphere. It absorbs carbonic acid if left exposed after being slaked. Slaked lime goes further than unslaked, but should be applied immediately and lightly forked in to prevent the air having play upon it. Its efficacy consists in its absorbing

carbonic acid resulting from the decay of the humus in the soil. There may be this danger in applying unslaked lime, and that is that the burning resulting from its being moistened by the dew or rain may be the death of the nitrifying bacteria, as a temperature of 140° F. stops their activity.

SCIENCE AND COFFEE.

BY THE LATE MR. WILLIAM PRINGLE, M.S.C.I.,
(SOMETIME AGRICULTURAL CHEMIST IN COORG, SOUTH INDIA,
TO MESSRS. MATHESON AND CO.)
(Reprinted from the "Madras Mail.")

V.

DRAINAGE.

SINCE a Committee of the House sat in 1845 to consider the question of improvements in Agriculture, drainage has ranked first in the opinion of practical agriculturists as a means of permanently improving the land. The evidence available shows that there is always an improvement in the yield of the land where it is thoroughly drained. The ratio of improvement is usually not less than 20 per cent. on soils where the natural drainage is fairly good, and in the case of moors and swamps the land is improved from a state in which it would not grow food stuff of any particular value to a condition of first-class fertility, as may be seen in parts of Yorkshire, Lincolnshire, Cambridgeshire, Holland, &c. The importance of the physical condition of the soil is quite as great as its chemical composition, and exerts as great an influence on the growth of the plant. Plants appear to have a selective power as regards soils, and refuse to grow on those that are unsuitable either from a physical or a chemical point of view. Tea will thrive luxuriantly on stiff clayey soils that are quite unsuited to coffee. The latter is very sensitive and shows unmistakably its preference for light, sandy well-drained lands. Looking at the subject carefully, it is apparent that coffee requires a soil which offers but little obstruction to the passage of its roots,—one through which air as well water can readily find its way.

It is necessary to consider some of the characteristics of the various soil substances before entering on the consideration of the effect of drainage on the soil. Firstly, sand. This is present in almost all cultivated lands to a greater or less degree; coarse, dry sand is almost incapable of taking up moisture from the air; fine sand will sometimes absorb 1 to 2 per cent. Soils in which sand predominates in large coarse grains are poor and hungry; they do not retain sufficient moisture for the growth of the plant. Quartz soils are often of this nature. Dry clay readily absorbs moisture and holds it very tenaciously. When dry it will absorb from the air about 5 per cent. of moisture in twenty-four hours. It possesses the power of deodorising and cleansing water filtered through it. According to Professor Way, the matters are oxidised, if the filter is sufficient in depth: the nitrogen of the organic matters is converted into nitric acid, the carbon to carbonic acid, and the hydrogen to water; the finer the particles the greater the action. Clay, moreover, is very plastic and mobile; it is when wet a dense non-porous substance impervious alike to water and air; if dried, it shrinks and cracks, and the more rapidly the drying takes place the greater the number of fissures. Fertile soils always contain more or less clay; when mixed with a certain amount of sand and presenting certain physical characteristics, they are known as loams. In a clayey loam, that is where clay predominates, tea does well; in a sandy loam, coffee. The generality of soils in Southern India and Ceylon that have not suffered from

surface wash are sandy loams of varying degrees of fertility, depending to a considerable extent on the fineness of the particles of which they are composed. Some of these soils are very impervious to air and water when once saturated. If the soil become full of water, like a sponge resting on a plate, that is to say, if it rests on an impervious strata, the water does not pass through, taking air with it, but having saturated the soil flows off the surface, carrying with it the fine alluvium and soluble salts. For the time being the chemical actions cannot proceed within the soil, and as the supply of available oxygen is soon consumed the water stagnates, becomes sour, and unfitted for plant-food. Drains are therefore necessary to prevent the soil becoming saturated with water. When dug sufficiently deep they not only act as discharges of surplus water, but as aerators of the land. As the water flows through the land it carries air down with it, and as the air is continually renewed the changes within the soil proceed in a healthy manner. By drawing the rain through the soil they prevent surface wash and loss of valuable soil and manure. As the soil is aerated to a greater depth by thorough drainage than by any other system of cultivation, the roots of the plant are able to find conditions favourable to their growth further from the surface. This means that the available supply of plant-food is increased, as the roots have an increased area of growth. They are also less liable to suffer from the heat of the sun during a severe drought, as there is an increased layer of soil to protect them, and as the moisture is evaporated from the surface the supply brought up from below by capillary attraction is intercepted by a greater mass of roots of extended depth, and the plant derives greater benefit from it than on undrained lands, where the roots form a thin superficial layer. It is for the above reason that in England in seasons of severe drought the grass has so often been seen to be fresh and green over the drains, while it was burnt up and withered between them. Where wash has not removed the surface soil, the general characteristic in Coorg, the Wynaad, and parts of Ceylon, is first a thin layer of vegetable mould, resting on sandy loam, under which is clay, then ferruginous ground, clay, laterite and country rock, chiefly gneiss. Sometimes one or more of these beds are wanting, and they vary in thickness from a few inches to many feet. It is at the junction of the soil and gravel that a pan most often forms. The gravel gets cemented together and obstructs the passage of the rain through the soil. In such cases it does not require a great excess of rain over and above that which is carried off by surface drainage and evaporation to saturate the soil. On moor land these pans are often formed, and bogs, morasses, or swamps result. It appears at first sight strange to find on a hill side a bog, but such are common on the hills of Scotland, Ireland, England, Wales, and are not unknown in Ceylon and South India. Such lands are reclaimed and brought into cultivation chiefly by deep drainage, which, by lowering the water level, allows the air to follow the rain through the soil and gravel to the clay. Sometimes, where the gravel is absent, the pan is formed by a calcareous ferruginous layer below the soil resting on the clay. Needless to say these pans not only prevent the rain from penetrating the land, but also obstruct the rise of water from below. Thus in drought the only available supply of moisture for the plant is that above the pan; when this is exhausted, the plants are soon scorched by the sun, and drop their leaves. It is not *Hemeleia vastatrix*, it is want of moisture. These pans break up and become permeable when the iron salts which bind the particles together are fully oxidised. An excess of iron existing as lower oxides is prejudicial to plant life, but when these are saturated with oxygen they accelerate the decomposition of organic matter, and are most beneficial to the plants. Recent experiments on the absorption of nitrogen from the air show how necessary it is to have it brought into intimate contact with the feeder roots. Nitrifying organisms, according to the

balance of evidence at present available, assist the plants in absorbing or taking up nitrogen from the air by roots. If the air is excluded by water which is surcharged with organic compounds and soluble salts, a healthy action cannot proceed. Further, the sap is diluted, and the evaporation of excessive quantities of moisture from the leaves of the plant lowers the temperature and vitality of the plant, rendering it more susceptible to disease.

Where the plants are water-logged during the monsoon they make no growth. On land that is easily saturated continuous rain does less harm than heavy showers daily followed by hot sun. In the latter case the sap is as rapidly evaporated as it is formed, resulting in a greatly depressed vitality of the plant. The plant has to live in a hot, moist atmosphere. The evaporation from its leaves and from the soil are most favourable to the development of fungoid growths, such as *Hemeleia vastatrix* and black rot on coffee, smut and mildew on wheat, &c. Johnson and Cameron thus express their opinion:—

“Where too much water is present in the soil, that portion of the food of the plant which the soil supplies is so much diluted that either a much greater quantity of fluid must be taken in by the roots, much more work done by them that is, or the plant is scantily nourished. The presence of so much water in the stems and leaves keeps down their temperature also. When sunshine appears, an increased evaporation takes place from their surfaces; a lower natural heat, in consequence, prevails in the plant, and the chemical changes on which its growth depends proceed less rapidly.” Soil condenses many times its volume of gas within its pores, but the amount is dependent on its nature and the percentage of moisture present. Calculated on Blumtrilt and Renhardt’s figures the amount is as follows:—

1 cubic foot of	Yields ozs. measures of gas.
Garden soil moist	2,000
” ” air dried	5,400
Clay moist	3,500
” ”	4,000
River silt moist	2,900
” air dried	4,800

If the soil is not merely moist but surcharged with water, the amount of gas held in the pores will be very small, and if the supply is not renewed the water becomes charged with effete organic matter and saline compounds. If the water is removed by evaporation, these may be left as a saline efflorescence on the surface: a want of recognition of this fact has often led to failure when land has been irrigated. Water holding large quantities of saline matter in solution was poured into the land, the natural subsoil drainage being defective, the water was evaporated, leaving the saline matters in the land. Such land soon became so charged with salts that the generality of plants would not grow in it; such extreme cases rarely happen on coffee or tea estates, as they are generally so situated that the salts brought to the surface by evaporation are carried off by surface wash, and though the land is rapidly impoverished, the plants are not killed off by excess of saline salts. These are formed in the soil by the natural decomposition of the rock particles, which are dissolved by the water and carbonic acid, then raised to the surface by capillary attraction, the sun evaporates the water and leaves them on the surface or close to it.

Drainage forces rain and air to pass into and through the soil. The oxygen contained therein brings the organic matters to a state fit for plant food. It oxidises the iron compounds, breaks up the hard pans formed by the ferrous salts, and converts these lower oxides to the ferric state, in which form they are exceedingly valuable. It carries the soluble salts down from the surface, but these are not lost, as the soil forms an efficient filter, and if the drains are sufficiently deep, very little phosphoric acid, ammonia, or potash is lost. When the drains are sufficiently deep and not too close together, so that the land is well drained and not over-drained, sufficient water is

held in the land to supply the requirements of the plants. The action of drainage is to make the land more porous and so increase its power of capillary attraction, enabling it to bring up water from a greater depth; to force the rain through the land, so preventing loss of the fine alluvium and soluble salts by surface wash. As water is evaporated from drained lands, more moisture is brought up from below, and the land being in a fine physical condition the supply is equalised and not so easily exhausted. The soluble salts brought up are carried down by the first rain, or even by a heavy dew, thus circulating in the soil about the roots of the plant. These are not likely to accumulate in injurious quantities, as any excess over and above that which the soil can hold and the plants take up is removed by the subsoil drainage. The rain contains nitrogen as ammonia, as nitrates and nitrites, carbonic acid and dissolved oxygen; it also carries air with it, which supplies the nitrogen to the nitrifying organisms. By fully aerating the land, the available plant food is kept in a more equitable condition of supply than where the excess of salts brought to the surface by evaporation are carried off by surface wash and the water held by the soil has to be evaporated before air can enter. These are some of the more important reasons for deep drainage. In my next article I will take up the discussion of the best methods of drainage.

BANGALORE, }
14th October. }

WILLIAM PRINGLE.

TEA.

Indian Tea Association. We have received the Annual Report of the General Committee for the year ending 28th February 1897. The pamphlet contains as usual a great amount of interesting matter, which we shall review at length next week. In the Monthly Return of Sailings of Indians and Ceylons, dated 14th June 1897, we notice that the season's shipments are up to date considerably ahead of those last year.

Low prices.

The Indian average for the week ending the 28th May was $5\frac{3}{4}d.$. We think this is about the lowest average it has ever touched, despite the fact that prices for tea are invariably low at this time of year. Yet the Ceylon average stood at $7\frac{1}{2}d.$. Java and Natal, on which we always look down, were $5\frac{3}{4}$ and $5\frac{1}{2}d.$, respectively, while Singapore, a new arrival, touched $7\frac{1}{2}d.$. Extremely lugubrious reading this, were it not for the fact that bottom price was entirely owing to two wretched Cachar gardens that swamped the Indian average with more tea than all the rest of the districts put together. The price realised by these unhappy totes was $4\frac{3}{4}d.$! Think of that, ye boomers in tea, and rejoice! Assam had the very respectable average of $9\frac{1}{2}d.$, Darjeeling the same, the Nilgiris got $7d.$, South Wynaad $7\frac{3}{4}d.$, and Travancore $6\frac{1}{4}d.$

London Market.

INDIAN TEAS.—There has been a further diminution in the quantity brought forward, says the *Produce Markets Review* of the 29th ult., which included a considerably larger proportion of the inferior descriptions. For these, as has been the case for some time past, the demand is inactive, the lower quotations failing to stimulate trade; holders are therefore unable to reduce their stocks of this class of tea to any appreciable extent. The medium grades, on the other hand, are readily taken at fully former rates. The prospects

of an adequate supply of these teas for the next few weeks is not encouraging, judging from the comparatively limited quantities offering, and it is quite possible that an improving tendency in prices will prevail until a good assortment of the new crop is available. An extremely limited selection of the fine and finest sorts is offering, more so than usual at this period, and as there does not appear to be any chance of an increase in the quantity for some little time, the stocks held by the trade should prove remunerative. There were 10,000 packages catalogued for public sale, and about 8,000 were sold. The above included 106 packages of New Season's, mainly from the Assam district, and being of very fair quality for early arrivals they were easily disposed of at satisfactory prices. There was also a small invoice of Singapore Tea, the leaf being, on the whole, well made, but the infusion falling short of both Indian and Ceylon. The rest of the sale principally consisted of Calcutta-bought and reprinted Teas, for which there was a poor demand, and a large quantity was withdrawn.

CEYLON TEAS.—The quantity offered has again been large, although somewhat smaller than last week, but, as the demand continues good, prices remain strong. The inquiry for the lower grades is active, especially for Leaf kinds, and, although no change in values has taken place, the market is very firm. Medium and finer descriptions have been well competed for at late rates, and as the finest kinds are still scarce, high prices were paid for the few lots offered. At the public sales 23,000 packages were brought forward, of which about 1,300 were withdrawn. Shipments to the United Kingdom to the 4th instant consisted of 36,902,296 lbs., as compared with 34,513,332 lbs. to the same date last year.

THE LATEST TEA DRIER.

AN UNPRECEDENTED SUCCESS.

OF the many new patents in Tea Machinery which have been offered to the Tea Planting community during the past year, Davidson's Patent Automatic Tea Drier stands first in the ranks, and after a full season's working in Sylhet has been pronounced by numerous experts to surpass, both in quality and quantity, the work done by any other Automatic Drier in existence.

For the information of our readers we shall give a full description of this novel apparatus and the work that it has done during its trial in Baraoora Tea Factory, Sylhet, during past season.

That Davidson's New Automatic Drier can work with absolute safety at a temperature of $300^{\circ}F.$ will come as a surprise to many, and that it has been found impossible to burn the tea with the apparatus, even though negligent coolies be in charge, may seem an over-estimated eulogistic statement, but it is nevertheless true.

An advertisement of this Machine appears on the back page of this issue, in which an electro engraving of the Drier is to be seen.

The Drying "Box" or "Chamber" of the Machine contains a series of travelling webs; the leaf is fed into the Drier from the top and delivered at the bottom, but one of its peculiarities is that the rolled leaf on entering the Machine is subjected immediately to a powerful "downdraft" of air at a very high temperature, which instantaneously checks the "fermentation," and as the

leaf is in a moist state it is found that even at a temperature of 300°F. the leaf is not in any way scorched or burned, but on the other hand it is the means of developing a beautiful aroma in combination with a briskness that would otherwise be unobtainable.

The travelling webs carry the leaf through this highly heated air and empty it into an atmosphere of reduced temperature and so on as web after web is reached the temperature is found to be lower till it is exhausted at a final temperature of 120°F. to 160°F. according to the regulation of the Machine. The finished tea has a delicious aroma and feels quite cool to the hand.

The hot air is supplied by a powerful compound Multi-tubular Sirocco Stove of an entirely new design which considerably reduces the consumption of fuel as compared to other Machines. The downdraft of air through the tea is produced by means of a large centrifugal fan, to which pipe connections may be attached in order to discharge the moist warm air from the Drier out of the building; this not only enables the Factory atmosphere to be kept at a comfortable degree of heat, but also prevents the Factory air from being charged with moisture, which is highly injurious to any finished tea that there may be in the building. The Machine in Baraoora Factory made no less than 700,000 lbs. of tea last season by itself, and Mr. Bull, the Superintendent, has stated that he can always depend on its drying 50 maunds (4,000 lbs.) of tea per day without in any way interfering with the coolies in charge.

The prices realised by the sale of Baraoora teas last season showed an improvement of $\frac{3}{4}$ d. per lb., and as all the Brokers' reports describe them as *brisker* in liquors, the enhanced price has been entirely attributed to the New Drier.

We have to congratulate Messrs. Davidson & Co. on the success of their latest invention, and we wish them every success with it in the South Indian Tea Districts.

DIGESTED TEA NOTES.

CULTIVATION.

To start with, it is patent that different kinds of soil require different treatment. Yet patent as it is, most planters seem perfectly oblivious of the fact. Further, that it is as easy to *over-cultivate* certain soils as to *under-cultivate* others. With light soils, try and render them more compact and absorbent; while with heavy soils try to make them more open and less absorbent.

Sandy Soils.

Don't require so much forking or digging as heavy soils, being more porous. Being poor in organic matter, allow the weeds to grow a bit and then hoe it in. Some people have very fanciful notions about weeds, especially in clean-weeded Ceylon. Yet four or five weedings, if the stuff is thoroughly well covered in, is ample in the most forcing climate, while on very poor soil and in cold climates two thorough weedings would be enough. But it should be *thorough*. Weeds, by nature of their stronger digestion (root-action), can assimilate food tea cannot tackle. When

the weeds decay, they give up this food ready digested for use. It would be extremely useful to change the prevalent weeds into leguminous ones, a process that could certainly be accomplished in time, for obvious reasons not necessary to dwell on. But the jungle, *i.e.*, weeds, must be buried *green* and moist. Otherwise if sun-dried and hardened it will further lighten the soil, instead of rendering it heavier.

At the end of the season, and after the pruning, work the soil deeply and leave as rough as possible for the cold weather. Unless the prunings are very light, do not bury them in a light soil, as large coarse prunings decay very slowly and render the soil more porous than ever.

Clayey soils.

Just work the other way about. First attend to the draining, which should be thorough. Good deep cultivation is wanted, but must never be done when the soil is wet, as this makes them cake and clod more than ever. It is good to bury coarse prunings, as this opens up the soil. If the weeds are allowed to dry before burying, so much the better. A thorough forking or hoeing after pruning is even more important than in sandy soils, as the clods left untouched by the coolies' feet will help to sweeten the soil all through the cold weather. In Upper India forks are comparatively unknown, all the work being done by large hoes or mamoties. Careless forking, *i.e.* bending, exposing and twisting the roots, does a great deal of damage. The proper way is to begin forking close to the stem, and digging outwards.

On hilly gardens weeding should always be done by hand in the rains and never by hoeing or scraping. This of course is to save wash. A good reason why the last hoeing or forking should be as soon after the prune as possible is to allow the broken and damaged roots ample time to recover before the first flushes are on.

Drainage.

It is of first importance in a flat country to select for tea cultivation only those blocks which can be cheaply and easily drained of their surplus water. Some large gardens in Assam are on such a dead level that the greatest fall they can command is 4 feet. Tea will never flourish on badly-drained soil. Well-drained land is far warmer than badly-drained soil, as the heat employed in the latter case to evaporate the surplus moisture all goes to warm the land in the former instance. Well-drained land is also far more friable, better aerated and without doubt far more fertile. It is sometimes thought that drainage renders plants more liable to drought. This is wrong. The soil being more porous, the subsoil water can rise more easily than ever.

In undrained land the surface soil in dry weather contracts into hard masses, and the deep subsoil water has no power to rise to the surface. Stagnant water makes the soil sour, prevents formation of nitrates and produces poisonous compounds which in time kill out the plants growing in it.

But bear this in mind. Easily friable open soils with a free subsoil can be greatly harmed by draining.

As a general rule, the deeper the drains the better. Steep slopes should be always drained, through not so much for drainage proper as to stop wash.

Method of draining.

No lateral drains should enter the main drain either at right angles to it, or exactly opposite each other, as they quickly get silted up and useless. There is no object in having lateral drains wider than 9", as the unoccupied space is wasted. The width apart

HYDROCELE & ASTHMA. Instant relief! Permanent cure guaranteed or the Price (Rs. 5) refunded. Don't despair even if in the last stages. Apply to—MANAGER, V. C. WORKS, Ranaghat, Bengal.

depends altogether on the class of soil (heavy=close; sandy=further apart) and the slope.

Clearing.

This is far too carelessly done as a rule. In Assam one deep-hoeing, and, after staking, cleaning the spots round the stakes, are all that is done. The whole clearing should be cleaned and the soil pulverised. Otherwise cockchafer grubs cannot be discovered and killed as they should be. Instances are known where young clearings planted at stake have been completely destroyed in this way. In Assam planting at stake is very precarious owing to droughts. Some good can be done by thatching the seed, but unless regularly "ferned" it harbours insects and grubs of all kinds. Two or three seeds are usually sown at each stake (but Mr. Bamber does not state whether they are germinated first or not), and if all dangers are warded off, the operation is very cheap, saving both money and time.

In China the seed is gathered in October, kept mixed with sand and earth during winter, thus keeping them fresh until the spring.

Nurseries.

The site and soil of the nursery is extremely important, as stunted plants never develop afterwards properly; essentials are: a good soil, subsoil porous, protected sufficiently from sun and strong wind, lowlying position and proximity to water. The soil should not be of better soil than the rest of the garden, as the plants would be unduly checked in planting out. But it must be perfectly clean from all weeds and grubs and thoroughly drained, also sufficiently stiff for soil to hold round roots when transplanting. If too much pulverised, the surface will cake when watered, hindering growth unless continually stirred. Before sowing, germinate seed before rain, not when *wet*, but when slightly moist. Shade in drought, but remove shade when plants are up, as this would weaken them.

The distance apart varies a great deal, depending on the jat and the time the seedlings remain in the bed. In Cachar and Sylhet 4" x 4" is usual for ordinary purposes, and 6" x 6" for vacancies. In Assam they are put out 8" x 9" and 10" x 10" respectively. Never over-crowd them. Far better spend extra money in increasing your nurseries, than save at the expense of your plants.

Be very careful that in making the beds, the sub-soil from the drains is not thrown over the surface, as this will check the growth for some weeks. In transplanting, always reject the weakly and stunted plants for all purposes. Transplanting is best done in cloudy weather, to check evaporation. Actually *wet* weather is bad, as the soil sets in hard lumps round the young plant. Keep as much ball on as possible, to prevent injury to the tender rootlets. If main root is injured or twisted, cut off above damaged part with a very sharp knife. If earth won't adhere properly, extra care must be taken in transplanting so that all the roots are placed in a proper position.

Tipping or even cutting down the plant to near its root is sometimes attempted before or after transplanting. Cutting should be done some time before or some time after, in order not to check growth unduly. Tipping is usually done when the plant is 2½' to 3'. Seedlings that have sent out lateral branches in nursery should never be cut low down, but long whippy plants without laterals should be cut low, to force side shoots and develop into a bush. The usual age of the seedling when transplanted is 12 to 18 months, but when of good growth and going into rich soil on the plantation, somewhat younger. For steep or shallow soils a good root growth is essential, to avoid harm from drought.

Old nurseries having all their top soil removed by the young

plants should, when the garden is planted up, be manured heavily with swamp soil or other dressings; so that they can be planted up and not form an eyesore on the estate.

The distances in planting out vary greatly. The better the soil and better the jat, the wider apart they can be planted. The usual distance is 4' to 4' 6", going in some cases to 5' or 6'.

Where the rainfall is very heavy, planting is usually done closer, the plants being smaller than where the rainfall is less. This is explained by the fact that the greater the fall of rain, the greater area of leaf is required to remove the excess of rain by evaporation. Consequently the leaves are set close together on the stems, diminishing the length of the shoots and also the size of the bush itself.

Vacancies.

This is an extremely difficult matter to tackle, *unless* dealt with systematically from the first. Old plants rarely die out. Vacancies are chiefly caused by planting out weakly seedlings; also by undrained soil, decaying roots of certain forest trees, white-ants, careless cultivation, and cattle. On many gardens 10 per cent. of vacancies is not uncommon, while it frequently amounts to 15 or 20 per cent. This means that from 1 to 2 acres in every ten are unplanted, but are cultivated at just the same cost as the rest. Ten to twenty rupees wasted out of every hundred spent on cultivation is no light matter.

So that the question of supplying these vacancies is extremely important. When a plant dies, remove immediately from the soil and ascertain cause of death. Dig a large hole *in situ*, and let it remain unopened for some time; mix with quicklime if any fungoid growth is found. Place two or three baskets of cattle manure or rich well aerated swamp-soil at bottom of it. Then after some little time, put in a well-grown and well-rooted two year old plant of similar jat to surrounding bushes. Plant extremely carefully, press limed soil firmly round its roots, and insert a large pole to mark the spot. Specially trained men should inspect the transplants until firmly rooted. Hand weed for a foot round the stem: don't dig or fork near. For some years the plucking and pruning should be very careful. Colonel Money recommends sowing in specially made pots or bamboo baskets, and planting as they are, breaking the pots *in situ* to allow free passage of roots.

Seed Bearers.

Tea seed should be sown as soon after planting as possible. It should also be of the soundest and best quality obtainable; poor seed always makes poor plants. Seed bearers should be in a secluded spot as far as possible from any plants of inferior jat, as otherwise cross-fertilization will invariably take place. Curiously enough the purest indigenous are not the best as seed-bearers, but "indigenous once removed" produce excellent seed and plants.

The soil for the seed-garden need not be so rich as for flushing. But mineral food of all kinds is required, especially lime or magnesia, also chloride of sodium or common salt; these all produce fruitfulness. Nitrogen is not needed in great quantities, as this promotes flush rather than seed.

Little or no pruning is required, but allow the bushes to grow up into trees with long straggling laterals, towards the extremities of which are produced the largest number of seeds. The only pruning required is to remove excessive wood and decayed matter from the interior, to allow a free current of air. They should be widely placed to prevent "drawing," and to allow plenty of space for deep cultivation, which latter is very important. In old gardens where the yield is falling off manuring will be found of use.

DISTRICT ASSOCIATION.

KANAN DEVAN.

Annual General Meeting held at Devikulam Bungalow on Saturday, 29th May 1897.—*Present*:—Baron J. von Rosenberg (*President*); Messrs. W. Milne, R. Hedger, E. Harley, W. O. Milne, A. H. Mead, H. S. Buist, A. F. Martin, J. Hamilton Hunter, R. F. Russell, F. Armstrong, H. M. Knight, T. W. Schmid, W. D. Martin, F. J. C. Martin.

Read notice convening the meeting.

Read and confirmed minutes of last meeting.

Election of office bearers for the year. Proposed by Mr. A. F. Martin, and seconded by Mr. Schmid, that Mr. Milne take the chair. Mr. Knight then proposed that Mr. Sharp and Baron J. von Rosenberg be re-elected as Hony. Secretary and President, without ballot, as a complimentary recognition of their efforts on behalf of the Association. This was seconded by Mr. Milne and carried with acclamation. Baron J. von Rosenberg having made a suitable reply for himself and Mr. Sharp, who was unavoidably absent, Messrs. W. Milne, W. D. Martin, and F. Armstrong were elected by ballot to the Committee with power to add to their number.

Roads and Communications.—Read letter from Mr. G. D. Gordon re work on Ghât Road. Mr. Knight having offered to undertake all work on the road from the Mettu to the Panniar river, Mr. Milne proposed that Mr. Knight's public-spirited offer be accepted with thanks, and that the road maintenance of Section Devikulam to Chinnakanal be entrusted to the Devikulam and Periakanal Estates, and that Mr. G. D. Gordon be asked to undertake the revetting and blasting. This proposal was seconded by Mr. Schmid and carried *nem. con.*

Resolutions of last meeting not yet given effect to. Proposed by Mr. Milne, and seconded by Mr. Russell, that the question of the insanitary condition of Bodinaikanur and of the printing of duplicate discharge certificate be now taken in hand by the President and Honorary Secretary respectively. Carried.

Account and Balance Sheet for the Year.—Proposed by Mr. Knight, and seconded by Mr. Armstrong, that a special committee be appointed consisting of Messrs. Milne, W. D. Martin, and the mover, to enquire into and report upon the accounts, and to deal with the question of low-country establishment and Mettu Rest House charges. Carried.

Communications from the U. P. A. S. I.

Read circular from the Secretary re registration. Proposed by Mr. Milne, and seconded by Mr. Knight, that the K. D. P. A. delegate to the next U. P. A. S. I. meeting be instructed to vote for registration. Carried.

Read Circular re Famine Fund.

It was unanimously resolved that this Association disapproves as such of giving any pecuniary assistance to the Famine Fund, owing to, and as a protest against, the refusal of official assistance by the Madras Government to members of this Association when sending their officers to a famine-stricken district and importing several hundred coolies at an irrecoverable expenditure of Rs. 8 per head.

Read letter re Presentation of an Address and Casket to the Queen-Empress.

Resolved that this Association approves of the principle of voluntary contributions from individual members of Associations, and is opposed to the cost being taken from the Reserve Fund

Membership.—With reference to a resolution passed at last meeting re membership, it was proposed by Mr. Knight, and seconded by Mr. A. F. Martin, that the wording be changed from "allowed a vote" to "allowed membership, the number of votes held being limited, etc."—Carried.

Transit Service between Amanaiakanur and Bodinaikanur.—Resolved that the President be asked to put himself into communication with the transit companies with a view to accelerating the service. The meeting closed with a vote of thanks to the chair.

A. H. SHARP,

Honorary Secretary.

THE OPINION AND THE FACTS.

FIRST let us have what the doctor said, then the facts upon which he based his opinion, and finally we may ask whether the facts justified that opinion.

The doctor's opinion was this "*The man is suffering from chronic inflammation of the brain.*"

The facts as set forth subsequently by the patient himself under oath, and also verified by careful investigation are these:—

In August, 1889, the first symptoms of disease appeared. He had a bad taste in the mouth, and a thick, slimy phlegm covered the tongue and teeth, so that he was often obliged to wipe it out with a handkerchief. He had no appetite, and after eating the simplest thing he felt great oppression, and pains at the sides and chest. Later on he was seized with dizziness and dreadful pain in the head, the back of the head being swollen, and so hot that it seemed on fire. This pain in the head grew worse, until the patient fancied his head must burst; and, as it was, he nearly went out of his mind with the agony of it. He got little or no sleep night or day, and as he could take practically no nourishment—that is, nothing at all equal to the needs of the body—he gradually fell away until there was scarcely anything left of him but skin and bone. After a time a hacking cough fixed upon him, and he constantly spat up much matter. At this point his malady had some of the indications of consumption.

For a considerable time Mr. Manning (the patient's name) was confined to his bed, and for nearly a year was unable to leave the house. As a rule he would rise from his bed, about noon, and lie on the couch the most part of the day. To show his weakness we need merely say that he could only cross the room by taking hold of the furniture. The physician who attended him for one year said that Mr. Manning had *chronic inflammation of the brain*, and recommended the application of poultices and fomentations to the head.

"After having been under the doctor's treatment for a year," says Mr. Manning, "I was no better, and he said he could do nothing more for me. I then had another doctor, who said my case was hopeless, and nothing could be done for me. Our Rector's daughter got me several bottles of medicine for consumption from London, but it did no good, and I lingered on in the same state year after year. I was in such pain that I often wished it might be God's will to take me. Several times it was reported that I was actually dying."

"In November, 1892, Mrs. Franklin, wife of the corn merchant, gave me a bottle of medicine which she hoped might do me good. It was called Seigel's Syrup. I had no faith in it, but I began taking it. In a week I felt a little better. My head was easier, I had some relish for food, and what I ate agreed with me. So I kept on with it, and gained a little every day. From that time I never looked behind me, and soon gained two stone in weight. I am now quite strong, and am back to my work. I can eat any kind of food, and am free from all pain. But for this medicine, Seigel's Syrup, I believe I should to-day be in my grave; and so great is my desire that others may know of the remedy that saved my life, I give full permission to the proprietors to publish my case if they think best to do so."

The above statement is condensed from the more extended legal one in order to save space. The other, however, will soon be published in full in another form. This is signed by Mr. Henry Delph Manning, of 3, High Street, Hilgay, near Downham, Norfolk, and has appended confirmatory statements from witnesses of high standing.

Now, we ask, was the doctor right in thinking the case to have been one of cerebral inflammation? No, clearly not, as that nearly always arises from a severe injury to the brain, and is usually fatal in a short time. The head trouble in this case was congestion of the brain, resulting from acute indigestion and dyspepsia, Mr. Manning's true and only disease. When Mother Seigel's Curative Syrup cured that, the brain and other disordered organs recovered health and tone.

ESTATE PRINTING

of any description, neatly and promptly
executed, at moderate rates, by

ADDISON & CO., MADRAS.

MARKET SUPPLEMENT.

SATURDAY, JUNE 26, 1897.

COFFEE.

COFFEE. London advices dated 4th June 1897 say:—Coffee continues dull, and with auctions consisting mostly of indifferent qualities, prices have further given way about 2s per cwt.; fine descriptions command previous rates. "Futures" 3d to 6d per cwt. cheaper for Santos; yesterday the quotations for Rio were as follows, viz., 34s 6d, June, and 36s for December; Santos 37s 9d for June and 38s 6d for December.

During the past week the supplies at auction have been moderate, and the selection for the most part of indifferent quality, possessing little interest for the trade. The demand has been very slow, and prices generally show a decline of 2s per cwt., exception being made in favor of the limited quantity of fine quality, for which full prices have been paid. A quiet tone has prevailed in the market for futures, and prices are rather easier, closing as follows:—

London.....Santos.....September delivery	... 38s Od.
New York ...No. 7 Rio.....	... 7.20 cents.
Hamburg Santos.....	... 38 pf.
Havre Santos.....	... 47 francs.
Holland Good ordinary Java	46½ cents.

Imports Deliveries and Stock of COFFEE in London are as follows:—

	STOCK.		IMPORTS.	
	1897.	1896.	1897.	1896.
West India..... tons	442	467	602	928
Ceylon	94	136	182	279
East India	2780	3324	4172	6130
Mocha	548	500	432	488
Brazil	2639	1470	1046	739
Other Foreign	7556	6057	13921	11320
Total tons...	14059	11954	20355	19884

	HOME CONSUMPTION.		EXPORT.	
	1897.	1896.	1897.	1896.
West India tons	166	282	349	613
Ceylon	74	207	140	253
East India	973	1337	1205	2672
Mocha.....	244	247	98	102
Brazil	606	560	1037	1214
Other Foreign	4308	3794	5147	4737
Total tons...	6371	6427	7976	9591

The preceding figures exhibit—

In the Imports an increase this year of	471 tons
Home Consumption a decrease of	56 "
Export a decrease of	1615 "
Stock an increase of	2105 "

Auctions this week have gone off as under:—

CEYLON,—Plantation.—10 casks 4 tierces 2 barrels 3 bags sold, smalls 90s., fine middling colory 108s., good colory bold 115s., peaberry 112s 6d to 121s.

EAST INDIA,—168 bags sold—Wynaad, bold, 94s; cherry dried triage 63s 6d.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (May 28, 1897) says:—A rather better tone has prevailed at Public Sales this week, and the supplies showing signs of falling off. Previous values have been well maintained.

Only 1900 bags East India were offered and all disposed of at unchanged prices, except for fine colory qualities which realised very full rates.

The smaller supplies of Central American met more competition and rather better prices were obtained.

The Term market has continued to decline and quotations make a fall of 1/- since our last.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending June 2nd, 1897, says:—Bank rate 2%. Bombay Exchange closes at 1s 2½d. Brazil Exchange 7½d. Rupee paper 3½% 62. Silver 27½d per oz.

We have no change to report in this market, which continues dull for

all kinds except fine, and occasionally lower. Auctions close to-morrow, and will be resumed on the 10th inst. Brazil markets are very dull.

Daily receipts have averaged 7,428 bags in Rio, and 4,286 bags in Santos.

Futures have been dull during the past week, and after but trifling fluctuations close quiet with quotations unchanged to 6d easier, viz.:—Good average Santos in Havre, September, delivery fcs. 46.00, in Hamburg pf. 38, and No. 7 low ordinary Rio in New York \$7.20.

To-day's London official quotations are:—

	June	July	Sept.	Dec.	March	May
Rio ...	34/6	—	35/6	36/—	—	—
SANTOS ...	37/9	37/9	38/—	38/6	39/—	39/6

We quote:—

Ceylon, mid. to good mid. 101/ @ 115/	Costa Rica, mid. to fine... 83/ @ 108/

Do. last year 383 „ „ 744 „ „ 12,212 „			

TEA.

Of Indian Tea the public sales were small, but consisting mostly of Calcutta-bought teas, they experienced a slow market at easier rates; the selection included a few small shipments of New Season's Tea of fair quality, which sold comparatively cheap.—Of Ceylon Tea the auctions were large, but, with good competition, prices were well maintained. The imports of Indian Tea, as usual at this season, were quite insignificant last month, whilst the deliveries were very heavy, being 1,400,000lbs. in excess of those for the same month last year; the stock, though still 5,500,000lbs. heavier than a twelvemonth ago, was reduced by 10,700,000lbs. The imports of Ceylon Tea during May were some 700,000lbs. in excess of the same month's last year, but the deliveries show a much greater expansion, being 750,000lbs. heavier than the landings, and 2,200,000 lbs. in excess of the deliveries of May last year. The stock has thus been materially reduced, but is still 1,400,000lbs. heavier than a twelvemonth ago.

SUPPLEMENT TO PLANTING OPINION.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report of June 4th, 1897, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

Indian.	Ceylon.	Java.
1897-1898...7,903 packages.	29,621 packages.	701 packages.
1896-1897...3,557 "	25,068 "	177 "
7,903 pkgs. INDIAN	Total 38,225 packages were offered in public auction this week.	
29,621 " CEYLON		
701 " JAVA		

Movements of Tea in London for the whole of the past season, as shown by the figures of the Tea Brokers Association, are given below :—

Week's av. of New Season's Tea sold on Garden Account, 1897,
301 pks., av. 8½d. 1896, 238 pks., av. 8d.

	1897.	1896.
	Pkgs. Price.	Pkgs. Price.
Assam ...	200 p 9½	20 10
Cachar and Sylhet ...	49 6	90 8
Travancore ...	52 5½	128 7½

Indian. This week's small auction consisted mainly of Calcutta bought Teas; the few New Season's Teas sold with fair spirit, the best invoice being from the Doom Dooma Co.'s "Hansura" division, which realised an average of 10½d. per lb. The Old Season's Teas sold at rather easier prices. The official telegram from Calcutta gives exports to U. K. from the 1st April to date as 3,185,000 lbs., against 2,421,000 lbs. last year.

Comparative prices of Indian Tea in London :—

	1897.	1896.	1895.	1894.
DUST. (Fair ordinary, dark liquor) ...	4d	5d	4½d	4d
FANNINGS. (Red to brown, strong rough liquor) ...	4d	5d	5d	4d

	1897.	1896.	1895.	1894.
BROKEN TEA. (Brownish to blackish, strong liquor) ...	6½d	7½d	7½d	5½d
PEK. SOUG. (Blackish greyish, useful liquor). 7d	8½d	8d	6½d	6½d
PEKOE. (Greyish to blackish, some tip, useful liquor) ...	8½d	9½d	8½d	9d
PEK. SOUG. (Blackish greyish, inferior liquor). 5½d	6d	6½d	5½d	5½d
PEKOE. (Blackish greyish, some tip, inferior liquor) ...	6½d	7d	7d	6½d

Ceylon. The auctions passed with good spirit at prices fully up to last week's rates, the higher grades of good liquoring Teas ruling, if anything, slightly dearer. The official wire gives exports from Colombo to U. K. for May as 9,500,000 lbs. and estimates the quantity for June as 10½ to 10¾ million lbs. Export to U. K. from 1st January to end of May was 43,000,000 lbs., against nearly 42,000,000 lbs. to same date last year. Average for week 7½d. against rather over 7½d. last year.

Ceylon Tea sold on Garden Account 1st Jan. to date 1897, 463,109 pkgs. av. 7½d. 1896, 414,187 pkgs., av. 8½d.

Comparative prices of Ceylon Tea in London :—

	1897.	1896.	1895.	1894.
PEKOE SOUG. (Ordinary leaf; fair liquor) ...	6½d	6½d	7½d	5½d
PEKOE (Ordinary leaf, little twist; fair liquor) ...	7d	7½d	8½d	7d
PEKOE SOUG. (Rather bold leaf; indifferent liquor) ...	5d	5½d	6½d	4½d
PEKOE (Somewhat bold leaf; indifferent liquor) ...	5½d	6d	7½d	5d

Java. The 701 pkgs. sold with good spirit, but without change in quotations.

Bank rate 2 per cent. Exchange on London three months sight.—Calcutta 1/2¾ Colombo 1/2¾.

ADVERTISEMENTS.—Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

N.B.—Remittances should be sent to the Managing Proprietor of this paper, Coonoor, Nilgiris, South India.

MANAGER’S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 9th July 1897.

Kadur. MUDIGERE, 30th June.—*Weather.*—A very nice break on for the last six days which is making things grow splendidly. *General Health.*—Very bad all round. Every estate has any amount of fever amongst coolies just now. Crop of jack fruit plentiful. *Labour.*—Ample for all requirements. Maistries and contractors going about the country looking for work. The rain on nights of 21st and 22nd prevented men here attending the Durbar in Mudigere. The prospectus for the Kadur Sky Meeting is advertised for September 14th and 16th, and it is to be hoped that the weather will be pukka Queen’s weather this time.

Nilgiris. KOTAGIRI, 30th June.—24.26 inches for the half year, 6.40 inches of which due to strong monsoon in June; this is the heaviest fall on record for the half year. The rain was too early and too copious, with 4.72 inches in February, followed by 3.46 inches in March, 4.83 inches in April and 4.68 inches in May. Estates that had not cropped last year responded to the early rain by a good show of blossom at the end of February, also estates that got through their pruning early in the season, but generally speaking it may be accepted that rain has been too constant, too heavy and too early, notably on estates under systematic shade, for the flower; and short crops have to be faced by many this year on this side. Blossom has been blown all along since February in a most

meagre and disappointing way with never a good spell of dry weather in between to force out the spike with a good burst; one of the best shows this side has just appeared at the end of June and will make all the difference on many places. Prospects, therefore, more hopeful. Berries swelling fast in all stages, promising a most accommodating crop to gather in. Labour plentiful.

KILKOTAGIRI, 28th June.—Since Monday the weather has changed and we are having very hot sun all day; weeding seems to be the general occupation now. *Planting*.—Some are still planting, but most stopped with the change in weather; several estates have put out a good many—one, I hear, 20,000 plants. *Handling* is going on. *Labour* is coming up but slowly, and most estates are short-handed but expect more coolies up every day. *Grain* about 19 measures (ragi) per rupee.

GENERAL NOTES AND ARTICLES.

"Famine" Coolies!

We publish elsewhere a communication of a somewhat extraordinary character from a well-known correspondent, Mr. B. Nelson. The facts of the case are simple and are susceptible of easy proof, and we hope the matter will be taken up in earnest by the U. P. A. It throws perhaps some light on the recent decision of the Kanan Devans P. A. to refuse to contribute towards the Famine Fund.

Jadoo.

The inventor of this patent manure, Col. Halford Thompson, has written us a long letter (which also appeared in the *Madras Mail*) in answer to "Toda's" criticism. This latter gentleman has replied to the above letter in the *Mail*, but as neither of the communications throws any fresh light whatever on the controversy, we have decided not to publish them, and unless fresh matter is brought in, *i.e.*, authenticated details of actual experiments, see no use in devoting further space to the subject.

Intensive planting in excelsis.

We have always advocated the practice of intensive rather than extensive planting, but it is difficult to read without a smile of the very biggest planter in Bermuda having only twenty-five acres all told. The crop he indulges in is early ground fruit, flowers and vegetables with the surprising result of about £40 clear profit per acre annually. The whole island is only 10,000 acres in extent, and the average holding is but five acres or so. Sometimes as much as £100 per acre are made.

The Giant Nettle.

Mr. Gleeson, Superintendent of the Gardens of the Madras Agricultural Society, writes us: "I have heard of a Giant Nettle—probably read about it in your paper—which grows somewhere among the Hills of S. India. Now I have been trying to get some seed of that indential nettle for a long time, but cannot succeed in obtaining it. Will you, with your wide circle of planter readers, try to help me? I hope I shall be able to return the compliment some day."

Will some of our readers, especially those correspondents who conducted such an animated discussion in this journal last year, kindly help us in the matter?

Para rubber.

Some interesting experiments, which will be continued over several years, are being made in the Royal Botanical Gardens of

Ceylon, on the best methods of tapping and cultivating, with the cost thereof, Para rubber trees (*Hevea brasiliensis*). There are some 3½ acres of this tree at Heneratgoda, from which many thousands of seed and plants have been distributed in the East. The total average annual yield in Ceylon varies from one and a half to two pounds per tree. An acre containing 50 trees, the value of the produce at London prices is £13. The cost of labour is slight, but it must be remembered that for ten to fifteen years, the yield is *nil*. So that except in low swampy lands where nothing else can be profitably grown, Para rubber will never pay. There are other varieties of course which stand a much better chance of success.

Amsterdam cinchona sales.

"Our Amsterdam correspondent wires on Thursday," says the last number of the *Chemist and Druggist*, "that at the auctions of Java cinchona-bark held there that day 3,301 packages sold at an average unit of 4·20c. per half-kilo., being equal to a further advance of 2½ per cent. on the May auctions, the equivalent of the unit in English money being about 7d. per lb. The English and American manufacturers bought the equivalent of 7,257 kilos. of quinine; the Brunswick factory, 2,086 kilos.; the Mannheim and Amsterdam works, 1,067 kilos.; Frankfort-on-Maine and Stuttgart, 1,846; Auerbach, 1,508; and various buyers, 2,813 kilos. of sulphate of quinine. The prices paid at the auctions ran from 14½c. to 37½c. (equal to 2½d. to 6½d. per-lb.) for *Manufacturing* barks, and from 9c. to 80¼c. (equal to 1½d. to 1s. 2½d.) per lb. for *Druggists'* barks. The market was very quiet."

Essential Oils.

Planters interested in the distilling of essential oils will note the following extract from the *Chemist and Druggist*:—

Oil of limes is becoming scarcer every week. For distilled oil 5s. 6d. per lb. is said to have been paid, and at present holders already talk of 6s. or 6s. 6d. For expressed oil almost the same quotations (6s. 6d. per lb.) is made. The new crop is not due in the ordinary course of business until September, and it is thought that before that time much higher prices will be seen. The new crop of *Neroli* oil, which is now being distilled, is said to have yielded satisfactory results, but the prices have not been definitely established. Our quotations vary from 5s. 6d. to 7s. 3d. per oz. for *Petale*. At auction two bottles containing each 1 kilo. of *Chiris'* oil of neroli petale, of 1895 crop, were offered, but no bids were made for them, and they were bought in at the nominal figure of 10s. per oz. Of *Cuscus* oil 40 bottles, each containing about 9 to 10 oz., were offered, but no bid, was made for these. *Cassia* oil is neglected and dull of sale; 10 cases were catalogued for auction, but not actually offered, as they were not landed in time. Two cases *Star-anise* oil sold cheaply at auction at 6s. 6d. per lb., which is below current market prices. Of *Eucalyptus* oil very little was offered to-day. Six cases *Portuguese Globulus* oil, shown before, were still limited at 2s. per lb., at which they cannot find buyers. Five cases Fisher's oil of *Nutmeg* were bought in at 5d. per oz. *Lemongrass* oil steady at from 2½d. to 2½d. on the spot. It is said that about 200 cases, shipment during present year, have been sold on arrival at 2½d. per oz., c.i.f. terms. *Citronella* oil is quoted at 1s. 2d. to 1s. 2½d. per lb. on the spot, for tins, and 11½d. to 1s. per lb., c.i.f. terms. *American sassafras* oil is quoted somewhat lower at 1s. 9d. per lb.

Denaturalized agricultural salt.

The attempts both in India and Ceylon to denaturalize salt, so as to enable it to be used free of duty for agricultural purposes, have been many but unsuccessful. We learn however that in Prussia, where a state monopoly with regard to salt exists, as in India, that the question has

been solved by means of using pulverized wormwood for the purpose. The following letter to the Hon. P. Coomaraswamy from a German gentleman named Mr. Fr. Lange was published in the *Ceylon Times*:—

BERLIN W., Feb. 22nd, 1897.

The Hon. P. Coomaraswamy, London.

DEAR SIR,—According to your wish I append an abstract of the German law *re* inland revenue on salt, dated the 12th December 1867:—§2. The inland revenue on salt is 6 marks for 50 kgr. (about 112 lb. a hundred-weight), §20. Free of tax are the following:—

No. 2 the salt used for agricultural purposes, *i.e.*, for the feeding of cattle and for manuring.

No. 3 for pickling herrings and similar fish.

No. 4 the salt employed for all other industrial purposes with the exception of that for industries preparing nourishment and relish for men (*vide* No. 3 exception).

The salt for purposes (*vide* No. 2 and No. 4) must be denaturalized according to article 5 of the agreement of 8th May 1867. This shall be accomplished by means of pulverised wormwood (enactment of the 25th March 1878). I shall be glad to give you any more information, if wanted, and remain, dear sir, yours faithfully,

FR. LANGE.

We trust that our United Association will take this matter up and press upon Government the advisability of introducing the Prussian method of denaturalizing salt for manurial and commercial purposes. For though salt may in itself be incapable of serving as a direct plant food, yet as a solvent and mechanical agent, its value is undoubted. Inland cocoanut plantations especially would benefit by the change, and in addressing Government, due stress should be laid upon the benefits to be derived alike by ryots and planters.

Planters and marriage. As a class, planters labour under the odium of being less partial to marriage than most other classes in India. It was alleged some time back in home papers, that the superintendents of estates in Upper India were directly forbidden to marry by their Managing Directors, on pain of instant dismissal. This was denied hotly by the planting organs of the districts concerned. Judge of our surprise, therefore, when in the *Indian Planters' Gazette* of the 19th inst., we see prominence given to the following in an article entitled "Should Assistants Marry?" :—

"Cases have cropped up lately of Assistants, possessed of from five to ten years' tea experience, with salaries ranging from Rs.250 to Rs.400 a month, being flatly told if they marry they must go."

Such a statement in a responsible paper like our contemporary carries a weight that is indisputable. If the allegation is true, it is time indeed that the great B. P. should arise and twist the tails of the offending Directors. It is intolerable that such tyranny should be exercised on Assistants by their "bosses." Their reasons for such behaviour are vicious and unsound, false alike in morality and hard common sense. As the correspondent above quoted remarks:—

"Here we have a number of men who by steady industry have achieved a fair degree of success in their profession—a hard and dreary one enough in all conscience—a privilege refused to no one similarly placed in other walks of life is calmly denied them, and their natural wish to create a home for themselves is flouted as preposterous. Is it hoped that an Assistant by remaining single will make better tea, manage labour better, or lead a more moral, steady, or industrious life? Ah, that question of morals! It ill befits any one to cast a stone, but recent action upon the part of tea authorities would seem to place a premium upon immorality, or, at any rate, to evidence an utter disregard for what becomes of their Assistants—the toiling producers of many a fat dividend. Who can blame the Assistant if, disappointed in his natural hopes, he turns to the kept woman for comfort, or who can wonder if, in consequence, he sinks a

bit in the scale and measures his work and his responsibility by his own standard of life. Certainly not his Burra Sahibs, for they have driven him thither. * * * * Touching the management of labour, any one who knows aught of the subject knows full well that the Manager or Assistant who fails to keep himself aloof, in a moral sense, from the native loses therewith a portion of that divinity which should hedge in a planter, if he is to become a successful manager of labour."

Roads on the Nilgiris. Taking the district as a whole, the Nilgiris are very well off for roads, and it is only in the more newly opened parts that complaints are made. One of these young sub-districts, Kil-Kotagiri, has been opened up, though, to such an extent that its claims for being served with efficient means of communication are undeniable. There are, we are informed, already 20 large coffee estates in the district, owned by Europeans and natives, besides hundreds of small native holdings. There are also a number of Badaga and Irula villages, whose only communication with the plains is by means of pack-bullocks, hundreds of which come up the ghat every week. The expenditure on the estates, a great portion of which naturally is distributed among the local labour, is estimated to be at least 15,000 rupees per month, and often more. The small holdings and the hundreds of acres of grain cultivation are not included. These large estates and numerous holdings furnish of course a very large traffic with the plains, but at present there is not a single bandy-road within seven miles of the centre of the district. The only substitutes are bridle-paths, and these, we learn, are very badly kept up near the estates. A short time ago the local planters petitioned Government for increased facilities in communications, but, no answer being favoured the applicants, they have had for the present to make the best of a bad job, and worry along with what roads they have. What is most required at present is a short road some ten miles in length, from the signpost on the Kodanaad Road to the Nilgiri Boundary. Thence the Coimbatore authorities should help with about five miles of ghat to join the road from Kotagiri to the Kotagiri-Mettapollum ghat, within about 1½ miles from the latter town.

The road asked for is certainly but a very small affair, and it is undoubted but that new clearings would be still more eagerly made than at present; were the cost of transport but lessened in the manner indicated. The funds required would not be great, and it would be possible to obtain sufficient funds for the annual expenses for keeping-up and repair by means of tolls, and perhaps something over. The P. W. D., in its wisdom, classes roads and communications as non-productive works. The Government, as a whole, sees things more truly, we hope; as it undoubtedly benefits directly from the increased value of the lands tapped by new arteries for traffic.

U. P. A. S. I. LEAVES.

(GATHERED BY THE SECRETARY, U. P. A. S. I.)

THE dates of the Annual Events are now definitely fixed.

The Planters' Dinner will be given at the Bangalore United Service Club on the evening of Friday, the 6th August. Any gentleman who wishes to be present will kindly give

early intimation, so that the Club Executive may be notified in good time how many "plates" they are to lay.

On the following day a meeting of the Committee will take place at the Cubbon Rooms, when the order of business for the Annual Meeting will be considered and arranged, so that the proceedings of that meeting may be as expeditious as possible.

The Annual Meeting will open at the Cubbon Rooms at 11 o'clock on Monday, 9th August. A preliminary Agenda paper has been circulated, and it is hoped that all recommendations as to additions, omissions, &c., will be sent in soon, so that a *puckha* Agenda paper may be drawn up and circulated by the middle of this month.

The chief subjects for discussion are (1) The report of the Enquiry Committee; (2) the methods of raising and employing U. P. A. S. I. funds. Mention of minor matters is reserved until the list has been revised by the Secretaries of the various District Planting Associations.

The meeting will take place during the Race week at Bangalore, when many planters, besides delegates from District Associations, will be at that place. Opportunity is now taken to remind *all* planters that they will be very welcome. Last year there was a good number of 'visitors' present, and if their attendance is doubled or trebled this year, so much the better. The more interest that planters openly manifest in the progress of the Association and the common weal of the planting community, the more likely is the Association to succeed in the work it has undertaken. A cordial invitation is therefore issued to all. It can hardly be addressed to each planter individually, so the Secretary ventures to send it round in this somewhat informal way.

GERMAN EAST AFRICA.

(Continued.)

Yes, its a lovely country. The coast line has a green beauty of its own. The water is like crystal, and you see fathoms down to the coral and anemones and sea-plants on the bottom.

The headlands are dotted with cocoanuts and large shola trees, and the bays are encircled with mangrove that look lovely at a short distance and quaint near to. Once you start up-country, five miles takes you past all cultivation and into a rolling park land, very dry at times, but in the monsoon wet enough in all conscience. The foot hills have all been cultivated and are so still in patches, and round the topes of coconut trees that always mark a village of beehive huts are fields of maize, rice, potatoes, beans, etc. Turn it with a hoe, and it laughs with a harvest.

The hills are densely clothed in heavy jungle so dark that in many places the sun hardly penetrates at midday, and the trees are hoary giants standing often enough 200 feet in height, 100 feet and more to the first branch; up above is quite a world of greenery with flowers and orchids, birds and butterflies that never descend to the earth at all. The jungles are singularly still as a rule till nightfall, when everything wakes up. As evening approaches, you will hear the hornbills laughing like so many maniacs and the pigeons cooing; then the bark of the small antelope

comes up from the hollow and the chirruping of birds as they settle down for the night. Later on comes the call of the owls and the whirring hum of the nightjars and the countless beetles, and still later you may hear the grunt of a pig and the whining snort of the leopards, and the weird call of the night monkey. It is a lovely country and lonely and a feverish. But some day it will be a great planting centre. Coffee does well but for leaf disease. Tea should grow well and of good *jât*. The foot hills are admirably adapted to cocoa and Liberian coffee. Cotton does well on the coast and tobacco in the dryer parkland. The only difficulty is labour, which is dear and so far bad.

But I would caution those going there against the black water fever of the country: it is deadly; but till you begin clearing does not attack one badly.

A railway now passes the foot of the hills and should be of great service to the Usambara planters. If I went there again I should go to Fuga above Kologur; it is a bit higher than Usambara and has not so much frost, but it is further from the sea about 90 miles. Nothing by rail, but a lot to walk, when potters won't do more than 15 miles a day.

The officials are very good, but some of the non-officials are awful, the scum of Germany. As a rule there are exceptions—dear old Van Horn was one, and Titus Schütz another, and the owl Fritz Moritz another.

Some of the timber is first rate and would be priceless at home.

The English Mission people are doing a lot of good working like slaves and all for nothing; they are heroes in the best sense of the word.

I'd like to go back to look them all up, but it's unlikely that I shall ever get there again. *Labour*.—Local untrained labour is Rs.8—10 a month for a man, Rs.6—8 for a woman; rough carpenters get Rs.1—2 a day, but rates are all on the down grade, and with roads and railways should be fairly cheap in time. The niggers are merry, lazy lot, but can work well, and now "qua hère" Africa.

WANDERER.

THE S. I. PLANTERS' ENQUIRY COMMITTEE.

OUR contemporary the *Madras Mail* has not been very long in reviewing the lengthy report of the South of India Planters' Enquiry Committee. More fortunate than its rivals, it has been able to draw aside the veil of "confidence," and give its readers an idea what the report says. We publish its articles on the subject hereunder, in the hope that planters will take the matter up and discuss it in its many bearings. A great deal will depend upon the character of the "remarks" that are to be submitted to the U. P. A. S. I., and as that body is the representative of the District Planting Associations and these, in turn, protect the interests of individual planters, the opinions of these gentlemen will no doubt be very welcome to the fellows. It must be remembered that the Government of India has preconceived prejudices against the advance system, against penal labour laws, and against Extremism. Planters will need all their new-born unity of purpose if they are to induce the Government of India to legislate in conformity with their wishes; and even if that should happen to endorse the views of the Enquiry Co-

mittee at every point, there would still probably remain much to be done before "Victory" could be recorded.

The following are the articles that have appeared in the *Madras Mail*:—

I.

Before touching upon the chief points of the comprehensive Report sent in to the Government of India by the South of India Planters' Enquiry Committee, it will be as well to remind our readers of the circumstances under which that Committee was appointed, and the scope of the enquiry it was directed to make. It was the outcome of a Memorial presented to H. E. the Viceroy during his tour in this Presidency in 1895. In that Memorial the U. P. A. S. I. asked in particular for increased protection against "loss from wilful breach of contract and dishonesty with regard to advances" made to coolies and maistries. Proposals previously put forward with this object had been rejected by the Government of India, but the U. P. A. S. I. suggested that the conditions of labour in Southern India has not been sufficiently known or explained to that Government, and that the appointment of a Committee to enquire into the matter might lead to a clearer understanding of planters' difficulties. His Excellency the Viceroy replied in such a manner as to show that he was inclined to look with disfavour on legislation of the kind that the memorialists appeared to wish for. He reminded them that the origin of most of their difficulties lay in a system of advances, as to the necessity for and desirability of which they themselves were, he said, by no means agreed. However, His Excellency decided that such an enquiry as that desired should be made, and in due course Mr. (now Sir) W. Mackworth Young, Resident in Mysore and Chief Commissioner of Coorg, was nominated by the Government of India as President, Mr. J. W. F. Dumergue, L.C.S., by the Madras Government as its representative, and Mr. J. Williams Hockin, of Vayitri, South Wynaad, by the U. P. A. S. I. It was directed that the Committee's enquiries should extend to Coimbatore, Nilgiris, Madura, Malabar, Salem, Tinnevely and Coorg, and the Committee was further requested to consider whether, in order to render the enquiry complete, it should not also invite evidence from Mysore, Travancore and Cochin.

"The enquiry was to cover the following ground:—1. As regards the system of advances to garden coolies and maistries—(a) the nature of the system as at present worked; (b) the necessity for its continuance; (c) the difficulties experienced in its operation; and (d) the best methods of removing them. 2. As regards the prevention of coffee stealing—(e) whether the conditions under which coffee is produced and brought to market are such as to render it desirable (1) to extend to "parchment" and "cherry-dried" coffee the legislative provisions now applying by Section 9 of Madras Act VII. of 1878 to "green-gathered" coffee; and (2) to amend that Section by substituting the word "person" for the words "cooly, maistry or other labourer employed on a coffee estate." In response to suggestions made by the Madras Government, the Government of India stated that it intended that the question of reciprocity in the execution of processes should be discussed under sub-head (d) but that it could not agree to any consideration of a proposal that breaches of contract which fall under Act XIII. of 1859 should be made extraditable offences under Section 11 of Act XXI. of 1879, or that the procedure for extradition under Section 14 of the same Act, viz., the case of offences not ordinarily extraditable, should be simplified.

This gives a general idea of what the Committee had to enquire into. The course taken was to frame a series of questions to be answered by Planters' Associations and individual planters; and beyond this, oral evidence was taken, and 49 witnesses were examined. The Committee explain that they "laid their foundations wide" when framing the questions referred to; and they express the belief that every member of the several Planters' Associations who wished to bring forward his personal views had an opportunity of doing so. Referring to the fact that not many maistries were brought forward for examination, they remark:—"We are not disposed to think that the investigation has been less complete because the setting forth their whole case has devolved on the planters themselves;" and they also express themselves as, upon the whole, satisfied with the evidence they were able to collect. The enquiry being so far-reaching and the Committee so well satisfied that the evidence was reliable, the conclusions arrived at must carry weight. Planters will be glad, therefore, to know that the Committee have expressed the opinion that "the system of advances is at once the backbone of

the planting industry and the cause of the principal difficulties attending it." They will note with special interest also a remark that "altogether it appears to us that, notwithstanding the increase in the population of Southern India since the famine of 1876-77, the demand for labour is in excess of the supply, and that the disproportion is likely to grow greater, not to diminish." The Committee consider that maistries are indispensable. They comment on "the chronic impecuniosity of the cooly." Alluding to the consensus of opinion among planters as the necessity of advances, they point out that it should be recognised that in holding to this opinion planters have every inducement, from a pecuniary point of view, to desire the change which they feel to be impracticable. "No one would give advances if he could get the labour he required without them." Finally, the Committee record their finding, anent advances, viz., "that however much planters would be benefited by the abolition of the advance system, its abolition is impossible under existing circumstances, and that this method of meeting the planters' difficulties cannot be regarded as practicable." "On this subject," they say, "we find that there is a practical consensus of opinion among the planters themselves and that his opinion is corroborated by the testimony of the employers of labour." In another place it is observed, "there is nothing on record before us to controvert the evidence which has now been accumulated, that advances are absolutely necessary for imported labour."

We need not touch here upon the subjects of coffee-stealing or on the means by which the Committee arrived at the general conclusions that are stated in the Report. Before closing our present remarks, however, we must show how thoroughly the Committee have grasped the actual position as regards the system of advances, and the protection that planters wish to obtain. They realise that what planters want is the enforcement of the contract rather than the punishment of the offender. The civil courts, it is remarked, do not afford the remedy; Act XIII. of 1859 does not adequately meet the planters' case. Not only is the language of the Act vague, but "it does not enforce the ultimate performance of the contract," and "it does not protect the planter against the enticement of his labour by other persons." Moreover, "it never was intended to be applied to contracts for agricultural labour, still less to cooly emigration." Yet this Act, with all its faults, "has remained on the statute book as the sole, though imperfect, sanction in Southern India of estate labour contracts." It has been "a useful handmaid" to the planting industry, but the Committee state very plainly that much more is necessary, and on almost every point of importance they concur with the opinions that have been repeatedly expressed by leading men among the planting communities in various parts of Southern India.

His Excellency the Viceroy referred in 1895 to general or abstract objections to legislation such as the planters wished to see introduced. As the planters have argued, so the Committee argue: special circumstances call for special courses of action. They hold that the system of advances is necessary, and the rights of property cannot be efficiently protected unless their advances are secured by special enactment. They remark that the want of proper facilities for enforcing labour contracts has resulted in an extensive practice of fraud, which is demoralising the class furnishing the labour. There is ample justification, they think, for the view that the Southern India planting industry needs the protection of a penal labour law; they consider that the time has not yet come when legislation controlling the relations between employers of labour and labourers, giving adequate protection to the employers against fraud and wilful breaches of contract amounting to fraud, and at the same time safe-guarding labourers against oppression, can be dispensed with; and they "venture to think that the time when special legislation on labour contracts can be abandoned will be indefinitely postponed in Southern India unless the necessary measures are now taken by the Government." Comment on the measures suggested must be reserved. They were briefly specified in our issue of the 21st instant, and we have now shown the main points of the line of argument that led up to them. Whatever may be said of the recommendations themselves, planters cannot but appreciate the judicial and yet sympathetic manner in which their case has been stated, and their contentions confirmed, in the Report of the South of India Planters' Enquiry Committee.

II.

In a recent issue we commented on the findings of the South of India Planters' Enquiry Committee, and showed how the Report submitted to Government corroborated the representations of planters themselves in respect to the chief points under consideration. The attempt of the planters to "educate" the Government of India has

so far succeeded that conviction has been carried to the minds of the Committee, and the Committee themselves have put before the Government of India "instruction" of the very kind that planters approve. It remains to be considered, however, whether the remedies suggested will meet with the same approval from planters as they certainly must accord to the Committee's diagnosis of their case. These remedies have been already briefly stated in our columns, but it is necessary that they should be referred to again, and that light should be thrown on the course of argument that the Committee put forward to justify them. It is also necessary to point out that the recommendations submitted do not accurately exhibit what the Committee would suggest as the *best* course of action, for the scope of their deliberations was restricted by certain stipulations made by the Government of India with reference to the vexed question of extradition. A word or two will show the bearing of this restriction. The Committee remark with reference to the grievances of the planter in Native States, who "except in so far as he is able to obtain local labour (a small proportion of his total supply,) has no labour law at all," that the simple and obvious remedy "is to allow complete reciprocity in the service and execution of warrants under Act XIII. of 1859 between British Territory and the three Native States concerned under such safeguards as may be deemed necessary." "But," they continue, "we are precluded under the terms of our instructions from recommending that breaches of contract under Act XIII. of 1859, or rather disobedience to an order under Section 3 of that Act, should be made an extraditable offence under Act XXI. of 1879." As a consequence, the Committee dismiss the question of Reciprocity because, in the partial form in which alone they are permitted to consider it, they hold that discussion would not lead to any result.

The recommendations made are intended to meet the following difficulties:—(1) The inability of the planter in any planting district in Southern India to obtain effectual redress for fraudulent breach of contract on the part of maistries and coolies under the existing system, and to guard himself against serious loss; (2) the special disability under which the planting interest in the Native States labours, in the absence of any provision for pursuing defaulting maistries and coolies into British India; and (3) the increasing demoralisation of British Indian maistries and coolies employed in Native States. This last difficulty need not be noticed here beyond a remark that the way in which it is stated points to a belief that unless a remedy is applied existing difficulties will not merely continue but increase. As regards the first difficulty, the Committee, in seeking a remedy, remark that it is not to be found in existing legislation. "Act V. of 1866 cannot be utilised in regard to the labour employed on plantations within the Madras Presidency, and its rigid enforcement, as regards the labour employed in Coorg and the Native States of Mysore, Travancore and Cochin could only result in disaster to the planting interest in these tracts, unless it were also made applicable to the labour employed in the Madras Presidency itself and to the labour exported from the Madras Presidency to Ceylon, the planting interest in which enters into competition with the tracts mentioned." Section 492 of the I. P. C. also constitutes an inadequate remedy, because it provides no means of enforcing the contract, and planters attach much more importance to this than to punitive provisions. The Civil Courts do not, in the opinion of the Committee, afford the remedy, nor does Act XIII. of 1859. Reviewing all these points, the Committee, instead of recommending amendments of the latter Act, fall back upon Act V. of 1866, which is at present a dead letter. One point in which this Act fails is that it does not apply alike to labour imported from British territory into Native States and labour imported from Native States into British territory. Probably no single Act could do this, but the Committee obviously aim at an agreement among the different Governments concerned that shall provide for a general application of a modified and amended Act, based on Act V. of 1866. With this view they go the length of recommending a Treaty or Convention between the British Government and the three Native States in regard to reciprocity of procedure. This would avoid interference with the Extradition Act; but it is to be feared that, as the suggestion is opposed to the general policy of the Government of India, and as no precedent can be cited, the proposal regarding a Convention will not be entertained. Foreseeing this, the Committee suggest as an alternative in default of a Convention: (a) that British Magistrates should be empowered to give effect to orders of certain Magistrates in Native States in respect of fraudulent breaches of contract under the amended law, or if there is no

amendment under Act XIII of 1859; or, preferably, (b) that Magistrates in British India and the Native States of Mysore, Travancore and Cochin should be empowered by their respective Governments to deal with persons found within their jurisdiction who commit fraudulent breach of contract, as explained in (a), across the border. This follows upon recommendations that Act V. of 1866 should be amended so as to provide a suitable labour law for all the planting districts in Southern India, and that the Native States of Mysore, Travancore and Cochin should be invited to adopt the amended law. The proposed Convention would probably suit the interests of planters still better; but, failing this, the alternative suggestions are likely to be generally approved as offering a decided improvement upon the present system. Suggestion (b) aims at the introduction of a system involving "substantial reciprocity." No doubt, its application would have to be carefully fenced in, so as to guard against abuses. British Administrations are jealous of giving authority, or even a semblance of authority, within British boundaries to the judicial officers of Native States. The scheme suggested would have to be elaborated with great caution, and for its successful application other changes in the existing laws would probably be necessary beyond the introduction of such a "suitable labour law" as that proposed by the Committee. Planters certainly need either Extradition or some sound substitute for Extradition. Without either they, especially those nearest to the frontiers that divide one jurisdiction from another, are at the mercy of the migrating maistry or cooly. Planters will probably have a good deal to say on this point, and they may possibly be disposed to cling to Act XIII. of 1859, to which they have hitherto been in the habit of looking for some small measure of protection.

Reviewing the Report of the Committee broadly, we are of opinion that it explains the position in a manner that should meet with very high approval from all parties, and that if it does not recommend a course that will fully satisfy planters—whose interests, by the way, are not in all cases identical—it at least suggests very important measures on their behalf, measures that would be so valuable to them that we hesitate to believe that the Government of India will agree to what has been put forward by the Committee, even if they should receive unqualified support at the hands of the U. P. A. S. I. Whatever may come about in this respect, we cannot close our remarks on the Report without commenting in very high terms on the thoroughness, precision, impartiality and independence with which it handles a subject beset with very great difficulties and many intricacies.

LETTERS TO THE EDITOR.

A PLAIN TALE FROM THE HILLS.

"Aux nouvelles que J'apporte
Vos beaux yeux vont pleurer."

French Ballad.

SIR,—The story I have to tell of how planters in Native States can be robbed with impunity can hardly be expected to equal interest one of Rudyard Kipling's "Tales from the Hills," but however lacking it may be in interest, it has at least the merit of undisputed veracity, and the "denouement" is certainly as sensational as any lovers of romance could wish. As Mr. Ewart attempted to procure labour from the Bellary district has already been noticed in the Madras papers, it is as well that an exact account of what has happened should be placed before the public, to prevent similar attempts being made by other planters, and in the hope that such arrant swindling will be brought within the meshes of the law by the exposure of such cases. Mr. Ewart being in want of labour for the Isfield estate decided in the early months of the year to endeavour to recruit it from the famine district in Madras Presidency, selecting Adoni as a place where he was well known to the people. As a result, some coolies accepted his terms and proceeded by train at his expense as far as Koilpati, where they were detained with a view to marching them to the estate. Arrived at Koilpati they flatly refused to proceed, and as a result of Mr. Ewart's personal endeavours to persuade them, about a dozen came to work. Again

the others he had no remedy, being a planter from a Native State and therefore an *outlaw* in British territory. As one who saw the coolies, it may not be out of place to put on record that although they came from a famine district they bore not the slightest trace of famine, being in considerably better condition than the ordinary inhabitants of this country. I used to be under the impression, now I know a wrong one, that people who suffered from famine would be likely to appreciate plenty of food, but these coolies had apparently been so well fed that food was of less importance than washing it down, which they did so successfully that they all got drunk on their rice money. I will here leave these coolies on the estate and return to those that refused to move from Koilpati, as strangers in a strange land. Your readers may be wondering how they got on. As they refused to work on the hills in the hopes of recovering the outlay, they were offered work at the cotton mill at Madura, to which place they went in a body.

This they also refused, showing they had no wish to earn an honest living, and as I don't suppose they had inherited a double dose of original sin, how completely they had become demoralised by indiscriminate charity. Some took an advance to go to Devicolum, and have since bolted. A lot of them were offered work at Madura Station on the ordinary monthly pay; this was also declined. I am afraid that your readers will think I am beginning to get off the track a bit, and bearing in mind the Biblical maxim of "he that will not work neither shall he eat" will be wondering how these got on and how they could escape the common lot of either working or starving. If your readers ever thought that, they are reckoning without taking into account the paternal Government that takes care of such lazy loafers. The Government paid their expenses back to Adoni, amounting to not far from Rs.10 each. I know this will be deemed incredible, and everybody will immediately say that it is impossible: that the Government have no money for such a purpose. Their expenses were paid, so I am informed, out of the FAMINE FUND. I should doubt whether any contributor to the fund ever supposed that it would be used for such a purpose. To pay the expenses of a lot of people who have admittedly obtained money under false pretences, and if Mr. Ewart resided in British India instead of being an outlaw, would have been prosecuted criminally, seems to me an operation that might perhaps be expected from a Criminals Aid Society, but hardly from a Famine Fund. I invite H. E. the Governor's attention to this and trust he will decide whether the Famine Fund is intended to be devoted to such a purpose; for assuredly if the Famine Fund is capable of such elasticity of application, it would be advisable to drop the word Famine as a misnomer, and adopt some other title less calculated to mislead subscribers.

The immediate result of this extraordinary application of the Famine Fund was to induce the few coolies at work to desert in a body, relying on their criminal dishonesty being similarly subsidised. I have, I think, now very creditably redeemed my promise of a sensational finish to my "Plain Tale" in a way that in a work of fiction would be deemed incredible; but it is only another example of the truth of the old adage, that "truth is stranger than fiction."

It may not be out of place here to warn the Nilgiri P. A., who I see were advertising for labour from the Famine districts in the Madras Presidency, that the coolies have no intention of taking to estate work as a livelihood; their sole idea is to make a convenience of the estates up till about October and then good bye, if they didn't bolt before; and for this great condescension on their part they expect the estates to pay their expenses both ways. I mention this, as most probably the Nilgiri planters have the same crude ideas about famine coolies that we had down here. Whether it will be considered worth while endeavouring to recruit labour after these revelations I know not, but my advice would be that they had "rather bear those ills they have

than fly to others that they know not of." Of course they are not in the same position as Native State planters; but bearing in mind the coolies' great inclination for bolting and their dislike for honest work, and leaving alone the peculiar assistance they may receive from the Famine Fund, I fancy they will agree with me in thinking that "*Le jeu ne vaut pas la chandelle.*"

Yours faithfully,

B. NELSON.

ARIENKOW, SHENCOTTAE, 20th June 1897.

ACCOUNTANTS ON ESTATES.

DEAR SIR,—Don't you think it would be a good idea if sundry and several estates guaranteed an income of say Rs.100 and horse allowance to an accountant who would go round the different estates and make up the rough cash books and prepare statements for owners and agents? We are all able to keep daily cash books and balance our cash, but double entry and preparation of accounts in good style is a failing amongst the planting community. I understand that this is the method adopted in Ceylon and works well. There are many Eurasians or even natives who are good accountants and who would be glad of the job, and I am sure if you take up the idea and recommend a man, he would be well supported and earn more than I have suggested.

P.

COST OF LIVING ON A PLANTATION.

SIR,—This is an interesting subject to a great number of your readers, and I hope a few more letters, blending instruction with amusement, will appear on the point.

Accident of residence would appear to regulate the amount and character of the expenditure very considerably, and food would seem to be twice as cheap in some districts as in others; while a young man living in a populous district with lady inhabitants *must* spend more on his clothes than a jungle-wallah, miles from any one else, need do.

The number of visitors a man has, too, is a serious point, and I think we should criticise the accounts given in a more liberal spirit than "On the Cheap" does, who calls a very moderate drinker in the North a "sink." Now (even leaving out visitors) one bottle of Bass for dinner and one peg of whisky a day, which is all that "Indigo Assistant's" liquor bill comes to, does not constitute a man a "sink" I hope. My own feeling is one of envy that I cannot imitate "Indigo Assistant" in drinking Bass, but am obliged to content myself with light imitations of beer, such as Pilsener. The other 60 bottles or so of soda not wanted for the whisky (as I presume that a man of "Indigo Assistant's" fine taste in beer would not spoil three bottles of good whisky by diluting them with 96 sodas) are easily got rid of by drinking one when he comes in from his morning's work, and another in the afternoon. "On the Cheap" possibly drinks twice as much in water and weak tea (which though cheaper is thirstier behaviour) and then thanks his stars he's not such a sink as other men are. When a man drinks one bottle of whisky a month, he must either take it as medicine, or keep it for Sundays.

One point that puzzles me in both "Ex-Creeper's" and "On the Cheap's" letters is what they do with their dirty clothes. Neither of them employs a dhoby; and though the "butler" may wash flannel shirts and socks in the bath, and dry them in the kitchen, yet surely there are many articles, such as table linen, used even by men living on the cheap, that need professional handling, and I think *something* should be put down for dhoby, and docked from "On the Cheap's" tobacco, which I consider excessive, and thank my stars I am not such a chimney.

"Ex-Creeper's" Rs.16-4-0 for bazaar is too wonderfully cheap for this part of the world, where I find that mutton for myself alone at 4 as. a lb. comes to Rs.3 per week, or Rs.12 per month,

leaving only Rs.4-4-0 for other bazaar items. Of course this may be considered gluttony by "On the Cheap;" it may be so (we all have our faults), and perhaps some of it ought to be docked to pay for the dhoby.

I once, like "On the Cheap," had to live as cheaply as possible, and with the greatest economy I found that Rs.75 per month (and no clothes bought) the least I could manage on. I had two luxuries though, for I did not throw up my Club, to save the subscription, and I stuck to my *Madras Mail*. Your other correspondents seem able to do without these items. I drank nothing myself, and kept only a certain amount of whisky for visitors; but local prices were high, and my bazaar account was far heavier than any of your other correspondents.'

What I should like some amiable correspondent to tell me now is, how to find two bottles of whisky "ample" for passers by, without my having, in nine cases out of ten, to lock them up, and either pretend I haven't got any whisky, or boldly to say I have it, but won't produce it. Both courses are very painful to me, for if I look up a man after a long ride, and can't get a drink, I feel that "sink"—ing feeling that "On the Cheap" objects to very strongly; and as I should like to do others without being done by them, some cheap substitute (that they will drink) to palm off on my friends would be very welcome.

My opinion is that on Rs.100 a monthly respectable existence is possible, if strict economy be studied—that no gentleman should be asked to live on less—and that if the business cannot afford to give so much, a respectable Native or Eurasian should be employed. No young gentleman should be set over a lot of natives on a pittance of Rs.50 to 70 a month; with an old hand like "On the Cheap" it is different, for a man who understands natives could live on Rs.40 a month, and be considered a lord, while an inexperienced youngster would suffer in his authority.

VAN RESD.

COFFEE PLANTERS AND THEIR CURERS.

SIR,—One often hears a lot about "curers" and that they do not do justice to planters and that their charges are high, etc., etc. One of the chief causes of annoyance is the loss in drying coffee at the works, and it seems hard to account for; but I think if planters will follow the figures given, they will find that the "curer" is not to blame. 18 bushels in 1,000 is a fair allowance for dryage. Planters seem to forget that when parchment coffee has by exposure to the low country sun arrived at a dry point, any further exposure makes the parchment so brittle that it pulverises when swept up for measuring and bagging. One can hardly expect the "curer," who is limited to time, to take on labour and dismiss it at will any more than we planters can if our crop comes with a rush, and so a higher percentage of dryage is recorded in the "curer's" books; there are two degrees of dryness, I believe, "bone" dry and "horn" dry, the latter when you can indent the bean with your teeth instead of cracking it like a nut. Coffee will peel in the "horn" dry state, but I do not think any respectable "curer" would do so; it is only practised by "cheap" men. There is another point about drying coffee of which planters seem to know very little, viz:—Parchment will lose 2lbs. 1st day and 4lbs. 2nd day!! that is, if coffee arrives at about 40lbs. per bushel. Another complaint against the "curer" is the difference between "Estate" and "Yard" measurements, but I don't think there is much to "kick up a row" about (although I have often "growled" myself about it!) and if the whole of the coffee received by curer were taken into account, I do not think it would work out at more than '019, although individual lots are sometimes 2 to 5% short; but *turns* are freely discussed by planters, and many planters gauge the "curer's" efficiency by it, or in other words how much is stolen from the "curer's" yard!! The above seems strange, but is nevertheless true and only shows how far some planters will go if they get a bad out-

turn; but it hardly seems necessary to defend the "curer," for you must remember they are a body of men managing large "curing yards" and holding large sums of money accused of not being able to take care of produce entrusted to them; still the idea is abroad that systematic robbery is allowed in the curing yards, but it is ridiculous on the face of it. The best out turn I ever heard of was 79 bushels, but several cases of 80 bushels are known, but they are more the exception than the rule. Personally I am satisfied if I get 95 right through my crop.

Some planters have asked the following question:—What do curers grant as to the maximum waste of weight allowed on coffee shipped home? I believe the answer is "Nothing"!

The following, I believe, are correct weights:—

Single bags net weight shipped	...	...	...	168lbs.
" " " " of bags	...	...	...	2½
	Gross	...	...	170½
Trade tax on bags	3	...	...	5
Draft " "	2	...	...	165½
				2½
Net loss to planter	...	...	...	
			Net Coffee	168lbs.

The question of "Draft" is often discussed by planters. Broker to whom the question was, I believe, submitted, wrote:—"Dealers have persistently refused to buy without customary allowances." The question of draft is a serious one, and I believe all agents have from time to time tried to reduce it but with no success; the planter is at liberty to impose any condition he likes on the London trade when selling his crop, but he will I think, come off second best!!

Prices are governed by certain trade customs and allowances and it would be folly to try and attempt to interfere.

Some time ago planters agitated for a reduction of curing charges, and I believe some firm or firms offered to do it for Rs.35 per ton, but I do not care to say too much on the subject. I will, however, give my opinion, and it must be taken for what it is worth (not much I'm afraid!) I am, however, fully convinced that no honest curer can do the proper amount of work necessary to cure a ton of coffee for Rs.35 per ton and at the same time leave a fair margin of profit for himself. In these days of "leaf" and "drought" the expenses of *garbling* have been very much increased, but the question of curing "freight" is a subject much discussed. Some years ago the B.I. agents offered to contract for Rs.35 per ton, while the coffee steamers were asking 4/- and some planters contracted to ship with the B.I., ignoring the fact that the B.I. rate is 12 cwt. (Bombay scale) at the time or 52/6 for 18 cwt. (coast scale), so the planter was paying 10/- more to ship by the B.I. than he would have had to do with coffee steamers! The shipper by B.I. has the benefit of transshipment at Bombay, with the "luxury" of having coffee delivered in London in "lots," the coffee being shipped by P. & O. at Bombay, and these P. & O. sometimes have no room for the whole consignment! but this I know is a "sore point" so I'll shut up!

"KOLA"

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contains ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.68	"	Phosphoric Acid.

Orders should be booked early for the present crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. Germination guaranteed.

Only thornless variety extant, and is not procurable anywhere from the MANAGER, ARIENKOW ESTATE.

COFFEE.

White ants.

One does hear occasionally of white ants attacking tea, but we do not remember ever having seen or heard of similar cases in coffee. Yet, among the various ills the unhappy Shiré Highlands planter has to put up with, is this formidable pest. Says a correspondent to the *Central African Planter*:—

"Until I came to Namasi I never saw coffee injured by white ants, but here they are not so particular as they do the same to several other plants, dead or alive. The ants are larger, and they almost do without the usual tunnel of soil or clay, and climb the trees on a dull day or in the night time, without any protection but shade. They do more harm in the wet season. Where the coffee is stronger they leave a longer stump which grows again, but young coffee are cut down level to the ground and seldom recover. Mr. Ferguson of Coorg had never seen white ants do the same in India. Only a few acres are affected badly, but there are a few all over the plantation."

King Coffee!

Our good friend the *Ceylon Observer* still sticks to his opinion that coffee cultivation is practically abandoned in South India. The reason he bases his contention on is the fact of the steady decline in crops, which decline he apparently entirely attributes to land going out of cultivation. This is not so. The reason of the shortage of crops is due to successive bad seasons, coupled with very bad attacks of leaf disease. Let our worthy but aged contemporary attempt a trip to the coffee districts of South India and see what land he can pick up fit for planting coffee in! The good old king may be decrepit, but he is not quite so moribund here as Island folk would fain believe. The contrast between the position in the East generally and that of the West is certainly striking, i.e., that while 20 years ago the produce of both was about the same, the West now say twelve times as much as the East.

Cuttings.

In reading a recent notice of a book called "The Nature and Cultivation of Coffee" by Mr. Arthur R. W. Lascelles, we notice the following paragraph:—

"It may not be generally known that coffee propagates readily by cuttings; but if the cutting be taken from one of the side branches, it will never form a centre stem, but will always evince the peculiar characteristics of the lateral branches; but if on the other hand, a sucker or shoot be planted, it will form a plant perfect in all respects and in no way to be distinguished from a seedling."

At first sight the fact that coffee can be propagated by cuttings seems more curious than important. Yet if one reflects on the value of pedigree seed, i.e., seed from an always heavy and healthy cropper, which will come true to name, and the difficulty of obtaining it pure, the prominence we have given the matter will be explained. Cuttings from any given stock will be absolutely certain of reproducing the habits of their parent. So that given a hundred really good trees, the commencement of a most valuable young clearing might be made without any difficulty. It seems a great pity that what seems to us to be a point of crucial importance to the industry should be treated with the neglect it has hitherto received.

The Market.

"Throughout the week," says the *P. M. Review* of the 5th June, "trade has been quiet, and still continues dull. There was little demand for the large supply offered by auction on Tuesday last, and ordinary qualities of Costa Rica sold at a

decline of 1s. to 1s. 6d. At yesterday's sales, which also consisted chiefly of Central American and Colombian sorts, good supplies were offered, but less than one-half was sold at about previous rates. Plantation Ceylon still commands high prices."

TEA.

Tea bulking.

We extract the following interesting remarks from a Ceylon exchange:—

As the subject of tea bulking is much in evidence at present, and perhaps justly so, a few remarks on it may not be altogether amiss.

In the early days of the Tea Industry here, a high authority stated in the *Observer* that the way to bulk tea was to put it in a heap from the bins, then spread it out in a circle, then heap up again and so on till a perfect equalization was obtained. This is a slovenly plan, as the coolies would be kneeling or squatting amongst the tea.

In absence of a bulking cylinder, a neat and sure way is to operate on a floor 30 or 40 feet in length by 10 feet in breadth, the tea brought from the bins in pails or bags, then poured out shoulder high, from end to end of the space above mentioned. All bins containing the grade should be opened simultaneously, and the charges of pails or bags poured out alternately from the several bins. When finished the heap of tea will be at an angle, like road metal, several feet in width at the base.

The tea of various fields, and days' makes, will now be in *strata* in the heap; all that is required is to turn it carefully from end to end twice. The further handling of the tea in final firing and packing will thoroughly mix it, all differences will be incorporated, or bulked. This work is soon learnt by coolies, and is done very speedily and costs little or nothing; but it is so very important for both buyer and seller, by samples, that the Superintendent should see it done. Should he choke with the tea bloom, no matter. It is easy to *close up the ranks!*"

The Home Market.

Indian Teas.—Although only about 7,900 packages were offered at this week's sales, says the *Produce Markets Review* of the 5th June, this quantity proved in excess of requirements, as the larger portion consisted of undesirable sorts. Prices generally for the common kinds were irregular and in some cases easier, but the more useful parcels fetched quite former rates. The medium descriptions were again well competed for, and brought stiffening rates, and the tendency of the market for these is towards higher prices, as short supplies appear probable. For fine and finest teas there was active competition, and for the few lots offered decidedly firmer prices were paid. The first estimate of the coming crop amounts to 156,500,000 lbs.; of this quantity 138,500,000 lbs. will be available for this market, or 6,000,000 lbs. more than in the season 1896-97. The reports from Calcutta are not of a favourable character respecting the quality of the tea coming forward, and, from the prices fetched at public sales, it would appear that a large proportion consisted of the common sorts, with

which this market is overburdened. The figures for May, as compared with the same month last year, are, on the whole, favourable. The imports were 493,000 lbs., against 235,000 lbs., while the deliveries have increased 1,400,000 lbs., the quantities being 11,232,000 lbs. and 9,831,000 lbs. respectively; the excess in the stock, although 5,465,000 lbs., is smaller than in the previous month, but it is still equal to about three months' consumption. The public sales comprised 7,903 packages, 1,604 of which were withdrawn, consisting mainly of the commonest descriptions. At Calcutta, on the 3rd inst., 9,000 packages were submitted to public auction, and, owing to the poor quality, low prices ruled.

Ceylon Teas.—The quantity catalogued this week for public sale has again been large, but notwithstanding the increased quantity brought forward, and the advent of the Whitsuntide holidays, prices have been generally firm, while in some cases a hardening tendency was noticeable, with an occasional advance. This was more particularly the case with Broken Pekoes, about 8d to 9d, which were in strong demand, and although the market cannot be actually quoted dearer for these grades, higher prices were in a few cases paid. The finest descriptions, as is usual at this period, are scarce, and command high prices. At the public sales 28,900 packages were offered, of which about 2,200 were withdrawn. The following are the figures for the past month compared with May last year: The imports amounted to 8,142,000 lbs. against 7,466,000 lbs., and the deliveries were 8,919,000 lbs. and 6,749,000 lbs., while the stock stands at 19,953,000 lbs. as compared with 18,557,000 lbs. The exports from Colombo during May amounted to 9,500,000 lbs., which are considerably below the estimate.

DISTRICT ASSOCIATIONS.

WYNAAD.

Next Meeting postponed from July 7th to July 21st by request.

PROCEEDINGS of a General Meeting held at Meppadi Club on Wednesday, June 9th, 1897. Present:—Messrs. Day, Handley, R. Lamb, Mackinlay, Powell, Robinson, Romilly, Taylor, Trollope, Waddington, Winterbotham, and Mr. Hockin, *Honorary Secretary*.

1. *The Proceedings of the General Meeting of March 3rd and Special Meeting of May 19th* were taken as read.

2. *S. I. P. E. C. Report.*—Read three circulars from Sec., U. P. A. S. I., re Report of the South of India Planters' Enquiry Committee. Resolved—That the Hon. Sec. address the Chairman, U. P. A. S. I., and the Honorable Mr. H. P. Hodgson, requesting that a copy of the report be supplied to the Hon. Sec. of every Association at least three weeks before a Committee Meeting is called and that the final consideration of the Report be postponed till the Annual Meeting of the U. P. A. S. I. at Bangalore in August.

3. *Powers of Delegates to U. P. A. S. I. Meeting.*—Read circular from Sec., U. P. A. S. I., requesting the opinion of the Association as to whether delegates to the Annual Meeting of the U. P. A. S. I. shall be free to hear all arguments and discussions and then vote according to their convictions, or if they shall be instructed to vote only in a particular manner. Resolved—That except on minor points it is impossible to expect any Association to be bound in any matter, on which planters feel strongly, by the act of a delegate voting contrary to, or in ignorance of the views of the majority of that body; and that it is desirable that no matter of any importance be decided at any meeting of the U. P. A. S. I., unless the matter has been fully explained to District Associations two months before such meeting.

4. *Individual Membership, U. P. A. S. I.*—Read two circular letters from the Secretary, U. P. A. S. I., explaining Mr. Parsons' scheme. Resolved—The meeting is entirely opposed to any scheme of Individual Membership.

5. *Advance of 50 % on last year's subscription.*—Read letter from Sec., U. P. A. S. I. Resolved—That this be treated as a donation to the U. P. A. S. I.

6. *U. P. A. S. I. Reserve Fund.*—Resolved that the money paid by this Association towards the expenses of the S. I. P. E. C. and by members of the same to the Reserve Fund shall be considered as the Wynaad donation to the Reserve Fund. The Association disapproved of a large Trust Fund but does not object to the present moderate Reserve Fund to meet emergencies and to be augmented out of income as occasion serves.

7. *U. P. A. S. I. Finances.* Chairman's scheme for re-organising finances and voting power.—Read letter from the Sec., U. P. A. S. I. giving details of this scheme. Resolved—That this meeting approves of the Chairman's scheme.

I. To abolish the present system of subscriptions and votes.

II. To raise funds by an assessment of 1 anna per acre on the total registered acreage held by members of each Association.

III. To allow each District Association 1 vote for every Rs. 10 so paid, it being understood as the Chairman explains that—

1. Each District Association may raise its assessment in any way it likes.

2. No Association is obliged to pay the full assessment.

3. The only penalty for not doing so will be a proportionate loss of votes. Under the above conditions the Association would be willing to agree to an assessment of $1\frac{1}{2}$ anna per acre if such was thought necessary, provided that (a) The increased subscription from each Association shall include all future subscriptions of members to the Reserve Fund. (b) That any surplus of income over expenditure be transferred yearly to the Reserve Fund. (c) That in any year in which the expenditure of the U. P. A. S. I. exceeds the income, the loss shall be made good from the Reserve Fund. Resolved also that as this is a matter of vital importance it be left for final confirmation till next meeting.

8. *Registration, U. P. A. S. I.*—Read circular from the Sec. U. P. A. S. I. The meeting approved of such registration.

9. *Address to Queen Empress.*—Read circulars from Secretary U. P. A. S. I., announcing that the casket and address were ready enclosing copies of the address and promising photographs of the casket. Recorded.

10. *Scientific Investigation of Leaf Disease.*—Read circular from Secretary, U. P. A. S. I., enclosing letter from the Hon. Sec., South Mysore, proposing this. Resolved: the meeting approves the Honorary Secretary's reply thereto and thinks no useful purpose will be served by such investigation.

11. *Malarial Parasite.*—Read U. P. A. S. I. Secretary's circular giving copy of order of Government of India stating that no enquiry is possible at present, but the subject will not be lost sight of. Recorded.

12. *General Proxies.*—Read U. P. A. S. I. Secretary's circular. Resolved that the meeting does not approve of general proxies.

13. *Statistics.*—Read U. P. A. S. I. Secretary's letter. The Honorary Secretary was instructed to inform the Secretary that the Association are prepared to abide by the return of 11,000 acres of cultivation given in the South of India Planters' Enquiry Committee Report as the total for the district.

14. *Famine Fund.*—The Hon. Sec. stated he had received and forwarded to the Sec., U. P. A. S. I., Rs. 1,195, as the total contribution to this fund from the Wynaad Planters' Association, and was requested to print the list of subscribers.

15. *Annual Meeting of the U. P. A. S. I.*—Read letter from the Secretary saying this would probably be held on the 4th or 9th August at Bangalore. Recorded.

16. *Delegates to the Annual U. P. A. S. I. Meeting.*—Messrs. C. Romilly and J. W. Hockin were elected as delegates.

17. *Form of Contract under Act XIII. of 1859.*—Read draft of new Contract drawn up by Messrs. Winterton and Edge and correspondence thereon. Reserved for future consideration.

18. *Roads.*—Read letter from Malabar District Board District Engineer stating orders for immediate temporary repairs to the Talipoya Bridge had been issued.

19. *Drafts on Treasury.*—Read letter from Hon. Sec. to Accountant-General Madras, and reply thereto, stating that Govt. were opposed to the granting of such drafts. Resolved—That the Hon. Sec. address the Govt. of India, Finance Department, requesting to be informed why such drafts could not be granted for Wynaad as they are now for Coorg and other planting districts.

20. *Post Office*.—Read correspondence *re* want of money in Vayitri Post Office and with Mr. Powell *re* Meppadi Post Office, showing that complaints on these heads had been attended to. Recorded.

21. *Pay of Police*.—Read letter from Superintendent of Police, Malabar. Recorded.

22. *Malabar District Board Member*.—Read letter from President stating Mr. J. W. Hockin had been appointed as a member of the Board. Recorded.

23. *Poodoopady Rest House*.—Read letter from Mr. Trollope. The Hon. Sec. was requested to communicate with Mr. Ferguson on the subject.

24. *Resident Engineer*.—Read correspondence with Hon. Sec., Nilgiri Planters' Association. Recorded.

25. *Medical Fund*.—Mr. Waddington tendered his resignation as Hon. Sec. of this Fund and was requested to reconsider his decision but regretted he was unable to do so. Resolved—That this Association accepts Mr. Waddington's resignation with extreme regret and takes this opportunity of thanking him for having succeeded in putting the Medical Fund on a sound financial basis and for his services since rendered as Hon. Sec. Mr. Hockin was requested to act as Hon. Sec. and Mr. Robinson as Treasurer of the Fund.

26. *Failure of Service of Warrants*.—Mr. Robinson was requested to report his case to the Hon. Sec. for transmission to the Superintendent of Police, Malabar.

A vote of thanks to the Chair closed the proceedings.

(Signed) G. ROMILLY, *Chairman*.

(„) J. WILLIAMS HOCKIN, *Hon. Secretary*.

COORG.

PROCEEDINGS of the Annual General Meeting of the Coorg Planters' Association held on Monday, 31st May 1897, at the North Coorg Club, Mercara.

PRESENT: Mr. John Logan, *President*; Messrs. A. Bopanna, H. F. Davy, E. A. Fennell, C. G. Maclean, E. L. Mahon, Jas. T. Morgan, C. M. Nanjappa, F. N. Pearse, G. R. Pearse, C. Thimmiah, R.B., J. S. Trelawny, H. C. Wood; G. F. Meiklejohn, Commissioner of Coorg, *Honorary Member*; Major Penno (Visitor); G. B. Wake (Visitor); H. G. Parsons, *Hony. Secy*.

The President welcomed Mr. Meiklejohn, the Commissioner of Coorg, and hoped that he would give the Association the benefit of his advice so far as his official position would permit.

In identifying himself with the Association, greater confidence would result as between officials and the planting community.

Mr. Meiklejohn, in thanking the meeting for the welcome accorded him, remarked that he recognised the prosperity of the Province was largely dependent upon the planting enterprise, and that he would do all in his power to assist the industry.

Annual Report.—The Honorary Secretary then read the report and placed the accounts on the table.

ANNUAL REPORT.

GENTLEMEN,—On behalf of your Committee I beg to submit the following report on the business of the Association for the past twelve months.

Crops.—The season just closed has turned out disappointing; large crops were not expected, but the result was even worse than anticipated.

The prospects for 1897-98 are also poor, and there may not be an improvement on last year.

It would appear that the unseasonable weather is chiefly accountable for these short crops, for in a few exceptional cases they will be good, and even estates that are known to be in a high state of cultivation have unaccountably failed.

Labour has been plentiful and estates maintained in high cultivation.

Borer.—Two successive dry seasons may conduce to severer attacks of "Borer," but the dense shade will probably minimise damage; at the same time the coffee districts are now so heavily shaded that crops have been undoubtedly reduced.

Tea.—Attention has been directed to the introduction of Tea, and the Coorg Government are to be congratulated on the encouragement they have extended towards those willing to experiment and pioneer.

Tea if successful should in years to come assist in establishing the

prosperity of this Province, for the natural advantages, in favour of profitable cultivation, are considerable.

Chief Commissioner.—Mr. Mackworth Young, Chief Commissioner of Coorg, handed over the Government to Col. Donald Robertson in December 1896. A reference to our proceedings for years and our experiences must reconcile us to the fact that the Government of India consider an annual change of Chief Commissioner to be to our advantage.

In Col. Robertson we are fortunate to have an officer who is deeply interested in the prosperity of Coorg, and one who is not new to the Province.

Your Committee in February met the Chief Commissioner at Mercara; a report of the deputation has been circulated among you.

In April Col. Robertson paid a demi-official visit to Coorg, a favour not extended to us by other Chief Commissioners for several years, but one to be noted and appreciated, the more especially as there appears to be considerable discontent among the inhabitants of the Province for probable causes referred to later in this report.

U. P. A. S. I.—Those of you who have obtained copies of the 1896 book of proceedings will have remarked the steady work that is being done by the U. P. A. S. I. Some statistics appeared in the book but were far from complete; however, your Honorary Secretary cannot do more than deal with the material supplied, and trusts that the directory forms just circulated will be all returned. The question of individual membership of the U. P. A. will be dealt with to-day, and you will probably endorse your previous resolutions that the principle is one that must be admitted.

The objections now appear to be imaginary: however, your Honorary Secretary does not propose to press the question at the U. P. A. meeting in August. If delegates are to attend with instructions to vote to order, the business of that assembly would then become a farce.

The Government of India appear to doubt the jurisdiction of the courts under Act XIII. of 1859, and the U. P. A. are watching our interests, but we hear the Chief Justice of Madras declines to allow counsel to appear and argue on our behalf.

Railway.—Your Association have lost no opportunity of urging Railway extension upon which the maintenance of the future prosperity of this Province so largely depends.

Your Honorary Secretary attended a conference at Bangalore in August 1896 convened by Mr. Mackworth Young, but regrets to say that he does not think the subject has progressed.

The interest and importance of the question will lose nothing during Col. Robertson's tenure of office, but your Association feels keenly that no preliminary steps are contemplated.

We have been told to produce figures and we have done so. We asked Mr. Lee-Warner that an expert may be deputed to examine our figures and report on the sources of traffic. We understood from his reply to our deputation in April 1895 that this would be attended to. We now note with mingled feelings from a para. in the *Madras Mail* that the Pudukottah State has started an identical proposal which is to be immediately acted upon. The question of how the line is to enter Coorg, or where it should go, is one which is not of the greatest importance to us. It is our policy to support a scheme there is the best chance of obtaining.

Your Committee believe that the proposed line most in favour with the Chief Commissioner, Mysore Durbar, Commissioner of Coorg, and others is an extension of the Arsikere-Hassan line to Sidapur (Coorg) which if continued from Hassan *via* Yedatore to Mysore on the east and Ammatti-Sampaga Ghat to Mangalore on the west will meet our requirements.

In advocating the above, your Association are fully aware that a more direct and probably better service for the Province would be an extension from Tellicherry *via* Coorg to Mysore; however favourable such a line would be, your Committee must fain admit the proposal does not receive the countenance and support of those with whom the question to a great extent depends.

P. W. D.—We understand the P. W. D. grant has been reduced to Rs. 1,60,000, a sum hardly sufficient to enable the Department to keep up its standard of efficiency.

Your Committee regret that the Province has lost the services of Mr. M. Leslie, late Executive Engineer, to whom a vote of thanks was forwarded from this Association.

We welcome his successor, Lieut. Rivett-Carnac, R.E., who may rely upon receiving from the members of this Association the same support and assistance as extended to his predecessor, and we sincerely hope that his relations with us may be as cordial.

Several roads are required in the Province which at present there is little hope of being immediately constructed, and in the face of a large annual surplus revenue it would seem that more might be done in this department. The following roads and bridges have been urged for years:—

- | | |
|-------------------------|----------------------------|
| 1. Ponnampett-Wynaad. | 4. Sidapur-Suntikoppa. |
| 2. Pollibetta-Sidapur. | 5. Madapur-Hatti bridge. |
| 3. Veerajapett-Nalknad. | 6. Suntikoppa-Somawarpett. |

Regarding the Pollibetta-Sidapur Road, there must be some mistake as to the reason for non-construction as stated in the Administration Report of 1895-96, page 18, para. 167, clause 4.

On 28th December 1895, a report and valuation was submitted to the Commissioner of Coorg, showing that the land compensation was assessed at Rs.1,000 by the Executive Engineer, Subedar of Yedanalknad Taluq.

Mr. A. Bopanna and your Honorary Secretary, and further a deputation of your Association to the Chief Commissioner, Mr. Mackworth Young, on 3rd January 1896, informed him that many of the ryots were prepared to grant land *free*, which land we have not yet heard has been taken over. In face of the above facts, we think it hardly correct to report that this road was not proceeded with owing to the prohibitive compensation asked for by the owners of the land through which the road will pass.

The Bamboo district attach so much importance to this road that they are prepared to agree to a toll to be imposed for the special purpose of providing funds, and would emphatically point out to Government that the road will be of benefit to the whole district and not a few proprietors in the immediate neighbourhood. Attention is drawn to the P. W. D. Administration Report of 1895-96, page 2, section 10, giving an accurate history of this road.

Police.—Until we have an Assistant Superintendent of Police, we need not look for much improvement in this dilapidated force.

The District Magistrate has ample work to keep him employed without the duties of Police Superintendent.

Your Committee would be pleased to hear that they have been mistaken in stating that in the last ten years not one instance of house-breaking into European dwellings has been detected by the Police, and several are well known to have occurred.

A European Inspector has recently taken up his duties, but this is not what we want.

The Province is entitled to an Assistant Superintendent, and we would again urge, as Mr. Lee-Warner pointed out, that the offices of Police Superintendent and District Magistrate are incompatible with one another.

Forests.—Satisfactory rules as to grazing in Government Forests have been published in the *Gazette*, and we are now allowed, at a slightly enhanced rate, to graze all the year round.

The area of Government Forests under all heads amounts to 570,739 acres.

Postal.—The postal communications between Coorg and the West Coast have been much improved, but in the promotion of Mr. Farrer, late Postmaster-General, we have lost one who had personally taken a keen interest in the Province. Witness the mail tonga service.

There have been many complaints as to the inefficiency of the special tongas supplied by the contractor, and it is to be regretted that this department of the Mail Contractor's establishment should be steadily deteriorating.

Motor Car.—A member of your community proposed to run a Motor Car from Mysore to Mercara.

While willing to give every support to the proposal, your Association wish to see matters take a more definite shape.

Coffee Stealing.—There have been no cases of importance reported to your Coffee Stealing Prevention Fund during the past season, and the balances in hand are for the present sufficient.

Jamma.—The imposition of an extra cess of one anna in the rupee on Jamma holdings and all other cultivated lands has caused discontent, and it is a question whether the Government of India are wise to impose a tax concerning the justice and good faith of which there is some doubt, and from which a revenue of not more than a few thousand rupees can be raised.

The alienation of Jamma lands has its advocates, and with certain provisions it would seem advisable.

Bane.—The desirability of a better title to Bane holdings was brought prominently to the notice of the Chief Commissioner in February, and is no doubt receiving his attention.

The enhanced assessment of 4 annas an acre to establish a right seems altogether unnecessary, and had it not been for the strong opposition of Mr. Meiklejohn, our Commissioner, to whom the thanks of the Association are due, a large increase would have been imposed on Bane lands.

With a surplus revenue of 3½ lakhs, the imposition of fresh tax seems unnecessary; but if Government are desirous of establishing right and acting on principle, surely a nominal increase in cess would meet the case.

General.—Mr. L. E. Buckley, I.C.S., officiated as Commissioner during Mr. Meiklejohn's absence on leave, and in place of Mr. Leggatt, retired, Mr. F. E. Carr has been appointed as District Magistrate.

The revenue of Coorg for the year 1895-96 amounted to Rs.9,65,300, the highest on record. The surplus was Rs.3,26,818, as against Rs.3,53,497, but there was an increased expenditure of Rs.27,925 on public works.

The land revenue demand amounted to 3,96,205, of which the revenue from coffee land amounted to Rs.1,33,313, or one-third, and the land record cess yielded Rs.34,873.

The area of assessed coffee lands equals Rs.84,991 acres, an increase of 399 acres, and the coffee crop was about 4,000 tons, worth, say 56 lakhs; the value of coffee property may be estimated at £2,000,000. With reference to a remark earlier in this report as to the discontent among the inhabitants, from information gathered and through the Coorg gentlemen, members of this Association—and who we are pleased to see strongly supporting us—the causes would appear to be: (1) the changes in the rate of land taxes, the people not knowing what next may be sprung on them; (2) the tax of one anna in the rupee on Jamma and all other lands; (3) the tax of 4 annas per acre on Bane; (4) the summary attachment of property when land tax is not paid. As to causes 1, 2, 3, we are strongly of opinion that such variation of taxes creates distrust and unrest always to be deprecated in dealing with a people who cannot understand the object of Government in continually altering rules and customs especially in connection with land. With regard to clause 4, your Association would strongly urge that the Government show every reasonable consideration to the people with reference to revenue demands; it sometimes happens that a person may be in a position to pay in time, but if property is summarily attached and advertised for sale, credit is damaged and discontent set up, due perhaps to the absence of a little leniency. Your Association would especially urge consideration in the coming year; there must be considerable privation caused by several bad coffee crops. Doubtless a certain measure of discontent has arisen owing to the stringent and probably necessary measures in the collection of revenue as compared with former years, but this alone does not account for the apparent unrest and want of confidence felt by the people. Your Committee would draw your attention to the remarks of Mr. Mackworth Young in his review, No. 1816, dated 2nd December 1896, paras. 6 and 7, the more especially where he says as follows:

"In connection with the new settlement, proposals have been made since the close of the year for the abolition of certain antiquated and unequal taxes, for the introduction of a local rate together with a measure of self-government which, if sanctioned, will mark a new era in the administration of Coorg."

"Mr. Mackworth Young endorses the remarks of his predecessor regarding the cheapness of the Coorg administration, and he has endeavoured quite recently to point out how it should be strengthened and placed upon a satisfactory basis. The proposals he has made involve additional expenditure which, however, is fully justified by the large annual surplus of the Province; but the present financial position stands in the way of any immediate amendment. The amelioration of the Police Department is one of the most urgent needs of Coorg."

We trust that this Association may have every opportunity of discussing any new measures that may be under consideration; and venture to hope that Government may allot more funds for works that have been urged for many years prior to the present financial troubles.

The question of experimental cultivation should receive more attention from the Agricultural Department which we are supposed to have, and it would not appear out of place to suggest that the services of a veterinary officer would be valuable where stock forms a large proportion of the capital of the ryot. At present there is absolutely no scientific aid in cases of cattle and other diseases.

These are a few questions deserving of attention and are justified from the annual surplus of the Province, and the increased burdens on land the Government are about to impose.

In conclusion, your Committee sincerely regret the loss of Mr. G. R. Evans, who died in London in May 1896, and who took the greatest interest in Coorg and the affairs of this Association.

More recently we have to deplore the death of an old pioneer in Mr. J. Brewer, who died in Madras.

Accounts.—The accounts are laid on the table in addition to the ordinary work of the Association; there have been the "Famine Fund" and the "Reserve Fund" of the U. P. A., and the work of the Association becomes annually more and more exacting, and your Honorary Secretary trusts you will excuse him for any shortcomings you may have noticed.

The accounts show a balance of Rs.233-8-9 in favour of the Association, but the large outstandings are much to be regretted. Members are earnestly requested to pay up if they honestly wish to facilitate the duties of the Executive.

Reserve Fund, U. P. A.—With few exceptions the U. P. A. Reserve Fund has been loyally supported, and your Committee thank all subscribers for their donations.

Rs.2,981 have been promised by members of the Coorg Planters' Association, of which Rs.2,116 have been paid in and remitted to the Secretary, U. P. A., including Rs.250 paid direct by Mr. W. H. Sprott. Unfortunately several members have as yet promised nothing.

Famine Fund.—Rs.627 have been subscribed to the Indian "Famine Relief Fund" and forwarded through the Secretary, U. P. A.; this amount would probably have been larger, but there was another Fund started in the district to which several had subscribed before the Association subscription list was published. At the Annual General Meeting held on 29th May 1896 there were 66 members on the books of the Association; we have lost during the year two by death, and one recently resigned. One member has rejoined, and the register shows a membership of 78 at the commencement of the new year, an increase of 12, and your Honorary Secretary tenders his best thanks to all those who have supported him during the past season.

Gentlemen, your Committee trust this report will meet with your approval, and now beg to tender their resignations and that of your President and Honorary Secretary, and ask you to open the ballot papers and elect new officials for the year 1897-98.

Proposed by Mr. E. A. Fennell, seconded by Mr. J. S. Trelawny, that the annual report and accounts as read be adopted.

Carried *nem. con.*

Ballot.—The following gentlemen were elected for the year:—

<i>President.</i>	<i>Honorary Secretary.</i>
John Logan.	H. G. Parsons.
	<i>Committee North.</i>
W. M. Ball.	H. Mann.
E. A. Fennell.	E. Meynell.
W. G. MacKilligin.	W. H. Sprott.

	<i>Committee South.</i>
A. Bopanna.	J. S. Gerrard.
E. M. Breithaupt.	H. G. Grant.
F. W. Gerrard.	A. Lambert.

Proposed by Mr. Fennell, and seconded by Mr. Davy, that the ballot papers be revised before next year.

Mr. Davy pointed out that one or two members were noted as North Coorg, whereas their interests were chiefly in the South, and suggested alterations. *Recorded.*

Delegates, U. P. A. S. I.—Resolved that one member be elected by the North Coorg Committee and one by South, and one by the Coorg gentlemen, to accompany the President and Honorary Secretary to the meeting of the U. P. A. S. I. in August.

Circulars, U. P. A. S. I.—The Honorary Secretary then acquainted the members with contents of various circulars received from the Secretary, U. P. A., from 1st March to 31st May. *Recorded.*

Individual Membership of the U. P. A. S. I.—It was resolved that this Association do adhere to the resolutions already passed that such members are desirable and should be admitted.

The Honorary Secretary then made the following statement with reference to this question. Mr. Parsons spoke as follows:—

"I have circulated through the Secretary, U. P. A., to the various Associations a modified and detailed scheme for individual member-

ship of the U. P. A. S. I., but if the principle is accepted, details as to rate of subscriptions, etc., may be fixed by the meeting.

"I have, however, informed the Secretary, U. P. A., that there is no intention of submitting the scheme if delegates are deputed to vote to order. I maintain in this case that the meetings of the U. P. A. would become a farce. Delegates may receive instructions, but should be allowed discretion to vote as they may deem fit after hearing arguments in the course of debate.

"The objections to individual membership are now brought down to two heads, viz.:—

1. Association of Associations.

2. Balance of voting power.

As to (1) I have no wish to alter the constitution of the U. P. A. as an Association of Associations, but to enlarge the scope of membership. (2) The limiting of individual members to the number of votes owned by an Association obviates the possibility of units combining and outvoting their Association delegates. Where then are the objections to individual members? Unless it be that one Association by delegates and individuals may become too powerful: this may be possible if one district does its duty more than another, but the remedy is obvious.

"I am firmly and honestly convinced that if the U. P. A. really wishes (1) to increase its income and establish a Reserve Fund (2) and to create a direct personal and active interest in its affairs throughout the planting community of S. India, then membership is the only means of securing these objects.

"Other Associations do not think it will succeed. I go so far as to say, give the scheme a trial for two years, and I am prepared to accept the result as final.

"Other schemes such as that District Associations shall subscribe Rs.1,000 a year are worthy of consideration, but I have no hesitation in saying that no guarantee can be given by any District Association for, say, ten years, and as far as we in Coorg are concerned, we are unable to hold out any promise of such a thing.

"It would mean increased subscription. Those who are prepared to join the U. P. A. would not object, but there are many who would go off the list, and for my part I shall be curious to see how the method of raising funds in Mysore is found to work smoothly.

"However, it matters not what scheme is adopted. Coorg, I am positive, will loyally support the majority, and if questions are carried against us, we should be the last to hint at secession.

"I see an influential member of one Association informing his meeting that if individuals are allowed, one Association after another might secede.

"I cannot permit such a statement to pass unchallenged, because it appears to me uncalled for and ill-advised, and I am confident the U. P. A. is not constituted on such a very slender basis as we are asked to believe.

"The Chairman, U. P. A., is to draw attention to the finances and move a resolution.

"I am glad to have your support as to individual membership, for it appears conclusive that voluntary membership of the U. P. A. is the only way to preserve District Associations as at present and to improve the finances of the U. P. A., and it is pitiable to think that the chief Association should be crippled.

"The scheme of buying votes might end in the U. P. A. becoming the property of the richest Associations, which is undesirable. It might be arranged, however, for Associations who prefer it, to have their votes in this form, but let others such as ourselves have them through the voluntary membership of individuals. I believe there will be a more permanent increase by the latter than can be expected from Associations. Gentlemen, I will not say more; the question may come up in August at Bangalore, when some satisfactory solution should be devised.

"I would withdraw my scheme did I honestly think there was more in the objections than a fear as to what might happen, but as these objections to my mind are more or less imaginary, I persevere, and am convinced that when we see some 300 or more individual members of the U. P. A., then, and not till then, we may flatter and console ourselves that every thinking and patriotic member of the community takes a real and active interest in the great Association."

(Signed) JOHN LOGAN, *President.*

H. G. PARSONS, *Honorary Secretary.*

MARKET SUPPLEMENT.

SATURDAY, JULY 3, 1897.

COFFEE.

Latest advices from London are dated 11th June, and state concerning Coffee:—This market, which has been closed since the date of our last report, reopened yesterday, when supplies to a fair extent were offered at auction. An important parcel of Ceylon Plantation shipped from Trieste was limited above market ideas, but the remainder direct import realised steady values. A small proportion of good Costa Rica and fine East India sold with good demand at full to extreme prices, but for the greater part, which comprised less desirable qualities, the competition was slow and prices, as a rule, shew a decline of 1s to 1s 6d per cwt. The market for futures opened with a stronger tone, but subsequently became quiet, and quotations are rather irregular at the close, viz:—

London.....Santos.....September delivery	...	38s 3d.
New York ...No. 7 Rio.....	" "	7.35 cents.
Hamburg Santos.....	" "	38½ pf.
Havre Santos.....	" "	47½ francs.
Holland Good ordinary Java		46½ cents.

Imports Deliveries and Stock of COFFEE in London are as follows:—

	STOCK.		IMPORTS.	
	1897.	1896.	1897.	1896.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (June 11, 1897) says Public Sales were resumed yesterday after a week's interval, and moderate supplies brought forward met fair competition at about unchanged rates. Over 1,600 bags East India were offered and realised value for all qualities.

Central American kinds sold irregularly, good prices being obtained Costa Rica, whilst Guatemala and Columbian went rather easier. A qu tone has prevailed in the Terme market and quotations show little or change since our last.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report of June 11th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	7,903 packages.	37,922 packages.	701 packages.
1896-1897...	10,642 "	52,530 "	2,502 "
— pkgs. INDIAN	8,301	Total 8,301 packages were offered in public auction this week.	
— " CEYLON			
— " JAVA			

The Home Consumption and Exports of British Grown Tea during season just closed, although large, have not equalled the quantity imported.

SUPPLEMENT TO "PLANTING OPINION."

Analysis of Export of Tea from U. K. (not including transhipments).

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 16th July 1897.

Lower Pulneys. **AHTOOR, 6th July.**—*Weather.*—Rainfall for June 1'25 inches; no rain since the 19th or 20th ultimo, very hot and dry. Clouds forming up during the last day or so. No planting done yet. *Crops.*—Prices of grain have not altered. Crop prospects very poor all round, owing chiefly to unusual rainfall early in the year. *Plant-diseases.*—*Green bug:* I can't trust myself to record my opinion of this for fear of shocking the susceptibilities of your readers. *General Health.*—Has been bad during the past two months. Many coolies as well as managers down with fever. Some deaths in the lines. General health improving now however. *Labour.*—Rather scarce owing to local gangs having gone down with fever and being afraid to return to work yet awhile. *Interesting Items.*—There is a talk of the Mangalore Estate changing hands again.

Nellampathy, British.

7th July.—*Weather.*—Rain for fortnight 4'91; total for year 41'68. We have had a delightful break of about 10 days and now the rain seems setting in again. Planting is progressing on estates generally, and the last week has been "planters' weather" (far above "Queen's"!) with little or no rain during the day and nice showers at night. I was somewhat out in my last report when I said the average rain for the district in the fort-

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; and Quarterly, Five Rupees, including postage.

ADVERTISEMENTS.—Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

N.B.—Remittances should be sent to the Managing Proprietor of this paper, Coonoor, Nilgiris, South India.

night was 35 inches. It would be nearer 45, I think, from what I have heard. Rice, &c., very dear, 8 dingalies per rupee, gram 11½. *Plant diseases*.—In statu quo. *General Health*.—Bad, a great deal of sickness among coolies. Fever and dysentery very prevalent and Europeans on new estates not exempt. *Labour*.—Fairly plentiful; cultivation in the low country has kept back the Moplas, but they are now beginning to come up freely. Tamils nearly all up, such as intend coming at all. Maistries have mostly full gangs this year. Sorry I quite forgot about weekly edition coming out. Two tigers were shot the other day, or rather one one day and one the next, and a third badly wounded, otherwise very little game about.

Coorg.

POLLI BETTA, 5th July.—*Weather*.—Seven absolutely rainless days after the monsoon has fairly started is rather too much of a good thing. On the 19th ultimo we were favoured with a deluge amounting to nearly 6 inches in the 24 hrs. Of course it goes without saying that this sort of thing is to be deprecated, as also the monsoon drying up entirely. On the 20th a lighter state of affairs set in, which made it very favourable for planting; but on the 25th rain ceased and it continued rainless till the 3rd inclusive with the single exception of the night of the 1st instant when there was a fall of 15 cents. On the 14th there was a fresh 'burst,' which has been light so far with daily downpours not exceeding 40 cents. It is expected that it will be heavier next week. *Plant diseases*.—With the exception of some borer showing up, coffee is looking in prime condition. *Labour*.—Tamils beginning to come in. Work getting on, but there is a dearth of skilled coolies for planting, &c., in parts. *Public health*.—Fair.

Central Travancore.

PEERMAAD, 3rd July.—*Weather*.—The monsoon set in on 5th June, but first five days were not at all bad; the monsoon pucca began on 11th and from then till 22nd inclusive it poured almost continuously, no less than 51.44 inches falling in the 12 days; since that date the weather has been almost perfect, not sufficient rain for those who have new clearings to plant. Total rainfall for June 60.95; for year 74.49 inches. *Crops*.—Tea flush gradually falling off. *Labour*.—Tamil labour short, but Malayalees coming in plentifully, as rice is very dear in the low country now, consequent, I believe, on the merchants having formed a ring and holding their supplies. *General Remarks*.—Roads, as usual in monsoon, are in a disgusting state. A bridge on the Eastern Ghât over the Periyar stream has been carried away and the road is impassable for cart traffic. All rice has now to be got from Cochin. Price Rs.9 per bag.

Nilgiris.

COONNOOR, 7th July.—Raining again at last, thank goodness, for coffee, especially low coffee, wants it rather badly. Tea generally shut up, very bad go of flush worm last month. Leaf in coffee is showing up in parts. *Labour*.—Ample. *Health*.—Fair. Prices of grain getting higher every week.

KIL KOTAGIRI, 6th July.—The weather was hot up to the 3rd; on the 4th we got a small shower with clouds; since then I am glad to say it has been raining off and on all day nearly. Planting will begin again with the first large shower. Handling is started everywhere now I think; some estates that were behind with thin pruning are doing the two works as one. Coolies are coming up again, and all the estates will, I hope, have full gangs by the 15th. Shade is being cut down on all the estates or rather lopped up. The wet season we had this year has, I am afraid, done damage to all the estates, especially those under shade; there was no time to force out the spike, with the shade out I hope there will be a wet season next year. Ragi about 19 measures; all grain still dear.

S. E. Wynaad.

PUNDALORE, 7th July.—*Weather*.—In my last report I stated that when it was very hot we wanted rains and now we want the sun to shine a little to warm us, but it is hard to expect what we want from Nature. Unexpectedly Nature granted the request. There was a break from the 25th June to 4th July; it was very hot both day and night and made one to suppose that he was on the African Coasts. All planting operations were stopped. On the 5th the monsoon burst again and unceasingly pouring and overflooding the paddy fields followed by heavy winds. From yesterday the planting operations have begun. *General Health*.—Very good. *Labour*.—Excess, where ready payments are paid. *Plant-disease*.—Leaf-disease is beginning to show on the weaker plants. Liberian looking splendidly. *Crops*.—Swelling nicely and on some plants the cherry is very ripe and picking necessary. Paddy is being transplanted and the ryots are very busy at the plough. *Interesting Items*.—The *Planting Opinion* is to be published weekly instead of fortnightly as heretofore. If it copies out the telegrams and some news of the day as the *Nilgiri News*, overland weekly editions of *Madras Times* and *Mail*, I think will be a boon to some of the lowly-paid Superintendents, who cannot subscribe for those highly charged papers, and subscribers may increase if they can get a chance of weekly reading from the *Planting Opinion*.

GENERAL NOTES AND ARTICLES.

CHEMISTRY AND MECHANICS OF CULTIVATION

THIS subject, if followed in all its ramifications, covers nearly the whole course in agricultural chemistry, as well as a short treatise upon simple mechanics. We will not be so ambitious as to attempt to deal with it in its entirety, but merely purpose to review a few salient points as briefly as compatible with lucidity.

In a recent lecture by Dr. W. C. Stubbs before the American Agricultural Association, the lecturer sets forth how intimately the agriculturist has to concern himself with the operations of the two great series of ever acting forces in nature, the constructive and the destructive. These forces are gravity, heat, water (alone, as a vapour, liquid or solid), water charged with carbonic acid, oxygen of the air, chemical affinity, vitality and a lower form of the same, i.e., ferments. Insignificant in themselves, these forces have produced all the changes in the earth's surface and are still acting with undiminished intensity. The internal heat of the earth, the deposition by water of rock material, solidified by pressure, and other causes are but in the process of rock-making. As soon as rock appears the destructive powers of nature attack it, so as to render it suitable for the support of plant life: first lichens, then mosses, grasses and weeds, and finally shrubs and trees. At the same time, moving water is constantly at work transporting much of this material at lower levels. As soon as enough alluvial matter is deposited, rock-making begins again by pressure. This transformation is first exemplified

The most comfortable and convenient for visitors.

TERMS MODERATE

in the hard pan which occurs underneath nearly every soil which is cultivated with shallow implements.

Our first and primary object is to arrest this tendency to rock-making, to open up the first 12 or 18 inches of soil to the disintegrating influences of air, water and vegetable matter. The larger and deeper the roots of our crops, the more effectively they work towards this end. But to enable these deep roots to develop, the soil must be deeply broken up. For the soil is their home; therein they must find their food, their drink and their air. Without air and water the rock dust will not yield up its stores. So that the amount of soluble food available is largely determined by tillage.

Another object in breaking or inverting soil is to destroy weeds or grasses and relieve it of the foulness of excess of vegetable matter. Yet another is to control moisture. To support our crops, the soil must be of a certain warmth. If the land is water-logged, the consequent evaporation produces great cold. Land must therefore be relieved of excessive moisture, and this is done by draining and by so tilling the soil as to expose the greatest possible surface to the air. On the other hand, droughty soil should be kept "flat," and much drainage should be avoided. This retards evaporation and keeps the soil moist.

Soils vary immensely in their capacity for retaining water. Some will carry 51% of their weight in water without dripping, while others will barely hold 20. The former when containing 12% are too dry for successful cultivation of crops; the latter will sustain plants when holding only 1½ to 2% of water. The differences are due to the percentages of clay, silt and sand contained in the soils. The more clay, the more water held; the more sand, the less the soil can retain. As too dry a soil is as bad as too wet a soil, a true loam (mixture of sand and clay) is best adapted for cultivation as a rule. It has been found that about 50 to 60 per cent. of the water-holding capacity of every soil is the amount best adapted to rapid growth.

So much for the physics, the chemistry and the geology of breaking soils.

If this work has been intelligently performed, subsequent planting and cultivation are simple processes. If badly performed, tilth as well as cultivation proper should be kept in view. By "tilth" is meant the best conditions for the growth of crops. It should be obtained if possible before planting, so that the after cultivation is purely one of culture, that of the maintenance of tilth.

Cultivation is too often regarded as a process of destruction of weeds and grass, and is resorted to only for such purposes.

True cultivation should look only to the preservation of tilth which a proper preparation of the soil has established. It involves only two principles—the maintenance of the most rapid rate of nitrification and other chemical changes, and the conservation of the proper amount of moisture. Nitrogen is the most costly of the ingredients of plant food. It is also the most fugitive. It is derived chiefly from organic matter which, by a process of oxidation, is converted into nitric acid. The salts of nitric acid are extremely soluble, and, if not utilized at once by growing plants, is washed out by heavy rains. Hence there is a gradual development of nitric acid during the period of growth of plants, and the process by which this oxidation

of organic matter into nitric acid is accomplished is called nitrification.

This oxidation is going on in every fertile soil, and when stopped, even though the soil may be rich in vegetable matter containing nitrogen, the plants thereon must also stop their growth. What is necessary for nitrification? (1) Organic matter containing nitrogen; (2) a certain amount of moisture; (3) a free access of air; (4) a certain temperature; (5) a mild alkali with which the nitric acid can combine when formed; (6) the presence of minute microscopic organisms or ferments. With these conditions fully maintained, nitrification is most rapid and effective, and the growth of plants is just in proportion to its rate. It can, therefore, be readily seen how cultivation tends to maintain the proper conditions for rapid nitrification. Many beneficial effects of cultivation can now be easily explained. We cultivate shallow, because such a process not only prevents destruction of roots of the plant—an *evil always to be avoided*—but also because nitrification takes place in the upper layers of the soil, and by the act of cultivation the ferment is well scattered. Again the temperature at which fermentation is most active is about 90 deg. to 110 deg., and this temperature obtains in the upper layers of the soil. The action of the ferment is suspended at or about 50 deg. and 150 deg. It is destroyed by high heat and electricity; hence when lightning strikes a soil, nothing will grow where struck for some time afterward.

The presence in small quantities of lime highly favours nitrification. Moisture in excessive quantities excludes the air and suspends the vital activities of the ferment; hence the necessity of drainage. The absence of moisture is equally as objectionable, and here the second object of cultivation promotes the first.

From these considerations it will be seen that frequent cultivations, provided no roots are cut, are favourable to rapid nitrification. Soils cultivated daily produce better than the same soils cultivated weekly, and the latter better than those cultivated less frequently.

Besides the beneficial effects of rapid nitrification, other chemical changes of great practical value are induced by shallow and frequent cultivation. The soil is a great laboratory, and the chemical changes taking place there are complex and continuous, and frequent stirrings accelerate these changes and give increased available plant food. Stir the soil if possible always after rain, but never while still wet, as this latter destroys rather than aids the ferment of nitrification.

The second object in cultivation is to conserve the moisture. On the approach of a drought, very shallow and almost continuous cultivation should be practised. A layer of finely divided soils thus made checks evaporation just below the surface. Again, finely divided soils have the power of absorbing hygroscopic moisture from the air (from 1½ to 23 per cent.), which is important in a prolonged drought with heavy dews at night.

In conclusion, all soils are comminuted rock particles, and must be broken and exposed to the disintegrating agents, to prevent incipient rock-making, to furnish easy permeability to roots, and to yield soluble food for the plant.

Cultivation should look only to the maintenance of tilth and moisture, and should be practised frequently. The instruments to be used depend largely upon the character of soil used.

Labour in Native States.

The position of planters in certain Native States is rapidly becoming most critical. To such straits are they reduced that we are given to understand that a certain Travancore firm imported a large number of famine coolies, agreeing to pay their expenses both ways, for a contract term of working of only five months. Despite these liberal terms, a large proportion of these "famine" coolies bolted away back to the fostering care of a seemingly over-generous Government.

A New Chlorophyll Theory.

At a recent meeting of the Academy of Sciences, M. Etard communicated a note on chlorophyll. As the result of a prolonged chemico-biological research upon the relations of chlorophyll-bearing organs, he has demonstrated that of different species of plants each has various chlorophylls differing from the chlorophylls of other species. Every plant, says M. Etard, requires a certain number of chlorophylls to hold captive the heat and light rays by means of special "bands of absorption," which select for every molecular change the particular heat and light waves that suit them.

Ceylon labour supply.

There is no doubt that this question is of as great interest to India as to the Island: for if the 100 thousand more coolies that are required within the next two or three years are obtained, it may have momentous effects on our own supply. And not only will it affect that, but indirectly the markets for plantation produce generally. As the local *Times* points out, the estimated labour would be sufficient to bring into cultivation tea land enough to produce an extra 30 million odd pounds of tea. And besides the plantation coolies, a keen competition arises in the P. W. D. Roughly, Ceylon, which now employs about 200,000 plantation coolies, wants another 150,000 for all its needs, and that very soon.

Cacao profits.

A very general impression prevails that cacao, though fairly sure, is by no means to be compared with coffee or tea as a paying investment. Yet we are assured that, in Ceylon, granted suitable land and a good jaf of plant, returns of from 12½ to 18 per cent. can be reasonably expected on the capital invested. And this, it must be remembered, is with crops of 2 to 3 cwt. only per acre with an average price of 68s. per cent. As regards "pests," for the first ten years of its existence there is no more troublesome tropical product than cacao to tend and foster. After that age, the West Indian experience is that very little in the way of disease or insect attacks may be feared, though in Ceylon no marked immunity seems to obtain even then. It is generally conceded that the best, i.e., the hardiest, varieties are those known under the name of forasters.

A contrast.

Ceylon enjoys the distinction of being the most pushing and successful of all our plantation colonies. More than any other colony or dependency in the British Empire does the prosperity of this Island depend on the position of its planting industry. In a long and genial speech at the recent Old Colonists' Dinner, the Governor contrasted the position of the Island in 1837 to what it is now with telling effect. The population then was only 1¼ million, it is now well

over 3; the revenue was under 3½ million rupees, it is now 21; the imports were only 5 million rupees, they now amount to 77. Of roads there were only 240 miles, now 3,500; of schools only 35, now 3,900; of hospitals now 65.

A grand record of prosperity, which H. E. the Governor frankly owned was due almost entirely to the perseverance and ability of the great planting community of the Island. If it were possible to collect comparative statistics of scattered planting districts of India, North and South, we doubt not in the least that the record would be well nigh as striking.

The Wright Subscription Fund.

Mr. J. W. Minchin writes from Ootacamund on the 5th inst. as follows:—

An account has been opened at the Bank here in the joint name of Mr. Henry Wapshare, of the Ouchterloney Valley, and myself, and we will disburse the money as may be necessary for the family. The following subscriptions have been made—amounting Rs.398-8-0—and some gentlemen are giving an allowance monthly for the support of the family. The R. C. Mission have most liberally offered to take charge of some of the children, and there is prospect of the three eldest being provided for.

Subscriptions collected for the Family of the Late Adolphus Wright of Wynaad.

Chemistry of Cacao.

Several varieties of *Theobroma Cacao* are indigenous to South Africa and are cultivated in the East and West Indies, and parts of Africa and Australia. Each fruit pod (8-10 inches long) contains 30-40 seed imbedded in pulp. This must be fermented to allow of isolation of seed, and much depends on the way this is done. The beans are then dried and rolled very carefully. The brush is then separated, and the resultant kernel are known as cacao nibs. These contain about 50 per cent. of fat or cacao butter; 12-14 % albumenoids; 8-9 % cellulose; 2-3 % of starch, and ap

able quantities of sugar, gum, tartaric acid, and 'cacao-red', this last resulting from the oxidation of the annin. Far less tannin is present than in tea. The most important ingredient is the cacao-alkaloid theobromine (1 to 4 %) which chiefly gives the stimulative and refreshing properties. It is a white powder with a very bitter taste, markedly poisonous in large doses, and is closely allied to caffeine and theine, acting as a stimulus on the heart and as an excitant on the nerves. Cacao also always contains a certain minute proportion of copper.

Being so "fatty" it cannot be simply ground into powder. There are two methods of preparation which yield (1) essence or extract, (2) ordinary cacao and chocolate. In the first method the material is warmed and part of the fat is separated by pressing it out when melted. In the second process the crushed nibs are "diluted" with sugar and various flours. The essence or extract is more wholesome, by virtue of the removal of the fat, than the powdered cacao or chocolate. Alkalies are added in the latter cases to prevent the appearance of oily globules on the surface of the prepared beverage.

Cacao is certainly more nutritious than tea, but as a rule this is due to the large percentage of flour starch and sugar that it contains. Cacao butter is a valuable bye-product much used by chemists, and in the preparation of expensive soaps. The husks themselves are used in Germany, and a little in England, like tea.

COMMERCIAL NOTES.

THE *London Commercial Record* of 18th ultimo is responsible for the following:—

According to telegraphic advice from Bombay, the West Coast of East India has at last been visited by the Monsoon. On the 15th inst. rain set in in real earnest, 3in. being measured in Bombay and no less than 7in. in the Calicut districts. This practically brings the Indian season, as far as Mincing Lane produce is concerned, to an end. Very few will regret the termination of a season which has proved most unsatisfactory to all—with the exception of dealers in Pepper. Opening under the most promising auspices, the hopes of those interested in that part of the world were raised to an unusual height, only to be dashed to the ground by the appearance of the famine and the plague. Instead of brisk business, originated by small crops and stimulated by good trade and speculative demand, we have, on the whole, witnessed a slow, dragging market in produce from the West Coast of India. Pepper alone, as we intimated above, made a praiseworthy exception, hardly, however, on its own merits, but in consequence of the unsatisfactory position of Singapore Pepper. Unusual activity prevailed in Tellicherry black, in fact more so than we have ever witnessed here before, and the most extraordinary feature of the movement was not only the demand of Continental agents, who might have been sent into our market to effect a coverture of some Continental bear, without disturbing the particular market of that speculator, but also the strong request in which this usually much neglected Pepper stood on the part of home consumers. We hear that experiments have been instituted with this Pepper with a view of trying its efficiency as a substitute for Singapore Pepper, and we have been given to understand that these experiments have proved highly satisfactory, and that in future we may look for a fresh demand for this description. A great point in favour of this Tellicherry black Pepper is apparently the uniformity of its quality which should be of immense value to the consumer to whom an allowance is not always adequate to the loss he sustains by inferior tenders. We hear that not one allowance has been awarded on all the stuff delivered, which up to the end of April amounted to 76,115 cwts., shipped to Europe. The following comparative figures may be of some interest to our readers. Exports of Tellicherry Pepper from the three most important ports, Tellicherry, Calicut and Cannanore:—

1895			To India.	To Europe.
Jan.-March	...	...	14,438	6,957 cwts.
April	...	...	1,567	10,434 "
			16,005	17,391 "
Total 33,396 cwts.				
1896			To India.	To Europe.
Jan.-March	...	...	28,433	10,109 cwts.
April	...	...	2,778	12,615 "
			31,211	22,724 "
Total 53,935 cwts.				
1897			To India.	To Europe.
Jan.-March	...	...	14,109	48,933 cwts.
April	...	...	4,692	27,182 "
			18,801	76,115 "

Total 76,115 cwts., or an increase of 58,724 cwts., in the exports to Europe in 3 years. Business in this Pepper has now come to a standstill not in consequence of a diminished demand on the part of Europe, but owing to the obstinacy of Indian dealers and planters, who, frightened at the strong demand emanating from a part least expected, have withdrawn from the market and are doing their utmost to secure as much as they can of the available stuff in order to store it away to meet the requirements of Europe which are confidently expected in the next season. The outbreak of the monsoon greatly facilitates their endeavours. With the alarming decline in the supply of Singapore Pepper we think it highly probable that the anticipation of the future of Indian Pepper will be realised. The question is whether the good supply of the latter will not materially interfere with the hopeful anticipations of holders of black Singapore, or will black Singapore in time become such a rarity that it will demand fancy prices? We doubt it. About other produce of the West Coast of India now practically excluded from our market we shall have an opportunity to speak next week.

The Mungledye Tea Company reports increased crop but reduced prices. The amount at credit of revenue, viz., £344, is just enough to pay the dividend on the preference shares, on which an interim payment of 3½ per cent. was paid in December last, and it is now recommended that a final dividend of the same amount be paid.

The Assam Company shows in its 1896 accounts a net profit of £43,294, which, with the sum brought forward, gave a total of £44,160 available for distribution. Out of this an interim dividend of 5 per cent. was paid in January last, and it is now proposed to declare a final dividend of 15 per cent., making 20 per cent. for the year, and to add £5,000 to the reserve fund, leaving £1,728 to be carried forward. With a capital of £187,000 this Company has over 10,000 acres under cultivation. All its gardens are fully equipped with buildings and machinery which has been paid for out of revenue.

The Jokai (Assam) Tea Company's report states that the actual outturn for the past season was 3,466,609lb., against an estimate of 3,232,000lb., being an increase of 234,609lb. on the estimate and of 357,936lb. on the actual growth of the previous year. This large increase in quantity was not made at the expense of quality, but was the result of good cultivation and young tea coming into bearing. The average gross sale price per pound was 10.79d, against 10.51d last year, being an increase of 0.28d per pound. The average sale price of all Assam garden teas disposed of in Mincing Lane during the season was 10d, and of all Indian teas 9d per pound. The area of mature plant plucked was 6,185 acres, showing a yield which averaged 560lb. per acre; the cost of production per pound f.o.b. Calcutta was 8.53d, and, laid down in London, 8.87d per pound, inclusive of all home charges and commissions. The gross profit on the working of the season amounts to £33,046, and after deducting for commission to managers, &c., and for income-tax £5,642, there remains a net profit of £27,403, which is carried to profit and loss account; adding to this the balance brought forward and other profit and loss items there is a total amount for disposal of £30,179. The board recommends a final dividend of 5 per cent., making a total dividend of 10 per cent. on the ordinary share capital for the year, leaving a balance of £2,179. The estimates of expenditure, &c., for the current year indicate a crop of 3,666,000lb. of tea, for an outlay in India of Rs.15,15,700, or at 1s 2½d exchange, £97,615, and with £28,385 for English charges, makes a total of £126,000,

being an annual cost of 8-25d for laying down the tea in London, including all charges but commissions.

The Borjan Tea Company's report states that last season's crop was 136,278lb., and the average price 9d per lb., as compared with 113,371lb. and an average price of 10 $\frac{3}{4}$ d per lb. in 1895. The profit on the season, after deducting manager's commission, is £345, and with the amount brought forward makes a total of £894. The directors recommend a final dividend of 3 $\frac{1}{2}$ per cent. on the preference shares and of 4 per cent. on the ordinary shares, leaving a balance carried forward of £36. The directors have arranged to plant out an addition 200 acres during the present and ensuing seasons on the company's grants. To this end it has been decided to at once issue £2,000 fresh preference capital, and such further sum as may be found necessary for the upkeep of the above area till maturity.

A new departure on "Pearce and Plenty" lines is contemplated, the prospectus having been issued of the *British Tea Table Company, 1897 (Limited)*.—Capital £300,000, in £1 shares, half of which will be called Five-and-a-Half per cent. Cumulative Preference Shares. It is proposed to amalgamate the businesses of two companies, viz., "Pearce's Dining and Refreshment Rooms (Limited)" (more popularly known by its registered trade mark, "Pearce and Plenty") and "The British Tea Table Company (Limited)." It is to be hoped the Company will succeed in stimulating demand for Tea—Indian Tea in particular.

U. P. A. S. I. LEAVES.

(GATHERED BY THE SECRETARY, U. P. A. S. I.)

SOME interesting correspondence that has passed between the Madras Government and the Commissioner of Agriculture, Hawaii, is published in the *Madras Mail* of 3rd instant together with a brief G. O. The subject is "Scale Pests and Lady Birds," which was brought to the notice of the U. P. A. last year by Mr. Howard O. Newport, Honorary Secretary of the Lower Pulneys Planters' Association. At the Annual Meeting in 1896 a resolution was passed requesting the Madras Government to take this subject up with a view to securing for the benefit of this Presidency the services of Professor Koebele, who has greatly distinguished himself in Hawaii by his campaign against scale insects. It was thought that he might be of great assistance to coffee planters by investigating the scale pests that attack the coffee shrub in India.

Writing to the Commissioner, the Government of Madras asked for information on the following points:—

(1) as to the results obtained from the experiments which have been conducted,

(2) as to the approximate cost of obtaining a consignment of lady birds for experimental purposes in Madras and the source from which to procure such a consignment, and

(3) as to whether Professor Koebele could arrange to visit Madras for a short period for the purpose of investigating the insect pests which cause damage to coffee in the Madras Presidency.

Should Professor Koebele consider such visit to be practicable, what salary and allowances he would consider sufficient remuneration for his services and on what conditions he would undertake the visit.

The Commissioner of Agriculture and Forestry, Hawaii, replied as follows, under date Honolulu, 3rd March 1897:—

Your communication, dated the 14th November, 1896, in which he makes certain enquiries concerning the entomological work of Professor Koebele was duly received. I have delayed answering your letter until I could communicate with Professor Koebele who had departed from these islands on a mission to Mexico and Central America, in search of beneficial insects to send to this country. I can offer you no encouragement that Professor Koebele's services

will be available for the Madras Government, at least for two or three years to come, as he is under an engagement to this Government and to the Hawaiian Sugar Planters' Association, each paying one-half of the salary and expenses. The salary paid to the Professor is \$3,000, or six hundred pounds sterling per annum and all travelling expenses. Your first question, as to the results obtained from the experiments which have been conducted, I beg to answer as follows:—Before the engagement of Professor Koebele, the vegetation of the Hawaiian islands was sorely infested by numerous coffee or scale insects, which were so destructive that any industry, except sugar growing, seemed impossible. Particularly were the coffee trees infested with a terribly destructive scale insect (*Pulvinaria psidii*). The tree could not ripen its fruit, the berries turned black and dropped off long before they became ripe. *Tetranychus telarius* (spider) was also present as well as several other destructive scale insects infesting coffee trees. The outlook for the coffee planter was gloomy indeed, and no one had the courage to start a new plantation, although it seemed but a question of a short time when the industry would cease to exist in this country. Now, all is changed, the coffee trees are free of scale pests and blights, and new plantations are being started all over the islands. This wonderful change has been accomplished by the introduction in this country of the natural enemies of the scale pests that were present. The work of finding these natural enemies and sending them to this country was entrusted to Professor Koebele, and well has the work been done. The Professor has sent us beneficial insects from California, Australia, Ceylon, China, Japan and these keep our vegetation practically clear of scale pests. The Professor is now on a mission to find and send to us parasitic and beneficial insects for cut-worms and caterpillars that are injurious to sugar-cane, pastures and garden produce.

Question (2) as to the cost of obtaining a consignment of lady birds for experimental purposes in Madras and the source from which to procure such consignment.—The cost of such a consignment should be but trifling—an experienced collector can collect many hundreds of lady birds in a day. The method of packing them for shipment is to place the lady birds in small, practically air-tight wooden boxes in which some slightly moistened moss has been placed; the boxes should then be wrapped in oil cloth so that no outside moisture can penetrate to the boxes. In order to safely carry the lady birds on journeys of over one week's duration, they must be carried in a temperature of between 30 and 40°F.; this temperature can be found in the cold storage or ice room of all passenger steamships. If transshipment from one steamship to another is required on the journey, a trustworthy agent should be on hand to make the transshipment without delay, for if the lady birds are once thawed out it is fatal to make them cold again. In this manner they can be safely carried on journeys occupying from one month to six weeks. As to the source from where to procure the lady birds, I am afraid that my advice will be of little service to you as I am not familiar with the coccids or scale insects affecting the vegetation of Madras, if there are any of the *Dactylopidi* present, the *Cryptolaemus montrouzei* will surely feed on them. Australia is the nearest country that can furnish that valuable lady bird as well as many other useful coccinelladae. China and Japan also have many indigenous species, some of which have proved of great value to these islands. I would strongly advise against the wisdom of relying on the importation of only two shipments of lady birds and judging from the effects of the importations as to what can be accomplished in this branch of applied entomology. There are over 1,700 different kinds of coccinelladae lady birds catalogued and probably many hundreds yet undiscovered and all are, with very few exceptions, coccid or scale feeders, such as the *vedalia cardinalis* will feed only on one scale, while others, such as the *Cryptolaemus*, will feed on several. In order to obtain the results, all countries within reach of a month's or six weeks' journey should be explored for the beneficial insects they can furnish, the work should be entrusted only to a skilled entomologist, one who has made the life habits of beneficial and injurious insects a special study. While all countries have their beneficial insects they also have those that are injurious, and if the work of collecting is done by a person not thoroughly competent, injury instead of benefit might result.

As to whether Professor Koebele could arrange to visit Madras for a short period for the purpose of investigating the insect pests which cause damage to coffee in the Madras Presidency.—In reply to your question I beg to say that I have communicated a copy of your letter to Professor Koebele and in reply he writes that he feels himself bound to the service of this country as long as we may require

am about to visit the United States and shall be absent from these islands for three months. During my trip I shall visit some of the United States agricultural experimental stations and shall meet several entomologists of established reputation; among them I may find one who would be willing to undertake the work of searching for and introducing beneficial insects to Madras; should you desire to learn the result of my enquiries I shall be glad to send the same on receipt of a request from you.

I have mailed to you under separate cover one copy of the *Planters' Monthly* for December, 1886, containing a Report on insect pests. Two copies of the *Planters' Monthly* for February, 1897, containing the Report of the entomologist of the Hawaiian Government. Three copies of the Reports of the *Minister of the Interior* containing the Reports of the Commissioner of Agriculture and the Government Entomologist. One copy of the *Pacific Commercial Advertiser* for the 27th February, containing an article entitled "The Coffee Outlook."

Upon this, the Madras Government has passed G. O. No. 351, Revenue, dated the 18th May, 1897:—

The following letter acknowledging the receipt of the second of the papers read above and stating that the question of employing an entomologist from the United States cannot be decided until after the receipt of definite proposals from the Planters' Association, will be sent to the Commissioner of Agriculture and Forestry, Honolulu.

It remains now for the U. P. A. S. I. to formulate the definite proposals that are here invited. No doubt the matter will come up for discussion at the Annual Meeting next month.

The British Consul-General at Antwerp has raised the question of giving out a market for Indian Coffee in that place.

The Madras Government has received an intimation from the Government of India that the congratulatory Address received from the U. P. A. S. I. will be duly transmitted to Her Most Gracious Majesty.

PLANTING PRODUCTS IN CEYLON.

The following extracts are from the report of the Ceylon Botanic Gardens and will be found of interest:—

Tea. The year has been favourable to this crop, the export once more being the largest on record. It exceeded 108 million pounds, an increase of almost 11 million pounds over 1895. The area under tea cultivation continues to increase, though more slowly than in previous years. The average price has been lower (about 8½d per lb.) and exchange higher—two circumstances tending to check extension.

The tea plant seems admirably suited to the poor soil of Ceylon, and is also remarkably free from disease; this is probably in great part due to the tannin in the leaves. It will not do, however, to assume too great permanence for this immunity. Tea being a leaf-crop stands manuring well, and this is a great circumstance in its favour; the use of manure appears to be steadily increasing.

The tea industry would appear to have about reached its zenith, and a more critical period in its history seems likely to commence, demanding the attention of planters to scientific questions as to manuring, coarse or fine plucking, methods of manufacture, rotation of crops, and so on. The increased production, and the fact that the competition is now less with the hand made teas of China than with the factory teas of India, Java, &c, will gradually render haphazard cultivation and manufacture no longer profitable.

Coffee. The export of this product in 1896 fell partly, owing to bad crops, to little more than a third of that in 1895.

The planting of Liberian coffee is apparently increasing slowly. Several kinds of Coffee are on trial in the Gardens (see section), but none show much promise of usefulness, being much attacked by leaf

disease. *Coffee stenophylla* in particular suffers from the disease. Great expectations have been aroused by the success in Java, &c., of the hybrid between Liberian and Arabian, and I hope to obtain this kind in 1897 for trial here.

Cacao. The exports show a steady increase; those of 1896 exceed those of 1895 by about 4,000 cwt.

Much anxiety was caused during the last quarter of the year by the rapid spread in Matale and Badulla Districts of a disease which has attacked the trees for some years past, increasing in destructiveness every year. The nature of the disease is at present unknown, but every effort will be made to discover its cause and to check its ravages.

The Nicaraguan cacaos referred to in the report for 1895 are now established, and some are growing well.

From the report for 1896 of Mr. Hart, Superintendent of the Royal Botanic Gardens, Trinidad, I quote the following paragraphs:—

"The 'Old Red Dutch' cacao sent at my request by the late Dr. H. Trimmen, Director of the Ceylon Botanical Department, for comparison with our varieties, proves to be synonymous with the true Criollo cacao of Trinidad, having the same form and also the same white or light-coloured seeds. The Criollo variety has however almost disappeared from cultivation, being ousted by the more vigorous growing Forastero imported from the Mainland, with which it has evidently hybridized, if the numerous varieties or intermediate forms between the two kinds now to be seen growing in every plantation are to be taken into account. On estates where the Criollo form predominates the cacao produced is of the finest quality. The origin of the colour and form of Ceylon cacao has therefore been now fully ascertained.

"I would point out, however, the direct influence for good which a change of climate, or rather a change of seed from one climate to another brings to pass. The Forastero has practically ousted the Criollo of Trinidad. The Criollo introduced into Ceylon has done well there, while the Criollo of Nicaragua will as certainly fall before the recently introduced Forastero, as the same kind has been already displaced by it in Trinidad.

"Cultivators of all kinds will always find that great benefit arises from making a change of seed from one country to another or from one district to another."

Coconuts.

The export of oil continues to fall off, but that of most of the other coconut products shows an increase. The area of land planted in coconuts is also increasing.

Rubber.

The tree of Para rubber (*Hevea brasiliensis*) which was tapped in 1894 was again tapped this year, yielding 3 lb. ¼ oz. of dry rubber, or rather less than in 1894. The yield of this tree has been 27½ oz. in 1888, 42 oz. in 1890, 45 oz. in 1892, 51 oz. in 1894, 48½ oz. in 1896; total in nine years 13 lb. 6 oz. or about 1½ lb. per annum. The tree is now twenty-one years old, and should bear tapping every year. I desire to call special attention to this yield, for many persons entertain the most exaggerated ideas of the rubber-yielding capabilities of this and other trees. Of course a much larger yield can be obtained for one or two years, but it is at the sacrifice of the life of the trees. If the results of the tapping of this tree be taken as a basis, the yield of a rubber plantation after the tenth year (fifty trees to an acre) should be perhaps 100 lb. of rubber per acre per year, worth about £12 or £13 in London. In comparing this with other products, it should be remembered that the labour cost of rubber is very small.

The cultivation of Para rubber seems likely to succeed in the low-lying wet districts of Ceylon. There seems little likelihood at present of any serious fall in the supply of rubber from wild sources, but the demand is increasing, and by the time the private plantations in the East come into full bearing, it is quite probable that the easily accessible native sources will be becoming exhausted.

Little reliable information is at present available on the subject of rubber, and I am devoting what time I can spare from other duties to a series of experiments in cultivation and tapping of rubber at Heneratgoda and Peradeniya (see above, section 3). These were commenced at Heneratgoda in December chiefly on a plantation of eleven or twelve year-old trees, which, being planted only 12 ft. apart, are now much too crowded. About 150 of them will be sacrificed in the course of the experiments, leaving more room for the remainder.

Several plants of Lagos rubber (*Kickxia africana*, Benth.) were received from Kew in 1896, but are not doing well. The species forms a stout tree, and is therefore suited to cultivation, but it will be a long time before seed is available in quantity.

LETTERS TO THE EDITOR.

ANSWERS TO CORRESPONDENTS.

["A Lover of All Truth." Not authenticated, declined with thanks. "Van Resd." With our weekly edition space is more valuable than ever, but all interesting extracts dealing with Planting will be received with thanks, especially if accompanied with remarks as to the particular manner of applying the moral thereof. "Nathal's Love." Good skit, but the tale mocked at appeared in part only by mistake; we are 300 miles off our printing office!—Ed.]

"ARTIFICIAL MANURES."

SIR,—Now that most planters are going in for the above and leaving their "old love" "CATTLE," I shall be much obliged if some or all of them will answer the three (3) following questions, because I presume they have taken to "artificial" with an object, not because Mr. So and So uses them with a certain amount of success, but that they have thought out the matter and are acting on it; so it will not be a difficult task I ask:—

- I. Does the application of nitrogenous manure produce an increased crop?
- II. In what way does an increased yield result from the manuring with nitrogenous salts?
- III. Quantity of nitrogen used?

KOLA.

BUTTER FOR PLANTERS.

DEAR SIR,—Referring to your general note on "Butter for Planters" in issue of 26th ultimo, the Managing Proprietor of the dairy seems to have exhausted all his supply of 1 lb. sample tins in sending you the same.

Twice have I written humble requests for a sample tin with the further humble request that it should be sent V. P. P.

In my first letter I held out the hope of a 5 lb. monthly order if the butter was approved of.

Can I have offended the gentleman's susceptibilities by asking that the butter should be sent V. P. P.? (I ask for I have received no answer to either letters.) If I have, I will, if pressed, take a tin free. If through your courtesy this should meet the Proprietor's eye, perhaps he might wake up to the fact that a prompt reply to request often results in a standing order, which I imagine in his case is a thing to be desired.

"PAT CLOYNE."

SHORT CROPS.

SIR,—I think it very plain that the universal short crops this year are due to one great cause—an unfavourable season—extending throughout the whole year. This unfavourable season took various forms, and had various effects—in one place inducing leaf disease from which the trees were unable to recover in time to set their blossom, and in another bringing unseasonable showers in February which checked bud and encouraged flush.

Yet again I know of estates on which both of the above causes operated only in a mild form, and the effect of short crops is due totally to insufficient blossom showers.

We have had an abnormal year altogether, and while some of us got more rain than we wanted in the monsoon, leading to leaf rot and leaf disease, others got more rain than they liked in February and others again far too little in April and May.

The great parent "Unfavourable Season" produced offspring of various makes and sizes, but all working to the same end, so that "Kola" and "Expd. Dt." may both be right, and half a dozen more, with as many opinions.

VAN RESD.

CHRISTIAN COOLIES AND PLANTERS.

SIR,—I have been following with some interest the letters appearing in *Planting Opinion* re Christian Coolies and Mis-

sionaries. Although of the same opinion as "A Much Disgusted Planter" that heathen coolies are preferable to "Kisti ones, still I am inclined to take a middle view and reiterate Crolech's query, "Do planters (disgusted or not) and other highly educated Englishmen, reared in good Christian homes, set an example of sobriety and general morality to their native servants? If they did, the Christian would be a far better man." He often is the sad spectacle of a number of planters meet together and partaking in a disgraceful drinking bout, the majority of the men present having to be carried to their homes by their own servants, or more sober friends. I care little for Christianity and look upon the converted native as a farce (of which more anon), but I do believe in upholding the prestige of the British name in India (or anywhere else for that matter). If men become unseemly inebriated and make utter fools of themselves while in this state, and live questionable moral lives, can it be otherwise than expected that their servants and those dependant upon us for a livelihood should look upon Christianity in a wrong light. How true is the proverb that "example is better than precept."

The Christian religion teaches one that all men are equal and that Christ eat with sinners and publicans; yet the converted Christian cooly will not touch the food cooked by a low caste man, nor will he so much as enter his house, neither will he carry beef "because he is of a better caste." In fact he retains all his old caste prejudices, and yet he is allowed to call himself a Christian; this is why I look upon him and his new religion as a farce.

"MIDDLE VIEW."

ECONOMICAL WORKING OF TEA ESTATES.

SIR,—Now that prices are falling and exchange on the rise it behoves those of us interested in Tea to be "up and doing" to let each other know how expenses are to be kept down without in any way allowing the estate to run down; and it seems to me that the only man who will pull through is the "cheapest worker." A few years ago any one who could earn a living at Home was sent out to "plant" more especially the Assam way; but those days are gone never to return. What was wanted in my humble opinion for a planter, and especially a Tea Planter, is a man who has had a liberal education and who possesses a fair amount of common sense to carry out orders or ideas; place that youth or man under a competent manager, have him thoroughly taught not only field and factory work but accounts as well. Keep him at work and make him a useful and practical "Tea Planter," who when his "time" comes up will be able to take charge of an estate and give his own views on the "working" of an estate (not like some of the "Creepers" are now doing in P.O., telling us how to live on Rs. 10 a month, without soap or dhoby) and who will have picked up a few dodge or two that may be worth passing on, these are the men of "Creepers" that are wanted, not the "Creeper" that will go off to every race meeting, gymkhana, a dance, etc., then coming back and going and working for "knock off" time to come and leave every mortal thing to the writer or maistry if possible, and when asked how it is the work is behind or leaf short, says: "Bad weather never turned up to-day"!! "no rain for the last three weeks hence no flush," and so on!!

Now I will try and give an example of an A-1 manager who should attend roll call as often as possible in the month so as to get to know his coolies not only by their faces but names (an important thing, in my humble opinion); visit each gang at least twice a day and allow no scamping of work, especially by the Badaga; look after small things and he will soon get use attending to the big ones; attend to coolies' complaints "practically," thereby very often finding out that your writer or maistry is trying "to do you." The careful planter will go into details before giving a contract and see what can be s

and not leave it to his writer to enter into the contract and arrange everything before going to master and thereby securing a commission from the "contractor" who must scamp the work to make a profit for himself and pay hush money all round.

Well, a "Creep" can't learn all the ins and outs of working an estate if he is not 'kept' steadily at work by the manager, for remember it is from the "Creep" that our future managers are to come. I will now shut up by saying that unless a manager can put Tea in London under 4 annas per lb. including all charges he is not worth his salt.

KOLA.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.63	"	Phosphoric Acid.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. Germination guaranteed.

Only thornless variety extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE.

COFFEE.

While high cultivation is eminently desirable, it is also extremely costly. We have been told of a certain Nilgiri estate that spends over Rs.300 an acre in cultivation and manuring, and finds it so profitable that even these rates are likely to be exceeded.

Nyassaland. Through oversight we have omitted to notice the report of a very interesting interview with Mr. G. M. Crabbe, a former Ceylon planter, in the *Times of Ceylon*. He returned about a month ago from Nyassaland, where he spent a year as Manager of a coffee estate at Mlanji. He was obliged to abandon his post on account of severe fever. The fever, of the dreaded Blackwater type, is a fearful scourge, and will be so for many years till the country is opened up. The elevation of the coffee districts is low, from 1,500 to 2,500 feet. The country is undulating; the rainfall about 30 inches; the temperature is cool and equable. The most unhealthy months are from November to the end of February, the planting season. Roads and communications are in a barbarous state. Labour is plentiful and the tribes gradually quieting down.

The Sandwich Islands. Consul-General Hawes has sent home a report from Hawaii on the situation and prospects of coffee cultivation in these islands. In a notice thereon by a contemporary, the *Madras Mail*, the chief points of interest touched on are as follows: The industry is of recent origin but, despite the usual pioneering failures, has progressed in a remarkable manner. The soil is volcanic and extremely rich. There is a vast area fit for coffee from 500 to 2,500 feet, with a westerly, sunshiny

aspect. Rainfall varies from 75 to 200 inches and seasons fairly regular. Temperature rarely exceeds 85° in the shade. The natives are lazy and unreliable, and Japanese and Chinese are preferred, but are as yet scant in numbers. Contract labourers receive 12½ dollars and free labourers 15 dollars per month, far higher than the rates obtaining in the East. The "lay of the land" is easy, with gentle slopes. The yield is stated to be enormous, being from 1 to 2 lbs. per tree, the latter only if suitably cultivated. Roads are being opened up rapidly. The Kona District especially is eminently favourable for coffee: rarely stormy, rich soil, moderate rainfall and regular seasons. Kona coffee yields the unusual proportion of 12 to 15 per cent. of pea-berry.

There follows the inevitable and not always reliable estimate. To establish and maintain a coffee tote of 75 acres for seven years costs as follows: 100 acres of Government land \$1,000. Manager's salary at \$1,200 per annum. The labour details are curious: "six Japanese are employed in the first two years, nine in the four following years and twelve in the seventh year. In the third year the crop is estimated at 20,000 lbs. = \$3,600; fourth year 60,000 lbs. = \$10,800; and fifth year 85,000 lbs. = \$15,300. This clears all working expenses up to date. Sixth year 100,000 lbs. = \$9,985; seventh year 125,000 lbs. = \$11,680, when the profits should have totalled up to \$21,000. The estimate is said to err much on the side of caution.

The Market. The lower range of prices, says the *P. M. Review* of 12th ultimo, is evidently leading to an increase in the consumption in other countries, although there is not much evidence of any improvement here. Such an inference can be drawn from the deliveries for the first five months, which in Europe have amounted to 182,830 tons against 166,410 tons last year, while the world's deliveries are given at nearly 300,000 tons for the same period, or an increase of fully 50,000 tons. The stocks during May have, in consequence, shown a reduction, the world's supply being about 7,000 tons lower: the total, however, is still 247,780 tons against 147,360 tons last year. The future of prices still rests mainly on the outturn of the coming Brazil crop, and judging from the latest reports, there is no indication of a short crop which would lead to an advance in the lower grades. At the auctions, which recommenced on Thursday, there was a very slow demand, except for the finer kinds which sold at very full rates.

LONDON COFFEE RETURNS.

	HOME CONSUMPTION.		EXPORT.		STOCK.	
	1897	1896	1897	1896	1897	1896
For the week ended June 5, 1897.	Tons. 361	Tons. 310	Tons. 748	Tons. 627	Tons. 14,323	Tons. 12,354
For the 22 weeks ended June 5, 1897.	6,614	6,608	8,942	10,364	...	...

The course of the market during the last four weeks, says Messrs. Arbuthnot & Co.'s monthly London report of 11th June 1897, has been marked by a tone of general flatness,

and the large proportion of the less desirable grades has contributed in a great measure to this result, as the market for such qualities is influenced by the decline in Rio and Santos. As a whole we must quote a reduction of 2 to 3 per cwt., exception being made in favour of the comparatively limited supply of good middling and colory qualities for which the value has been well maintained.

There have been occasional fluctuations in the market for futures, but the general tendency has been to easier prices as the receipts in the Brazils continue heavy and to the present date amount to 8,333,000 bags against 5,189,000 bags last year and 6,467,000 in 1894-95.

Good average Santos Havre Sept.	...	48 francs	
Mysore B size good mid to fine	...	94/- to	106/-

BRAZIL.

A large estate.

THE largest coffee estate in Brazil, we learn from the *American Grocer*, comprises 110,000 acres, of which 13,000 acres are planted with coffee, and 20,000 more are suitable for coffee trees. This plantation was sold to an English syndicate for \$5,838,000.

The United States Vice Consul at Santos furnishes the following statement of the trees in bearing and of the yield and profits from 1892 to 1895 and estimated profit for 1896 :—

Year.	Coffee trees in bearing.	Yield, pounds.	Profit, dollars.
1892	... 1,300,000	3,897,600	269,895
1893	... 1,400,000	4,200,000	349,645
1894	... 1,500,000	5,107,000	432,946
1895	... 2,069,700	8,400,000	637,266
1896	... 2,476,500	9,000,000	*711,133

* Estimated.

The total number of trees in this plantation was in June 1896, 4,426,604, of various ages, including 194,000 planted in October and November 1895, and it is estimated that two-thirds of the trees being new, from 1897 on an average harvest of 100,000 bags (13,200,000lbs.) may be expected, and that, when all the trees will have arrived at an age of three or four years, the yield may increase to 250,000 bags of coffee, or about 32,500,000lbs. per annum.

The next largest estate is owned by Carlos Schmidt, who arrived in Brazil from Germany some thirty-five years ago. The area of his property is 9,785 acres with 1,800,000 trees populated by nine colonies with 260 families furnishing some 1,500 labourers. There are several other plantations on which grow more than 1,000,000 coffee trees.

European Capital.

The introduction of European capital into Brazil for the development of the coffee enterprise will be especially useful at this crisis in the financial position of the country. The low prices received for coffee have greatly reduced the income, and in consequence of this the balance of foreign payments has become still more heavy against Brazil, and the planters are greatly embarrassed in meeting their obligations within the country. All this helps to diminish commercial transactions in Brazil itself and in turn reduces the volume of importations. It also cripples national industries and diminishes the demand for labour. The Treasury likewise feels the contraction, for diminished imports and lower prices for coffee lessen the revenues. Last year it is estimated that not less than fifty thousand contos of gold (say £5,000,000 to £6,000,000) were lost to the country by the fall in

coffee prices, which reduction will be greatly increased this year by the still lower prices. The increased prices for rubber and sugar will counterbalance this to a small extent, but it is highly improbable that it will reduce the total loss for 1896 to forty thousand contos of gold (say £4,500,000). Under these circumstances the recent large sales of coffee estates to European syndicates may be expected to favourably affect the future of the country.

Crops.

Brazil coffee has dropped to the lowest point since 1886. The decline within one year has reached 6 cents per pound, and is due to increased supply throughout the world. The full benefit of the lower prices has been given to consumers, largely through the war between coffee roasters.

The result of lower prices is an increased consumption, which, the first nine months of the trade year, shows an increase over the previous year of 362,163 bags. Retail grocers testify to a marked increase in their coffee trade during the past three months, which statement is supported by the Coffee Exchange report of 1st April which shows deliveries for the past five months, as compared with the season, as follows :—

	1896-97.	1895-96.
	Bags.	Bags.
November	445,222	342,721
December	414,434	319,740
January	468,915	424,646
February	423,857	365,134
March	469,205	426,036

The above is a gratifying statement and indicates that once more we may look forward to a period when consumption will steadily increase from year to year, as was the case in the former era of low prices.

The following statement reveals the position and movement of coffee during March :—

	Bags
Stocks in United States 1st March	504,800
Receipts in March	564,068
Total supply	1,068,868
Less stocks 1st April	599,566
Distribution during March	469,205

Of the above 356,939 bags were of Brazil sorts and 112,266 bags all other sorts.

The combined movement in Europe and the United States was as follows :—

	Bags
Stocks on 1st March	2,436,050
Receipts in March	1,455,170
Total supply	3,891,220
Less stocks 1st April	2,801,520
Distribution during March	1,086,690
February	967,600
January	975,800

The world is absorbing 1,000,000 bags per month and stock is increasing. The visible supply of the world on 1st January was 4,024,968 bags against 3,552,792 bags at same date last year. On 1st April, 4,181,529 bags against 2,634,670 bags on 1st April 1896, an increase in one year of 1,546,859 bags—sufficient reason for a drop in prices. The question now is: Has not the decline gone far as the position of the article warrants? It certainly is not to take the "bear" side on coffee.

The receipts in Rio from 1st July 1896 to 1st April 1897 were 2,910,000 bags and in Santos 1,503,000 bags, or 1,420,000 bags more than the total crop in 1895-96. The total receipts in Rio and Santos for nine months of 1896-97 were 7,413,000 bags, or 1,937,000 more than the total crop of 1895-96 and the largest receipt record, exceeding the 1891-92 crop by 16,000 bags, with the months' record to be added.

An era of cheap coffee has been entered upon. Extreme low prices will check new planting enterprises, but we must bear in mind that 1896-97 marks the first tangible results of the last five years' extension of the planting industry.

SCIENCE AND COFFEE.

BY THE LATE MR. WILLIAM PRINGLE, M.S.C.I.,
SOMETIME AGRICULTURAL CHEMIST IN COORG, SOUTH INDIA,
TO MESSRS. MATHESON AND CO.,
(Reprinted from the "Madras Mail.")

NOTE.—These papers are being published in pamphlet form: register orders with Messrs. Addison & Co., Mount Road, Madras.

V.

DRAINAGE.

(Continued.)

In the last paper I gave the more important physical and physiological reasons for recommending deep drainage, and showed that the object of drainage was not merely to carry off the surplus water, but to get the rain and air into the land; to bring it into a finer physical condition; increase its power of capillary attraction, so rendering plants grown on it better able to resist drought; to fully oxidise the decomposing organic matters present, also the iron salts, rendering them valuable as plant food; to prevent loss by surface wash, not only of the soluble salts brought to the surface by capillary attraction as the water is evaporated off, but of the finer particles of the soil also; and to bring the nitrogen of the air within reach of the nitrifying organisms of the soil, and so allow the plant to obtain from the air some of the nitrogen it requires. Where the land is thoroughly drained all these results are obtained, and only such substances as are in excess are removed by the rain in its passage through the land. Having briefly sketched the reasons why drains are required, we have now to consider how best to drain the land. The depth of the drain is of the greatest importance. Shallow drains, gutters, merely carry off the surface water and leave the subsoil chilled and saturated; they fail to do more than direct the course of the surface water. Mr. Parkes, Engineer of the Royal Agricultural Society, examined before the Committee of the House of Lords in 1845, stated that land should never be drained to a less depth than three feet, and four feet is preferable whenever an outfall can be obtained, at which depth it will rarely occur that drains need be placed nearer than 33 feet asunder. Deep drains work by means of the fissures caused by cracks in the soil; these cracks do not occur as a rule in moist clays till they are drained. If they occur during a severe drought they are larger and not so numerous as on drained lands, and close up during wet weather. They are of no benefit to the vegetation. When the land is thoroughly drained they remain open, even in the wettest weather. Mr. Dempsey, C.E., gives the following table which represents the depth and distance apart that practice has assigned to drains in England:—

Character of Soil.	Depth.	Drains Distance apart.
Compact.		
Tenacious clay	... 2 feet 6 inches	15 feet.
Friable clay	... 2 " 9 "	18 "
Soft free clay	... 2 " 9 "	21 "
Medium.		
Clayey loam	... 3 " 0 "	21 "
Gravelly	... 3 " 3 "	27 "
Friable	... 3 " 3 "	30 "
Porous.		
Light loam	... 3 " 6 "	33 "
Sandy	... 3 " 9 "	39 "
Light gravelly sand	... 4 " 0 "	51 "
Coarse	... 4 " 6 "	60 "

Judging by what I have seen of the soils of Southern India and Ceylon, I would for coffee soils recommend the minimum depth to be three feet. This will in most cases bring the water line below the tap root; probably three feet for the side or wing drains will be sufficient and four feet for the mains. As aëration of the land and improvement of the physical conditions

are the objects in view, I would keep three feet as the minimum depth for all drains on coffee, tea, and cocoa estates, but would vary the distance between them to suit the nature of the soil. Main drains are best made in the direction of the natural flow of the surface water, and may be about four chains apart. The wing, or side, drains should be cut so as to give them a fall of not more than one in sixty to eighty, and the distance apart must be regulated to suit the soil and contour of the land. On most coffee soils one to two chains apart would be a good distance to place them at first; then, if that were found insufficient, another could be put in between. The fall of the main drain is not a matter of much importance, but should be sufficient to run the water off easily. On steep lands catchpits should be cut at intervals to moderate the force of the flow of water. With the wing, or side, drains the full benefits of the ammonia nitrogenous matters and carbonic acid contained in the rain will not be obtained. A fall of one in one hundred gives very good results, but it would not be greater than one in sixty, and may be very much flatter as long as there is a decided fall, —if it is only one inch in a chain it is enough.

When jungle or grass land is above the estate it will often be advisable to cut a catch drain five or six feet deep along the boundary and start the mains from it. The wings branching out on each side of the main drain should not be placed opposite each other, and should have the junction with the main rounded off so that the water does not enter at right angles or nearly so to the main, but more or less parallel with it. If the soil is a clayey loam resting on an impervious clay great care will be required on steep estates to lay out the drains so that landslips will not occur. Where possible, it is advisable to cut the water channel in the clay. On steep land it is necessary to carefully prevent any lodgment of water, especially where a yellow clay rests on a blue, and drains should be cut below the yellow in the soil in the blue clay when practicable. Where ferruginous gravel lies on clay it is advisable to cut the drain through the gravel into the clay, in order that the lower oxides of iron may be fully oxidised and deprived of their deleterious qualities.

Open drains are more suitable for plantations than closed ones laid with pipes, which are liable to be blocked by the roots of the trees. They will, for three feet deep, cost from four to eight running yards per rupee, depending on the nature of the soil, presence of stones, roots, &c. There is no necessity to have them any wider than required to allow the coolie to cut out earth to necessary depth, say for mains two feet wide at top and nine inches to a foot at bottom, with a depth of four to six feet.

Wing drains need not exceed one foot six inches at top by four to six inches at the bottom. Depth is the important factor, not width. These drains will more effectually cultivate the land than even deep fork-digging. They will often restore the fertility of lands which have been poached and compact by hand weeding and mamotie digging till they are impervious to air a few inches from the surface. Neither coffee, nor tea, nor any other crop will do well on land through which both water and air cannot easily find their way. Tea will not grow on the site of old coolie lines, nor as far as I am aware, on any other land that has been compact by constant traffic. On many of the estates in Ceylon the natural drainage of parts is so good that coffee may be seen growing luxuriantly within a few paces of washed declivities on which the coffee had died off. Had these steep lands been thoroughly drained at the beginning, they would have had much more coffee growing than now exists. I would call the attention of tea planters to the advantages of thorough drainage before it is too late. Let them just consider. Coffee has practically been replaced by tea in Ceylon. History repeats itself. What is to replace tea? While thinking over the matter, it is as well to leave nothing to chance, and instead of resting content with natural drainage and superficial gutters, deep drain the lands before it is too late. If by skilful cultiva-

tion wheat can be grown on the same land for sixty years, so can coffee and tea; but this requires thorough drainage and suitable manures if remunerative returns are to be obtained. Extended observation has shown that when one order of plants has reduced the food most suitable to them to a minimum they die off, and are naturally followed by another order which avails itself of the store of food left by the preceding one, and the plant that follows is one that makes a minimum demand on the food required by the first. If any one plant is to grow continuously on the same land, the *status quo* must be maintained. Manuring will not do it, unless the land has natural drainage; the soil must be aerated as well as manured.

Plants derive their nitrogen and carbon partially from the air and partially from the soil. The leaves absorb the carbonic acid from the air, while the roots appropriate a share from the soil. Liebig contended that the nitrogen was taken up from the air. His words are very instructive: "Annual and especially summer plants grow and attain their perfection in a comparatively short time; they do not prosper on a soil which is poor in those mineral substances necessary to their development. To attain a maximum height in the short period of their existence, the nourishment contained in the atmosphere is not sufficient. If the end of cultivation is to be obtained, we must create in the soil an artificial atmosphere of carbonic acid and ammonia; this surplus of nourishment, which the leaves cannot appropriate from the air, must be taken up by the corresponding organs, *i.e.*, the roots, from the soil. But the ammonia, together with the carbonic acid, are alone insufficient" Mr. G. Ville corroborates these deductions so clearly put forth by the illustrious Professor fifty years ago. In his manual on artificial manures he wrote:—"But another, and equally important result must not be lost sight of, *viz.*, that if the three mineral ingredients are omitted from the normal manure and nothing left but the nitrogenous matter, its efficacy is almost entirely lost. We therefore see that the acid of phosphoric acid, lime and potash is absolutely necessary, and if it happens that the use of the nitrogenous matter without any admixture of them succeeds, it is because the soil is naturally supplied with these three mineral ingredients. . . . Vegetation imperatively demands fourteen elements, but it is only necessary to give four to the land, as the rest are obtained from the air, the soil, and the rain." No stronger arguments can be produced than these, supported by the experiments of M. Boussengauer, Lawes and Gibbert and Hebrugel Wilfrath, that it is absolutely necessary to bring the air and rain in contact with the roots; and in no way can this be done more effectually and cheaply than by deep drainage. In Great Britain, according to Mr. Parkes and Mr. Smith of Deanston, the cost is as follows for labour only:—

	Depth.	Distance between drains.	Cost per acre.
Uniform clay	3ft.	33ft.	£ 1 0 0
" " "	3 to 4ft.	33ft.	1 6 8
Clay with some stones	4ft.	50ft.	1 6 6
" hard gravelly subsoil	4ft.	49½ft.	1 15 6
Clay, gravel and sand	4ft.	66ft.	1 6 8
" gravel and subsoil	3½ to 4ft.	33ft.	2 10 0
Sand and gravel	4ft.	40ft.	3 6 0

The width of these drains was from four to nine inches at the bottom and from eighteen inches to two feet wide at top and cost per rod of six yards for cutting 8½d. to 1s. 2d.

The bottom is easily cut out by a scoop hoe of the Essex pattern, and as the drains do not require to be filled up, as in the case where pipes or tiles are used, they should be cut for considerably less on land that is free from rocks and tree roots. It is essential when the drains are once made to keep them clear and free from dirt and dead leaves.

Had the importance of thorough drainage met with the consideration it deserves, thousands of acres of the best soil of the Coffee Districts of Ceylon and India would have not found

their way into the rivers to be carried down to the low-lands. Though there would probably have been failures of coffee, poor lands, there would have not been the wholesale destruction of estates. A tree cannot grow if the soil is washed off its feeder roots, and must fail. Whether its death be attributed to *Hemileia vastatrix*, green bug, blackrot, or insidious defunctification the cause is most frequently want of strength to resist the attack due to insufficient nutriment. If the supply is short because feeder roots are exposed by the soil being washed off, they are useless; the mouths of the tree are gone, they cannot take up the food, and the death of the tree is only a question of time. To wash, which could in most cases have been prevented by thorough drainage, the greater number of failures of coffee estates in Southern India and Ceylon are due to. There are very few estates that will not be improved by thorough drainage. Where it is of the first importance to have healthy plants and good pecuniary returns, let drainage be the first consideration; then manure and reap the full benefit derivable from the climate, rain, air, and soil.

TEA.

NEW MARKETS.

WANT of space in our last issue forbade us to notice Messrs. Gow, Wilson and Stanton's interesting diagram of the progress of the industry during the last seven years. The same reason now makes it difficult for us now to do more than note the most interesting points. In 1887 foreign markets only absorbed 14 million pounds of British-grown tea, last year 42½ were thus disposed of. The Indian Tea Industry first began in 1837. It took 50 years for Indian and Ceylon tea to reach 50 per cent of the tea consumed in Great Britain. Next year it will probably supply half the total amount produced in the whole world. In 1837 England took 30½ M. lbs., all Chinese. In 1887 it was 183½ M., half of which was Indian and Ceylon. Last year it was 227¾ M., 89% of which was British.

The dangers of over-production have been postponed but the large areas now coming into bearing in India and Ceylon will mean a recurrence of the danger. The price has been steadily falling with the increase in supply and consumption. The tea imported to England has increased by 42 M., in the last six years, while the price has fallen 2d. in that period.

Of the new markets open Australia has supported British enterprise by displacing 50% of China tea by Indian and Ceylon. North America consumes 100 M., of which it supplies 10 M. only; this has taken 10 years to effect, but in the last 3—4 years the proportionate increase has been very quick. South Africa is receiving attention. In Europe Russia, Germany, Denmark and Holland are the only countries which use tea in any quantity.

Reduction in cost of production has proceeded steadily but has now reached a point when amalgamation of small estates and concentration are the only important channels left for improvement. Applied science has been till now quite neglected and evidently will only be adopted when absolutely forced on the industry. Broken teas are a great and increasing discount: the export trade demands only leafy teas, and the greater the extension of foreign markets, the larger the amount of broken teas placed on the London market. China is doing her utmost

maintain her present, and even regain her former, position. Such competition cannot fail to be of importance.

Messrs. Arbuthnot & Co.'s Monthly Market Report dated London, 11th June 1897, says:—

SOUTH INDIA.—Rather over 4,300 packages were brought to the hammer averaging 6 $\frac{3}{4}$ d. contrasted with 7d. for 1,900 pkgs. in April. The style of leaf was fair, but, as a rule, the teas lacked strength and flavour.

Travancore.—The majority of shipments from the Madras Presidency were from this district, but the character of them on the whole was of an ordinary description; useful invoices were however received from Bonami, Arnakel, Kudwa, Karnum, and Peshhurst.

The Neilgherries.—Seven invoices were catalogued, most of which were of good quality and met with attention.

South Wynaad.—The offerings were as usual small, but being of saleable style they commanded good competition and passed off with spirit.

A Rock ahead.

Under this title the Calcutta financial organ, *Capital*, strikes a warning note on the continuous extension of tea-planting. We have as it is very nearly displaced the whole of the China Tea that used to be sold in Great Britain. The only other outlet, which of course remains a huge one, is that of foreign markets. The great danger of course lies in this: is it possible that we can force foreign consumption faster than our supply increases? Our progress has been great in the past few years, but the danger of over-production thus avoided has been very grave; it behoves all to keep a watchful eye on the situation.

The London Market.

INDIAN TEAS.—The market has been practically closed, says the *P. M. Review* of 12th June, no public sales having been held and but little Tea offered privately. Until the new crop arrives in fairly large quantities the demand is not likely to show much improvement, as the supply mainly consists of inferior descriptions. Then, of course, all will depend on the character of the Teas, and if the imports contain a good proportion of the medium and finer kinds, there will be a good demand, as these grades have for some time been very scarce. On the other hand, if they are principally of poor quality, and especially coming on an already overstocked market of these kinds they are not likely to meet with much inquiry, and importers must be prepared to accept lower prices than those now current. Although the season is reported to be a late one, the facilities for the transport of Teas from most districts to Calcutta have so much improved of late years that considerable shipments will probably reach here about the middle of next month and the beginning of August. It is satisfactory to note that the reports of the weather are more favourable, and, should this continue, the deficiency in the outturn in some of the gardens will no doubt soon be made up, and in the course of a few weeks a much better selection will probably be forthcoming. The public sales for next week are small, only 4,514 packages being catalogued.

CEYLON TEAS.—This market opened on Thursday, when the first sale since the holiday took place, but only a small quantity was brought forward, and firm to advanced prices resulted. Next week, in consequence of the auctions being extra large, the usual sale will be divided into two days,

part taking place on the Monday and the remainder on the following day.

A YEAR OF TEA.

"In accordance with custom," Messrs. W. J. and Hy. Thompson have reviewed the Tea trade of a year, dating from 1st June 1896. They publish certain figures relating to sales, crops, &c., and remark:—"There is much in these figures encouraging to all who are interested as producers in the growth of the trade in Indian and Ceylon tea. The continuous increase in production has been accompanied by a steady growth of consumption; not, indeed, at home sufficient to absorb the increase in supply, but still, such as to maintain prices, speaking generally, at a fairly remunerative level; while abroad, sufficient progress has been made to exercise an influence upon value, and to justify confidence in a wider development in the future." But the next sentence is less sanguine. The review continues:—"It is obvious that so great a decrease in the use of China tea at home having already occurred, and its place having been filled by British-grown tea, the rate at which consumption of the latter grows will not be so rapid in the future, unless something exceptional should happen to stimulate it. The following figures illustrate this:—Proportions in which the different growths were used in the United Kingdom: Of China, &c., 21 per cent. in 1891-2, 13 $\frac{1}{2}$ per cent. in 1893-4, 11 $\frac{1}{2}$ per cent. in 1895-6, and 10 per cent. in 1896-7; British grown tea, 79 per cent. in 1891-2, 86 $\frac{1}{2}$ per cent. in 1893-4, 88 $\frac{1}{2}$ per cent. in 1895-6, and 90 per cent. in 1896-7. The ability of the home market to take larger quantities is, therefore, becoming mainly dependent upon the greater consuming power of the country in the aggregate." So far this has shown continuous and steady growth. Messrs. W. J. and Hy. Thompson attribute this (1) to the facilities given to the public, by purveyors, for obtaining a cup of tea properly made, which has helped to make it a more popular beverage; (2) to the moderate price at which tea of good quality is now obtainable from all the principal vendors. They consider it not an exaggeration to say that to a large part of the population the good tea of India and Ceylon has become an almost necessary article of diet, cheaper and more exhilarating than any of its rivals.

As these causes have now been at work for some time in London and other great centres, if not in the country, it is thought that there might be some risk in calculating on home consumption expanding in the future as substantially as it has done for the last two years. The firm whose review we quote, remarks, therefore, on the need "of turning to the large and, as yet, almost unopened outlets" for Indian teas abroad. It does not discuss the means of finding the way into new markets, it urges the necessity, and adds, "As pioneers in this work, those representing the Planters' Association have done good service; for their distribution of information respecting the production and preparation of our tea is in itself of the highest value." Nevertheless, Conservatism carries the day, and these brokers hold that in the long run, and for large results, reliance must be placed upon the ordinary channels through which trade flows. It is, therefore, they say, opportune that the system

of sending out tea as a proprietary article, under a registered title, has been so widely adopted, as it is perhaps more conducive than any other to place our teas where they were unknown before and enable consumers to obtain a regular supply. Whether this be so or not, the facts stated in the review under notice are decidedly encouraging. The progress made in trade abroad, through the medium of London, is shown by the following figures relating to exports from the United Kingdom: Out of the total China, &c. 80 per cent. in 1891-2-3, 76½ per cent. in 1893-4, 62½ per cent. in 1895-6, 59 per cent. in 1896-7; British-grown tea, 20 per cent. in 1891-2-3, 23½ per cent. in 1893-4, 37½ per cent. in 1895-6, 41 per cent. in 1896-7. In conjunction with the increasing shipment to Asia, Australasia and America direct from Calcutta and Colombo, these statistics prove that progress is constant, if a little slow. It is also pointed out that an "influence not to be overlooked is the gradually growing inquiry for fine-flavored tea from abroad, not yet sufficient to meet the value of the larger supply from India, but already so constant as to raise the level of rates for the smaller quantity produced in Ceylon." This, Messrs. Thompson remark, "is a matter of deep concern to those engaged in extending the area under plant, as it has a direct bearing upon the two alternative policies, viz., whether to open up new districts whose ability to give good tea is doubtful, or to concentrate energy and capital upon more favoured localities. As regards districts where large crops can be produced at a low cost, it is obvious that if the value of such tea as they yield should decline much more, and cost be enhanced by higher exchange or difficulty in getting labour, the present margin of profit would disappear. It would be unwise to disregard the contingency of a further fall in the value of common tea, in view of the extensions made in recent years in districts which yield it, and of the possibility that however steadily the world's demand may grow, it may not expand fast enough to keep pace with the output. This is an eventuality suggesting discriminating caution in breaking new ground, and the devotion of far more attention to the quality of produce than to the out-turn of a heavy crop."

All this leads up to a recommendation that new markets should be opened out and developed, and, curiously enough, another leading firm of brokers—Messrs. Gow, Wilson and Stanton—publish almost simultaneously a circular urging the same general view. For the present, we must let the latter firm's suggestions stand over. As for the former, they are obviously right in stating that wide fields lie open before us—and that the possibilities of the future, if our taste for tea were to extend to those whom we influence, find a vivid illustration in the following figures: The British race in the United Kingdom takes annually 228 million lb. of tea, in the Australasian Colonies 28 million lb., in the Dominion of Canada 22 million lb.; that is to say about 48 millions of people take 278 million lb. of tea, equal to 5¾ lb. per head per annum. Whereas, in the United States of America, 65 millions of people use annually less than 1½ lb. per head; in Russia, 100 millions of people use annually less than 1 lb. per head; in Germany, 53 millions of people use annually less than ½ lb. per head; in France, 38 millions of people use annually less than 1-32 lb. per head. Naturally, such figures as these suggest an inquiry whether there is any reason why a sustained attempt to popularise their native product among the count-

less millions of India itself should fail. The attempt has been made, but no great success has yet been achieved. Should further attempts be made? The answer rests with planters themselves, and in this connection it may be interesting to note how changes of method in England have affected trade. Messrs. Thompson say that the successful development of the system of selling tea under a registered name is, in conjunction with the blender's business, transforming the methods by which the tea trade is carried on, and has attended by a material effect upon the London market. It has brought in a large amount of fresh capital seeking remunerative employment, and has placed ample means at the disposal of traders with progressive ideas who realize that in order to make and keep their business they must supply the public with good tea at moderate prices, and out-distance their rivals—if they can—by the merit of the article sold. Cannot a hint be taken from this, that the 'indigenous' demand for Tea be once more taken in hand with a view to larger developments?

POISONED FROM HEAD TO FOOT.

WE call particular attention to the subjoined statement. An incident of its kind, of equal interest and importance, has occurred of late years. A declaration so startling in its general scope, so full of corroborative detail, certainly warrants the conclusion that a new epoch in the healing art has dawned upon us. Aside from the force of the legal forms which it assumes, the facts, as alleged, rest upon the results of a thorough and careful investigation.

(Copy.)

I, George Lack, of 123, Stamford Street, Waterloo Road, London, do solemnly and sincerely declare as follows:—

"I was always a strong, healthy man up to April, 1876. At that time, whilst engaged at the Stamford Street Embroidery Works, cleaning out a tank which had been used for dyeing purposes, I slipped and fell in the tank (which was covered with verdigris) cutting both my elbows. The parts soon became swollen, and in a week's time the flesh was putrid, as if gangrene had set in. My system seemed to be poisoned, and I began to lose strength rapidly. My appetite left me and I could not bear the sight of food, and a little I did eat lay on my chest like lead. I went to the Royal London Hospital, Gray's Inn Road, where I was under treatment for several weeks, but I got worse. After this I got an order and went into Lambeth Infirmary, where I was placed in No. 11 Ward. At that time my condition had become serious, for I felt so sick and faint that I could scarcely move, and, after a time, I got so bad that I could only get up for an hour or two each day. Later I had abscesses formed on my shoulder, and gradually spread over my back and the upper part of my body. My face was completely covered with the abscesses, which, on healing, left deep marks, that I have to this day. After this I had swelling around the joints, and I had abscesses formed in the calf of my leg, and I had also run deep wounds, extending from the top of my ankle to the bottom of my feet. An offensive discharge of matter came from the parts, and it seemed as if the abscesses were drawing the life out of me. I was now in a hopeless, helpless state, and felt that I did not care for soon my end came. For days and days I never closed my eyes, and on one occasion I had but little sleep for eighteen days and nights together, the doctor's sleeping draughts having no effect upon me. When I did at length fall asleep I slept from Thursday to Sunday afternoon. From all the doctor's medicines and applications I got temporary relief. On one occasion the doctor said that I could not live throughout the day. The nurses placed a screen round my bed, expecting that I should die during the day, and my breath was sent for. When the doctor called at night he was surprised to find me alive. However I took a turn for the better, but for m-

afterwards I was, as it were, on the brink of the grave. I had to be lifted in and out of bed, and was fed on slops and light food. Sometimes better, and at other times worse, I continued in this wretched state for over FIVE YEARS, during which time I remained in the hospital. In August, 1881, I became tired of being in the hospital, and was carried to my house. I was so weak and emaciated that I got a pair of crutches to help me to hobble about the house. My father and friends who saw me were shocked at my feeble and emaciated appearance, and thought I was not long for this world. I lingered on in the same wretched state for two more years, expecting and wishing that I should soon be out of my misery. In November, 1883, after suffering over seven years, my father bought me a bottle of medicine called Mother Seigel's Curative Syrup and persuaded me to try it, saying that it had been of great benefit to him. After I had taken half the contents of a bottle, I felt brighter and in better spirits than I had been in for years. My appetite improved, and by continuing with the medicine my legs began to heal, and I got stronger and stronger. In less than three months I was able to put aside my crutches and walk with the aid of a stick. After I had taken Mother Seigel's Curative Syrup six months I was back at my work, as strong as ever was in my life, and have since kept in the best of health. I wish the particulars of my case known to other sufferers, and the Proprietors have my consent to make what use they like of this statement. And I make this solemn declaration, conscientiously believing the same to be true. By virtue of the provisions of the Statutory Declaration Act, 1895 (Will. IV. c. 62).

(Signed) "George Lack."

Declared at No. 16, Godliman Street, Doctor's Commons, in the City of London, this 13th day of April, 1893, before me, (Signed) George H. Brocks, a Commissioner for Oaths.

Here we have a case of profound and persuasive blood poisoning. Verdigris (chemically the bibasic acetate of copper) is, when introduced into the circulation, a slow poison, for which no positive antidote is known. There is no doubt that the physicians in the hospitals did all that could be done, with the knowledge and resources at their command. Unhappily their treatment, at best, was only mildly palliative; the poison continued its deadly work, until it saturated the poor fellow's entire system and perverted all its functions. What but an ultimately fatal result could have been reasonably expected.

Mr Lack's final and perfect recovery, through the use of Seigel's Syrup, illustrates beyond the need of comment the unprecedented power of that well-known remedy to renew the digestion, stimulate the secretory organs, and thus to purify the blood. In common with all who shall read the details of this case, we most keenly regret that Seigel's Syrup was not taken immediately after the results of the accident first appeared.

TO STAMP COLLECTORS.

• 5,00,000 Foreign Stamps, (well-mixed).

Includes some very good varieties. The best offered at the price, which is extremely low.

No. 1a. Containing 100 Stamps, Rs. 1-4 (post free).

Contracts cannot be entered into for less than a month, nor for less space than quarter of a column at the above rates. A discount of 5, 10 and 15 per cent. will be allowed on advertisements ordered and paid in advance for 3, 6, and 12 months respectively.

II. LINE RATES OF ADVERTISEMENT:—

1. English Advertisements: 4 as. per line, first 4 insertions 2 as. per line, fifth and following insertions.
2. Vernacular Advertisements: Tamil and Telugu, 8 as. per line each insertion; Hindustani, Canarese and Malayalam, 12 as. per line each insertion.

III. CIRCULATION OF LEAFLETS:—

1. For each circulation locally and by post Rs. 25.
 2. For each do. locally only „ 15.
 3. For each do. by post only „ 15.
- (This excludes extra postage where the weight of leaflets necessitates such.)

Advertisement charges are strictly payable in advance, except by approved customers.

MARKET SUPPLEMENT.

SATURDAY, JULY 10, 1897.

COFFEE.

COFFEE. Advices dated London, 18th June 1897, state:—The market has been fairly supplied, but the tone generally has proved very dull, and prices for the most part are easier. Ceylon is firm, and the fine qualities of East India also sold at full prices, but the bulk, which consisted of low middling to middling qualities, was only partly sold at a decline of 2s per cwt. Colory Costa Rica and Guatemala are without change, but less desirable kinds are dull of sale. Foxy green Nicaragua, &c., which sold last Friday at a reduction of 3s to 4s per cwt. subsequently recovered 1s to 1s 6d per cwt. "Futures" have been dull, and the closing prices are the lowest for the week, viz:—

London.....Santos.....September delivery.....	37s 6d
New York.....No. 7 Rio.....	7.15 cents
Hamburg.....Santos.....	37½ pf.
Havre.....Santos.....	46 francs.
Holland.....Good ordinary Java.....	46½ cents.

The Dutch Trading Company announce their next auction for June 22nd, when 19,000 bags 40 cases will be offered, against 26,300 bags 70 cases in 1896. Good average Java is valued at 46½ cents.

Imports Deliveries and Stock of COFFEE in London are as follows:—

	STOCK.		IMPORTS.	
	1897.	1896.	1897.	1896.
West India.....tons	434	444	638	946

Total tons... 6965 7061 9188 10646

The preceding figures exhibit—

In the Imports an increase this year of	466 tons.
Home Consumption a decrease of	96 "
Export a decrease of.....	1458 "
Stock an increase of.....	1964 "

The auctions this week have gone off as follows:—

CEYLON.—Plantation.—8 casks 1 tierce 3 barrels 1 bag sold, triage 81s, smalls 94s, middling 94s, fine middling and bold 107s to 109s 6d, peaberry 112s.

CEYLON.—Liberian.—1 cask 1 tierce 5 barrels sold at 47s for bold and medium yellow.

EAST INDIA.—1,699 bags mostly sold as follows: Mysore, triage 66s to 82s 6d, smalls 85s to 96s, middling dull 93s, good middling colory 98s; Neilgherry, triage 63s to 70s, smalls 75s to 80s 6d, low middling to middling gray 86s 6d to 89s 6d, good middling 94s to 97s 6d, good well made 100s to 100s 6d, good to fine bold 101s to 106s 6d, peaberry 90s to 103s 6d; Naidooobatum, smalls 84s; Wynaad, dull gray 81s; Travancore, triage 64s 6d, good boldish hard gray 98s, good bold 101s, peaberry 101s 6d.

To-day's auction comprised—218 bags East India, 26 half frazils Mocha, 19 barrels Jamaica, 744 bags Nicaragua, 149 bags Colombian, 36 bags Vera Paz, 1000 bags Guatemala, 207 bags Salvador, and 21 bags Mexican. The sales went off with slow demand at 6d to 1s decline for common pale kinds. Good colory qualities mostly bought in.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (June 18, 1897) says:—Auctions have been on a small scale this week, and although the demand was slow, values show little or no change since our last. No Public Sales will be held next week in consequence of the Diamond Jubilee celebration. About 1,700 bags East India were offered but a good part consisted of second hand parcels which sold slowly at about previous rates, whilst colory qualities of recent import were fully maintained.

Fair prices were obtained for the small quantities of Central America brought forward.

An easier tone has prevailed in Futures and quotations mark a decline of 1- on the week.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Fortnight ending June 16th, 1897, says:—Bank rate 2%. Bombay Exchange closed at 1s 2½d. Brazil Exchange 7½d. Rupee paper 3½%. Silver 27½ per oz.

Public sales were resumed on the 10th inst., and since then the market has been very dull and lower for almost all qualities except finest, which is very scarce. Ordinary kinds show a decline of about 2s to 4s per cwt. foxy greenish Nicaragua, of which the supply has been heavy, selling at an even greater reduction. Brazil markets continue dull. There will be no sales next week owing to the Jubilee celebrations.

Daily receipts have averaged 5,857 bags in Rio, and 5,286 bags in Santos.

According to Messrs. Duuring and Zook the European stocks on 1st inst. showed an increase of 2,400 tons, and the visible supply a decrease of 6,630 tons, the figures being 143,000 tons and 249,660 tons respectively against 140,600 tons and 256,290 tons on the 1st May.

Futures continue quiet, the week's movement being a decline of 3d 6d viz:—Good average Santos in Havre, September delivery, fcs. 46. in Hamburg pf. 37½, and No. 7 low ordinary Rio in New York \$7.20.

To-day's London official quotations are:—

	June	July	Sept.	Dec.	March	May
RIO	34/6	—	35/6	36/-	—	—
SANTOS	37/3	37/3	37/9	38/3	38/9	39/

We quote:—

Indian. Amongst the 12,463 packages brought forward 4,377 were New Season's, the remainder consisting of Calcutta bought and second hand Teas. The New Seasons passed with fair spirit, but without material change in quotations. Other kinds were somewhat neglected and sold with irregularity. Telegraphic advices from Calcutta state that some damage has been done to the Tea Gardens in various places by the recent earthquake, and that delay may occur in the shipment of New Season's Teas.

Week's av. of New Season's Tea sold on Garden Account, 1897,
4,377 pks., av. 8½d. 1896, 3,702 pks., av. 8d.

FANNINGS. (Red to brown, strong rough liquor)	4d	5d	5d	4d
BROKEN TEA. (Brownish to blackish, strong liquor)	6½d	7½d	7d	5½d
PEK. SOUG. (Blackish greyish, useful liquor).	6½d	8d	8d	6½d
PEKOE. (Greyish to blackish, some tip, useful liquor)	8½d	9d	8½d	9d
PEK. SOUG. (Blackish greyish, inferior liquor).	5d	5½d	6½d	5½d
PEKOE. (Blackish greyish, some tip, inferior liquor)	6d	6½d	7d	6½d

Ceylon. Owing to the heavy quantity, sales were held on Monday and Tuesday, in order to enable buyers to devote sufficient attention to the large number of samples. The Auction passed with some irregularity, especially in Teas of higher grade with only indifferent quality. Teas for price were fairly steady. Private telegraphic advice from Ceylon gives the amount exported to U. K. for the first half of June as 5,250,000 lbs., against 6,000,000 lbs. last year. The total exported from 1st January to date is now 48,250,000 lbs., against 47,750,000 lbs. same period last year.

Average for week 7½d. against rather under 7½d. last year.

Ceylon Tea sold on Garden Account 1st January to date 1897, 505,717 pkgs., av. 7½d. 1896, 466,844 pkgs., av. 8½d.

Comparative prices of Ceylon Tea in London:—

	1897.	1896.	1895.	1894.
PEKOE SOUG. (Ordinary leaf; fair liquor)	6d	6½d	6½d	5½d
PEKOE (Ordinary leaf, little twist; fair liquor)	7d	6½d	8d	7d
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	5d	5d	6d	4½d
PEKOE (Somewhat bold leaf; indifferent liquor)	5½d	5½d	6½d	5d

Java. The 2,257 packages brought forward consisted mostly of Teas of direct import. Sales passed with fair competition especially for Teas with good liquors, but other kinds showed some irregularity. A good invoice was brought forward from Perbawatee, while a few Teas from "Ardja Sarie" and "Tjiomas" grown from Assam seed were of good useful character.

Bank rate 2 per cent. Exchange on London three months sight.—
Calcutta 1/2½ Colombo 1/2½.

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 23rd July 1897.

Coorg.

POLLIBETTA, 12th July.—Weather.—Fresh burst set in on 4th not 14th. Rainfall exceeded one inch on 6th and 8th, three inches on 9th, 2.50 inches on 10th. Total for the week ending 10th, 10—11 inches. Monsoon still going strong. 2.50 inches yesterday. Rain lighter to-day. Long intervals without rain between showers. Planting in progress. *Plant diseases.*—Coffee looking splendid all over. A little leaf-disease only in parts of nurseries here and there. *Crops.*—Coffee crop showing up better every day. *General health.*—Fever, coughs and bowel complaints prevalent to a small extent. *Labour.*—Sufficient. Paddy cultivation actively pushed on all over the country.

Nilgiris.

SHOLUR, 15th July.—I regret I have not sent reports the last two weeks, but stress of work has prevented me, and I had not quite got into the way of your weekly issue. The monsoon has been very mild as far as wind is concerned, but rainfall 24.65 to date against 20.93 to a similar period last year. Highest and lowest temperature in July 67° and 56° respectively. Tea had a bit of a stop owing to cloudy weather and wind, but putting out a splendid flush after the short break. Labour plentiful. Grains dear, gram and ragi having gone to 18 and 16 seers per rupee respectively. Should the wind hold off and the soft rain interspersed with sunshine continue, August should be a record month for tea planters on this side.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; and Quarterly, Five Rupees, including postage.

ADVERTISEMENTS.—Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

N.B.—Remittances should be sent to the Managing Proprietor of this paper, Coonoor, Nilgiris, South India.

Nellampathy, British.

15th July.—*Weather*.—Rain for week 12.51. Total to date 54.19. On Tuesday and Wednesday it seemed like breaking again, but this morning there is a heavy Scotch mist with heavy showers now and again. We had five days very heavy weather with wind very high, and working in clearings was exceedingly dangerous, as numbers of trees were falling. *Plant-diseases*.—Leaf showing in a few places but not badly yet. *General Health*.—Fair; still a lot of sickness about. Last week cholera broke out among the Moplar and there have been about 12 deaths I think. The Moplar all cleared out saying, "If they were to die they would much prefer doing so in their own country." This has thrown work back considerably on large openings where Moplar labour is depended on to a great extent for most momatie work.

GENERAL NOTES AND ARTICLES.

ACT XIII. OF 1859.

AN IMPORTANT RULING.

A RECENT ruling of the Government of India caused a commotion among planters in the South of India. For many months the planters of the Madras Presidency and the Native States of Mysore, Travancore and Cochin have been agitating for amendments in the law that regulates their settlements with maistries and coolies employed to work on their estates; and in particular with respect to the subject of fraudulent breach of contract, in cases where advances have been given in order to secure a supply of labour, and the labour bargained for is not forthcoming. In the Native States planters went so far as to ask for some form of Extradition, with a view to the enforcement within British territory of contracts made within any of these States, and *vice versa*. The planter claimed, in fact, that he should be protected in his contracts with cooly-maistries or recruiters, and that in view of the risk of these men taking advances from him and then failing to supply the labour they had undertaken to bring to his estate, the law should contain penal provisions under which the defaulter might be punished. In this respect, Act XIII. of 1859, which purports "to provide for the punishment of breaches of contract by artificers, workmen and labourers in certain cases," falls far short of what is needed by the planting community. Consequently, planters want additional protection over and above that which is given in that Act. Indeed, many maintain that only *nominal* protection is afforded by this Act, and that when an attempt is made to give practical application to its penal provisions, there is sure to be a breakdown. Be this as it may, the Government of India recognised that the question raised by the South Indian planters needed looking into; and an Enquiry Committee was appointed to investigate the complaints or grievances of planters, to consider whether advances in regard to contracts for labour were really necessary, and to study the conditions generally that affect the relations between Planter and Estate-labourer. This Committee has framed its report, the tenor of which is distinctly favourable to the planter's view. It might reasonably have been expected that pending consideration of this report the Government of India would at least have refrained from taking any action calculated to remove from the planter some of the little "protection," whether actual or nominal, that is accorded to him at the present time. The

Government appears to think otherwise, however, and very long ago it made a move that struck a new and unexpected blow at the planting industry.

This is how it happened. A case was recently brought to the notice of the Government of India in which a Magistrate in Assam issued a warrant under Section 1 of Act XIII. of 1859 for the arrest of twenty-two persons, residents in the Benares District in the N. W. Province, on the ground that they had received advances of money from a recruiter of labour under a promise to proceed to Assam and there work upon the Assam-Bengal Railway. The warrant directed that the persons in question should be taken before the Magistrate in Assam; but when the matter came before the District Magistrate of Benares, who was desired to execute the warrant, he demurred, on the ground that warrants issued under Act XIII. of 1859 do not fall within the provisions of Section 83 of the Code of Criminal Procedure, 1882. This point was referred to the Law Officers of the Government of India, who decided that there is reasonable room for doubt whether the provisions of the Code of Criminal Procedure, 1882, regarding warrants apply to warrants issued under Section 1 of Act XIII. of 1859, and whether a warrant under that Act can be executed at all outside the jurisdiction of the Court which issues it. Remarking upon this, the Government of India says in a Resolution dealing with the subject:—"On the one hand, the words of Section 83 of the Code are unqualified, and so far appear to apply to all warrants. On the other hand, they may be restricted to warrants issued under the Code by virtue of Sections 75 and 93, which seem to apply to the whole chapter." Government states that "though a warrant may issue under Section 1 of Act XIII. of 1859, no 'offence' has been committed until the Magistrate has made an order, and that order has been disobeyed." It then proceeds to say:—"On grounds of administrative policy it is clearly inexpedient to apply the very special procedure provided by that Act, which applies in certain cases penal provisions to the breach of a civil contract, should be capable of being employed to drag labourers many hundred miles from their homes to answer a charge of such breach; and if it should be decided that the existing law permits of such proceedings, it will be necessary to consider the propriety of amending it." Meanwhile, the Government of India, thinking that the doubt expressed ought to be resolved, requested the Madras Government "that applications for the issue of warrants, under Section 1 of Act XIII. of 1859 for the arrest of persons outside the jurisdiction of the Court applied to, and proceedings for the execution, under Section 83 of the Code of Criminal Procedure, 1882, of any such warrants be carefully watched, and that at the earliest opportunity be taken advantage of to mention the District Magistrate or Sessions Judge, as the case might be, to call for the record in the case of any such application or proceeding and refer the matter to the High Court under Section 438 of the Code, necessary measures being adopted to have the question fully argued before the High Court and the result reported to the information of the Government of India." The course here laid down was adopted. The Madras Government took up the matter, and one or two cases were referred to the Local High Court. The Chief Justice declined to hear the Counsel on behalf of the U. P. A. S. I., as representing

planting community; but the Government of Madras, with impartiality that cannot be too highly admired; met this difficulty by instructing the Government Pleader to lay *both* sides of the question before the Judge, in order to obtain a fair and just ruling. The result, as will be seen from a report published on another page, is a decisive victory for the planters.

There may be another fight yet, for the Government of India has uttered a scarcely veiled threat that if its view of the law is wrong, the law shall be altered to make it right. In the face of the report of the Enquiry Committee, this threat loses much of its force. Still, there are one or two points that deserve notice. A reference was made to the Madras High Court on a point of law raised in the North-West Provinces; and a hint was thrown out as to what line should be approved of the Government of India. As to the legal aspect of the question raised, it may be observed that the Government of India probably errs in its statement that no offence has been committed until the Magistrate has made an order and this has been disobeyed. There has been at least one ruling to this effect, we believe; but there is certainly room for the counter-argument that the act in regard to which the Magistrate issues an order or passes a sentence, contingent on a certain immediate default, cannot be confused with the default itself. In any case, either the breach of contract or the default of recognizance and security is an act to be ascertained at the first hearing (in the words of Section 494 *p.* of the Procedure Code of 1882) punishable by law in force. Therefore, the present Procedure Code applies. We might follow this brief statement up with stronger arguments in support of the same view; but the ruling of the Madras High Court renders further detail unnecessary. That ruling should settle the matter finally in favour of the employer, and we cannot believe that the Government of India will attempt to render the ruling obligatory by pressing for amendments of the law that could be opposed alike to the interests of fair play and to the forcible representations of the South of India Planters' Enquiry Committee.

suggestions.

Very often, in personal interviews with some of our readers, we have received novel and valuable suggestions with regard to making this journal of increased value to our public. We have been able to embody many of them from time to time, much to the advantage of the paper. Unluckily, we are at present unable to arrange for a representative to tour through our very scattered planting districts, to take down impressions first hand: might we suggest that much the same result would be attained were freer use made of pen and paper?

the Ceylon Planters' Association.

After a long and chequered but highly useful existence this Association has recently decided upon building a "local habitation," corresponding in adequate measure with the importance of the body whose deliberations will be held therein. The laying of the foundation stone was performed with due solemnity by Lady Ridgway. In the subsequent speech-making, H. E. the Governor again testified, in happily chosen words, his appreciation of the industry of the Island. He pointed out the great value of the buildings, as being a visible and imposing reminder of the importance of the Central Association. May it not be long ere our own United Association follows the good example!

Official dilatoriness in Travancore. That is a very pretty state of affairs that the report of the Central Travancore P. A. exposes. The

Dewan has again assured the Hon. Secretary that maps and title-deeds in respect to lands bought at auction in 1895 are being prepared, and will shortly be issued! It is to be hoped that the Dewan fully realises the disgrace that this delay casts upon his administration. In former days things were supposed to be dealt with more promptly in Travancore, which will soon lose the name of The Model State if official work is allowed to fall so very far in arrears. When, too, the D. P. W. of the State is accused of crimping coolies, there would seem to be something radically wrong in the State of Travancore. Now that these matters have been prominently brought to notice, the Dewan will no doubt give them earnest attention, and proceed to rectify what is wrong.

Advances in "South India."

We were not a little surprised to read in the Ceylon Times, in a report of an interview with Mr. G. Benzie (who has been doing surveying work for Messrs. Finlay, Muir & Co.'s estates), the following: "... but on the other hand their (the Ceylon planters') mouths would water if they heard Mr. Benzie describe the abundance of labour there is and impart the information that *advances are absolutely unknown.*" Advances unknown in Southern India, and the findings of the great Planters' Enquiry Committee, which practically devoted itself to the advance question, only published a couple of weeks! Well-meaning Mr. Benzie, surely he deserves some *kudos* from Messrs. Finlay, Muir & Co. in particular and South Indian Planters in general for his rose-coloured statements. By the way, what does this gentleman mean exactly by the term "South India?" As understood in India, its boundaries extend a few hundred miles at least north of the particular jungles which he surveyed.

Bananas.

The chemical make-up of bananas and potatoes is strikingly similar, as will be seen from the following table:—

	Bananas.	Potatoes.
Water	... 75.71	75.77
Carbonaceous matter	... 20.13	20.70
Albuminoids	... 1.71	1.79
Woody fibre	... 1.74	.75
Ash	71	.97

This fruit is used, as is well known, in tropical countries as the potato is used in temperate climes. It has great advantages over the latter in the many different ways it can be prepared and eaten, though in India there are only two methods in general use: ripe, as a raw fruit, and ripe, in fritters. Yet from the meal alone soups, porridge and puddings, bread, cakes or biscuits can be made, which are more digestible than any known farinaceous material. A delicious syrup can be prepared from the ripe fruit, not to speak of excellent preserves and mock apple sauce. The plantation bill of fare is not so extensive that we can afford to do without such a great stand-by: it is difficult to understand our Anglo-Indian ignorance on the matter.

"The Coccidæ of Ceylon."

We much regret having failed, through inadvertence, to acknowledge the receipt of a copy of the first

part of Mr. E. Ernest Green's work on the "Coccidæ of Ceylon," which reached us some little time ago. The letter-press is excellent, interesting and valuable even to the non-scientific planter, while the coloured illustrations are numerous, life-like and very handsomely got up. The only fault in the whole book was that the first edition of the letter-press was accidentally printed in too large a scale to match the plates. This has now been remedied, and a second edition has been published of the proper size. The subsequent parts will be issued of a uniform size with this. The book is one which will be sure to prove of real scientific and practical value to South Indian Planters, as many of our coffee and tea pests are identical with those in Ceylon. It is rather too expensive a work to be largely bought privately, but each District Association at least should subscribe for a copy for the purpose of reference.

Mr. Green, by the way, has lately been appointed Honorary Consulting Entomologist to the Government of Ceylon, with especial reference to the cacao disease which is now troubling the minds of planters of that staple.

Resident vs. imported labour.

One of the latest schemes towards solving the great question of relieving congested districts by emigration to sparsely populated tracts in India is the proposal to induce a movement of the ryots of Bengal and the North West Provinces to cultivate the waste lands in the Assam valley. Peculiar interest attaches to this scheme, in that the meeting at which it was discussed was held at the London offices of the Indian Tea Association, and an appeal was made to the members present to give it their moral support. The scheme, which is supported by Government, is a benevolent one looking at it from one direction, i.e., that of the ryots. Viewing it, however, from the planters' stand-point, the position changes its aspect a great deal, and instead of giving the scheme their support, the representatives of the planting industry were almost unanimously opposed to it. The chief recruiting grounds for the tea labour force are situate in Bengal and the North West. Any considerable shifting of population would greatly intensify the present enormous difficulties of procuring an adequate and suitable labour supply. Resident labour looks very nice on paper, say the Assam planters, but which of the two would they prefer to do: cultivate their own lands at their own sweet will, or work on a plantation under strict surveillance? We trow, they answer, the latter.

And yet, comparing small things with big, local resident labour in the Nilgiris presents certain very distinct advantages. The Badagas, for instance, though extremely independent and by no means reliable, are nevertheless of the greatest use in executing certain contract works such as weeding, digging, pitting and the like. Few if any estates depend altogether on their aid, as the cultivation of their private lands always receives their first and earliest attention. Yet despite that fact, they form, and the local tribes in the Wynaad, Pulneys and other districts also form, one of the great advantages in planting in these localities.

Rubber.

This product is causing almost as much excitement among tropiculturists as rhea. And to add to the interest, the ignorance that

envelops both is equally dense. The only Eastern country where serious attempts to cultivate rubber have been made on a large scale are Assam and Ceylon. Both have practically abandoned its cultivation, leaving the meagre results of their experience at the disposal of experimenters. Briefly, the secret of their non-success lies in the adoption of wrong species of rubber. It should by no means prevent, however, Ceylon is it preventing, renewed trials with this fascinating staple. There seems to be no reasonable doubt whatever that the present huge consumption of rubber will keep prices for many a long year to come, not taking into account the depletion of the wild rubber-producing regions which operation goes on apace. With regard to depletion it is safe to say that of the many wild varieties of vine or tree used for producing the article, there is scarcely a single one which is not either utterly destroyed or seriously injured by the wasteful and ignorant methods employed. New regions are certainly being tapped, but on the other hand the supply from the older and more accessible sources is diminishing beyond doubt. Borneo and Burmah exported 11½ thousand cwt. in 1892 and only 7½ (thousand) in 1895. The United States' imports fell off 9½ million pounds in 1896 compared with the preceding year. From Brazil she received almost 6 million less; from the remainder of South America almost 1 million less; from Central America over ¼ million while from the East Indies the import was lessened by nearly one half and from Africa to one-fourteenth. Slackness of trade will scarcely account for all this. The writer in the *British North Borneo Herald* states, it will appear from the statistics of Para, the headquarters of South American rubber trade, that there was an increase in rubber received of 1,224 tons in 1896 as compared with 1895, but as many varieties of rubber from different countries are being shipped to the Para market in quantities that grow larger every year, the apparent excess does not prove that the supply from the Amazon Valley has increased, or even been maintained, notwithstanding the great activity among collectors in that region. The price of fine Para rubber to-day is evidence to the contrary. In London it is 5½d per lb. higher than at the same date in 1895, 6¼d. higher than in 1894, and 7½d. higher than in 1894, at the corresponding dates. We do not pretend to say there will be any actual panic in the market, as that would be absurd. The world's consumption is about 100 million pounds annually, of which one half is imported into Great Britain. The consumption has been gradually increasing during the past three years, as has the price likewise. Almost one third of the supply comes from Africa, and seems to depend almost altogether on the Dark Continent, how the position is to be maintained. And Africa is being exploited very thoroughly.

Steel track roads.

Perhaps there is no question that steel track roads excites greater interest than road-making. Good roads and plenty of them. Steel track roads seem as if we were going too strong, though, till we hear what the Road Commissioner of New Jersey says on the subject. The cheapest of all roads is perhaps the ordinary earth road, but for the next place steel tracks runs neck and neck with Macadam or Telford roads. And in up-keep expenses, and the huge weights that have to be drawn in steel tracks, it is a case of steel first and

st nowhere. Just listen to this: a horse will pull five times as much on steel as on a Macadam, and twenty times as much as on an ordinary dirt road. And again: the cost of freight in cents per ton per mile is as follows: On sand, 10 cents; on hard earth 20; on Macadam 5 to 10; on iron rails 1 cent.

Our readers must not run away with the idea that we wish to do away with the country cart. This way madness lies. No, simply to lay down steel gutter tracks sufficiently wide and with low flanges, so that the ordinary cart wheel can readily get in and out of them. The gauge of the local bandy would of course be taken as the standard, and, without disturbing the ancient carrying conditions in the slightest, traffic would be enormously increased and the cost equally lessened. The necessity of repairs to an ordinary road are due in great part to the action of water on the wheel ruts. By the use of steel gutter tracks, no wash would take place at all, as the water would find an excellent and practically indestructible conduit in the gutter tracks.

From the comparative rates of haulage already given, it would be safe to estimate the cost of freight on our ordinary district road as at least 30 times more than it would be on steel rails. In other words, for every thirty rupees now spent per ton, we should only spend one. The matter, we opine, is worth taking up and testing, for, if practicable, it is almost impossible to over-rate its importance to India, the land of scanty railways and immense distance.

Since writing the above, we have seen the matter referred to by an American exchange, the *American Grocer*, which gives a description of the steel tracks made by the O'Donnell Steel Track Highway Company, 143, Chambers Street, New York. Hon. John O'Donnell, late State Senator and State Railroad Commissioner, obtained a patent last November, and is the General Manager of the Company. The steel track is described as follows:—

"The track is five inches wide on the bottom, with half inch raised sides made of half-inch steel. It is laid on a longitudinal timber resting on ties. The middle between the tracks is filled in with stone and rounded up, the water running into the tracks and to the sides of the road by conduits from the steel track. The great difficulty in all road construction has been to take care of the rainfall on the road. If the water penetrates the crust of the road, the frost inevitably follows and the road is ruined. This gutter track takes care of the water perfectly."

Our contemporary supports our remarks as to the enormous prospective value of the introduction of the system. It says:—

"If all the advantages claimed by the Company prove true—and the reasons advanced seem well grounded—the steel track highway system will mark a new era. No invention since the steam age will so generally affect inland commerce and freight and transportation as this steel track highway. It means a revolution in the mode of business. It will be an active competitor with railroads in moving slow freight, for a horse will draw twenty times as much on a steel track as on a dirt road.

"The cost of the steel track all ready to lay is \$1,500 per mile. To this must be added the cost of ties, a longitudinal track timber, and the filling in of the track."

U. P. A. S. I. LEAVES.

(GATHERED BY THE SECRETARY, U. P. A. S. I.)

GOVERNMENT has decided that though the Report of the South of India Planters' Enquiry Committee is not strictly

confidential, it is desirable that all discussions of it by District Planting Associations and the U. P. A. S. I. should be held in Committee, and that no press report of the proceedings should appear.

Honorary Secretaries of District Planting Associations are requested to take special note of the above.

In this connection it may be remarked that a copy of Act XIII. of 1859 was published in the U. P. A. S. I. Book of Proceedings, 1894, to which reference can be made by all who wish to study the Act. A copy of Act V. of 1866 appeared in *Planting Opinion* of 26th June 1897, so that this also can be referred to without difficulty.

Surgeon-Major Ronald Ross has kindly intimated that he intends to furnish a brief paper on the Malaria question, for consideration at the Annual Meeting; so this subject will be added to the Agenda.

A ruling of the Madras High Court with reference to Act XIII. of 1859 appeared in the *Madras Mail* of 15th instant, and is republished in the present issue of *Planting Opinion*. No detailed circular will be issued on this subject, but merely one calling attention to these publications, either of which provides planters with particulars of the Court's decision. The ruling adds a fresh item to the glad tidings that will be formally announced at the Annual Meeting of the U. P. A.

The following are the subjects entered on the Agenda of the Annual Meeting to commence on 9th proximo:—

AGENDA.

1. Secretary's Report and Accounts.
2. Election of Office-bearers.
3. The Report of the South of India Planters' Enquiry Committee:—
 - (a) The Labour Question.
 - (b) Coffee-stealing.
4. U. P. A. Finances:
 - (a) Method of raising funds.
 - (b) Partition of funds between Tea and Coffee.
 - (c) Reserve Fund.
 - (d) Reporter's Fee.
5. Registration of the Association.
6. Constitution of the Association.

Revision of rules: (a) general, if Registration be decided upon; (b) with special reference to the formation of the Committee.
7. The Casket and Address to the Queen.
8. Subscriptions in default.
9. Scientific Investigation.
10. Malaria.
11. References to the High Court under Act XIII. of 1859.
12. Employment of Counsel *re* Act XIII. of 1859.
13. Roads and Communications.
14. "Planting Opinion."

U. P. A. S. I. FINANCES.

In the report of the last meeting of the Central Travancore P. A., which is given on another page, will be found a brief sketch by Mr. Acworth of his financial scheme in connection with the U. P. A. S. I. As Mr. Acworth remarks, Mr. Parsons' Individual Membership scheme has not "caught on." Besides this, Mr. Parsons realises that he cannot hope to get his scheme adopted by delegates who are instructed to vote to order. In all probability, therefore,

he will not bring it forward at the Annual Meeting next month. In that case Mr. Acworth should be pretty sure of a favourable hearing. Some Associations have from the beginning leaned towards a system of subscriptions in proportion to acreage under cultivation; Mr. Acworth meets their ideas. Others, who prefer a "lump sum" subscription, can make the necessary payment accordingly. Then, too, any Associations that are in favour of individual votes would seem to be at perfect liberty to sell or dispose of their votes, or a portion of them, to individual members of their respective Associations. If the scheme be adopted, and any Association takes this course, the Individual Vote will be put to a test, though the constitution of the U. P. A. S. I. as an Association of Associations, not of individuals, will remain unchanged. The income to be raised under the scheme would admit of the steady construction of a solid Reserve Fund. Progress in this respect would be less rapid than some planters desire; but however satisfactory it might be to have a magnificent Reserve Fund to contemplate, there can be little doubt that an ample annual income and steady allotments to the Reserve, year after year, will mean, in the long run, a more healthy and more useful state of affairs than that which a reserve of Rs.2,00,000 or so would furnish, unless also backed up by liberal annual subscriptions. Planters are bent upon establishing a Reserve, and they incline to regard it as a permanent nest-egg. They must, however, recollect that if it should be a nest-egg that lies idle and does not stimulate the lying propensities of the planting poultry, it will be useless. They have to consider not merely how to *construct* a Reserve Fund, but how to *utilise* it. Mr. Acworth has pointed out an excellent way on the one hand; no doubt there will be also some discussion at Bangalore next month as to whether the money is to be devoted to this object or that, or to be merely "sat upon" so that the Executive hen may always have the pleasure of feeling that she has *something* under her. We would strongly urge that Mr. Acworth's scheme should be regarded *first* as a scheme for the provision of an ample annual income, and only in a secondary degree as one for the establishment of a reserve. In other words, that planters should proceed on mercantile lines, and carry over to the Reserve each year such surplus funds as they find themselves able to spare. Unless they do this, they may at any time find that while they have a substantial nest-egg to gaze upon they have not an anna in their coffers to meet current expenses. Under such circumstances a reserve might easily become an absurdity.

"EVERY PLANTER HIS OWN ANALYST."

QUITE a fetching title, isn't it? and ought to attract the attention we wish for it. Everyone knows what soil is, and some know—but very few—what soil is good and what is bad *before* they plant in it. The usual thing is to obtain the knowledge afterwards, but this sort of method of obtaining the opinion of plants is too expensive to be useful. And yet it is not so very difficult to find out if a soil is good or bad. The best soil should contain about 50 to 70 per cent. of sand in it, from 20 to 30 per cent. of clay and from 5 to 10 per cent. each of pulverized limestone (calcareous material) and humus. Briefly, the reason why good soils should contain the above mixture is that clay alone would be too

cold and too heavy, sand alone too dry and too loose, without humus and lime the formation of nitrates would be practically impossible.

The next thing, after knowing what the best soil should be, is for the planter to find out how nearly his own land approaches the standard given. This he can do easily enough. Let him carefully weigh, say, half a pound of thoroughly dried soil which fairly represents his field block. Put this in a bucket with water and thoroughly stir it. The whole of the clay and humus, and a large portion of the limestone, if present, may be removed by simply pouring the discoloured water into another vessel. This should be repeated until the sand is washed clean of clay and organic substances. The sand must then be dried and weighed. If there is a quarter of a pound of it, the soil contains 50 per cent. of sand, and may probably be classed as a light sandy loam. But if it gives seven or eight ounces of dry sand, it is a sandy soil. In other words, if there are only ten parts in a hundred of clay in a sandy soil; ten to forty per cent. of clay it is a sandy loam; from forty to seventy per cent. of clay, a loamy soil; seventy to eighty-five, a clay loam; eighty-five to ninety-five, a strong clay.

The clay which is in the water that is poured off will soon settle, and may in turn be dried and weighed. This is a very simple and valuable, though rough, way of soil analysis—is it not?

If a planter sets seriously to work to judge for himself the value of his soils, there is a vast amount of knowledge he can pick up bit by bit. Knowledge of real practical value, not mere empty theory. Information that will guide almost every act of tillage, draining and manuring. Knowing what a soil wants, it is comparatively easy to supply its needs. Just to mention a last point particularly apposite in this monsoon season: have you ever had the curiosity to examine the discoloured water that flows down your drains after a heavy shower; have you ever thought of smelling or tasting it? Try it, and you will be very soon convinced that the peculiar smell and taste is due to the nitrates and ammonia robbed from your soil. Having arrived so far, we wonder if you would be sufficiently thoughtful to try and arrest this waste, even if you know how. Nitrates are soluble, as you have proved, and being soluble, can be taken up by coffee or tea roots. Clearly the waste that occurs must be put down to the fact that the feeding rootlets of tea or coffee are not sufficient to hold the excess of nitrates. What can you do? Try letting weeds grow a while and act as savings banks till the monsoon is over; you will get your otherwise wasted nitrates almost all back again. To test this interesting point further, examine carefully the drainage water off a clean weed and a weedy field in the monsoon: which gives the greater flow, and which is the darkest coloured? You will have to wait long for this answer.

ACT XIII OF 1859.

THE *Madras Mail* of 15th instant contains the following among items of Legal Intelligence:—

THE MADRAS HIGH COURT—15TH JULY.

(Before the CHIEF JUSTICE and Mr. JUSTICE SHEPARD.)
Act XIII. of 1859.

Mr. E. B. Powell, Public Prosecutor, at the instance of the District Magistrates of Trichinopoly and South Canara argued two revised

cases in which an authoritative ruling of the High Court was desired to whether warrants issued under Section 2 of Act XIII. of 1859 could be executed in localities outside the jurisdiction of the Magistrate issuing such warrant. The reference was made under an order of the Government of India, dated the 26th October, 1896, the material portion of which ran as follows:—

The Government of India are advised that there is reasonable room for doubt whether the provisions of the Code of Criminal Procedure, 1882, regarding warrants apply to warrants issued under Section 1 of Act XIII. of 1859, and whether a warrant under that Act can be executed at all outside the jurisdiction of the Court which issues it. On the one hand the words of Section 83 of the Code are unqualified, and it may appear to apply to all warrants. On the other hand they may be restricted to warrants "issued under the Code" by virtue of Sections 75 and 93, which seem to apply to the whole chapter. It is to be noted that though a warrant may issue under Section 1 of Act XIII. of 1859, no "offence" has been committed until the Magistrate has made an order, and that order has been obeyed. On grounds of administrative policy, it is clearly inexpedient that the very special procedure provided by that Act, which applies in certain cases penal provisions to the breach of a civil contract, should be capable of being employed to drag labourers many hundred miles from their homes to answer a charge of such breach; and if it should be decided that the existing law permits of such proceedings, it will be necessary to consider the propriety of amending it. The Government of India are, however, unwilling to bring the Act in question under discussion unless the necessity for its amendment is clearly made out; and they therefore desire to obtain an authoritative ruling upon the point in doubt.

Mr. Powell said that opinions on the point were divided, the Government of India being of opinion that such warrants could not run outside the jurisdiction of the issuing Magistrate, the other side holding *contra*, and he had been asked to place both sides of the question before their Lordships and to obtain an authoritative ruling. Section 2 of Act XIII. of 1859 gave a Magistrate power, on a complaint for fraudulent breach of contract, by an employer to issue a warrant to apprehend the offender for the purpose of making an enquiry into the complaint and deciding if a breach of contract had taken place, the manner in which such breach of contract might be dealt with, or the offender punished. Section 83 of the Criminal Procedure Code gave power for the issue of warrants outside a Magistrate's jurisdiction, but Sections 75 and 93 of the same Code appeared to limit it to warrants issued under that Code alone.

Collins, C. J.—You are now going to argue that a warrant of arrest under Act XIII. of 1859 should run outside the jurisdiction of the issuing Magistrate.

Mr. Powell.—Yes. It is contended by the Government of India that under definition of "offence" in the Criminal Procedure Code no act or omission has taken place which is punishable under that Code, for it was not the breach of contract that was punishable under Act XIII. of 1859, but the disobedience of the order of the Magistrate that was made punishable.

Shephard, J.—Why do you assume that the sections relating to warrants are limited to offences under the Criminal Procedure Code?

Mr. Powell.—That is the contention of the Government of India, as will be seen from their letter.

Shephard, J.—Suppose then that the warrant sections of the Criminal Procedure Code do not apply to Act XIII., what provision is there for such warrants at all?

Mr. Powell.—None whatever, and that is the argument of the other side, and to put that forward it will be necessary to trace the law regulating the procedure from the date of Act XIII. Act VII. of 1854 provided for the execution of warrants in places outside the jurisdiction of authorities issuing them. This, however, applied only to heinous offences, but Act XVII. of 1856 extended the provisions to all criminal processes whatever. That Criminal Procedure Code was repealed by XVII. of 1862, in which the language with regard to this particular matter was very similar. That Code permitted the execution of a warrant in another jurisdiction in the case of an offence supposed to have been committed. It did not define the word "offence", and the only Section giving jurisdiction to Courts in respect of special laws was Section 21 which gave it in respect of offences under such laws. Either, therefore, the Legislature considered breaches of contract under Act XIII. of 1859 to be offences, or it deliberately excluded them from the jurisdiction of the Courts it constituted by the mere use of an undefined word. It does not seem reasonable that the latter alternative can be accepted.

Collins, C. J.—I suppose there is no doubt that the offence—I call it an offence—charged was under Section 1 of the Labourers' Act?

Mr. Powell.—There is no question about that. To return, however, to the interpretation of the Codes, similar remarks to those mentioned above apply to the next Procedure Code X. of 1872. Again there was no definition of the word "offence." And by Sections 7 and 8 all criminal trials, and by Sections 6 all enquiries by Magistrates, should be held according to the provisions of the Code, and it cannot be denied that even in the preliminary stage a case under Act XIII. of 1859 is either a trial or an enquiry. The only reported case I can find with reference to this is whether a case under Act XIII. of 1859 can be tried summarily. The Sub-Magistrate of Chingleput decided a case under the Act summarily. The Madras High Court held that cases under the Act were enquiries of a special character and should be conducted with patience and care. The point deserving of notice in this case, however, was that all the Courts dealing with that case accepted the fact that the Criminal Procedure Code governed Act XII. of 1859.

Shephard, J.—That was the Code of 1872?

Mr. Powell.—Yes. It seems pretty clear that all the old Codes applied to Act XIII. of 1859. If the new code does not apply we have the strange fact that the Legislature, without specific mention, had deliberately cut away from that Act all directions and powers of procedure which had previously been in force with regard to every proceeding prior to disobedience of the Magistrate's order. If the process cannot be executed beyond the jurisdiction of the Sub-Magistrate issuing it, *i.e.* if the Sub-Magistrate of Coonoor cannot issue any summons or warrant beyond a radius of 5 or 6 miles, and can neither summon a defaulting cooly from Ootacamund nor issue a bailable warrant for him in Mettapolliem—Act XIII. as a safeguard of the planting interest, is practically dead.

Their Lordships delivered the following judgment:—

We are clearly of opinion that Section 83 of the Criminal Procedure Code is applicable to warrants issued under provisions of Act XIII. of 1859. There are no words in that Section limiting the operation of it to warrants issued under the Code. The reference to warrants issued under the Code made in Sections 75 and 93 cannot, we think, be taken to have the effect suggested. It cannot be supposed that if when the Codes of 1861 and 1872 were in force, the Sections in them corresponding to Section 83 of the present Code were applicable to warrants issued under Act XIII. of 1859, that the state of the law was intended to be altered under the Code of 1882. And we hold that none of the provisions in Chapter VI. of the Code apply to such warrants, which may lead up to the conclusion that there is no provision made for the issue or execution of them. It is not necessary to say whether under Act XIII. of 1859 breach of contract constituted an offence. The language of the Act appears to us to indicate that such was the intention of the Legislature. At any rate the Act authorises a Magistrate, on complaints being made, to issue a warrant, the only question being whether the provisions of the Criminal Procedure Code apply to that warrant. We think the provisions in question do apply.

RHEA FOR SOUTH INDIA.

We are indebted to Mr. John Cameron, Superintendent of the Mysore Government Gardens, for the following excellent *précis* on the Rhea Fibre Plant. The hints for South India planters will be found especially valuable:—

MEMORANDUM ON THE RHEA-FIBRE PLANT.

Boehmeria nivea.—Hook. and Arn.

Origin of botanical name.

The genus *Boehmeria* was created in honor of George Rudolph Boehmer, a German botanist. The specific name, *nivea*, (snowy) has reference to the underside of the leaf, which is white like snow.

Figure and description.

Boehmeria nivea is a soft-wooded shrub of the nettle family, *Urticaceæ*. But it differs from the proper nettle in having no stinging hairs. Root tuberous and fibrous. Shoots mostly simple and cane-like; herbaceous at first but soon becoming woody. When full grown they vary in height from four to eight feet, or even higher where the conditions of growth are exceptionally favourable. Leaves alternate, long-petioled, hairy, broadly cordate, acuminate, coarsely toothed, and snow-white on the underside. The unisexual flowers

are somewhat crowded in simple or branching panicles in the axils of the leaves. In every case the pistillate or female flowers occupy the upper position, the male or staminate flowers being found at the base of the panicle. The plant has not been known to produce fruit or seed in Mysore, where it is an exotic, hence these parts are not figured.

Habitat and distribution.

The Rhea plant is truly indigenous to the Malay Islands, China, and Japan. But like other useful plants it has been cultivated and domesticated to some extent in many other parts of the world, as in India, Brazil, Paraguay, Ceylon, Australia, and the warmer parts of Europe. It is, in short, a subtropical plant requiring a copious rainfall (otherwise irrigation) to bring its growth to perfection.

Propagation.

To secure seed, the plants cultivated in this country require very special treatment. But even then the supply is usually scanty and precarious. It is fortunate, therefore, that the Rhea plant is so readily propagated by the division of its tubers, offsets, and stems. The best plan is to lift a matured plant bodily for the purpose of division. The tubers, which resemble small potatoes, can then be dibbled into the nursery separately, the larger ones possessing several "eyes" can also be cut into "sets" as in the esculent just referred to. Then by careful handling, a sturdy rootstock can be separated into many parts, each having a little root and stem. Finally, the cane or stem can be reduced into cuttings of 5-6 inches in length. The best cuttings are obtained from the matured wood, but treated under glass, in fine sand, the tender or herbaceous portions of the stem will also take root. By the above methods many thousands of plants can be raised from even a limited stock. But to insure success it should be done during the growing season. In this climate, old stools and freshly rooted slips are practically as hardy as nettles, so that once established the plant is propagated without risk or even much trouble. The Botanical Gardens possess several thousand plants from which young stock can be raised in quantity. Rhea has also been domesticated to some extent in the coffee districts, so that even in the absence of seed, we have ample material to propagate from.

Sites for natural growth.

In Mysore, the hill country included in the districts of Hassan, Kadir, and Shimoga, affords the position and climate best suited to the hardy growth of Rhea, and in the most favourable situations it is not improbable but the plant would run wild to some extent. What is really required in this new product is its possession in great quantity raised at a nominal cost. It should therefore be encouraged to spread in suitable localities. It might, for instance, replace *Lantana camara*, with which it is nearly equally hardy, but less aggressive and far more useful.

Sites for cultivation.

It follows that where the plant will thrive without help it will also be the most productive under liberal cultivation. Extensive areas of comparatively open forest land having a good head-flow of water from some perennial stream would answer well, providing that the soil is fertile and open. Good drainage is a very essential condition of this culture, so that the sloping sides of hills and sholas might be preferable to lands situated on flats and in basins. The annual rainfall should not be less than 50 inches and would not hurt growth if it reached 100. Wet lands on the sides of rivers and canals bordering the Malnad would only be suitable if they are porous and easily drained. But in all probability the existing wet crops are much more profitable than Rhea is ever likely to become under similar conditions of cultivation.

Cultivation.

Virgin forest soil, and good loam with a liberal admixture of sand, are equally suitable for the vigorous growth of Rhea. But there must be no stagnation of water, hence it is necessary that plots demarcated for planting should be thoroughly opened by the plough. This is best done at the close of the monsoon when the surface herbage can be ploughed in and left to rot during the dry season. At the bursting of the South-West Monsoon another thorough ploughing will be needed to make the surface soil soft and workable. Rooted plants of Rhea can then be put out in the field at 3-4 feet apart. The crop will not be a full one during the first year, but in the 2nd, 3rd and 4th years it will be full. Under good cultivation the young plants throw out many suckers or offsets, and after 12-15 months of continual growth the intervening spaces will be nearly full of stems of various sizes. After the fourth year the growth becomes stunted and the fibre deteriorates in length, texture, and value. When this takes place the field has to be broken up and resuscitate the original field, a large amount of manure would

have to be applied in the first instance and at reasonable intervals subsequently. After the first planting, field operations consist of weeding, hoeing, and removing the matured stems.

With continual growth all the year round, supported by irrigation during the dry months, an average yield will be three cuttings but under exceptional circumstances even four cuttings may be obtained.

Possible yield per acre.

The outturn of fibre per acre differs according to climate and situation. But the average results under proper cultivation are not likely to exceed eight tons of ribbon (stripped bark) per acre. At any rate a larger quantity than this should not be expected from Indian cultivation.

Present market value.

Bales of assorted ribbons are now purchased on contract by a home company at £1 per ton. But it is very doubtful if this would be maintained in the open market. Any quotation of value at the present stage of the industry must therefore be more or less unreliable. But supposing the yield in India is only six tons per annum, and the market value £5 per ton, an acre of Rhea would be worth £30 to the cultivator.

J. CAMERON,

SUPERINTENDENT, MYSORE GOVERNMENT

BOTANIC GARDENS, Bangalore

LETTERS TO THE EDITOR.

WHITE ANTS EATING COFFEE TREES.

SIR,—In your Coffee Notes of 3rd July, with reference to white ants attacking coffee trees on the Shiré Highlands, you say you have never seen or heard of such a thing in India.

Amongst a few 16-year old trees on my tote near Bangalore these pests have lately killed one tree, having riddled the above and under-ground portion of the stem with their burrows. I have also laid open the roots of another tree, which was evidently suffering from some complaint, and found the same pests just commencing there also.

"ALOE KO"

BLACK BUG IN TEA: A QUERY.

SIR,—I noticed the other day, much to my disgust, a small patch of tea attacked by "black bug." Some two or three days ago the same field had a very bad go. It was cut down to the collar, the prunings burnt, and the ground sprinkled with lime. About a pound of bone and poonac was given to each tree to enable them to recover from the shock. The jât is a rather Hybrid.

The question is this: how to treat the trees, so as to destroy the pest and stop its spread? I cannot collar prune again so short an interval for fear of killing the trees outright. Spraying is unsatisfactory, and beyond some emulsion to choke the insects (for being "sucking" and not "biting" insects I conceive it of no use to attempt to poison their food by arsenical washes) there would be little use in spraying.

Que faire? I propose pruning the young wood to within 12 inches or so of the low prune, collecting and burning all the prunings, washing the stumps with cow-dung and ashes, forking the piece thoroughly, and manuring with peat thereafter.

I had thought of cutting down the trees to the ground and burning the prunings *in situ*, but feel a little timid about the results of such drastic treatment! Any hints would be most oblige one who much wishes to give a sure and painful

DEATH TO B

GIVING OF CHARACTERS.

SIR,—Some time ago one of your correspondents wrote in indignant terms of the indiscriminate way that some people give characters (I think it must be the juvenile element this time)—

written characters or "chits" to natives generally. No doubt many of these easily won documents are bestowed in the very blindness of the writers' heart, at the same time but a little consideration would show that this mode of humouring Ramawamy is very often the means of placing a weapon in his hand that he is not at all entitled to, and may be the means of leading some unsophisticated new-arrival (or should I say "creeper") astray.

I have come across some very flattering testimonials of this nature, but perhaps the sample I give below may best illustrate what, in my opinion, ought to be avoided:—

"June 28th, 1897.

—Estate.

"Bearer is the best 'Chuckler' I have seen since I have been in India—he can mend all sorts of saddlery, boots, etc., as good as any shopman at Bangalore.

—"(Signature)——"

To lend additional charm, I suppose the above was written on beautifully crested note paper with the significant motto

"PATIENTIA ET PERSEVERANTIA."

SHORT CROPS.

SIR,—“Perseverance” has given us an interesting problem, but one which I fear there is little chance of solving. Each man has his theory; one says leaf-disease, another the heavy monsoon, another early rain, and so we go on, with no facts to prove what is the cause of the exceptionally heavy failure under which we are suffering. Under these circumstances I am afraid opinions can help us but little, and I confess I am unable to form one with any degree of satisfaction to myself. One would naturally suppose after a heavy monsoon crops would be poor owing to the nitrates being washed out of the soil by the heavy rainfall, but I don't think failure to set can be put down to this. Leaf-disease, although the cause of small crops, and to some extent responsible for failure, has I think a greater tendency to prevent the formation of spike than to cause the blossom to fail. I have known years in which leaf disease was even worse than we have just experienced, with nothing like the percentage of failure. The amount of failure is this year quite exceptional, and I am inclined to put the cause down to “Season,” a thing it is impossible to explain but of the utmost importance where crops are concerned. I do not for a moment think we are likely to suffer in the same manner year after year. We have our healthy seasons, and the reverse, fruit seasons, and seasons almost without fruit, and the present year is without doubt a bad fruit year. Not only is the coffee crop poor, but this year the jungle trees have little or no fruit, which can hardly be put down to leaf-disease. With fairly good rains and a fine show of blossom, I doubt if even such general failure has before been experienced in Mysore as we have to face this year. I say “unfavourable season,” which I am afraid is admitting I know nothing about it. I have, however, no hesitation in expressing my opinion that leaf-disease is the cause of small crops, and anything which can be found to prevent, cure, or even mitigate the attack would be a God-send to planters. After all these years a cure seems hopeless, but I think to a great extent it may be prevented. I have found the application of Nitrate of Soda and Potash mitigate the attack greatly, if applied at the right time. I have also experimented with Sulphate of Copper and Sulphate of Iron, and I am of an opinion the disease may be prevented with Sulphate of Copper if the conditions for its application are favourable. It is necessary to treat the trees at least three times, and this is almost an impossibility where the rainfall is heavy and of long duration, but on estates where the monsoon is broken up by sunny days, it would be quite possible to carry out the treatment on a small estate. The idea of burning all the fallen leaves and prunings would be labour lost, as experiment shows

that after the leaves have been on the ground a short time the spores all die, and will not germinate under any conditions. Directly the spore ceases to obtain nourishment from the leaf it is killed by light.

KADUR, 3rd July 1897.

MYSOORE PLANTER.

LEGUMINOUS SHADE.

E. Lithosperma v. Nitrates.

DEAR SIR,—In P. O. of the 26th ultimo, H. G. R. in his friendly criticism of “Coffee Cultivation without Manure” takes exception to my writing that burying *E. Lithosperma* twigs is supplying coffee with nitrates ready made. Nitrates ready made is an expression I do not think I have made use of, but I believe I wrote that manuring with *E. L.* was practically manuring with nitrates. That this should be understood in the sense H. G. R. has understood it is very natural, and I am much indebted to him for calling my attention to it and giving me an opportunity of more fully explaining my meaning. There may not appear at first sight much difference between the two expressions; but in writing “practically manuring with nitrates” it was in reference to the extreme rapidity of decay that *E. L.* loppings undergo. I quite agree with your correspondent that nitrogen in *E. L.* is “Organic Nitrogen” and not in the same form as in nitrates; but from a point of view of availability there is Organic Nitrogen and Organic Nitrogen. The first step in the natural manufacture of nitrates is the liberation in the form of ammonia of the nitrogen in the organic matter; once in the form of ammonia it is converted by the nitrifying organisms into nitric acid, when it combines with lime, potash or soda to form nitrates. That the nitrogen in *E. L.* is very quickly converted into ammonia anybody can easily ascertain, by the simple expedient of leaving a heap of *E. G.* loppings to lie and sweat for two or three days, when smelling a sample from the interior of the heap will afford very satisfactory nasal evidence that the nitrogen is being liberated. Nitrogen in *E. L.* twigs is I think from this an easily get-at-able form. To give an extreme instance of unavailable organic nitrogen, I might take the case of teak. There is a certain amount of nitrogen in teak, but manuring coffee with teak blocks would certainly be an unsatisfactory way of supplying it with nitrogen.

There is no doubt that the quick action of a manure is in proportion to its complete decay, and that is why cattle manure is such unsatisfactory stuff for quick action, and this doubtless has led to the large and increasing use of chemical manures. It was because of the decay and complete disappearance of *E. L.* loppings in so short a time that I said that manuring with them was practically manuring with nitrates.

In a manure the nitrogen of which is so rapidly turned into ammonia as is the case with *E. L.*, I think we are justified in ranking it very highly as a fertiliser, as once we have got the nitrogen converted into ammonia, the rest is, I should fancy, soon accomplished by the nitrifying organisms of which there is every reason to think there is an abundance on all coffee estates. To give a further instance of the quick acting and efficiency of green manures we have the case of the paddy cultivator who uses them for a three-month crop, so that in three months the nitrogen is liberated, manufactured into nitrates, and taken up by the crop. If this is the case with *Tephrosia Purpurea* used as a paddy manure, the same rapidity of action might be more than expected from *E. L.* as the shoots are so much more succulent, and I should feel inclined to state as a fact that the rapidity of decay is in proportion to the succulence of the green manure buried. I hope I have made clear that in writing that manuring with *E. L.* was practically manuring with nitrates I was alluding to the extreme rapidity of decay that *E. L.* undergoes, and which I believe fully justifies me in placing as high a value on the nitrogen in *E. L.* as on the nitric acid in nitrates,

as nitrogen once liberated as ammonia is in an ordinary fertile soil very rapidly converted into nitrates by Nature's process. I hope H. G. R. will excuse me if I cannot agree with him when he says that the danger of too much humus is likely to arise with green manuring. Too much humus is a theoretical danger that I don't think is ever likely to arise in practical coffee cultivation in S. India. Coffee is an essentially humus loving plant. The growth of a new coffee clearing before any humus has been lost by wash is always infinitely superior to that on land that has been opened only a few years, and the only important change that has taken place is the loss of humus. On the hills of S. India, I am afraid the difficulty will be in the future as it has been in the past to prevent loss of humus rather than danger from excess. In contrasting green manure with nitrates, a green manure like E. L. seems to me to enjoy certain advantages over a manure like nitrate of soda. It is very easy to apply a larger amount of nitrogen in, as I hope I have demonstrated, a very readily available form than would be applied in the form of nitric acid in an ordinary application of Nitrate of Soda, and this at a nominal cost; there is also the advantage of E. L. containing a considerable supply of valuable mineral constituents that coffee is in need of. The great advantage of E. L. to my mind over ordinary manure is the extreme rapidity with which it disappears, in fact is completely digested, and thus affording an unfailing and constant supply of everything coffee wants. This, I believe, affords the true explanation of it when tried as a coffee manure.

B. NELSON.

ARIENKOW, SHENCOTTAH, 8th July 1897.

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contain per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.64	"	Phosphoric Acid.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE.

COFFEE.

One ton per acre.

A Sumatra planter writes to a local paper from Serdang that a certain coffee estate in the vicinity is picking over one ton per acre, and doubts if British India, Ceylon or Java has ever equalled it. He admits, by inference, however, that this yield is something quite exceptional, even for Sumatra. So we should imagine.

Cuttings.

A CORRESPONDENT, "G. E. R.," writes us with reference to the paragraph on this subject in our issue of 3rd July:—

"All the cuttings that I have tried came to a certain height and then died, of course. I do not know if this is always the case. What first made me try cuttings was, when making a nursery, the coolies cut some jungle plants (coffee) and made stakes of them to keep the soil in; these all sprouted and when taken out about a year later had five or six suckers on them from 6 inches to 1 ft. high. I then planted out a few; they did well till they were a couple of feet high and then blacked and died back, the stem remaining green and sprouting out again. I can't put any reason forward for this, but at the time put it down to the tap root not being able to force its way down and on pulling them up found a root about 6 inches long with a lot of feeding roots besides. I should like to know the reason why they died."

If we might hazard an answer, we would suggest that wood, such as the stakes were presumably made of, hardly the best material from which to make good cuttings. If "G. E. R." would try making some cuttings in, say, April or May, from young pencil-wood, say, $\frac{1}{4}$ to $\frac{1}{2}$ an inch diameter, with sprouting "eyes," the results might possibly be different. The subject being, as we pointed out last week, of such importance in the propagation of good stock, perhaps Mr. Cameron, of the Mysore Government Gardens, might very kindly oblige with some simple directions as to the best methods of striking coffee cuttings.

The Market.

SAYS the *P. M. Review* for 11 June:—

Business has continued very quiet throughout the week, demand having shown a very decided falling off both for home consumption and also for export. The latter has no doubt been influenced by the fall in the terminal market, caused by an increase in the daily receipts at Rio and Santos of the new crop now beginning to come forward. But though the demand has been slack there has been some evidence of more confidence, and prices have been fairly well maintained, while some kinds, notably foxy goods from Guatemala, have sold at a slight advance from the depressed rates of last week. There has also been some inquiry privately for stock from East India and for London cleaned Costa Rica, and sales are reported at 2s. to 3s. per cwt. above the prices obtained at auction a few weeks ago. The Dutch Trading Company have advertised their next sale for Tuesday, when 19,100 bags and 40 cases will be offered against 26,300 bags and 70 cases at the corresponding sale last year.

Leaf disease and electro-culture.

It appears that interest in the application of electricity to agriculture, or in other words of electro-culture, is again reviving. Many have been the experiments made, and isolated remarkable results have been obtained from time to time. From all we gather on the subject, the most economical manner of adopting electro-culture is by erecting simple crown rods in the field, connected by means of underground wires. The theory is that the silent discharges of

electricity continually passing from the higher air strata to the earth will be concentrated in the field thus treated, with great advantages in the way of increased yield and freedom from disease. This last word, disease, connects our remarks with the heading of this note: to wit, the possibilities of protecting coffee against the attacks of leaf-disease by the help of electro-culture. The apparatus, which has been fully explained to us by an expert electrician of many years' standing, is extremely simple and very cheap. Wooden poles six feet or less in height are planted firmly in the land some 10 yds. or so apart, quincunx fashion. To the tops of the poles are attached "crown collectors," which are simple metal discs with a serrated upright rim. A hole in the centre of the disc enables them to be attached to the post, which is insulated by means of the extremity being covered with glass or rubber (an empty glass bottle does very well). Each collector is connected with each other by wires, which again run down the pole, properly insulated, into the soil some 18 inches below the surface. These wires extend horizontally some few feet from the poles. The continuous current of electricity which flows along the wires is supposed to greatly stimulate the nitrifying organisms and to be highly deleterious to the existence of fungoid pests. The experiment would be very cheap, simple and easily carried out.

Besides the influence of the current, the effects of electric light have in many cases proved to be of great value to the plants subjected to their influence. The quality of lettuces, for instance, thus treated, has been proved to be ten per cent. better, and in growth fifteen per cent. quicker, than plants cultivated in otherwise identically similar conditions. Some very thorough investigations are now taking place in the Agricultural Colleges of Amherst and Corvett, both with the electric light and underground currents.

LIBERIAN COFFEE.

THE extension of Liberian coffee cultivation in S. India, in many cases in an experimental stage, in others on a more extensive scale, is ample excuse for my calling attention to the results actually obtained so far in Ceylon, and a district where there is very old Liberian coffee not a thousand miles from Cape Comorin. In Ceylon in the latter seventies there was a considerable amount of land planted with what was fondly hoped was going to replace the Arabian variety. The original plants were planted at too high an elevation, and not making any satisfactory growth were removed to a lower elevation, where they thrived admirably, and I believe brought in the fortunate proprietors as much as 4 as. a cherry. What has become of all the Liberian planted in Ceylon at that time is not hard to say, as it has practically disappeared, and to such an extent that not long ago I saw Liberian coffee cultivation alluded to as a new product in a Ceylon paper. The causes of its disappearance were various, in many places the soil was unsuitable and probably the treatment, and the coffee more or less came to an untimely end by starvation, death being in many cases accelerated by a mamoty. The low price of the coffee was another great cause; I think about 1884 it was only worth some Rs.5 a bushel of rice coffee. This cause led to the cutting out of some decent coffee, some that I saw being so well grown that hitching an elephant on to the trees was considered a cheaper and more efficacious system of removal than by coolies. There was yet another cause, a cause that I hope Indian planters may

be spared, and that was bug. Bug obtained such a hold on the coffee, and thrived so well, that the only way of getting rid of the bug was cutting out the coffee. At the present day I see the Delgolle Company refer to Liberian coffee, of which they have a considerable acreage of young coffee, in a most discouraging way, both as regards present crop and future prospects. As the result of all the Ceylon experience, it may safely be inferred that Liberian coffee wants good soil. Crossing the water there is some old Liberian to be found which bore well and steadily for years, but is now unfortunately in a very unhealthy state. One clearing along a stream being, I believe, affected by the extensive felling of the forest on both sides which must have had a great effect on the moisture during the dry seasons, and another clearing, which was under heavy forest shade, has been terribly damaged by thinning the shade so much so that it is being densely planted up with artificial shade in the hope it may save it. There would be nothing very serious in this as it would only point to shade being a desideratum for Liberian, but the most serious thing is the failure of young coffee planted three to four years ago, even when planted with shade.

This would, I think, point to deterioration of the seed, and I am confirmed in this by the opinion of the planter who originally planted the old coffee, who holds that Liberian does not grow as it used to. There is no doubt that looking at any lately planted coffee and comparing it with the old original trees, that it seems an impossibility for the stems to attain the same size within any reasonable time. There is another item of interest in regard to Liberian, and that is that the crop has been a complete failure last year and the year before through drought, the blossom failing to set. That long droughts are not good for it I think may be taken as proved by the success of this species in the Straits, where I believe they seldom have a month of the year without rain. There is a very important thing to be borne in mind in planting Liberian, and that is that there are distinct varieties of the coffee, one bearing much heavier than the other. So that in starting a Liberian as in a tea clearing, the importance of jat is of vital importance. From all I have seen of Liberian in Ceylon and on the continent, the successful growth of the tree seems to require—

Deterioration of Liberian.

Different Jats of Coffee.

- I. Good soil.
- II. Plenty of moisture.
- III. Shade where at all liable to drought.
- IV. Selection of the right jat.

In reference to the deterioration of the trees, it is harder to know how to meet that. Importation of fresh seed from Liberia would undoubtedly be the best way, provided any guarantee could be had that it was the right variety and carefully selected, but it is questionable I think whether it would not be better to rely on the survival of the fittest; careful selection and cultivation of the parent seed trees would I believe be as good a way as any to ensure success of future clearings and avoid repeating past mistakes. I may be wrong, but I am strongly of opinion that sufficient care has not in many cases been paid to the selection of the seed. Taking a bushel of parchment out the store for seed is hardly the way to command success. I hope some of your readers will let us know how far their experience of Liberian coffee agrees or differs from the somewhat unsatisfactory experiences I have related.

B. NELSON.

COFFEE IN BRAZIL.

THE prospectus has been issued in London of The San Paulo Coffee Estates Company, Limited, (State of San Paulo, Brazil), with a share capital of £270,000, divided into

24,000 7 per cent. Preferred Shares of £5 each = £120,000
 15,000 Deferred Shares of £10 each ... = £150,000

There is to be an issue of £16,000 5½% First Mortgage Debentures of £100 each and £120,000 in 24,000 7% Preferred Shares of £5 each. The 15,000 Deferred Shares are retained by the Condé de Sao Clemente, the present proprietor, the Vendors and their friends. The Directors will be Messrs. Henry F. Tiarks, Esq. (Messrs. J. Henry Schröder and Co.), Chairman, Quintin Hogg, Esq., Rudolph Schröder, Esq. (Messrs. Schröder Gebrüder and Co., Hamburg), and Pandia Calogeras, Esq., Paris.

It is stated that the Company has been formed to acquire certain Coffee estates in Brazil, which Messrs. Schröder Gebrüder and Co., of Hamburg (the Vendors to the Company), have agreed to acquire from the Condé de Sao Clemente, who has been in possession of the estates for many years. The estates are equipped with dwellings, machinery, &c., and on the property are over a million and-a-half coffee trees, and a railway and canal belonging to the estates. The amounts realised from the coffee sent to Santos, after deduction of the expenses from the estates to Santos, increased from £34,813 in 1894 to £55,781 in 1896, and the 1897 crop, which shows a diminution anticipated and explained, is expected to return £32,402. There are other sources of revenue arising from trading profits on commodities bought by the colonists and others in the neighbourhood, also from railway traffic on goods other than those carried for the company.

The full Prospectus estimates the future Revenue from Coffee alone at £32,402, and gives a full description of the property and returns for the past three years.

The annual amount required to provide for the Interest on the Debentures now offered is	£8,800
The amount required for the Sinking Fund is	4,000
The amount required to pay the Interest on the Preferred Shares annually is	8,400

Total amount required for the present issue £21,200
 Leaving a considerable surplus for contingencies and dividend on the Deferred Shares.

Enterprise on a scale such as this is unknown in the Coffee industry of India, and would perhaps be totally unsuited to the conditions under which that industry is carried on. We call special attention to the new Company simply because it is an indication that the Brazil Coffee trade is not to be allowed to lapse into a state of inertia. Our Teutonic brethren take a keen interest in it, and have a heavy stake in it; so the industry is likely to be "pushed," no matter what difficulties may arise or be dreaded in the way of dearer labour, impoverished soil, or increasing distance from ports of shipment.

TEA.

Dusty teas refused in America. The threatened tea-tax in America has been, curious to say, blocked for the present. Instead of using the tax as a means of shutting out low grade teas from the United States, they have adopted a sieve test, by which no tea containing more than 10 per cent. of small broken is allowed admittance. This has had the effect of already shutting out large quantities of Ceylon teas. It cannot be too frequently pointed out that broken teas of all kinds are now practically unsaleable, except in London, and even there prices rule extremely low.

Home Market.

SAYS the *P. M. Review* of 19th June:—

INDIAN TEAS.—With small supplies and a limited proportion of the useful sorts the demand continues inactive. New Teas have been offered more freely, and a fair quantity was included in the public sales consisting of growths from several districts. The Assams are about on a par with those previously imported, and of fair average quality for early arrivals, while a few of the Darjeelings are well up to the standard of former seasons, but the bulk of the offerings are inferior in cup. The Doorgas Teas show better quality than the early imports of last season, and, judging from reports,

this improvement bids fair to continue. Those from Cachar and Sylhet are, on the other hand, mostly of inferior quality. Travancore have been somewhat freely offered, and as they are, on the whole, of a useful character they met with a good demand, and sold at some prices. For the old season's imports the demand was slack, excepting for the small quantity of the better grades, which fetched former rates, the common and undesirable sorts meeting with a scanty inquiry. A considerable quantity was withdrawn, the owners' value evidently being above those of the trade. At present it is difficult to form an opinion as to what effect the earthquake in India will have in the different Tea districts in India. If the damage to the factories and railways, as given in some of the reports, is confirmed, it will doubtless considerably curtail the exports from Calcutta, and the supply of Tea here will be on a small scale for some time.

CEYLON TEAS.—Owing to the small quantity of Ceylon Tea offered during Whitsun week the sales have been exceptionally heavy, and were in consequence divided into two days, viz., Monday and Tuesday, making it much more convenient for the trade generally. Notwithstanding the large supplies, values, on the whole, were well maintained, although some slight irregularity was at times apparent. Prices for the medium and lower grades of both Whole and Broken Leaf are now extremely reasonable, and it is not at all probable that lower values will be seen this summer. On the other hand, the earthquake in India will, no doubt, for some time cause a great demand for Ceylon descriptions. The public sales comprised 10 packages, of which about 3,000 were withdrawn.

A CEYLON CLEARING.

I WENT with the Sinhalese contractor round the boundary of the new clearing, marking a tree here and there as he went. Next day he started, and in a very short time he had the whole place down. Then the trees were allowed to lie for a month till sufficiently dry, and one day we went and cut it. It was not very much, only 35 acres. It was a small burn but needed some clearing up; so he put on 20 men and cut the small branches that had not caught fire, and piled them in big heaps and then fired them again; so that two months after the felling only the big trees were left. Then my work began, and first I had to trace the roads and drains, the roads at 1 in. 17 to 1 in. 20; the drains 1 in. 12. Whilst these were being cut, I had many cutting pegs driven, lining about 3,000 are wanted per acre and a man will drive I think it's 1,000 a day. Look it up in Rutherford; he'll tell you. I put in the roads and drains first for two reasons: (i) to save wash, (ii) to save pegs.

Then comes the base line, which must be put in very carefully with compass or theodolite. A mistake of 1 in. at one end of a long line may mean yards the other end.

The main base line in, I run lines at right angles to it, say every 80 yards; so

these must be at right angles to the base line and perpendicular to one another. These are then connected by running parallel again to the base line (see dotted line). If all has been done carefully, the lines will show four corners. It costs no more and looks a lot smarter.

Next comes pitting. We usually plant 3 x 4 or 4 x 4. Personally I prefer 4 x 4 unless it's bad soil, when I like

and manure). The pits are 18 in. deep, 15 in. diameter at the top and 12 in. at the bottom. The earth should be heaped on the lower side of the hole and a cooly will do from 80—100 daily.

The pits should be left open from one to two months to sweeten. The "filling in" coolies scrape in the humus into the hole, stamp it in fairly firmly, and make a heap of humus over the hole. The holes should always be cut immediately below the pegs, unless there is a big stone or stump there; then cut above, but never to one side or the other.

The filling in should be finished a few days before the break of the monsoon, and after two or three days rain begin planting. There are four ways of planting: (i) in bamboo baskets or seedlings with a large ball of earth round the roots; (ii) plants; (iii) stumps; (iv) seed at stake germinated or not at pleasure. I like the first or fourth way best, but the second is the commonest, the third is usually used in supplying an old clearing.

In the first instance the seedlings in baskets or with merely a ball of earth round the roots are taken carefully out of the nursery and laid in flat baskets for carriage to the clearing, and in planting the earth in the hole is scraped out with a small mamoty. The small plant is put in and the earth replaced and pressed round it, taking care not to bend the tap root. These should show no check at all in their growth with good weather.

2nd.—Plants. These are ready to be put out when the collar has browned. They are brought to the field in bundles. The coolies have sticks about $1\frac{1}{2}$ in. diameter and $2\frac{1}{2}$ feet long. With this they make a hole in the centre of the pit; place the plant in carefully, taking care not to bend the tap root. If too long and stringy they should be shortened a bit. Then put the stick in at the four sides of the pit and press the earth up to the plant all round and finally press in the top earth firmly. A cooly will put out 250—300 a day.

3rd. Stumps are plants two years in the nursery and are put in much the same way as the last; larger pits are necessary as a rule, and crowbars instead of planting sticks.

4th. Seed at stake. Holing and filling as before. Plant two seeds germinated or otherwise (I prefer otherwise as a rule, unless with old coolies; new coolies break the root-lets) in each hole and shade heavily. Shade to be lessened afterwards. Seed at stake has these two great advantages:

(i) No nurseries wanted; (ii) no check to growth.

All plants want shading a bit, but seedlings and seed at stake most of all.

A good clearing should only have 5—9% vacancies at the end of the first year.

Weeding should start six weeks after the first burn and should go on monthly.

A good clearing can be lightly picked at $1\frac{1}{2}$ —2 years old. Pluck for six months, then top to 18 inches—24 inches. Pluck lightly its first year. At $4\frac{1}{2}$ years— $5\frac{1}{2}$ years it should have quite matured, but will probably increase in yield up to the tenth year, after which with *no* manure it will begin to go back; but with manure judiciously employed, should keep up its yield and may be increased further.

WANDERER.

DISTRICT ASSOCIATIONS.

CENTRAL TRAVANCORE.

A GENERAL MEETING of this Association was held at the Penshurst Bungalow on Saturday, 3rd July, at 9-30 A.M. The Chairman, Mr. F. M. Parker, who has lately been indisposed, was fortunately so far recovered as to be able to preside, but owing to the press of work on Estates there were but few members present, a most unusual circumstance. The whole of the business on the Agenda paper had, however, been thoroughly discussed in Committee a day or two prior to the Meeting.

S. I. P. E. C. Report.—The conclusions at which the Committee had arrived were endorsed by the Meeting.

Resolved: That the Delegate to Bangalore be instructed accordingly.

U. P. A. Leaf Disease Expert.—Read circulars and correspondence.

Resolved: That no useful purpose will be served by employing an expert, a thorough investigation having taken place some years since in Ceylon.

U. P. A. "Planting Opinion."—Read circular from Chairman.

Resolved: That the paper deserved every possible support, Mr. Parker going so far as to say that, should it be necessary, he saw no objection to giving the Periodical a small subsidy from the U. P. A. Funds.

U. P. A. Proxies.—Read circular from Secretary.

Resolved: That open proxies are undesirable, but that the length of time fixed for sending them in to the Secretary prior to a General Meeting was unnecessarily long.

U. P. A. Individual Membership.—Read circular from Secretary.

Resolved: That this Association is entirely opposed to Individual Membership as embodied in Mr. Parsons' scheme, and that the representative to Bangalore be instructed to vote against it.

U. P. A. Famine Fund.—The Honorary Secretary stated that he had received and forwarded to the Secretary, U.P.A., Rs.545 on account of this Fund: also that he had forwarded on account of the

Reserve Fund Rs.1,365 to the same quarter: further that, considering the small number comprising the Association, the many calls on them, and their loyalty in supporting the Indian American Tea Fund, the amounts raised were most gratifying, and reflected great credit on the *esprit de corps* of the members.

Delegate to the U. P. A. General Meeting.—Mr. G. L. Acworth was unanimously elected to represent the Association.

U. P. A. Finances.—Mr. Acworth said:—

MR. CHAIRMAN AND GENTLEMEN,—You are all aware that the method of raising funds for the U. P. A. still occupies our attention, and I have given notice that in August next I will bring forward pro-

posals which will, I trust, meet the views of almost all. These proposals I have already laid before your Chairman and Committee, and I am glad to inform you that they have received the unqualified approval of these gentlemen: further, that more than one District Association has signified its intention of adopting them. They are:—

(1) That the present method of subscribing and voting be altogether abolished.

(2) That an annual tax of one anna per acre be levied on each Association.

(3) That a vote shall be held for every Rs.10 so raised.

(4) That the rule relating to proxies shall hold good.

Gentlemen, you are aware that Mr. Parsons has energetically pressed his scheme for the introduction of the Individual Vote, but for various reasons into which it is not necessary to enter, that scheme has been rejected by more than one District Association, particularly by those at a considerable distance from the place of meeting. Now what I claim for these proposals of mine is that it lies within the power of every Association to please itself as to whether it has an individual vote or not. Take our own Association as an example. Say we subscribe on 6,000 acres, we shall pay Rs.370 per annum, entitling us to 37 votes. If five or six members wish to proceed to the General Meeting at Bangalore, you can distribute these votes amongst them, and you can, if you wish it, say, "Vote as you like: we do not care." Personally I should object to any Association giving its delegates such power, though I think a certain amount of latitude should be allowed them, otherwise discussion is fruitless. But I think the line an Association wishes its delegates to adopt should be indicated. If, however, you wish to give your delegates full power to use the votes as they like, you introduce, so far as your own Association is concerned, the individual vote, and I cannot see how the U. P. A. can object to it, for it in no way affects your power as an Association, whilst other Associations are at liberty to do exactly as they please, and bind down their delegates to order as tightly as they can. From what I have said I think you will agree with me that with the adoption of this scheme, it becomes unnecessary for Mr. Parsons to press his measure for the individual vote, for his members can buy as many as they please up to the value of their acreage. An objection to my proposals has been that it gives large Associations too much power. Of this I am not afraid. Our interests are practically identical, whatever product we may be cultivating. At present it is true that coffee largely preponderates on the U. P. A. list, but year by year tea will come more to the front and in course of time will equal, if it does not actually exceed, coffee. Moreover I think we have too much sense to quarrel on such a point. We ourselves are a small Association and one of those most interested in this question, and if we are not afraid of having obnoxious resolutions thrust down our throats, others may, I think, rest equally satisfied. As regards the financial part of my proposals, I may say that our income should not be less than between Rs.9 and 10,000 a year, which would suffice to meet our expenses and at the same time enable us to lay by something annually to the Reserve Fund. Should these proposals of mine be accepted, any previous promises of contributions to the Reserve Fund over and above what has been already paid are of course annulled, and that Fund will be entirely built up out of such surplus income as we may year by year have it in our power to lay aside. Personally, I should like to see the Reserve Fund built up and assume considerable proportions more rapidly, but there is very great opposition to such a scheme, and the one I have now put before you will, I think, meet the views of almost all. Gentlemen, I will not weary you with more details, but will now put these resolutions formally to the meeting, and shall be very glad if you will endorse what your Committee has already approved.

The resolutions, having been put, were unanimously adopted.

Local Labour Contracts.—Read letter from Mr. Buxton Laurie. Recorded.

Condition of Roads and Bridges.—Read letters from Chief Engineer in Travancore and from Executive Engineer, Northern Division. Recorded.

Crimping Coolies.—More than one member having pointed out that the D. P. W. subordinate officers have begun to forcibly detain coolies proceeding to the Estates, it was unanimously resolved:—

That the Honorary Secretary be requested to draw attention of the Chief Engineer to the fact that several gangs of coolies under advance to work on various Estates in these hills, whilst proceeding to their destination, have been and are still being forcibly detained along the line of road between Kottayam and Koomlie by certain subordinate officers of the D. P. W., thereby inflicting serious losses on the planting community.

Title Deeds for lands bought at auction in 1896. The Honorary Secretary informed the meeting that the Dewan had again assured him that maps and deeds were being prepared, and would shortly be issued.

Medical Fund.—Mr. A. E. Veale, the Honorary Secretary to the Fund, informed the meeting that hitherto no satisfactory reply had been received from H. H. Government to the applications for aid to the various dispensaries. Should no support be received from Government, the Fund must of necessity break down, as it was impossible for the Association to bear so heavy an assessment. Some of the dispensaries had now been running for over a year, for over six months, whilst for over six months Dr. J. J. had been ably supervising the medical establishments, visiting the dispensaries with regularity and so on. The health of the District had much improved this season, probably a good deal owing to the effective arrangements made, and it was earnestly hoped that these would not fall through for want of Government aid.

A vote of thanks to the Chairman and Honorary Secretary terminated the Meeting.

GRANVILLE L. ACWORTH

Honorary Secretary

LOWER PULNEYS.

PROCEEDINGS of the Half-Yearly General Meeting held at the Dindigul Club on Monday, the 15th March 1897. Present: Messrs. L. J. Creed (*Chairman*), W. H. Gerrard, F. R. G. H. Ludwig, E. Morgan, H. Rowland Newport, Howard N. (*Honorary Secretary*), Gentha Coopasawmy Chetty Avergal (*proxy*) Messrs. E. deFondclair and H. E. Somerville. (Voted) Messrs. G. Mengel and C. P. N. Martin.

Minutes of last meeting taken as read.

Read Notice calling meeting.

Read letter dated 12th October 1896, from Mr. Morgan, for Mr. Palni Andi Pillay, of the Sirumallais, saying that he had his name retained on the books of the Association as a member, but he was unable to attend last meeting, and would forward his subscription later. Recorded.

Read letter from Mr. U. E. Doyle, dated 8th February 1897, regretting that as he was leaving the district he had to resign his membership of the Association, and wishing the Association success.—Recorded.

The first item on the Agenda paper being the U. P. A. Fund—

The Chairman called upon Mr. Fred. Gerrard, who proposed the adjournment of the discussion at the last General Meeting, to read the Proceedings.

Mr. F. R. Gerrard said:—In spite of all that had been said in the long discussions we have had on the matter, we come back to Mr. Acworth's scheme; it was easy to criticise and find faults with which it did not suit us, but no more solid scheme had, in the meantime, been evolved. We might meet Mr. Acworth's scheme if we double our subscription in the District Association, giving the amount thus obtained to the Trust Fund, but this would mean a loss of members which we could not afford. Failing Mr. Acworth's scheme in its entirety, the only alternative application was for him to be Individual Membership, and to this there was no objection.

The Trust Fund, he thought, should be supported entirely

proprietors, but if the subscription, in the case of Individual Membership being thrown open, was not put at too high a figure, many superintendents would join.

With regard to proxies—should Individual Membership be admitted,—he thought they should be allowed at General Meetings, but the vote only be given through the District Association representative.

Mr. Creed said:—Individual votes should not be allowed by proxy unless the holder was at the same time given full discretionary powers, and Association proxies should be allowed as at present.

Mr. Newport said:—If Individual Membership was allowed, he thought there would not be so great a difficulty as there seemed to be at present in getting representatives for the District Associations, and therefore, if it could possibly be done, District Association proxies should be disallowed. There was no doubt that proxies in any form at a representative meeting, as the U. P. A. would be in any case, were bad, and worst of all were the proxies that bound the holder to vote against his convictions. If proxies were not allowed to Individual Members, or what came to almost the same thing, their proxies had to be given away with full discretionary powers, Individuals might look upon it as paying for another's pleasure, and not join unless they were more or less sure of being able to attend the Bangalore meetings as the Mysore and Coorg men would be. He hoped that it would not prove so in fact, but thought it was a point that would have to be taken into consideration. Therefore he thought that proxies in both cases would have to be allowed; if any could be done away with, it ought to be the Association Proxies.

Mr. Mengel said:—He thought that if Individual Membership was granted, District Association Votes as well as Subscriptions should be done away with, otherwise the voting would clash.

The Honorary Secretary said:—He was also of opinion last year that, if Individual Membership were thrown open, District Association Votes should be abolished, but now he thought the U. P. A. could not afford it. At present the U. P. A. was absorbing the funds derived from the District Association Subscriptions for current expenses, that if another source of income was opened up to it—one of the funds, it didn't much matter which—but the income from the Individual Members by choice, should be kept religiously untouched year by year and added to the Trust Fund until such time as the U. P. A. could afford to do away with the one and live upon the interest of the other. To attain this end the quicker he would reiterate what he has said before and suggest the asking for ten years' subscription at once. He felt sure many Proprietors, and Superintendents too, would prefer to give a cheque for, say, Rs. 250, than be bothered with the subscription book every little while. The benefit to the Trust Fund is easily seen. With regard to the voting, he saw no reason why it should clash if proxies were allowed. A majority in the District Association would only strengthen its majority in the U. P. A. Meeting. It was very improbable that the minority in the District Association Meeting would hold more Individual votes than the majority; if it did happen so, it was easily remedied by the District majority taking more Individual votes!

He agreed with Mr. Gerrard, however, that Individual Members' proxies should only be brought up to the meeting by the District Association representatives, so that Individuals should not be able to collect a number of proxies merely to create an opposition.

He did not think either that there would be so many members present at a meeting as to obstruct business. The balance of power should still be with the delegates, and if the Individual Members were allowed to speak at all, they might be limited to, say, five minutes.

Resolved that the Honorary Secretary be asked to write again to the Secretary, U. P. A., asking whether any definite figure could be given, before next U. P. A. Meeting, as the probable maximum value of the Individual votes, so that we could go up to the meeting prepared to say how many of our members will join at once.

Read Circular, dated 14th February 1897, *re* Individual Membership and votes.

Read letter from Secretary, U. P. A., dated 20th November 1896, acknowledging receipt of L. P. P. A. Subscription List and Cheque for Trust Fund. *Recorded.*

Read letters from various members, expressing their readiness to, or refusing to join the U. P. A. as Individual Members, or asking for further particulars *re* same. *Recorded.*

2. *The U. P. A. Subscription.*

Read Secretary, U. P. A.'s letter, dated 13th November 1896.

Read Proceedings, Central Travancore P. A. Annual General Meeting.

Resolved that the extra 50% call paid on the U. P. A. Subscription for 1895-96 be considered as a donation for that year and the full subscription for one vote be paid for 1896-97.

3. *The Famine Fund.*

Read Circulars dated 24th Jan. and 12th Feb. 1897, and U. P. A. Chairman's circular.

Subscription papers were circulated for members who had not already sent subscriptions direct and desired to do so now through the Honorary Secretary.

4. *Iyempolliem-Manalore Transport Rates.*

Read letter, dated 9th February 1897, from Mr. E. deFondclair.

Mr. Fred. Gerrard, speaking on behalf of Mr. deFondclair whose proxy he held, said:—Mr. deFondclair's transport rates were 2 as. 8 p. from Iyempolliem to his Estate at Manalore for 50 lbs. and said he could get no transport coolies while Manalore Estate paid 4 as.

Mr. Creed said:—That 4 as. was paid for 65 lbs. and that the distance was greater. The rate 4 as. was general in the Kodavannaar Valley before he came into the District.

The meeting was of opinion that, taking the extra distance into account, this might be allowed, since the difference was only about 6 p.

5. *The Ahtoor-Kodaikanal Ghât Road.*

Read letter from Secretary, U. P. A., dated 3rd Nov. 1896, saying that he could only send a general recommendation before Government with regard to Roads and Communications in Planting Districts, and could not make mention of special cases.

The Honorary Secretary read part of two letters from Mr. Granville Acworth bearing on this subject, and said that so far we had only passed general resolutions with regard to Roads and Communications at the U. P. A. That these had done no good in our case. That he had heard it rumoured that we were quite wrong in our idea that a grant had been sanctioned for the construction of a bridle path. That the papers relating to this matter were pigeon-holed was only too probable! We were really worse off, if that were possible, than we had been. The time was come to bring forward a definite resolution at the U. P. A. asking for the early construction of, at any rate, the lower part of our ghât, *i.e.*, from Ahtoor to Thandi-gudi, and if Government didn't see its way to making the cart road now the construction of a bridle path, he felt confident that our prayer would be supported at the U. P. A.

He much regretted that an idea seems to have got about among the Government officials of this District that in matters where the Association moves, it has only in view the convenience of the comparatively small European Community, especially did it seem so with such of the Heads of Departments as have not been near, and certainly not on to, the Lower Pulney Hills. The Native Landholders on these Hills would not move of themselves, and when the Association moved it was, apparently, misjudged; if it was petitions signed by Natives that the Government officials wanted, we could send them many and largely signed ones too. He had been endeavouring to obtain some statistics from the Tahsildars of the various Taluqs:—

Read letter No. 793, dated 1st Dec. 1896, from the Tahsildar of Dindigul, and No. 444, dated 11th December 1896, from the Tahsildar of Kodaikanal, saying that they could not supply the information required except with the permission of the higher authorities.

Read Honorary Secretary's letter to the Collector, dated 5th December 1896, and reply No. 1660, dated 16th December 1896, authorizing Tahsildars to give the desired information.

The Honorary Secretary said that he had already obtained some of the statistics needed, but not all. That when we go up to the U. P. A. Meeting this year, we must have all such statistics at our fingers' ends. He asked that a Sub-Committee might be appointed to assist him in the compilation of these statistics and in the drafting of a resolution to be put before the Association at the next meeting.

Resolved that the Secretary is authorised to ask any other two members of the Association to form a Sub-Committee with him to collect statistics and draw up a resolution on the subject to be set before the next General Meeting of the Association.

6. *Sirumalai Coffee Theft Cases.*

Read letters from Mr. Morgan, Sirumalais, dated 19th October 1896; 1st November 1896; 16th November 1896; 25th November 1896; 21st February 1897, and Mr. G. S. Hickey, Pleader, dated 23rd January 1897.

Read through Judgments given in two cases of Coffee Theft from the Sirumalais, in which the thieves, though caught red-handed

had been acquitted by the Stationary Magistrate of Dindigul for apparently absurdly inadequate reasons.

Since a re-trial has been applied for, and granted by the Acting Joint Magistrate, the cases were still *Sub judice*, and were therefore not discussed.

Resolved that the re-trial of these cases be watched with interest by this Association, and the papers obtained for discussion at a future meeting.

7. Import Duty on Tea Seed.

Read Circular, dated 28th September, 1896.

And " " 14th January 1897. *Recorded.*

8. The District Board.

Read Honorary Secretary's letter to the Collector and President of the District Board, asking that the Planters might be represented on the Board, dated 12th November 1896.

Read reply of the President of the District Board, No. 1421, dated 24th November 1896, saying that there will be no vacancy on the Board until June 1897.

Read copy of Kanan Devan P. A. Honorary Secretary's letter to the President, District Board, dated 26th November 1896.

Read Kanan Devan P. A. Honorary Secretary's letters, dated 3rd and 5th December 1896. *Recorded.*

9. The Dindigul-Pothanur Railway.

Read Honorary Secretary's letter to the Hon'ble Mr. Hodgson, dated 12th November 1896, and his reply dated 17th November 1896. Kanan Devan P. A. Honorary Secretary's letters dated 26th and 27th November 1896. Honorary Secretary's letters to the Hon'ble Mr. H. P. Hodgson, dated 22nd November 1896 and 5th December 1896, and Mr. Hodgson's reply, dated 12th December 1896, also Honorary Secretary's letter to the Honorary Secretary, Kanan Devan P. A., dated 5th December 1896. *Recorded.*

Resolved that the Honorary Secretary be asked to write again to the Hon'ble Mr. H. P. Hodgson asking whether he has been able to obtain any information from Government yet as to their views on their subject of the construction of this Railway, as to whether he thinks the construction is likely to be taken in hand shortly, and his opinion as to the advisability of bringing the matter up again at the next U. P. A. Meeting.

10. Act XIII. of 1859.

Read Circular of the Hon'ble H. P. Hodgson, dated Jan. 1896, and "Counsel's opinion," dated 24th Feb. 1897. *Recorded.*

11. Government appointment of a Fever Specialist.

Read U. P. A. Secretary's letter, dated 26th Oct. 1896. Letter from Mr. E. deFondclair, dated 11th Nov. 1896, and Circular dated 21st Dec. 1896. *Recorded.*

12. Cinchona bark.

Read Circular dated 29th Jan. 1897. *Recorded with satisfaction.*

13. Lady-birds and Green-bug.

Read Honorary Secretary's letter to the Hon'ble H. P. Hodgson, dated 28th Nov. 1896. Letters from Mr. Hodgson, dated 24th Nov. 1896 and 11th Nov. 1896. Also Circular dated 23rd Nov. 1896. *Recorded with satisfaction.*

The Secretary was asked to mention this subject in his letter to the Hon'ble Mr. Hodgson and enquire if he has heard whether Government have had any reply from Hawaii, and whether any further steps were being taken in the matter.

14. The Virupatchy Post Office.

Mr. W. H. Gerrard in opening this subject said:—The Post Office at Virupatchy was the nearest, indeed the only Post Office, within reach of the Planters on the North side of the Lower Pulneys; he need hardly say what an inconvenience it was to have a Postmaster there that did not either read, write, or speak English.

The irregularities that take place were inconceivable; for instance, he had posted some Currency Notes in a Registered cover on the 30th January, the Postmaster's receipt for which was only received on the 4th of February and the Registered letter arrived at Madras on the 5th of February. The letter had been registered at Dindigul instead of at Virupatchy, apparently because the Postmaster had no one there to translate the English address to him!

Again, on two occasions Railway Receipts sent per V. P. P. were delayed at Virupatchy for three days, and he had to pay demurrage to the S. I. Railway on the goods, because the Postmaster could not read English.

This Post Office was the centre for several European Estates, some of these had only Native writers in charge and therefore were not inconvenienced as their correspondence was chiefly in Tamil, but the letters for the three Estates managed by resident Europeans using that Post Office were sent up to the Hills in one tappal bag, that of Peryoor, as the Postmaster could not sort them. Other letters

addressed to neither of the Planters were not infrequently also up in this tappal bag merely because they were addressed in English and the Postmaster could not read the addresses. No Planter has his own tappal bag, but had to trespass on the kindness of Mr. Fred. Gerrard to have his letters sorted out and sent him the next day!

That a Planter could not even own his tappal bag was a hard thing to think of, he thought, that ought not to be allowed.

He could state that for the Planters alone Currency Notes (Registered covers), Money Orders and Value Payable articles to the value of 20 to 25,000 Rs. a year passed through the hands of the Virupatchy Postmaster.

He proposed that the Honorary Secretary be requested to write to the Superintendent of Post offices, Trichinopoly Division, asking to appoint a Postmaster to Virupatchy that understands English.

Mr. Fred. Gerrard in supporting this resolution said that he had posted a registered letter on the 11th March, and that no receipt had been received from the Postmaster yet, as apparently there was no one at Virupatchy to translate the address to him.

Mr. W. H. Gerrard's proposition being put to the meeting was carried.

15. Address to the Queen-Empress.

Read Circular, dated 23rd February 1897, and 27th February 1897; also letter from Mr. Granville Acworth suggesting alterations in the draft, dated 14th March 1897. *Recorded.*

Proposed by Mr. Creed and seconded by Mr. W. H. Gerrard that:—This Association thinks that as it was considered wrong to subscribe Trust Fund monies to the Famine Fund, the expenses of this address and casket should not be taken from it either, but should be raised by special subscription. *Carried.*

Read Circular dated 23rd February 1897 re Mr. Sander's letter to the Secretary, U. P. A., on Coffee adulteration and Chamber of Commerce. *Recorded.*

New Members.—Mr. J. L. Creed said that Mr. Mengel, who was then present as a visitor, had taken up the Dindigul Agency, and some of the Planters, and took great interest in Planters and planting matters generally. We had precedent in Planting Associations being on Planters' Associations, therefore he proposed that Mr. Mengel be admitted a member of this Association. Seconded by Mr. Howard Newport. *Carried.*

With a vote of thanks to the chair the meeting then closed.

LOUIS J. CREED, *Chairman.*

HOWARD NEWPORT, *Honorary Secretary.*

MARKET SUPPLEMENT.

Owing to the Jubilee Holidays in London no markets were held, hence the brevity of our "Market Supplement" this week.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (June 25, 1897) says:—No Public Sales have been held this week owing to the celebration of the Diamond Jubilee; but they will be resumed on Tuesday next, 29th June. Business, from the above cause, has also been very quiet, and prices in East India and Central American show little or no change since our last report. Receipts at the Brazilian ports have again increased owing to the early start of the new crop coffees and the Terme market in consequence has been weak, quotations showing a decline of 2/- on the week.

TEA.

LONDON advices dated 25th June 1897 state:—To-day's quotations for good common Congou are as follows: June, 1897, 4 9-16d, 4 8-16d, August 4 8-16d, September 4 8-16d, October 4 7-16d.

To-day's quotations for fair whole-leaf Indian are as follows: 1897, 7 7-16d, July 7 8-16d, August 7 7-16d, September 7 7-16d, October 7 4-16d.

To-day's quotations for Ceylon are as follows: June, 1897, 5 8-16d.

Tea Duty Paid, June 21 288,995 lb.

Exports ditto 31,560 „

Imported in the Carthage, from Bombay, 278 packages; Manora, Calcutta, 329 cases; from Madras, 33 cases; from Ceylon, 9183 cases; half-cases, 101 boxes, 132 packages; Clan Mackay, from Ceylon, 198 packages; from Cochin, 198 packages.

PLANTING OPINION.

A WEEKLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, JULY 24, 1897.

[No. 17.]

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; and Quarterly, Five Rupees, including postage.

ADVERTISEMENTS.—Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

N.B.—Remittances should be sent to the Managing Proprietor of this paper, Coonoor, Nilgiris, South India.

MANAGER'S NOTICE.

Back Numbers: A few odd Back Numbers offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 30th July 1897.

Nilgiris.

NELLAKOTA, 13th July.—A second burst of the S. W. commenced on the 4th and continued up to the 11th. Yesterday and to-day have been cloudy with little or no rain. Planting and supplying in full progress; handling commenced on several places; coffee on the whole looking well with lots of fine wood for next year's crop if only Hemeleia Vastatrix will not lay its trail over it all. *Health*—Fair. *Labour*—Insufficient. Grain last week: rice 7 to 7½ seers per rupee; ragi 18-20.

Coorg.

POLLIBETTA, 20th July.—*Weather*.—Last heavy rain on 12th, amounting to over 1 inch in parts; 11 inches on 13th; 70 inches on 14th; no rain on 15th; 10 inches on 16th; 17th, no rain. On Sunday fresh light burst set in, and since weather has been gloomy more or less and light showers occur daily. Sunday, 20; Monday, 25 inch. Ideal weather for planting which is going on. *Plant-diseases*.—Specks of leaf-disease to be seen on leaves of individual trees if looked for; but coffee on the whole still looking fine. Parts will probably go sick about August-September. It will be better so, as trees will recover by crop time and be in good heart again at blossom time. Last season leaf-disease was postponed till late, and trees were too shuck to blossom when early rain came in February. *Labour*.—With few exceptions, sufficient for requirements. *Public Health*.—Some fever and bowel complaints prevalent, but on the whole as fair as can be expected.

Nellampathy, British.

21st July.—*Weather*.—Very pleasant and at the same time suitable for planting as a little rain comes daily. Rain for week 1.51; to date 55.70. *Crops*.—In a few places where handling has been done a fair crop is showing, but in the majority of cases the handling has only shown up the nakedness of the trees as far as the berry is concerned. *Plant-diseases*.—Leaf-disease, I am sorry to see, is very bad in some places, and all over some is seen, be it little or much. *General Health*.—Fair. Coughs, colds and fever are prevalent. Cholera has not entirely gone yet, and it has got in among Mulseras and Tamils, I believe. *Labour*.—In most cases more than sufficient for requirements this year, as the cry all over is "cut down expenses," and only the most necessary works are to be done. *Interesting Items*.—Well, rather! What do you think of a wedding? One of the Proprietors is taking to himself a wife and we are only recovering the shock now! That's nothing, however, compared to the absolute knock down blow we received when we found the Cochin people had discovered they had a lot of planters in their State who were continually

complaining of roads and bridges, and on awakening to the existence of this long-hidden and Secret Society they have actually—I hope no one has weak nerves!—pulled down TWO bridges which it seemed they kept as temptations to suicide for any wandering horseman (or perhaps they were meant as sambur pitfalls) and, just fancy, are rebuilding them. No, I don't mean putting a sound plank over the rotten one through which a pony has fallen, but really and truly making new bridges. *Tableaux Vivant!* *There's a picture for you!*

GENERAL NOTES AND ARTICLES.

Kola nuts.

We note in the *Produce World* that exports of this article from the West Coast of Africa promise to develop considerably. There is a good market at present in London from 8d. to 1s. 4d. per pound. The nut, by the way, should be cut in halves when raw, and then dried before export.

Lady-birds and bug.

In noticing that Mr. Koebele's services would be unavailable to the Madras Government for the purpose of introducing beneficial bug parasites, our contemporary, the *Ceylon Observer*, suggests that Mr. E. Ernest Green, Honorary Entomologist to the Government of Ceylon, be approached on the subject. If a suitable man cannot be found among our scanty scientific staff in India, the suggestion would seem an excellent one. Mr. Green, it should be noted, is now engaged in investigating a mysterious disease that is committing great havoc on the Island cacao plantations.

Misuse of Famine Funds.

In continuation of his "Plain Tale from the Hills," Mr. B. Nelson writes: "With a view of making my case more complete, I make the specific allegation that the coolies' (absconding from Travancore) rail fare was paid out of the Madura Famine Fund locally raised. Such a statement, if unfounded, can easily be refuted, but I have little doubt that I can challenge contradiction and defy denial." We note that Mr. Nelson has also written to the *Times of Ceylon*, which quoted his first letter to us, about the matter, warning them against attempting to import "famine coolies."

Bat guano.

We understand that considerable quantities of this valuable manure are available in Burma, and indeed form an article of commerce at its chief ports. We note that the deposits of bat guano in New Caledonia are being turned to commercial account, considerable shipments having been made to London. Curious to say, London traders have given it but scant encouragement, though the guano was of good quality. The Editor of the *Produce World* states that a fair average quality containing 5 per cent. ammonia and 16 per cent. phosphates should be saleable in London at £5 to £5-5s. per ton. Of course it would never pay planters to purchase at that rate, as our poonacs and fish manures are decidedly richer and cheaper.

Statistics of rainfall.

We are indebted to Mr. Digby T. Brett for a suggestion which, if we are enabled to carry it out in its entirety, will doubtless

prove of more than ordinary interest and value to the community. It is no less a task than collecting and publishing statistics of the monthly and annual rainfall of each of the different planting districts of South India for the past two years, more or less. We publish Mr. Brett's letter in our correspondence columns, and trust that our readers kindly send similar tables from their own districts. A correspondent points out, the information thus gained supply authoritative answers to the numerous queries regarding the chances of successfully introducing products. More especially, we may add, if statistical notes on temperature and elevation are added.

The Madras Almanac.

We have to acknowledge, thanks, the receipt of a copy of the *Madras Directory* for 1897, published by Messrs. V. Co., the well-known Printers and Publishers on the Madras Road. The book contains a large amount of valuable information respecting the various Institutions and Societies of Madras and the Presidency, Madras City, Mofussil, Government and Municipal Officers, Tea, Coffee and Cinnamon Estates, Gold Mines, &c., with a Commercial and Trade Directory, and List of Residents in Madras, &c. &c. It also contains two photos well executed of H. R. H. the Duke of York, and the Rajah of Ramnad, and it will be useful to business men as a book of reference when needed. The price of the publication, with paper cover, is only one rupee.

Ceylon labour.

At the annual meeting of the Ceylon Association in London on the 14th June, one of the most important questions discussed was that concerning coolies and the keeping down of advances. At present it is an acknowledged fact that certain estates give as much Rs. 100 advance per coolie, an amount which under no possible circumstances can be paid off by him. If it can't be paid off, it must be written in the books, instead of being placed among the assets. The cost of production must thereby be increased. Mr. K. Rutherford suggested that in a matter of this kind it was of no possible use addressing Government. The remedy lay with themselves, in combination to keep advances as low as possible. Very much the same thing has been tried in India, but has lamentably failed. We are curious to see how the experiment succeeds in "U. P. A. S. I. Ceylon."

U. P. A. S. I. LEAVES.

GATHERED BY THE SECRETARY, U. P. A. S. I.

THERE is very little in the way of 'pickings' this week.

Statistics come in very slowly. Perhaps planters do not realise how necessary *grains* are to the formation of a complete set. If complete statistics could but be put together, the importance and strength of the planting industry in Southern India would stand proved. At present, the men who would cast a doubt upon it.

The Editor of this paper is willing to publish, as far as possible, the full proceedings of the various District Planting Associations. To enable him to do this with any conscience, he wants copies forwarded sharp, and not many meetings of any particular Association reported.

ce! When reports of meetings extending over two to three months are all forwarded in a bunch, too great pressure is put on the space available, and an unpleasing monotony" of matter is presented. Honorary Secretaries are requested to send in either MS. or printed copies as early as possible.

It would also be well if the U. P. A. S. I. were enabled to have complete records of the proceedings of each of the District Associations. At present its receipts are of a fitful and spasmodic character.

INDIAN-AMERICAN TEA FUND.

TO THE EDITOR,

Planting Opinion.

DEAR SIR,—Will you kindly publish in your paper the following list of donations to the Indian Tea Association from estates in this District to the Indian American Tea Fund?

I am happy to inform you that every estate has contributed to the Fund.

LIST OF DONATIONS.

	RS.	A.	P.
Arnakal	86	0	0
Shley	15	0	0

Total Rs. 1,722 9 3

GRANVILLE L. ACWORTH,

PÉERMAAD, 19th July 1897.

Honorary Secretary.

THE ANAIMALAIS.

THE following are the rules and conditions on which land on these hills may be leased, as published in the *Nilgiri District Gazette* of 16th instant:—

Notice is hereby given that about 80 square miles of land on the Anaimalai hills in Coimbatore District are available for application for planting purposes under the subjoined rules. A map of the locality may be seen in the office of the District Forest Officer, South Coimbatore. Appendix.—Rules for the leasing out of lands on that portion of the Anaimalai forest reserve in the Coimbatore district which lies on the slopes draining towards Travancore and Cochin:—1. Applications for land in this reserve shall be addressed to the Collector of the district and shall be accompanied by a tracing of the topographical map of the Survey of India on which shall be marked the block of land applied for. The applications shall contain the following particulars:—(a) The estimated area of the land applied for. (b) The situation of the land and its boundaries as accurately as can be stated. 2. No lot shall exceed 1,000 acres and no lot shall be less than 160 acres, unless otherwise specially ordered by Government. 3. Every lot shall be compact and shall include no more than one block of land capable of being surrounded by a ring fence. A block of land will be regarded as fulfilling this condition although a public road may pass through it. 4. On receipt of an application under rule 1. the Collector shall require the applicant to deposit 10 per cent. of the upset price, which deposit will be refunded in case the lease of the land be not bought in by the applicant, and shall thereupon advertise the lease of the land for sale at the Collector's office at a specified hour and on a specified date which shall not be less than three months after the deposit of

such sum. 5. A notification of the intended sale of the land specifying the locality, the boundaries, the approximate extent and annual assessment of the land, and the place, time and conditions of sale shall be posted for three clear months in the offices of the Collector and of the Tahsildar of the taluk. An advertisement of the intended sale shall also be inserted in the *District Gazette* and published in one or more of the principal papers of Madras, Calcutta, Ceylon and Singapore. If the sale be not completed on the date fixed in the notification, the Collector, subject to the provisions of rule VIII., may postpone the sale for a period not greater than seven days to a date to be specified by him and to be intimated to all the parties that may be present and to be posted up in his office. 6. The Collector shall send to the applicant by registered letter written notice of the place and time of sale; but no sale shall be postponed in consequence of the non-receipt of such notice or delayed in consequence of the non-appearance of the applicant. 7. If the applicant withdraws his application prior to the date of sale, it shall be discretionary with the Collector to proceed with the sale or not as he considers best for the public interests. In such case, the applicant will be entitled to the refund of so much only of his deposit under rule IV. as may not have been expended in publishing the advertisements and notifications under rule V. 8. The lease of the land shall be brought to sale on the day appointed, provided—(a) that the application has not been withdrawn, or that if withdrawn, the Collector has decided under rule VII. to proceed with the sale, and (b) that no claim of private proprietorship or exclusive occupancy or of any other right incompatible with the lease of the land under these rules has been preferred and admitted by the Collector as sufficient ground for the postponement of the sale. At the appointed time the approximate area of the land as plotted on the map shall be announced and the lease of the land for a period of 30 years shall be put up for sale at an upset price of Rs.5 per acre and sold to the highest bidder above the upset price, subject to the following annual assessment payable on or before the first March of every year:—(i) During the first five years of the lease, eight annas per acre per annum on the whole holding. (ii) From and after the beginning of the sixth year of the lease, two rupees per acre per annum on so much of the holding as shall have been cultivated and eight annas per acre per annum on the remainder, provided that in no year after the first five years shall the assessment be less than the following:—

In the 6th year Rs.2 per acre per annum on $\frac{1}{30}$ of the holding and 8 annas per acre per annum on the balance.

" 7th "	" "	" "	on $\frac{1}{10}$	" "
" 8th "	" "	" "	on $\frac{2}{10}$	" "
" 9th "	" "	" "	on $\frac{3}{10}$	" "
" 10th "	" "	" "	on $\frac{4}{10}$	" "
" 11th "	" "	" "	on $\frac{5}{10}$	" "
" 12th "	" "	" "	on $\frac{6}{10}$	" "
" 13th "	" "	" "	on $\frac{7}{10}$	" "
" 14th "	" "	" "	on $\frac{8}{10}$	" "

In and after the 15th year Rs.2 per acre per annum on $\frac{1}{2}$ of the holding and 8 annas per acre per annum on the balance.

(iii) No assessment shall be leviable on public roads accepted as such by the Collector. For the purposes of calculating the assessment leviable in any year the Collector shall be the sole judge whether the land is or is not "cultivated." Every lease granted under these rules shall run from the date of its execution; but the assessment payable thereunder shall be leviable in respect of the official year and shall fall due on the 1st March in each year of the lease. 9. Every bidder shall deposit 10 per cent. of the upset price before bidding and the successful bidder shall pay the remainder of the purchase money plus all expenses under rule V. within thirty days on pain of forfeiture of his deposit. 10. Arrears of annual assessment shall be recoverable as provided under section 66 of the Madras Forest Act V. of 1882 in the same manner as arrears of ryotwari land revenue are or may be recoverable by the law for the time being in force in the Madras Presidency. 11. Lands, the lease of which has been sold under these rules, shall continue subject to all taxes payable by law. 12. The existing and customary right of Government, of other proprietors and of the public in existing roads and paths and in streams running through or bounding lands leased under these rules are reserved and in no way affected by such leasing. 13. The Collector can reject any application if for special reasons he considers it inexpedient to give the land applied for on lease. 14. An application not withdrawn amounts to a bid for the land at the upset price of Rs.5 an acre.

LETTERS TO THE EDITOR.

ANSWERS TO CORRESPONDENTS.

["Camp Takrepatam."—Many thanks for yours of 14th with its interesting notes, which we publish elsewhere. Please excuse direct reply, as with our weekly edition, our time is more limited than ever. We shall be very glad to hear again from you. "A. C. G." Nellampathies.—Write to the *Ceylon Observer* Press for the work you mention. "Q."—We don't quite see the force of your argument: in the absence of regular accountants, what can estate managers do, but keep the accounts themselves, or do you suggest that assistants or writers are more capable of carrying out this work? "Orange Pekoe."—Your "Advice to tea-planters" is doubtless well meant, and we thank you for the intention displayed in sending it. Fine plucking is very desirable, but it can easily be pushed too far. Kindness to tea-makers should certainly be studied. Your system of forking the land every five years only seems a little curious. Manuring on poor land is by no means waste of money. Weeding should be carefully attended to. This is the first time we have heard of Acme chests causing cheesiness in tea.]

BIRD LIME.

SIR,—One of your correspondents lately asked about Bird Lime. It is composed of Linseed oil boiled *very carefully and slowly* till it is of the required thickness and strong enough to hold a bird. Be careful not to have too strong a fire, or the stuff cakes and spoils. It must be *ropy*.

L. S. E.

OAKLANDS DAIRY BUTTER.

SIR,—If your correspondent in your issue of the 10th instant, signing himself Pat Cloyne, would kindly address us again, he will receive the sample tin of butter at once. We can assure him that neither of his letters have been received, and that owing to similar complaints from others, we have already addressed the Postal authorities.

We are quite aware that punctuality in the despatch of orders may mean increased business, and no orders, however small, will be neglected.

Yours truly,

YELAHANKA, 15th July 1897.

J. PARTRIDGE & Co.

BLACK BUG PARASITES: A QUERY.

DEAR SIR,—In my last letter I asked for some information as to the best means of combating black bug on tea. Since then I have noticed that the area infected is far larger than I had thought, and I am therefore stopping my pruning, being convinced that the remedy will cause more loss than the disease itself.

So I have bethought myself of another way of procedure. Some months ago a Kotagiri planter wrote you an interesting account of the manner in which black bug on coffee was destroyed by the attacks of certain lady-bird parasites.

I should be immensely obliged if your correspondent could kindly send me a small lot of these lady-birds for introducing into my bug-stricken tea. I should gladly pay all expenses, and I am sure you would be kind enough to direct the cooly to my tote, which, as noted at foot, is in Coonoor.

COONOOR, 20th July 1897.

DEATH TO BUG.

OLD MYSORE ESTATES.

SIR,—I see Mr. Meppen has only lately been writing in connection with "Old Mysore Estates" which appeared long ago. I see he refers to me as ungenerous in my remarks. I have not the number of P. O. in which my letter appeared, nor copy of my letter, so am hardly in a position to write about it. But I cannot quite see how he makes out the remarks were ungenerous. So far as I remember, he was writing in such a way as to leave the impression that the old chicks were still doing well and referred to Kelagoor Estate. I showed that all the Mysore dis-

tricts had been virtually replanted with Coorgs and they were invariably used on new estates, simply because of the general failure of the old chick in the vital matter of crop. It yielded very poor crops, while Coorgs yielded much better. As to Greens and Cannons, he admits himself two of them were in Mysore service, and they got land cheap and cultivated cheap. Yet he says my statements are pure fiction. There were two brothers Green two being partners in one or two estates, the third owner of another. If not all actually in the service through their brother knew all about it and went in for it. Where is the pure fiction? The essential part of my statement was they got land cheap, followed by a poor style of cultivation and added to their pay or pension, for they were all service whether Mysore or Indian.

CHICOR

CHRISTIAN COOLIES.

SIR,—In your issue of July 10th there appears a letter on the subject of Christian Coolies and Planters above the *nom de plume* of "Middle View." I have no wish to enter into a discussion on this subject, but there is one sentence in your correspondent's letter to which I take strong exception. "Middle View" writes: "How often is the sad spectacle of a number of planters meeting together and partaking in a disgraceful drinking bout, the majority of the men present having to be carried to their beds by *their own servants*, or more sober friends." If such a state of things existed in the district to which "Middle View" belongs, it would be indeed disgraceful, but I do not at one moment believe it to be the case, and consider that it exists in the too fertile imagination of your correspondent. It may be true that in olden times planters rendered themselves liable to the charge of being heavy drinkers, but such is not the case nowadays. At one time in England men in the society habitually drank too much. We read how Addison was one generation and Pitt and Dandass in another were not at all in a fit state to conduct business, and how even judges were known to come into court before they had got over the effects of a heavy debauch. Such times have passed in England, and are not to return, and so with the planters of the present generation. Planters know that it is impossible to combine drinking and work, in the Tropics or indeed anywhere else, and I will venture to state that for sobriety they will compare not unfavorably with any other body of men, though there may be, in every other community, black sheep among them. I am a planter, for such I take "Middle View" to be, to make such an uncalculated aspersion on the characters of his brother planters shows, to say the least of it, a want of *esprit de corps*. It is highly to be regretted, and I trust he will see fit to withdraw his statement, which I consider to be a libel on the Planter Community.

"A SCOT"

[We strongly agree with our correspondent, and can only express sincere regret for having allowed the letter referred to appear unchallenged.—ED.]

COST OF LIVING ON PLANTATIONS.

DEAR MR. EDITOR,—I have noticed with amusement that your storm ex-Creeper's letter and mine have raised. Of course I forgot the dhoby *pro tem*. The fiend costs me Rs.4 a month and misuses my clothes horribly and does not forget him long.

I quite agree with Van Rensd that no proprietor should expect white men to work for him for less than Rs.100 a month; on a hundred I could live fairly well, but I buy no new clothes, save jail cloth ones, and should not expect to have any liquor for my friends, much less for myself. Van Rensd calls me a chimney; may be I am, but like the chimney "The Private Secretary," it is a chimney that smokes d

od tobacco. I still hold that a youngster can live well in Ceylon on Rs.79, but by living I merely mean food, etc., not much liquor, still less entertaining and amusement, and *no new clothes*. I do not mean to say that I lived in the Nilgiris on about Rs.60 a month from choice. I did not, and hope I'll never need to do it again. Having no liquor I did not mind a bit for myself, but when an occasional man did drop in, I felt then; when Van Resd has been like me in a country where whisky can't be obtained except very occasionally, he'll learn to do without like me.

If Van Resd thinks I mean that I was comfortable on the small sum I mentioned, he is mistaken. I meant to show that such a man would keep body and soul, and a very discontented soul at that, together. For comfort the amended estimate should be as follows:—

Original Estimate.	(Starvation Point.)
Butler	15
Food (shandy)	25
Tobacco	5
Medicines	5
Sundries	5
	55
Dhoby (forgotten)	5
	60

Amended Estimate.	
Liquor	20
2nd Servant	10
Pony and Syce	30
Extra Shandy	5
Tinned goods	10
Club	3
Library	3
Clothes	25
	106

For that sum one should be able to live fairly well, not be ashamed to see a pal when he turned up, and may be save a little and yet be well groomed and fit to be seen, and I hope I may never have much less. Though I could do myself well on less, a youngster could not, as Van Resd says; and that salaries may rise is the wish of

ERODE, S. I. Ry.,
6th July 1897.

ON THE CHEAP.

RAINFALL STATISTICS.

DEAR SIR,—I enclose certain statistics as to rainfall in the Koppa Taluk of North Mysore. My estate on which the record has been kept is situated about the centre of the estates, so the returns may be taken as a fair average. Of course, rainfall varies greatly even on estates situated close to one another.

I have closed my averages up to 1894: it is in the last two years the monsoons have varied so much. 1896 is a very notable instance; and this year, at the most important part of it, we are far below the average.

Would you take up the question, and publish results in your paper? Statistics from North and South Travancore, Coonoor, North and South Wynaad, North and South Coorg, South Mysore, with my figures would cover the line of planting districts. Such statistics would be of great value, and answer the questions often raised whether other products than coffee could be expected to yield fair results in the several districts.

KOPPA, KADUR DISTRICT,
6th June 1897.

DIGBY T. BRETT.

NOTES.

Fractions omitted.

Rain gauge in use, Messrs. P. Orr and Sons' standard pattern.

Only once since 1880 has rain fallen in January; in 1882 1 inch 54 cents fell in four days.

The lowest rainfall was in 1881, 73 inches 50 cents. The

highest in 1882—1892, 192 inches 2 cents. For 1896 the rainfall was the third highest in the 17 years, and rain fell on the least number of days.

The average rainfall has been exceeded in only six years, namely 1882, 1883, 1888, 1889, 1892, 1896.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.64	"	Phosphoric Acid.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE.

COFFEE.

Value of grafting.

To that large number of planters whose only knowledge of agriculture, and a very extensive knowledge it is too, is derived from planting, the theory and practice of grafting is quite unknown. We will suppose that among the tens of thousands of coffee trees on the estate, some few hundreds of scattered specimens have been noticed of exceptional vigour and grand cropping powers. Evidently a most desirable *jât* to perpetuate. But how to do it? If the seed are gathered, the percentage of plants that will take after their parents is likely to be small owing to the pro-

miscuous cross-fertilization that goes on. It is far better than sitting with folded hands, but cannot a better and surer way be found? Here it is that grafting comes to our aid. For a slip or scion taken from the parent tree and grafted on to a hardy seedling is absolutely bound to grow "true to name." And, if care be taken to use as stock a hardy and disease-resisting kind, the resultant grafted plant will almost sure to prove a very valuable plant indeed. We understand that some experiments are to be tried in this direction with cacao in Ceylon, and we trust, if ever our Planters' Experimental Garden becomes a fact, such work will be taken up in earnest in South India.

COFFEE-PLANTING AT MACKAY, AUSTRALIA.

AMONG recent arrivals in Queensland is Mr. John Dansey, an old Ceylon planter, who was forced to abandon coffee-growing in that island owing to the heavy losses inflicted by the leaf disease. He has also been in most of the other coffee-growing countries in the world—the East Indies, India, and Brazil, for instance—and comes to this colony with a full acquaintance with the different methods of cultivation and treatment. Mr. Dansey passed through Brisbane lately with the intention of going as far north as Cairns, "prospecting" for coffee land. On arrival at Mackay, however, he found himself in the heart of the finest coffee-growing district he had ever seen, and had no wish to go any farther. He was perfectly astounded at the wild profusion in which coffee trees grow and produce their fruit on the few plantations in the district which include coffee among their crops, and exhibits as specimens of marvellous prolificness two or three branchlets heavily laden with ripe cherries. He is deeply impressed with the capabilities of the northern coast lands. Nothing could be more conducive to favourable coffee crops than the heavy dews and fogs which he saw while in Mackay, and the absence of frosts was an additional feature which would help the industry to a favourable extent. In answer to a question whether he was satisfied with the prospects of coffee in Queensland, Mr. Dansey became quite enthusiastic. Pointing to his cherry laden sprigs, he expressed wonder that the drought and frost to which the trees had been subjected had had no appreciable effect. If our farmers only knew the value of coffee, he declared, they would soon grow it extensively. Since the abolition of slavery in Brazil the world's crop of coffee has been short, [Mr. Dansey must have got considerably out of touch with the coffee market the last four years! Ed.—P.O.] and merchants are eagerly seeking for new sources of supply in order to keep pace with the demand. He believes that for the next forty years there will not be a safer crop for Queensland planters, and that farmers who at present grow only cane should in addition plant coffee, and thus have two strings to their bow. He is convinced that coffee is far before cane as a profitable crop. The cost of preparation and planting is not so heavy to begin with; the labour of harvesting is also much lighter, and the crop ripening in the cool months there should be no difficulty in securing the necessary hands at the right time. Mr. Dansey tells of a plantation near Mackay where the owner has grown coffee for years with very little attention, and has made a good living by roasting the berries and selling it in the neighborhood. From one tree on this estate he saw a man pick a four-bushel bag of cherries and regards that as remarkable evidence of fertility of soil and suitableness of climate. Mr. Dansey intends to settle down in Mackay, where he has under offer a large area of virgin land eminently fitted for coffee. He will not confine his attention to the one crop, but will probably try cocoa cardamoms, and other tropical products in order not to have all his eggs in one basket, as he expressed it. He has come to Brisbane to find two or three others who are willing to add their capital to his and take a practical interest in the industry, and with the view he is advertising for partners in his enterprise. He returns to Mackay in a few days in order to get things under way for the planting season, which is rapidly approaching.—*Brisbane Courier*.

LEAF DISEASE IN JAVA.

I HAVE been looking over the "Agricultural Bulletin" of the Malay Peninsula for April 1891 which treats of the above subject, says a writer in the *Central African Planter*. The article is trans-

lated from the Dutch and gives an account of the observations of Dr. Burek and also the methods which he employed to combat the disease and which, in Java at least, seem to have been attended with considerable success.

The article begins by describing the disease and then goes on to detail the conditions for the germinating of the spores. Dr. Burek found that air, water and darkness were all requisites of successful germination. Light kills the spores when they are wet, but it has no influence upon them when dry. "The requisites for germination are thus; water, air, and more or less complete darkness. For the further stages it is requisite that it fall upon the under side of a coffee-leaf, for on the upper side are none of the stomata by which alone it can penetrate to the inner tissue of the leaf..... The spore will not germinate in air, however damp it be. They require fluid water, so that the leaf can only be affected when it is covered with drops of dew or rain."

Two plans have been invented by Dr. Burek for the eradication of the disease, both of which, we are informed, have been attended with highly satisfactory results.

"The first of these consists in the destruction of the sick spot in the leaf. There are two forms of apparatus in use. One of these consists of a small bottle of concentrated sulphuric acid through the cork of which a glass tube passes. The coolie is supplied also with a fine needle of bamboo. The tube passes about half-way down the bottle, which is filled for $\frac{1}{4}$ or $\frac{1}{2}$ of its length with sulphuric acid; by this arrangement there is no fear of the sulphuric acid escaping if the bottle be upset. The operator dips the needle into the acid through the glass tube and then punctures the spot with it, a very small quantity is sufficient to destroy the fungus, and the sick spot drops out of the leaf, leaving a hole where the mycelium has been at work. This little instrument has proved most successful, but it has the disadvantage that the quantity of acid cannot be regulated and it is also liable to get upon and burn the hands of the operator. The instrument maker, Heckking, at Sourabaya, invented a pair of scissors for cutting out the spots, which is now used in many plantations in preference to the acid bottle. The coolies apparently work faster with the scissors and more easily. A little tube on the scissors receives the cut-out bits, and when filled these can be thrown into water or otherwise destroyed in order to prevent infection spreading, but in wet weather it does no harm to throw them down merely on the ground."

This plan was tried on gardens of 220,000 and 170,000 trees respectively with good results, but in other cases the reports were not so favourable, and it is admitted that in some cases the disease may become so bad that this treatment is useless. The other treatment is the Preventive Method.

"This will indisputably become the most general. It depends upon the treatment of the leaves with a chemical re-agent which acts fatally upon the fungus, but does not hurt the leaf. The spores of hemileia are very sensitive to many kinds of re-agents, organic and inorganic, and experiments were made with chloride of iron, sulphate of copper, nicotine, boric acid, sulphate of quinine, extract of cinchona bark, cupric hydroxide, mixture of lime and sulphur, cupric sulphosteatite.

"The last mentioned gave no satisfactory result, it soon washed off the leaves. Iron chloride gave good results at first, but the application on a large scale was found to be unsatisfactory on account of its hygroscopicity, which prevents an accurate proportion being taken, and its liability to decomposition, by which it soon loses its effect and is likely to injure the leaves. It is fatal to the fungus in doses of 1 part in 7,000 parts of water. Copper sulphate is more successful. It does not decompose; it is very cheap and easily obtained. One part per thousand of water was used with favourable results, but it will still kill the disease when one part is mixed with 150,000 parts of water, so that the stronger solution dose would be quite strong enough even if diluted by rain or dew to a large extent.

"Sulphate of quinine is fatal at a strength of one in 2,000, and borax and boric acid at the same dilution."

One objection to copper sulphate is that the solution becomes condensed by evaporation and crystals are deposited on the leaf which burn it and make it look unsightly, especially when used for a long time consecutively. This, however, may be obviated by the addition of a little sugar which prevents crystallization, at least to a large extent.

Tobacco water, however, does not damage the leaves at all. The liquid is applied by a spray diffuser to the under surface of the

leaves, any fungus already there is, of course, killed at once, and as the liquid becomes condensed by evaporation, a thin layer of tobacco extract is left on the leaf. The next rain or dew re-dissolves the extract, and this prevents the spores which fall upon the leaf from germinating; gradually, of course, the rain washes away part of the tobacco and it is, therefore, necessary to treat the plant again. Tobacco water does not remain as long on the leaf as copper sulphate or iron chloride.

TEA.

Japan falling off.

Last year's exports showed a, to us, very gratifying falling off in the export of tea from Japan. As for the Japs, however, this fact has, as already reported, stimulated them to renewed efforts to improve the quality of their teas and to push their sale in the markets of the world.

Tea in 1837.

From an interesting article in the *Grocer*, we note that 60 odd years ago the duty was 2s. 1d. per pound, and the retail price was from 6s. 4d. to 14s. per pound. All China of course. The market rates were as follows: Bohea, 2s. 10d.; Congou, common, 1s. to 1s. 4d.; strong, 1s. 6d. to 2s.; Pekoe kinds, 1s. 10d. to 2s. 8d.; Souchong, 1s. 1d. to 2s. 1d.; Caper, 1s. 1d. to 1s. 5d.; Fine Orange Pekoe, 2s. 6d. to 3s. 6d.

China.

One of the most remarkable features in the introduction of improved methods of manipulating and firing the teas in Foochow by means of modern machinery has been the total absence of opposition on the part of the Chinese. When one remembers the strenuous efforts of the heathen Chinese to keep out railways and modern improvements of all kinds, it is evident that they must be fully alive to the desperate condition of their industry. Though, of course, it must be borne in mind that as the processes of growth and manufacture are in entirely different hands, the latter being undertaken by men of a better class, chiefly Cantonese, the absence of such opposition can be partly explained.

The Indian Market.

There are some short-sighted planters, we believe, who actually discourage schemes for creating a consumption of tea by the native population, on the grounds that it would encourage theft on the plantation. We have no sympathy with such pessimists, and note with pleasure the good work done in this direction in an unostentatious manner by the Indian Tea Supply Co., Ltd. It is nine years since this Company was started, and last year it disposed of close upon 100,000 lbs. of tea in the country, mostly to native consumers. The operations resulted, however, in a net loss of Rs.600 odd on a total turnover of 12,200 rupees odd. The quantity of tea sold was considerably less than the preceding year, which amounted to very nearly 1½ lacs of pounds, which showed, however, a loss of 1,800 rupees odd, which occurred from Bombay sales.

The Home Market.

INDIAN TEAS.—In the absence of public sales, the business transacted has been unusually small, says the *P. M. Review* of the 26th ultimo, and no change in values can be reported. As far as can be judged from recent reports, the effect of the earthquake on the different tea estates is not so serious

as was originally expected. The means of transport, however, have undoubtedly been materially interfered with, owing to the partial destruction of railways, and this will most probably cause considerable delay in getting tea forward, and may curtail the supply here for a time. As information is so incomplete, it is impossible to forecast the effect on prices, but up to the present they have not been influenced. This is no doubt in a measure attributable to the somewhat heavy stock in the bonded warehouses, and to the liberal supply from Ceylon. The first public sales since Wednesday week will be held on the 30th instant, and catalogues are already issued for 4,370 packages, including about 3,500 new season's import from several of the districts.

CEYLON TEAS.—No sales have been held this week, and the market has been practically closed. A fair amount of business has been transacted privately, but no great desire to buy has been exhibited by dealers, probably in anticipation of the large auctions to be held next week. These, as after the Whitsuntide holidays, will be divided into two days, viz., the Monday and Tuesday, when a strong market is expected.

INDIAN TEA ASSOCIATION.

[THESE notes were penned a week or two ago, but pressure on our space has blocked them out till now.]

The Persian Market. In the Report of the General Committee of this Association for the year ended 28th February 1897, we find a note to the effect that it has been impossible to find out how the rubbishy stuff sold in Persia under the name of Indian tea is exported to Persia. This wretched article has naturally prejudiced the sales of genuine Indian manufactured tea enormously in that market. An instance was given by the Kangra Valley P. A. of a large quantity of native-made tea that was sold at Dehra Dun at about 2½ annas per lb.

The three months prompt.

The proposal originally made by the Central Travancore Planters' Association to reduce the three months prompt to one month was submitted to the Committee of the Association in London for their opinion, which was that it would not work for the benefit of the producers, and that it would be unwise in the interests of importers to open up the question of sale conditions, as the deposit of £1 per chest, which is a great safeguard to sellers, was bound up with the custom of three months prompt. The London Committee also considered that the change might lead to a reduction in price, which would more than counterbalance any gain which might be obtained by curtailment of the prompt. The General Committee agreed in the main with the views put forward from London, and were of opinion that it would be inexpedient to push the proposal any further.

The American campaign.

This campaign, as we have many times pointed out, is being conducted with very considerable success. In 1895 Rs.92,545 was contributed, representing 80 million pounds of tea, or only about one-third of the total production in India. Last year, 1896, Rs.1,03,674 were obtained in the

same way, i.e., 4 annas per acre and $\frac{1}{2}$ anna per maund of tea. In July last the General Committee asked for the views of the Committee of the Bengal Chamber of Commerce on a proposal to form a fund for the exploitation of the American and other markets. The planters in Ceylon raised annually in this way upon a smaller acreage and production about double the amount raised in India by voluntary effort. The Committee of the Chamber in their reply pointed out that there would be very great difficulty in the way of any such impost being levied in India, as all the various Local Governments would have to be consulted, which would involve considerable legislative and administrative difficulties, and further contingencies also might arise. The Committee of the Chamber deprecated the idea, and considered that whatever had to be done in the direction of opening new markets for tea should be done voluntarily as hitherto, the efforts already made redounding to the credit and honour of the tea industry in India. In view of this letter, the General Committee did not consider it was worth while pursuing the matter further in face of the difficulties in the way of carrying out the proposals.

Finances.

The total planted area represented by the Association during the year is 275,445 $\frac{1}{2}$ acres. This shows an increase of 10,307 $\frac{1}{2}$ acres on the previous year; but the total area under cultivation is still a long way from being reached. The Committee trust that during the forthcoming year there will be an accession of gardens to the membership of the Association.

A TEA PEST.

In a recent number of the *Indian Museum Notes* is a mention of what may prove a very dangerous pest to tea.

Mr. W. D. Holland, of Balangola, Ceylon, wrote that it had completely defoliated several acres of tea on his estate, and that the ground was quite black with their droppings. Fortunately a species of *Ichneumon* preys freely upon them and eventually reduces their numbers. Another case is reported where 50 acres were stripped of all the leaves except the youngest shoots. In forwarding specimens of the pest (*Thoesa recta*, Hempish.) and its parasite (an Hymenopterous insect of the family *Ichneumonidae*), Mr. E. E. Green, the Honorary Government Entomologist of Ceylon, gives the following particulars:—

LARVA: Colour bright yellowish green with a quadrate saddle-shaped spot occurring on the middle of the bag; a chain of smaller red spots on the median line in front, and two or three similar spots behind. Oval; convex above, a marginal and two dorsal series of conical spinous tubercles.

Cocoon, compact, oval, dull green, fixed to tea leaves or stem.

On the 28th January, 1895, specimens of a small beetle, together with pieces of tea stems riddled by them, were sent to the Indian Museum through Mr. E. E. Green, of Ceylon, from Mr. G. Alston, Superintendent of Tea Estate, Craighead, Nawalapitiya.

The insect proved, on examination, to belong to a species of Scolytid beetle, which has not previously been reported to attack tea plants in India. Specimens were therefore forwarded to Mr. W. F. H. Blandford, who very kindly examined them and identified them as belonging to the species *Xyleborus fornicatus*, Eichhoff, a form closely allied to the often destructive species *Xyleborus dispar*, of Europe and North America.

The following is an extract from a letter furnished by Mr. G. Alston:—

The pest appears mostly in patches, but has spread very considerably since I first observed it in any numbers three years ago. There is no evidence of any previous disease in attacked trees.

Most of the trees attacked show no outward sign of the pest, except when almost every branch is attacked, when they turn rather yellow and stop flushing. Young trees about two years old before they are topped often snap off at the spot where the borers have made holes for their entrance or exit. Strong vigorous trees in good soil seem to be very little affected by it, and throw out good red wood even from badly bored stems. On the other hand, poor plants on ridges or poor soil seem to naturally feel the effect of it quickly, though in no case have I seen a tree killed by it. Isolated branches die off, but new branches come out in their place. As a rule, one can only tell an attacked tree (except in the case of young plants when the stems snap off) on pruning it, when the holes in the wood are very apparent. It (the beetle) does not attack the cut surface after pruning, but makes its entrance through the bark. In the case of young red wood it very generally goes straight down to the pith: in older branches I have often seen the wood riddled as if a charge of snipe-shot had been fired into it, with only one or two minute holes in the bark for exit or entrance. And yet in the case of vigorous trees, they seem to thrive notwithstanding. Since 1893 the pest has spread very much, and become more general, though I cannot say that I see much difference in the fields that were attacked then."

The writer, in the foregoing account of the pest, practically suggests the remedy—namely, either not to plant in poor soil, or, if the soil is poor, to improve it, and thus to strengthen the plants against the attack—the great object of all medical treatment ever known where.

To prevent the spread of the disease the affected branches should be cut off and burnt.

DISTRICT ASSOCIATIONS.

LOWER PULNEYS.

PROCEEDINGS of the Committee Meeting held at the Muroom Bungalow on the 7th April 1897.

The Honorary Secretary said that before beginning the business of the meeting he regretted to have to record the death of our oldest and pioneer Planter, Mr. Eugene de Fondclair, who died on the 25th of March. The deceased gentleman was one of the original members of our Association. When the first meeting of the Planters was called with the object of forming an Association, Mr. de Fondclair himself was not able to be present, but he wrote to the Chairman of the meeting requesting his name to be put down as a member at once, and he has always taken a keen interest in the affair of the Association. We shall miss him, not only as a member of the Association but also as a genial companion and keen sportsman. His absence will also leave a void in Kodaikanal society, in which he was a general favourite, and in which place he spent a great portion of his life. Though Mr. de Fondclair did not actually introduce Coffee Arabica into the Lower Pulneys he was the first to open an Estate here with the object of making an industry of its cultivation. He opened up an Estate at Manalore in 1854, and subsequently at Peryoor in 1860, and it was not until after 1867 or thereabouts that others, seeing his success, opened up other large areas in the District. Mr. de Fondclair was on his Peryoor Estate when his attack of fever came on, and was taken down to Dindigul and to Medical assistance as soon as possible by two of the neighbouring Planters, but he only survived two days and passed away at 11 P.M. at the Dindigul Club. His family are in France, and so far as is known I have left no relations in India.

The Dindigul-Pothanur Railway.

Mr. W. H. Gerrard proposed that the Honorary Secretary be asked to write to the Traffic Manager, Madras Railway, on this subject, and since the Line in question was surveyed by Engineers deputed by the Madras Railway Company, ask him if he could give us any information on the following points:—

- (1) The date on which this survey was completed.

CENTRAL HOTEL, INFANTRY ROAD, BANGALORE.

(Under English Management.)

The most comfortable and convenient for visitors.

TERMS MODERATE.

(2) The Towns and Villages through which the route passes and at which there will be Stations.

(3) Whether he can let us have a plan of the surveyed route, and,

(4) Whether he is of opinion that the construction of this Line will be taken in hand within any reasonable time. *Carried.*

2. The Ardaloor Dispensary.

Read Original Resolution of the Association, dated 23rd July 1894.

"Proposed by Mr. W. H. Gerrard and seconded by Mr. J. Heimpel, that the District Surgeon be requested to open a small Dispensary at Ardaloor."

Read letter from Surgeon-Major Reeves, District Medical and Sanitary Officer, Madura District, dated 20th January 1896, suggesting the transference of the Thandigudi Dispensary to Sholakardu, endorsements on same, including the endorsement of the L. P. P. A. accepting the suggestions of the District Medical and Sanitary Officer.

Read Resolution of the Taluq Board, dated 14th March 1896.

"The Board approves, on the whole, the District Medical and Sanitary Officer's proposal. There is a Budget provision for building a new Dispensary, 1896-97. The Board, before building the dispensary at a high cost at a new and untried site, is of opinion that the dispensary should at once be moved to some temporary accommodation at Sholakardu. If after four or six months' trial the change of site proves a success, the construction of the new dispensary may be commenced."

Read Petition of the residents of Thandigudi, addressed to His Excellency the Governor in Council of Madras, undated.

Read Resolution of the Dindigul Taluq Board in consequence thereof, dated 27th March 1897.

"The Board are unanimous, with the exception of Mr. Newport, in thinking that the dispensary at Thandigudi should not be removed to Sholakardu. Their reasons are that Sholakardu is an unimportant village, that it is less accessible from the surrounding villages than Thandigudi, that it is less central with regard to the principal villages in the Lower Pulneys than Thandigudi, that the attendance at Thandigudi dispensary, which had fallen in 1895 from 2,355 to 1,440 rose to 3,052 in 1896 and that a dispensary at Sholakardu would mainly benefit the few Planters in the neighbourhood and the coolies employed by them. Mr. Newport as Secretary of the Lower Pulneys Planters' Association represents that a dispensary at Thandigudi is necessary, but that one at Sholakardu is equally necessary."

Mr. Newport said:—The original resolution of the Association must be borne in mind throughout the discussion of this matter and also the fact that we as an Association did not, now or at any time, suggest the transference of the Thandigudi Dispensary to Sholakardu, both the suggestions of the village of Sholakardu and the transference emanating from the District Medical and Sanitary Officer of the District. The petition of the Thandigudi residents which I have just read, I had not seen and knew nothing of until the meeting of the Taluq Board. It looks as though it had been carefully kept from us; even this copy I had some difficulty in obtaining, and finally did so through the kindness of Mr. Hickey, Pleader of Dindigul, and not through the President of the Taluq Board—as we had a right to expect, I think, since the subject is one that was originally mooted by the Association and since the present President's predecessor in office was courteous enough to do so. I much regret this, as the fact of the last resolution of the Board having been passed (vetoing all previous decisions of the Board as it did) may be looked upon as accepting without comment as facts all the statements in the petition, upon which it has acted; whereas the petition in question is full of gross exaggerations, misleading facts and absolute mis-statements. The whole petition is drawn up in such a way as to show a very good case for the petitioners. There is no objection to this, and least of all from the Planters' Association, for it must be remembered that the residents of Thandigudi are many of them Planters too. But it apparently goes out of its way to make out a bad case for Sholakardu. It says Sholakardu is an unimportant village of 30 houses and 100 inhabitants. On seeing this, I took the trouble to go over, verify it, and I counted 79 large houses there, many of them containing 4 and 5 large rooms and housing 4 and 5 separate families. The inhabitants amount to nearer 500 than 100 souls. And as for Thandigudi I have reason to think that the figures are exaggerated. However this may be, that Sholakardu or Ardaloor are as large as Thandigudi we don't claim, and nobody did claim, but that either of

the former would be more central for the majority of the hill residents we do claim.

The residents of Thandigudi in their petition have shown a number of villages (so called—many of them are mere hamlets of 3 or 4 houses) within an average radius of some 7 and 1/4 miles or so, while round Ardaloor, for instance, we can show a *larger* number of villages, a *larger* population, and a *larger* total amount of assessment paid to Government (directly, or through the Zemindars), *without* taking into consideration the Estates under Europeans, (which are, apparently, in the opinion of the President of the Taluq Board quite a negligible item) *within an average radius of 5 miles or so.*

With regard to the last resolution of the Board, though I think I may say that we are in accord with the residents of Thandigudi in their request, and are quite ready to accept a decision from the Sub-Collector to the effect that their Dispensary shall not be moved, still I take exception to the way their resolution has been worded and rushed through the Taluq Board without due consideration on the part of the members, while they admittedly knew little or nothing about it, and also the implied refusal to consider our claims to a dispensary at all."

At the meeting of the 27th March, the President in open meeting asked whether "anybody besides Mr. Newport knew anything about the matter," to which two members only replied. One of these had been Tahsildar of Kodaikanal from about 1890 to 1892 (it was only in 1891 that the hill villages of the Kanavadi Zemindari were included in the Kodaikanal Taluq, and they are still under the jurisdiction of the Tahsildar of Nellacotta in all revenue matters). These gentlemen knew Thandigudi, but only one of them had been to Ardaloor and neither of them to Sholakardu! The President and Sub-Collector himself *had not been on to the Hills at all*, and no other members of the Board knew anything about the matter, and yet the President, also in open meeting, said that he thought the Board had been very weak in passing the first resolution and promptly drafted and passed the second, which in itself constitutes a most sweeping criticism of the opinion and suggestions of not only more experienced Government Officials, but of Officials that *had* been on to the Lower Pulney Hills and seen for themselves some at any rate of the villages referred to.

Sholakardu is a rising village and not so unimportant as the Board seems to imply. It *is*, however, out of the usual run of Government servants' tours, and also is in the Kanavadi Zemindari, therefore Government Officials never go there and consequently know nothing about the country round. That it is less accessible from the surrounding villages I deny. Thandigudi is, as any one that knows the District can say, surrounded by hills and difficult of access from many parts of the Lower Pulneys. Ardaloor, on the other hand, is *more* accessible than Thandigudi for a larger number of inhabitants of the hill tracts. That it is less central I deny. Even by the showing of the residents of Thandigudi their village is on the extreme west of the Lower Pulney plateau, *there being no villages at all due west of it.* The remark that it would mainly benefit the few Planters in the neighbourhood is uncalled for, and moreover the President of the Taluq Board has no foundation for it. Even if it were so, it should not be made a reason for refusing us a dispensary, if we can show good reason for asking for one, and secondly as for the "few Planters" Europeans are *not* especially referred to the President informed me, on being asked, at the meeting. If the Board thinks Native Planters are few in the neighbourhood, we can but regret their gross ignorance of the facts and ask them to come and see for themselves. With regard to the last paragraph of the resolution, it is very boldly put and apt to be misleading, nor are they the words I used, which were—that while we were in sympathy with the residents of Thandigudi, and allowing their claim to a dispensary there, I wished my objection as Secretary of the Lower Pulneys Planters' Association recorded only in so far as the resolution meant a refusal on the part of the Board to take into consideration our claims to a dispensary on our side of the Hills. And since the resolution was worded as it is, I can but conclude that this was what the President of the Taluq Board meant us to understand, though I hope I am wrong in this.

Resolved—That this Association regrets the hasty manner in which the above resolution was passed, and regrets that the papers having reference to this matter were not sent to them for opinion and comment as the

previous President of the Taluq Board very courteously did do. They would also respectfully ask why it was that the original resolution of the Board was not carried out, and request that a trial dispensary, or a branch of the Thandigudi dispensary, be opened at Ardaloor as at first asked by the Association.

(3) *Lady-birds and green-bug.*

Mr. Newport said that he noted with alarm the re-appearance of Green-bug this year and its rapid spread. It was possible, he thought, that from our constant recurrence to the subject that some Associations might think that this was merely a fad and our particular hobby, but that he could assure them that if they saw the effect of Green-bug on our coffee they would not think so. The effect of Black or Nilgiri Green-bug was mild to that of the Ceylon Green-bug. He hoped soon to hear that Government had received a reply, and a favourable one, from Hawaii. He read a letter that appeared in the *Ceylon Observer* from Mr. E. E. Green suggesting the exchange of some Ceylon Lady-birds with those of Southern India, and his reply to it, which appeared in *Planting Opinion*, and the Editor's remarks on the same. He said he thought the experiment was well worth trying—anything was worth trying. The spraying operations that they were carrying on did not seem to have any appreciable effect. He also read a letter he had received from Mr. E. E. Green in which Mr. Green had mentioned certain species of Lady-bird that he said were preying on the *Lecanium Viride* in Ceylon, but were kept from increasing by their natural enemies, and suggested an exchange with *Chilocorus Nigrinus*.

Read Mr. Newport's reply to this letter. Mr. Newport said he regretted that there were no Lady-birds to be found now, and he did not expect that they would be found in sufficient numbers to despatch until next month. The Association approved Mr. Newport's procedure.

(4) *Famine Funds.*

Read Notice from the Acting Sub-Collector of Dindigul calling a Meeting at Dindigul on the 10th instant for the Indian Famine Charitable Relief Fund.

Read Letter from Honorary Secretary, I. F. C. R. Fund, Calcutta, dated 20th February 1897.

Read Letter from R. F. Grimley, Esq., Acting Sub-Collector, Dindigul, enclosing copy of the District Committee's notice in connection with the I. F. C. R. Fund.

Resolved—That the Honorary Secretary's reply to these letters to the effect that the Planters are already subscribing to the fund through the U. P. A., and that if they feel inclined to subscribe further, they will do so through the U. P. A., which they consider the proper medium for their subscription. That the Honorary Secretary also attend the meeting at Dindigul on behalf of the Association if convenient.

(5) *Address to the Queen-Empress.*

Read Circular, dated 19th March 1897.

Resolved—That this Association approves of the presentation of the Address and of the inclusion of the words "through our executive officers."

It would suggest, however, that instead of another subscription list being sent round, that the total cost of the Address and Casket be divided up between the number of votes on the U. P. A. (which are now 44) and each Association pay its share according to the number of votes it holds in the U. P. A.

Members of Committee ... { L. J. CREED, Chairman.
W. H. GERRARD, Vice-Chairman.
HOWARD NEWPORT, Hony. Secy.

PROCEEDINGS of the Committee Meeting held at Dindigul on Saturday, the 1st May 1897.

(1) *Address to the Queen-Empress.*

Read Circular, dated 12th April 1897.

Recorded that the Association has already (at last Committee Meeting) suggested a method of defraying the cost of the Address and Casket, which has been sent up to the Secretary, U.P.A.; and the Association has also already expressed its willingness to abide by the decision of the majority.

(2) *Individual Membership of the U.P.A.*

Read Circular, dated 20th April 1897.

Resolved that the copies of the Circular be sent to members, and the subject be brought up for discussion at the Annual General Meeting in July.

Read letter, dated 21st April 1897, from Secretary, U.P.A., in reply to Honorary Secretary's letter asking for information. Recorded.

(3) *Estate Statistics.*

Read letter from the Secretary, U.P.A., dated 23rd April 1897.

Resolved that the Statistics Forms received from the Secretary, U.P.A., circulated to members at once, with the request that they will kindly in and return them to the Honorary Secretary as soon as possible, and that required statistics be sent in to the U.P.A. Secretary as soon as obtained.

(4) *Famine Fund Subscriptions.*

Read letter, dated 23rd April 1897, from the Secretary, U.P.A.

Resolved that the U.P.A. Secretary be informed that although we cannot say definitely, we do not think it probable that we shall be able to collect any more Famine Fund Subscriptions before the Annual General Meeting of the U.P.A.

(5) *Filing of the U.P.A. Circulars.*

Read U.P.A. Secretary's Circular, dated 28th April 1897.

Resolved that as the Honorary Secretary has most, if not all, of the Circulars in question bound, that he ask if the loan of this book would be of any use to the Secretary, U. P. A.

(6) *Meetings of District Associations.*

Read U.P.A. Secretary's Circular, dated 28th April 1897.

Resolved that the Honorary Secretary be asked to comply with the request of the U. P. A. Secretary, sending him as long notice as possible, and to inform him that the Annual General Meeting of the Association will be held during July.

U. P. A. Proxies.

Read U. P. A. Secretary's Circular, dated 28th April 1897.

Resolved that this Association approves of the Form of General Proxy (to be used as well as the Original Form), giving as it does full discretionary powers to the holder. But, at the same time, thinks that the power ought not to extend to voting upon such subjects as may be brought forward with the general consent of the U. P. A. Meeting after it has assembled; and on which subject or subjects, therefore, the Proxy-Giver can have had no opportunity of forming any judgment or of discussing with his Proxy-Holder.

Read Circular from the Chairman, U. P. A., dated 12th April 1897. Recorded.

Read letter from the Secretary, U. P. A., dated 21st April 1897 acknowledging receipt of cheque covering the Association's subscription to the U. P. A. for the current year, and for Famine Fund Subscriptions received through the Honorary Secretary. Recorded.

Members of Committee. { D. L. J. CREE, Chairman.
W. H. GERRARD, Vice-Chairman.
HOWARD NEWPORT, Hony. Secretary.

NOT EVEN IF IT COST TWENTY SHILLINGS.

A NOTABLE percentage—about one-third, I think—of the power of a steam engine is used up in overcoming the friction of its own parts. Hence inventors are constantly testing devices to reduce friction. Yet they can never overcome it; and the resistance created by it represents power (and hence expense also) absolutely lost.

Now the human body is a machine propelled by heat, exactly as an engine is; and anything that retards it may be considered as friction. Very good, then.

You have noticed great differences in your own vigour. Some days you work easily, and on others with difficulty. This is so whether you are chiefly a muscle-worker or a brain-worker; or a mixture of both—as most people are. Occasionally you are able to do more work in a day than at other times you can do in three. It is the odds between walking on smooth, hard level ground and dragging yourself uphill through wet clay. What wouldn't lawyers, authors, clergymen, and all other brain-workers give for something having the power to keep their minds clear and strong? Or body-workers for something that would prevent aching, weakness, and fatigue? Do I know what will do it? No, I don't. If I did I could retail the secret for more money than is stowed away in the Bank of England. But I do know one thing, and will tell it you in a minute—for nothing.

First, however, we will talk of Mr. J. B. Goss and the friction he tried so long to overcome. Mr. Goss is a large farmer living at

Stradsett, near Downham Market, Norfolk, and is well known in his district. When the farmers meet on market days he often speaks of his experience and how he came out of it.

In order to cover it all he has to go back fifteen years—to about 1878. At that time he began to feel the signs of some disease which he could neither account for nor understand. At first he merely realised that he was out of condition. His work became less and less a pleasure and more and more a task. From his business his thoughts turned upon himself, and no man can work well in that form. Then he and his victuals began to disagree, which is a state of things to make a man ask what can the reason be?

He had a well-provided table, of course; yet he often sat down to his meals and couldn't touch a morsel. Mr. Goss knew that this would never do. If a man expects to live, he *must* eat. There are no two ways about that. So he ate more or less—although not much—without the stimulus of an appetite; he forced it down, as you may say. But this wouldn't do either. When the stomach goes on strike it can't be *whipped* into working before the question at issue is properly settled.

Thus it ended in his having great pain and tightness at his sides and chest. "I was constantly belching up a sour fluid," he says, "which ran out of my mouth like vinegar. I had a horrible sensation at the stomach for which I was not able to find any relief. For nights together I could get no sleep; and in this general condition I continued for five years, no medicine or medical treatment doing more than to abate some of the worst symptoms for the time being.

"In the early part of 1883 I heard of a medicine which was said to do good in cases like mine. Whether it would help me of course I had no idea. After so many things have failed, one naturally has no faith in a new one. Yet I got a supply and began with it. In a short time it was plain that I had come upon the real remedy at last. My food agreed with me, and soon all pain and distress gradually left me. Since then (now ten years ago) I have kept in the best of health. If I, or any of my family ail anything, a dose of Mother Seigel's Curative Syrup—the medicine that cured me—soon sets us right. We have no need of a doctor. (Signed) J. B. Goss, March 24th, 1893."

Mr. Goss once said that if Seigel's Syrup cost 20s. a bottle he would not be without it in his house. We can easily believe him. Considering what it did for him—and does for others—it would be cheap at any price. Yet, like plenty of things of the highest practical value, it costs but little. The reader can imagine under what difficulty and friction Mr. Goss must have done what work he did during those five years' suffering with indigestion and dyspepsia.

This then, we know; that life's friction and loss of power comes chiefly from that single disease, and that ease arises from the use of Mother Seigel's great discovery.

TO STAMP COLLECTORS.

5,00,000 Foreign Stamps, (well-mixed)

Includes some very good varieties. The best offered at the price, which is extremely low.

2. For each do. locally only " 15.
3. For each do. by post only " 15.

(This excludes extra postage where the weight of leaflets necessitates such.)

Advertisement charges are strictly payable in advance, except by w. approved customers.

MARKET SUPPLEMENT.

SATURDAY, JULY 24, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (July 2, 1897) says:—After the interval caused by the Jubilee Celebrations the Public Sales were resumed last Tuesday and the fairly large quantity offered met a slow demand at lower rates, except for colory and desirable parcels which realized steady prices.

About 1,200 bags East Indian were catalogued, of which a great part were small and undesirable lots; these were partly bought in, the remainder being sold at lower and irregular prices; desirable parcels went steadily. Larger supplies of Central American and Colombian (of which the sales chiefly consisted) went off flatly at an average decline of about 2/- except for colory description and favourite marks, which were unchanged to a 1/- lower. Terme markets have been weak, prices touching the lowest known for many years. The total production in Brazil for the Season just ended was 8,680,000 bags.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Fortnight ending June 30th, 1897, says:—Bank rate 2 1/2%. Bombay Exchange closes at 1s 2 1/4d. Brazil Exchange 7 1/2d. Rupee paper 3 1/2% 63. Silver 27 1/8d. per oz.

Public sales re-opened on the 29th inst., with a flat tone, the trade shewing no inclination to buy except at a lower price, and we have to report a decline of about 1s. per cwt. on most kinds except finest, which continue to be well competed for. The small quantity of Plantation Ceylon offered sold steadily. Brazil market are steady at the decline.

The Dutch Sale was held on the 22nd inst. and comprised 19,100 bags 42 cases, which met with a good demand at fairly steady prices, good ordinary Java selling at 46 1/2 cents against 46 3/4 cents in the May sales.

Daily receipts have averaged 8,928 bags in Rio and 7,428 bags in Santos.

Futures owing to increasing receipts in Brazil, have again shewn a declining tendency, and after considerable weakness and a subsequent slight rally, the market closes steady at a decline since our last of 1s 9d to 2s. viz.:—Good average Santos in Havre, September delivery, fcs. 44.75, in Hamburg pf. 37 1/4, and No. 7 low ordinary Rio in New York \$7.00.

To-day's London official quotations are:—

	July	Sept.	Dec.	March	May
Rio	32/6	33/-	33/6	—	—
SANTOS	35/6	35/9	36/3	36/9	37/3

CINCHONA.

The cinchona-bark auctions held in London, on June 29, were of fair considerable extent. The offerings included:—

	Pkgs.	Pkgs.
Ceylon cinchona	337 of which	253 were sold
E. Indian Cinchona	1,845 „	1,530 „

Throughout the auctions there was a very steady demand, almost all agents buying a fair proportion of bark, and only a few parcels were bought in on account of the high limits placed upon them. A considerable part of the Ceylon bark, and several parcels of the East Indian, were imported between three and six years ago. Druggists' barks were particularly well competed for. The average unit may be placed at to 1/4d. per lb., but for some lots a full penny-unit was reached.

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report dated July 2nd, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	29,273 packages.	116,391 packages.	3,764 packages.
1896-1897...	26,102 „	133,990 „	5,737 „
8,907 pkgs. INDIAN	Total 52,900 packages were offered in public auction this week.		
43,187 „ CEYLON			
806 „ JAVA			

The market remained closed, as far as public sales are concerned, Indians and Javas from the 16th to the 30th inst., and for Ceylons from the 15th to the 28th inst.

The damage done by the recent earthquake to Tea estates in India has been ascertained to be less severe than was at first apprehended, very few having materially suffered.

Indian. The better liquoring of the New Season's Teas sold with good competition at steady prices, Darjeeling especially being in request and bringing full valuations. Inferior kinds met with rather less attention, although quotations showed little change. Old Season's Teas were

SUPPLEMENT TO "PLANTING OPINION."

slightly neglected and sold irregularly. The official telegram from the Indian Tea Association gives the exports from Calcutta to the United Kingdom from 1st April to the middle of June as 6,295,000 lbs., against 6,49,000 lbs. for the same period last season.

Week's av. of New Season's Tea sold on Garden Account, 1897, 4,436 pks., av. 8½d. 1896, 2,208 pks., av. 9d.

Ceylon. The heavy auction, which was the accumulation of two weeks, was larger than any Ceylon Sale previously held in one week. The Teas met with fair competition and sold without change in quotations, except for Pekoes and Broken Pekoes of good quality, which brought rather dearer rates. Quality, as is often the case at this time of year, shows a falling off from earlier shipments. Average for week 7d against rather over 7½d last year.

Ceylon Tea sold on Garden Account 1st January to date 1897 546,090 pks., av. 7½d. 1896, 516,771 pks., av. 8½d.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; and Quarterly, Five Rupees, including postage.

ADVERTISEMENTS.—Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

N.B.—Remittances should be sent to the Managing Proprietor of this paper, Coonoor, Nilgiris, South India.

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 6th August 1897.

Nilgiris.

SHOLUR, 29th July.—A fresh burst of this miserable monsoon seems to have set in; during the last two days the wind has been high and 1-26 fallen, making a total of 26-68 to date. Highest and lowest temperatures 72° and 60° respectively. Tea was beginning to flush well, but want of sun and high winds re-commencing have checked growth. Health good, but prices of grain still above normal.

South Mysore.

MUDIGERE, 21st July.—*Weather.*—Taking it all round a light monsoon up to date, and a splendid season for planting and in fact for all sorts of tote work. A very pleasant contrast against the remembrance of last year. *Plant-diseases.*—A few spots of leaf rust noticeable on some places. *General Health.*—Still a lot of fever amongst coolies. *Labour.*—The promise of ghaut labour coming up early this year has not been fulfilled, and many estates are short-handed in consequence. Village coolies, too, are all busy with their paddy planting and are at a premium.

Coorg.

POLLI BETTA, 27th July.—*Weather.*—In my last report the decimal point has been omitted in the amounts of rainfall given. During the past week it has been splendid coffee weather. On no day did the rainfall exceed 60 cents, and there were intervals of sunshine. The total rainfall for the week was not much over 3 inches. Sunday was another light day and yesterday (Monday) was a fine clear day. To-day, however, the rain has been continuous and heavy. Planting is continuing. *Plant Diseases.*—A little rot about which will disappear with the handling. Supplies in some cases are getting leaf-disease badly. It has been a light year as regards borer. *Public Health.*—Fever, coughs and bowel complaints prevalent. *Labour.*—Sufficient. *Interesting Items.*—Volunteer team going down to S. I. R. A. Meeting and Rifle Meeting to be held at Polli Betta range first week of October next.

POLLI BETTA, 27th July.—*Weather.*—A capital monsoon for planting. Light rain daily for the last ten days with sunshine off and on. *Crops.*—With a few exceptions these will after all pro-

bably turn out better than last year. Prices of grain going up steadily. Gram, 9/- per 100 seers; rice, 9 seers per rupee; ragi, 18 seers per rupee. We have almost reached famine prices. *Plant-diseases*.—Not much to complain of, and there would be probably less leaf disease in October-November if more attention was given to systematic draining. *General Health*.—Better than this time last year. Fever and ague in a few cases, but general health good. *Labour*.—Sufficient. Not many Canarese; West Coast abundant. Tamils coming in. The Calicut-Cannanore Railway may attract labour from us during the next two years. *Interesting Items*.—Short crops are bringing out general proprietors in the autumn to see what's up!

Nellampathy, British.

28th July.—*Weather*.—Rain for week 4·68, to date 60·38. Sunday and Monday gave promise of a very bright break as

the sun was out strong and made folks sorry for Saturday's planting, but rain set in on Tuesday morning again with a vengeance and is at it again to-day. Monsoon has been very light, however, to date, and although it is glorious for planting operations, meantime we may feel the effects of it later on in many ways. *Plant-diseases*.—Leaf-disease is very, very bad in some places and is working in nurseries too. If the shortness of crops through leaf-disease theory is the correct one, next year ought to be another black year for this district. *General Health*.—Fair. *Labour*.—Moplas not available yet. The cholera has scared them very much, and I hear Tamils at the other end of the district are afraid to come here. *Interesting Items*.—The many congratulatory telegrams that have (or ought to have!) come to the district on our recognition by the Cochin people are surprising! Alas, it's all a mistake. The bridges *have* been repaired it's true, but not for the reason we fondly imagined. No no, it's *only* the Cochin Rajah coming up to shoot in the tail end of the year, and the parts of the road he will go by are being put to rights. I have been elected Honorary Secretary of an Association "for the better providing of sport for our respected Rajah and his suite." My programme, which has not been sanctioned yet however, and it may be premature for me to divulge it, is to kidnap him on his arrival and after putting the palanquin out of sight make him *walk* all over his road, when I humbly submit he won't want much more "sport" for a few years at least. It was suggested by the Honorary President that a horse be provided, but that was over-ruled as it was thought the excitement of crossing the bridges would be too much for one who did not usually risk his life in such foolhardy procedures, and it was thought that that might be reserved for a future occasion if he had not enough sport on this. This met with some opposition as some seemed to think he would have had all the "sport" he could desire *this* time and might never come again, so why not do this thing in style. Sambur are being shot for presentation.

GENERAL NOTES AND ARTICLES.

THE DIFFUSION OF PLANTING KNOWLEDGE.

IN one of our Trans-atlantic exchanges there lately appeared some excellent remarks on the extreme value of recorded practical experience, a value far in excess of the most fascinating of laboratory theory. For what is the value of knowledge except it be practically applied? The discoveries of the greatest *savant* that ever lived are of no avail unless they are turned to the use of man at the bedside, in field or factory, to heal his ailments, or to minister to his wants. In the words of our contemporary, "Every scientific discovery must be hall-marked with the royal

stamp of 'utility' before it can be passed as current among the workers of the world." Mankind want the simple truth in simple language, so that he who may read. Journalism has done more to disseminate useful knowledge amongst mankind than any other agency. It is impossible to take up the most ordinary periodical without finding some useful fact presented in plain ordinary language, fit for use at sight. Science exists for workers; all scientific work is valueless until it has been approved by them. Moreover every addition to truth, whether made by the labourer in the field, by the farmer, the scientist, professor or wayfarer, so long as it is absolute truth and can be so marked, belongs to the category of science: its value will depend entirely on the results of observation and experience.

In all scientific matters which relate to agriculture, the planter or the farmer is the ultimate judge and referee, just as much as the physician or the surgeon in his own domain. Actual experience is absolutely the only criterion open to the planter as to the doctor. But without doubt, how could the doctor gain his experience, how could he verify that experience without the advantage of medical journals in which diverse opinions are expressed by other workers in the same fields? Neither as our contemporary, the '*Barbadoes Agricultural Gazette*' ably puts it, can planters or farmers arrive at safe conclusions without the aid of journals in which are expressed freely and openly the views and opinions of their fellow-workers. "Journals—medical, agricultural, scientific or other—value the merely *scientific* at its face value just as men do paper currency—it may be worthless or it may equal gold—they prize, welcome and store-up approved and tested knowledge—real science—absolute truth. To preserve truth free it from the mass of rubbish in which it too often is concealed, to present it "fair and untarnished to the eyes of men," is the noble work of journalism—its true province: and let it not be forgotten that truth is equally valuable whether found at the bedside of the pauper or the sovereign, in the field or the laboratory, by the humble labourer with hoe and hand, or the degreed professor with his costly appliances. Journals therefore which represent any very great field of labour cannot be restricted so as to represent only a department of that labour,—to be really useful their work must be whole, entire, representative, and this it can never be confined to the 'departmental'; it must give voice to the work, and if devoted to agriculture, its pages should be filled with observations from field as well as from laboratory, and it will be found that, no matter how humbly expressed, the former will almost invariably outweigh the latter in practical value. Planters are too reticent, frightened by scientific bugbears, these graduates of Nature's university, because they have not the art and knack of the schools, are afraid to record their priceless observations; hence it is that much valuable experience which ought to be recorded in the pages of this journal is annually lost to us, buried with the observers who gathered it. "Planters are afraid of criticism: they dread these studies of Nature, lest some scientific sledge-hammer smash their poor little observation all to bits: they are deterred by the boggy, and forget that great truths have been discovered by unlearned men, and that truth itself is immortal, even when clothed in the humblest garb that the unlearned tongue can weave."

"A journal, especially a medical or agricultural journal, only exists as a storehouse of thought and observation—its object the truth, and this noble purpose can never be fulfilled, unless its pages are open to all who have something to bring. Muzzle it, restrict it to the few, banish from it opinions, views, controversies on matters of public interest that lie within its province, and it is a dead thing; however valuable as a special report, it is valueless as a journal."

Ceylon and the Anamalais.

From the *Ceylon Observer* we note that a Syndicate made up of prominent Ceylon planters has already secured a block of 2,000 acres on the Anamalai Hills. This Syndicate includes Mr. J. N. Campbell (Chairman of the Ceylon Planters' Association), Messrs. Norman Grieve, N. Rowsell, E. Hamlin, W. A. Mooyart-Denison and D. Edwards and Dr. Renny, all well-known men of great and varied experience. We heartily welcome this influx of energy and capital, and trust that it will be merely the prelude to a stronger flow year by year. Our contemporary points out the distinct advantages that South India possesses over such comparatively distant places as Java and Sumatra, where so much Ceylon capital is now being invested.

Rubber plantations.

In a report to the Foreign Office, Sir Henry Deering, the British Minister in Mexico, stated that the total expense for five years' cultivation of a rubber plantation of one hundred thousand trees would not exceed £2,500. The yield from the first harvest would be, say, £12,000, besides the profits from the interplanting of corn, cacao, bananas, &c. The net profits of the investment, after taking the entire cost of the last and all expenses up to the first year of harvest, would be £9,500. Each succeeding harvest for the next 25 or 30 years would bring in a steady income of £10,000. Something like 400 per cent. per annum profit on the investment! It is computed that an eight-year old tree ready for tapping will give about three pounds of rubber, fetching readily 2s. per pound.

Cocoa in Trinidad and Ceylon.

With a view to the possible introduction on a large scale of this staple, it is interesting to note the comparative cost of production in Trinidad and Ceylon. In the former colony it varies from £1-6-0 to £3-18-10 per bag of 165lbs., according to the crop, which again varies from ½ bag per acre to over 3 bags. This runs out to a little over £1-3-0 per cwt., but the prices in London are distinctly lower than for Ceylon cacao, while the average yield does not run much above 2 cwt. per acre. In Ceylon the cost f.o.b. varies from £1-10s. per cwt. for a 2 cwt. crop, to £1-6 for 3 cwt., and £1-3 per 4 cwt. crop. The highest yield recorded in Ceylon, says the *Observer*, is 7 cwt. per acre off an unmanured 21 acre field. Net prices in London again vary a great deal, but 55s. per cwt. seems a fair average.

Bee-keeping in India.

A correspondent asks for information on the possibilities of hiving the jungle bee. In January last we published details of a system adopted with some success by a Nilgiri planter, from which we extract the following. First the hives. Ordinary large clay chatties, with mouth turned down, and

a small hole in the side, make good hives. But they must be protected from the sun, or the combs will be melted. Place in an unfrequented spot, sheltered from wind and, if possible, with a southern aspect. Wooden hives are also good, but should have an angular depression in the roof to accommodate the honey formation always more abundant at the top of the combs. The hives ready, keep a look out for the wandering bees, sent out to look for quarters. These have a habit of searching everything and everywhere, following persons about, &c., and can be captured with ease. Put in the hive and keep them a short time shut up, then liberate. They will go home and bring others with them and finally the whole swarm will take up their quarters. It is often sufficient to place the hives in good positions and let the bees find them out for themselves. The yield from a good hive, where there is abundance of flowers, will be as much as 8 quarts in the year, being 2 at each clearing.

We shall be glad to afford further information if desired.

Salt in agriculture.

In discussing the value of salt to the planting industry, Mr. Cochran, Town Analyst, Colombo, thus summarises the opinions of leading agricultural experts at home:—

The question as to the value of common salt as a manure has always been a disputed one: men like Liebig, Lawes, Warrington, and Voelcker declaring against it; although Dr. Voelcker (according to Dr. Griffiths) latterly recognized its value as a manure which increased the yield of wheat, barley and oat crops. There is no doubt that in special cases salt is of use as a manure. Thus Dr. A. B. Griffiths states that from his own experiments and experience, a dressing of 1½ cwt. nitrate of soda, and 1½ cwt. salt per acre, forms an excellent manure for mangold-wurzel. From the evidence before us, I am disposed to consider the cocoanut tree as one of the special cases in which salt is useful as a manure.

Dr. Griffiths sums up the general properties of common salt from an agricultural point of view as follows:—

(a) The property of salt, in small quantities, in promoting the decomposition of the animal and vegetable matters contained in all cultivated soils is considerable.

(b) It acts as a *direct plant food* in small proportions.

(c) It has the power of destroying noxious insects, slugs and weeds, when applied to fallows.

(d) Salt possesses stimulating powers on growing plants.

(e) It has the power of preserving the juices of plants, and the soils in which they grow from the effects of sudden transitions in the temperature of the atmosphere (C. N. Johnson, F.R.S.)

(f) "It increases the power of certain soils of absorbing moisture from the atmosphere."

I may mention, in conclusion, that according to the same author, salt has been used as a manure in Palestine and in China for more than 2,000 years.

Vanilla.

This vine is grown in many tropical countries, especially in South America, where from the port of Tunham, South East Mexico, is exported more vanilla than from any other port in the world. Bourbon, the Mauritius and the Seychelles also furnish appreciable supplies. In Mexico are found four varieties,—the *Mansa*, *V. plumifolia*, *V. sylvistius*, *V. hortina* and the *Pompura*, *V. rotundifolia*. The *mansa* and the *plumpura* are cultivated. The cinnamon or wild vanilla has a more pointed leaf and a thinner vine than the *mansa*; the pod is shorter, rounder and thinner. They are less than six inches long, divided into three qualities, like the best vanilla, and are called vanillons in France.

The most suitable soil is a rich sandy loam, or vegetable mould, not too dry. They should be planted by small trees

grown for the purpose of giving them support. The temperature should have a mean of about 85 deg. F., never very cold or very hot, altitude (in Mexico) up to 1,000 feet. It is supposed to bear a full crop the third year, from 10-12 oz. of first class beans, 10 to 16 oz. second class, and 12 to 15 oz. third class; weight after curing. Fine vanilla fetches 26s. to 32s. per pound. The best pods are 7 to 9 inches long. The second quality are of the same size but less fine. The third consists of burst open pods, of pods with the ends broken, are red and dry, or undeveloped. In Mexico it fetches from 50 to 75 dollars per thousand in New York, which leaves a handsome margin for profit. The artificial substitute, vanillin or vanillon, has not affected the sale of vanilla, as it lacks the true flavour. After gathering the beans, they are plunged into almost boiling water, then put out on mats to dry, then dried in the sun on blankets. At night they are rolled up in blankets and shut up in tight boxes to ferment. After sizing and classification, they are tied up in bundles of one pound weight, and wrapped in brittening paper and tinfoil.

Weeds.

Weeds may be regarded in two lights: as competitors for the crop food, and as Nature's bankers. The difficulty is to decide under which head to class them at the different seasons of the year. For if we set to work to destroy them in our plantations when they are banking up surplus stores of food that otherwise would be wasted, we act wrongly. We also commit as serious a mistake in allowing them full possession when our coffee or tea wants every particle of sustenance it can obtain. In monsoon time weeds flourish luxuriantly: is there any necessity to do more than keep them in check at this time? Do they not rather store up in their tissues those precious manurial constituents we have been at such pains and expense to put into the soil, and which otherwise would be washed away by the too generous rains? But in the dry season, when every drop of moisture is needed for the crop, which otherwise can make no use of the food at its roots, then is the time to pursue the undergrowth to its death.

The weeds whose luxuriant monsoon growth appalled us die down, and if dug into the soil adds to the store of valuable humus and plant food. The life of the soil, the bacteria, cannot live without humus. Surely it is a matter for earnest consideration that our tiny but important allies should never be starved. Observe the ways of Nature. Which is the richest soil: on land bare of vegetation, or that simply reeling with plant life? Consider the growth of fertility in its different stages. How the hardy lichen and moss attack the hardest rocks, giving lodging to ferns, then to hardy weeds and brushwood, and lastly to trees. What does it prove, but that the digestive or root-solvent powers of some plants are infinitely stronger than others? That minerals utterly useless to, say, coffee or tea, can be seized upon by hardy weeds, pioneers of fertility, which in their decay render up in soluble plant food, the stores in their tissues wrenched from the inhospitable soil. Again, the deep roots of weeds, on their decay, shrink very considerably, and afford channels into which the rain can safely enter and percolate to the raw subsoil. This it attacks with its carbonic acid, breaking up the insoluble mineral compounds. There too does the oxygen of the air freely penetrate, that oxygen without which no root-growth is possible, the life gas that the nitrefying bacteria must have or die.

Artificial manures.

As we have very frequently pointed out, the ignorance among the largest buyers of artificial manures as to the most economical manner of purchasing is stupendous. It cannot too strongly insisted on that the *chief value* of poonacs, manure, etc., depends on the amount respectively contained of nitrogen and phosphoric acid. All respectable dealers readily furnish analyses of their manures where required, and it is an exceedingly easy matter to calculate the comparative value of their respective manures. The following serve as an illustration:—

Abbott & Co. sell poonac containing 5% nitrogen Rs.55 per ton, delivered at a given railway station.

Barclay & Co. sell poonac containing 6% nitrogen Rs.60 per ton, delivered at the same station.

The cartage, we will suppose, comes to Rs.15 per ton each case; thus the 5% poonac = Rs.70 per ton on estate, and the 6% poonac Rs.75 per ton.

Multiply the nitrogen percentage by 22.4 = number pounds nitrogen per ton. Divide the result into the cost per ton, and the result gives the price per pound of nitrogen. The apparently cheaper 5% poonac, therefore, costs about 10 annas per pound of nitrogen and the seemingly more expensive 6% poonac under 9 annas per pound of nitrogen—a difference of 10 per cent. ! In many places the cost of cartage is a great deal higher than Rs.15 per ton, and it is clear that for every rupee extra for carriage, the relative difference is increased. When we hear of estates purchasing 20,000 rupees' worth of artificials in the season, the percentage mentioned works out to a goodly sum indeed.

As it is very rare indeed, we believe, for poonacs to run above 5½ to 6 per cent. of nitrogen, it is evident that an artificial manure containing 9 per cent. of this element, and selling at only a small increase in price, is one to be not only *desired* but *bought*. Such a manure is to be found in a certain fish guano sold by one of the West Coast Manure Factories, who scarcely need our recommendation as to merits, as the demand is far in excess of their supply. Another point to be noticed in connection with the purchase of a good fish manure is the fact of its containing an appreciable percentage of phosphoric acid, which otherwise must be purchased in the form of bones. For coffee, of course, additional phosphates *must* be obtained, but for tea, the guano product and simple seems exactly the thing required.

THE Report of the Directors of the East-Indian and Anglo-Indian Deposit and Loan Society, Limited, to be delivered at the Twentieth Ordinary General Meeting of Shareholders on Thursday, the 22nd July 1897, says that the Deposit Account has further increased to Rupees 4,17,074-8-8 from Rupees 3,54,429-12-6 in the preceding half-year. The loans on Mortgages of House Property and Jewels have also increased to Rs.3,94,141-6-0 from Rs.3,48,824-15-0. Personal Loans to Rs.20,746-7-4 from Rs.19,044-11-4. The income derived by the Society during the half-year amounted to Rs.18,557-9-0 and the expenditure (inclusive of interest due and paid to Depositors) to Rs.14,968, leaving a surplus of Rs.3,589-9-0. This result is so satisfactory as to enable the Directors to recommend a special bonus of 2% on the paid up Capital in addition to the 8½% hitherto declared in each half-year. The above surplus of Rs.3,589-9-0 has therefore been applied as follows:—For Bad debts Rs.400; for Reserve Fund Rs.800; for Dividend Equalization Fund Rs.289-9-0; leaving a balance of Rs.2,100 representing 10½% on the paid up Capital for the half-year for Dividend and Bonus to Shareholders and for Directors' fees.

COMMERCIAL NOTES.

MR. W. F. RABAN presided at the Annual Meeting of the British Darjeeling Tea Company, Limited. He said that the Company had been singularly unfortunate in its starting. In the first place, owing to the exchange, when remitting their purchase money to Calcutta, they lost over Rs.30,000; then, owing to the illness and unfortunate death of Mr. Lloyd, they were involved in costly litigation, and the gardens and machinery were neglected; and when their present manager (Mr. Sproull) took over the charge, he found the labour disorganised, cultivation neglected, and the machinery very much out of repair. Their affairs had now been put on a very different footing. Until more of their young tea came into bearing, the cost per pound would continue high, but he honestly believed that when all their present cultivation came into bearing, they would have one of the finest properties for its size in Darjeeling. This year they would probably work at a loss, but in 1898 he thought they ought to pay their expenses.

THE season's operations of the Jorehaut Tea Company, Limited, have resulted in a gross profit of £21,969 and the net profit to £18,522. There was brought forward from the profit and loss account, 1895, the sum of £4,432, and adding this to the profit on the year 1896, the sum available for dividend is £22,955 7s. 5d. The Directors recommend a dividend at the rate of 20 per cent., payable on 1st July, and that the balance of £2,955 be carried forward. The reserve fund of undivided profits amounts to £21,579.

U. P. A. S. I. LEAVES.

[GATHERED BY THE SECRETARY, U. P. A. S. I.]

It appears that a slight alteration will be necessary in the Agenda paper already issued. "Coffee-stealing" is entered therein as a sub-head to the Report of the S. I. P. E. C., but one of the delegates has intimated that he has a resolution to put forward on a point that has no reference to this report. Coffee-stealing will, therefore, be entered as a distinct subject.

District Associations should take particular note of the fact that the chief subject for discussion at the U. P. A. Committee meeting on 7th August is the Report of the South of India Planters' Enquiry Committee.

The following are the subscriptions to the Reserve Fund of which payment had been made to the Secretary of the U. P. A. S. I. on and before the 27th instant:—

LETTERS TO THE EDITOR.

NOTICE TO CORRESPONDENTS.

["Cotton, Bangalore."—You might send us some working details of your enterprise, upon which some opinion could be formed. "One Interested."—Will appear in our next issue.—Ed.]

BREAD-MAKING: A QUERY.

SIR,—Can you or any of your many readers kindly give me a receipt for making good bread at home? I can get toddy.
ROTI.

THE LOWER PULNEYS PLANTERS' ASSOCIATION, DINDIGUL.

SIR,—The Annual General Meeting of the above Association will be held in Dindigul, but has been postponed till September. Notices will issue later.

21st July 1897.

HOWARD NEWPORT,
Honorary Secretary.

THE WRIGHT FUND.

DEAR SIR,—In continuation of the List of Subscriptions published by you, for the benefit of the family of the late Adolphus Wright, I have received Rs.20 from J. T. Murray, of Kotagiri, and Rs.15 from H. E. Lee, of Kadur, Mysore.

I am, Yours faithfully,

OOTY, 24th July 1897.

J. W. MINCHIN.

BLACK BUG.

SIR,—If "Death to Bugs" in your valuable journal of 17th current will address N. E. A., Bangalore Cantonment, giving full particulars of the pest, the same will be glad to send him a few packets of a remedy he has tried for insect kind, and would be glad to have his report on the same.

BUGS.

BEE-KEEPING IN INDIA AND ERYTHRINA LITHOSPERMA.

SIR,—Can you kindly give me any information, through the medium of your valuable paper, as to bee-keeping in India? Is it possible to hire or domesticate the Indian bee, or is

it feasible to procure bees in quantities which could be hired or domesticated at a reasonable cost? Can you, also, tell me whether the *Erythrina Lithosperma* is a good shade tree for coffee in spite of the undoubted excellent analysis of its loppings, or whether the tree itself is a surface feeder, and apt to take more than its share of goodness out of the land, or perhaps it may be that its foliage is on the tree at the wrong season of the year?

[Your queries are noticed elsewhere.—Ed.]

ENQUIRER.

ARROWROOT: A QUERY.

DEAR SIR,—Can you tell me anything about arrowroot and where to get it? I wish to plant two acres or so and wish to know how much I will require.

From Calcutta I was disappointed, as they say they don't grow it that side; your many correspondents may be able to furnish me with the information as regards planting, and the season when to plant, &c.

Any book on the subject if suggested will greatly oblige.

SAIFABAD, HYDERABAD, DECCAN,

Yours truly,

22nd July 1897.

MIZA MEHDY KHAN.

[We believe that in the excellent series of planting books published by the *Ceylon Observer* Press, Colombo, will be found a volume dealing with the cultivation of arrowroot.—Ed.]

THE JUNGLE LEECH AND HIS HABITS.

SIR,—Can any of your more learned readers tell me all about the common or jungle leech, I wonder? It seems to me rather extraordinary that about a thing we meet with daily almost so little is known by planters. Ask fifty men the question. Does a leech see, or is it by scent it knows of the approach of a victim? Where does it go to in the hot weather? How is it brought into the world. By egg or otherwise? Seeing there are so many leeches to be found in jungles where the supply of coolies does not equal the demand (in the opinion of the little brutes) and where there is little or no game to be found, what do they live on? Ask, I say, fifty men these and other questions, and I doubt if you will find two that can answer this satisfactorily. So if some student of Natural History will enlighten my ignorance, he will be doing the same kind office for many others I think.

"INTERESTED."

A WONDERFUL POOCHIE.

DEAR SIR,—I enclose a cutting from a home paper which, if true, it seems funny is never heard anything about in South India; but, perhaps, we have no tea worms here. I should have thought that in any case the making of the tea would have killed the insect. What say the tea men? [Gammon.—Ed.]

COFFEE.

TEA THAT MAKES YOU THIN.

EVERYBODY knows that tea when drunk in hot weather makes a person perspire. You have no cause for fear as long as you keep to drinking tea as procured in England; but if you don't want to waste away to a shadow, don't have anything to do with tea as they drink it in Ceylon.

The tea-plants of Ceylon are infested with an insect known as the tea-worm. This is a most minute creature, visible only through a powerful microscope. The leaves of the tea-plant are covered with them, and you probably get a few thousands of the creatures in a pound of tea; but they are quite harmless as received by us. In Ceylon, however, the tea is used soon after it is picked, and the insects, being then alive, have a peculiar effect on persons drinking the tea.

As soon as you have drunk a cup of this tea you will begin to perspire freely, the pores of the skin remaining open till the clothes are saturated through and through. The effect is so weakening that persons have been prostrated after only a few cupfuls. These, of course, were Europeans, the natives' constitutions being proof against it.

COST OF LIVING ON A PLANTATION.

SIR,—I join hands with "Yah" and "Van Read" on the subject "Cost" of living on a "plantation," and say a word to "On the

Cheap" and "Ex-Creeper" which I hope will not hurt their feelings, but teach them to be more philanthropic. If the writer independent gentlemen, which I presume they are, the more reason I say for them to keep such knowledge to themselves and study it for their own welfare; but where it is a matter of one serving another, I hardly think such ideas if carried would be charming.

Some are dirty enough to keep from washing for days, aside the use of soap, which is cheap enough now, sure goodness, but all men are not alike, and a good job too. Some live upon "ragi" as the poor native, but all cannot, and some of us who have been reduced in pecuniary circumstances to our coat to the cloth we have, but no well-bred man with means the back of him would draw the line I'm sure. To certain knowledge I have known men not to use soap for months, and as for food they would turn one joint into different forms in as many days; then guess its condition but we are all not alike I say. Now to the point, and would "not" be out of place either for me to suggest to "On Cheap" and "Ex-Creeper" to resort to the form once practised as to how little a horse could live upon, and when he brought himself to the last straw write us again.

AD RE

LEAF DISEASE AND NITRATE OF SODA.

SIR,—In your issue of 26th June, EXPD. DT. (I write signature as you print it) relates some experiences with nitrate of soda. It was not my intention to publish mine this year, but the result of two or three trials cannot be considered conclusive, but in case it should help others, I may as well confirm your correspondent as far as possible. I have twice applied nitrate in the hot weather and the permanent result has been nil. In October I applied 2 oz. to a field which had a very severe attack (as it has had for years every September-October) and was away for a fortnight; on my return, while a neighbouring field had got more, this field did not show a trace of disease nor has it since; the leaves attacked had all fallen off and there was a flush of young wood; it was too late to crop this year as it produced which makes me think that the following would be a better plan. Apply 1 oz. per tree in early September and then go round the open spaces (which will always be the better for being prevented from premature hardening and consequent probable loss of fruit, especially early bud) and the E. facings and other notorious spots in early October, with another 1 oz. This of course must be modified by local experience. Some estates harden early, some late, this place is very late, being surrounded by parky lands. I have seen many seasons with practically no wintering, and therefore a late flush is most undesirable. I did not dig the nitrate in as the field had been previously dug, and I am rather in doubt still as to whether it is necessary to dig it in; some of your correspondents say it is, while a very large user of it once told me that he never did so.

If your correspondents do not care to sign their names, can they at all events mention names of estates? This would be of use to their neighbours and assist them to adopt some conclusions from the result of experiments, as the same results cannot be expected from all soils and situations.

SEAGULLY ESTATE, MUDIGERE,
KADUR DISTRICT, MYSORE,
22nd July, 1897.

JNO. G. HAMILTON

CREEPERS IN CEYLON.

SIR,—Chancing upon the enclosed cutting entitled "The Prospects before Creepers" culled from the *Madras Mail* some time ago, brought to my recollection an article on the same subject, which appeared in P. O., April 3rd, 1897, and in which the following appears: "We only hear of the import (of creepers) but assuredly the export in the form of 'returned empty

must be of imposing dimensions." What a pity no statistics are kept! But I'm inclined to think that there are not so many as one would be led to suppose. Are creepers of a few months, even years not found in charge of every petty estate, of a few acres, formerly on which a native writer would have been employed, on a miserable salary of anything from 50 to 80 rupees?

The "Creeper trade" is a paying one, and I know of men who when in England paint glowing accounts of the life of a Coffee Planter, to would-be creepers, with the result that a haul is made. With what result it is hardly necessary to mention. The greed of a few is the ruin of many. What is the reason for the low salaries of *well qualified* superintendents now-a-days. I think we have not far to look for an answer, after having perused "The prospects before creepers"—a glutted market. In my humble opinion, we superintendents ought to combine, and in some way (by collecting statistics of the returned empties?) disillusionize those parents and guardians who believe that a creepership is an easy road to fortune.

SUPERINTENDENT.

THE PROSPECTS BEFORE "CREEPERS."—"Observer" writes:—I have heard it contended that in getting out young men, who pay long premiums, and £10 to £12-10s. stg. per mensem, for board which may cost Rs.60, the favour is conferred by those in this import trade. I think the following advertisements culled from last week's papers are conclusive of the opposite:—1st. A Company paying 25 and 30 per cent. dividends advertise for an assistant on Rs.100 per mensem. Supply so exceeds demand that business men are not ashamed to offer such a pittance; yet the last holder of the post lost *his health* and his predecessor *his life* in the service. 2nd. Another billet is offered, in the same feverish district, with the noble salary of Rs.70 per mensem. 3rd. Wanted an *experienced* European assistant, salary Rs.100 per mensem. [So that after gaining experience £5 10s. is what a "Creeper" may expect—one quarter of what he pays monthly for premium and board!] 4. "Wanted an experienced assistant, salary Rs.150 per mensem. *No creeper need apply.*" 5. There is a well-authenticated report current that thirty-seven creepers applied for one small billet lately, and 6. I know that over a hundred Ceylon men applied for a billet with a small salary in another Colony. I think your Overland issue should contain this, with the request that all home papers should copy and warn parents against creeper trappers who are becoming more and more numerous—the notorious success of a few stimulating the greed of many.—O.

COFFEE PLANTERS AND THEIR CURERS

SIR,—It is not always that the Coast firms meet with one so considerate, or appreciative of their work as "Kola," whose letter appears in *Planting Opinion* of 3rd July. Matters, however, have, I think, been pretty well threshed out between the planter and curer, and it is probably only in instances where abnormal shortcomings occur that any complaint is made.

As to the measurement of coffee, it has been from time immemorial a fruitful source of contention. But let the work be as carefully done as it practically can be, and you will seldom get the same lot of parchment to measure twice alike. I have seen the process gone through frequently, and invariably some difference was the result. On this account it is only right that some allowance should be made. I have, however, known the curer blamed for letting the cartmen off when the shortfall was small, and in other cases where the value of the shortage was kept off the cartmen, one planter saying the fellow must have stolen it, and besides it encourages him to pilfer on the chance of his getting off, the other complaining because in making the men pay it interferes with his getting cartmen to take his coffee. In the latter case, to avoid such contingency it was generally arranged that the planter could pay the cartmen the sums deducted if disposed to do so. But one can see how complaints like these may bear somewhat hard on the curer.

As to the shrinkage of coffee and loss of weight in drying, these of course must vary, according to the degree of moisture when received into the curing yard will be the time required for drying. If three days are required, the parchment from the longer manipulation it undergoes in spreading, turning gather-

ing in at night, &c., gets more broken than if dried only for two days. Dissatisfaction is avoided, I think, by a plan I have seen adopted, that is by taking the weight of a bushel (several being tried for average) when the coffee arrives and again when fully dried. If the planter gets these figures, it should satisfy him as to weight lost in dryage. If proper records are kept in curing establishments they should also show the total number of bushels after drying each lot, and the curer should also be able to produce test trials of small quantities to check outturn. Outturns vary of course, the relative bulk and weight of the parchment to the solid bean being a variable element.

Kola's lowest record outturn of 79 Bus. to the ton looks, I should say, suspicious, unless there was anything unusual to explain it. The fine Mysore coffee from old chick plants, almost perfectly dried on the estate which was at one time the custom in Mysore plantations, not infrequently ran 83 to 84 bushels, on a rare occasion as low as 81; but this was the extreme—95 with which Kola is satisfied seems high for an all-round figure. Good Coorg or Mysore should run about 92 or 93.

His reference to the difference in tonnage scales is interesting. One would think that business men would be the first to feel the inconvenience of such differences, and through the Chambers of Commerce arrange to have them remedied. But I doubt if there be a class more slow in progressive movements of this sort. One would think that uniformity in this and many other similar matters would be such a convenience in facilitating business transactions that every effort would be made to introduce it, but you don't find it so. In connection with this subject there is one which the Combined Planters' Association might well interest itself on, that is to get some uniform system of weights and measures adopted. Every little district has its own weights and measures, and what makes it so annoying and perplexing is that they so often use the same names; for instance, the *maund* is a designation used nearly all over India, but it is the same thing only in name. In one place it is 28 lbs.; in a district not far off it is 24, again 25, at another 33, another 82½!! and so on *ad infinitum*. So with the candy. So with almost every weight or measure you can name. People make a great noise calling for reforms that are of little or no importance. To replace the present barbarous system with a well-arranged scale would be a boon to the whole community, let alone traders. It should be made a burning question, and agitation should not be allowed to rest till the thing is accomplished.

STEAM.

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contain per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
16.64	"	Phosphoric Acid.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE.

COFFEE.

Erythrina lithosperma. A planter, just returned from home after a long holiday, asks for information regarding this tree *in re* its utility for shade. The exhaustive correspondence that has appeared in these columns on this very subject, renders us disinclined to go over old ground. Mr. B. Nelson, of Shencottah, Tinnevely, the "father" of this tree, will doubtless be willing to reply to any personal communications addressed him. We may mention, however, that we should be glad to publish results

of the many experiments tried therewith, we believe, in every coffee district of South India.

Foxy coffee.

A gentleman who has had very considerable experience in the curing of coffee writes us thusly: "When I had a great deal to do with the preparation of coffee for the London and Continental Markets, foxy coffee was always a vexed question and generally gave rise to a difference of opinion between the curer and the planter. I thought it was generally the result of fermentation during preparation on the estate, though possibly when coffee reached the coast very wet and could not at once be dried, it might suffer. But often we never knew of coffee being foxy till so reported by the brokers at home. Curers are generally too busy when coffee is arriving for the close experimenting that is required to determine how foxiness occurs. Fermentation was a doubtful cause, for in many cases everyone connected with the preparation denied its suffering in that way when in their hands. I have always thought that coffee is judged too much by colour. Some of the finest coffees, Cannon's Mysore and similar high-class qualities, if judged of by colour alone, would not have been graded very high. The French, good connoisseurs, liked their Indian coffee to be of a straw colour. They preferred native-grown kinds, which before they reached the market after a long sea-voyage round the Cape had generally acquired this tint. In fact this being the usual condition in which it arrived was made the market criterion of its quality. With coffee now going by the short route, the colour had not so much changed, but until I left the coast (about 12 years ago.—Ed.) many orders required it should be sent round the Cape. I don't know how it is now.

Disease-resisting varieties of coffee.

Scientific investigation into the respective disease-resisting powers of different varieties of the same

plants has already been rewarded in the well-known cases of the vine, apple, potatoe and wheat. Similarly among the many varieties and hybrids of coffee there must surely exist, were diligent search only made, numerous hardy specimens on our plantations, immune or practically immune from the attacks of our great enemy, leaf disease. We have noticed with great regret that the general feeling of planters, as expressed in the resolutions of their District Associations, with the honorable exception of the Nilgiri P. A., is against any scientific investigation into the cause or prevention of *Hemeleia vastatrix*. Surely it was ever one of the proudest boasts of our nation that we never know when we are beaten, and out of defeat snatch our most glorious victories. Because practical planters, all untrained in the highly scientific methods of scientific investigation, are helpless of themselves to combat their enemy, is that a reason for declaring that their case is hopeless? When the dreaded phylloxera almost decimated the vineyards of France, did they not set to work and successfully replant their fields with hardy American stock? Was not the silk industry in Southern Europe threatened with extinction until Pasteur, by his discovery of the life-history of the disease, showed the sericulturists how to resist the plague that threatened to overwhelm them? Does not the planter himself, when a valuable horse is sick, do his best to obtain the advice and help of a horse-doctor, a veterinary

surgeon? The assertion that, because we planters lamentably failed in our endeavours to cope with disease, therefore there is no help possible, argues a in ourselves that approaches arrogant self-conceit. have tried, we have failed; therefore everyone else must. Much in the same manner would a village doctor de that because he had failed to cure a mysterious disease, assistance of the best London physician would be r useless. To put the same thing in a different way there are doctors who devote themselves to the curi human and animal ailments, so are there, "doctors" devote themselves to curing the diseases of plants. we, who anxiously call in the aid of the doctor veterinary surgeon when our friends and horses are deliberately refuse to avail ourselves of the service "plant-doctors" when coffee, the plant by which we is attacked by a disease that paralyses its vital act nearly to the point of death? Such wisdom is s admirable, though to the scoffer it seems folly. Wh such attempts have failed in Ceylon, a country w climate is eminently favourable to the well-being of fungus; we have proved in South India that we are favoured by nature.

Some statistics.

I.—The following statement shows the total crop in Rio and Santos during the last fifteen years, commencing July 1 and ending June 30:—

	Rio Bags.	Santos. Bags.	Total. Bags.
1896-97 ...	3,552,000	5,103,000	8,655,000
1895-96 ...	2,399,000	3,081,000	5,480,000
1894-95 ...	2,712,000	3,987,000	6,699,000
1893-94 ...	2,588,000	1,702,000	4,290,000
1892-93 ...	2,980,000	3,213,000	6,193,000
1891-92 ...	3,722,000	3,664,000	7,386,000
1890-91 ...	2,395,000	2,913,000	5,308,000
1889-90 ...	2,351,000	1,869,000	4,220,000
1888-89 ...	4,124,000	2,611,000	6,735,000
1887-88 ...	1,921,784	1,120,043	3,041,827
1886-87 ...	3,500,234	2,587,912	6,088,146
1885-86 ...	3,887,618	1,668,965	5,556,583
1884-85 ...	4,117,116	2,095,435	6,212,551
1883-84 ...	3,186,696	1,871,584	5,058,280
1882-83 ...	4,742,969	1,967,880	6,710,849

Total { Bags.	65,365	153,969	83,359	45,924
{ Casks	201	166	98	169
Total, 1896. { Pgs.	59,335	168,492	60,360	51,683

The total offered during the first six months of the present year amounted to 348,599 bags 634 casks against 339,079 bags 801 casks during the corresponding period in 1896.

SCIENCE AND COFFEE.

BY THE LATE MR. WILLIAM PRINGLE, M.S.C.I.,
SOMETIME AGRICULTURAL CHEMIST IN COORG, SOUTH INDIA,
TO MESSRS. MATHESON AND CO.)
(Reprinted from the "Madras Mail.")

NOTE.—These papers are being published in pamphlet form: register orders with Messrs. Addison & Co., Mount Road, Madras.

VI. SUPPLIES.

THE future of the coffee-planting industry of Southern India depends on the successful supplying of the vacancies caused by the failure of the coffee trees due to borer, leaf-disease, over-bearing, old age, &c. No matter how healthy a coffee-tree may be, no matter how carefully pruned, handled, tended and nourished, its life will end sooner or later. Under favourable conditions, the tree may live for fifty or sixty years; as a rule, it will seldom last thirty. It will, under favourable conditions, be in full bearing in the fifth or sixth year, and may go on for 20 to 25 years giving paying crops. Many trees are exhausted in 10 to 15 years by unskilful treatment, borer, and attacks of *Hemeleia Vastatrix*, etc., and must make room for a new generation. If the vacancies can be successfully supplied and the plants developed in a healthy and vigorous manner, there is no reason why an estate should be limited as to age. If we can so arrange matters as to have a continual succession of young plants coming on and developing into healthy trees to replace those taken out, a coffee estate may be considered as a permanent investment. In suitable localities efficiently drained and manured this can be done; and an estate may be considered to be working under the best possible conditions of perpetuation where from 4 to 5 per cent. of vacancies occur every year that are successfully supplied. It is upon the success of the supplying that the life of the estate depends, and practical planters consider the question of supplying one of the first importance in Southern India. It is only when supplies cannot be got to grow that there is a necessity to abandon the estate. With many aspects and under some conditions the plants cannot be raised, except at a ruinous cost.

A good deal of land at one time and another has been opened under coffee that was never suitable for it. With such land the cheapest plan is to abandon it at once. Such lands in Coorg are those exposed to the full force of the east wind with a southerly aspect.

Supposing the land to be suitable for coffee, we'll consider some of the more important points connected with supply failures and the successful raising of coffee-plants. To begin with, the seed should be the best procurable, from healthy, strong trees; it should be fully matured, as, judging by analogy, it is impossible to obtain a strong vigorous offspring with under-aged and weakly parents. Heredity plays as important a part with plants as with animals, and amongst cattle-breeders the importance of a good stock to breed from is fully recognised. Experience has shown that good points can be perpetuated to the exclusion of bad ones.

This point has also been recognised in regard to plants; for instance in Sutton's "Pedigree Wheat." All doubtful seed should be rejected, and, if possible, seed from another locality should be planted. Evidence is wanted to decide whether it is better to bring the seed from a dry to a damp climate or *vice versa*. Judging from what I have seen, it seems preferable to move from the damp to the dry. The celebrated Nak Nad variety, with its fine bold bean, is grown in a comparatively moist, cold climate. It has done remarkably well in the Bamboo District, where some of the finest estates are planted with it. The most probable reason why the hotter and dryer Bamboo District has proved favourable to the development of healthy plants from that seed is that in the spring, when the plant appears above ground and when it is put out on the estate, the climate conditions are less favourable to the development of leaf-disease and other fungoid growths there than in the forest or on the ghats. Seed from Venezuela was introduced into Coorg three years ago, and I believe at least one proprietor is exerting himself to bring in seed from Abyssinia. These are steps in the right direction, and will, I hope, lead to the improvement of the Coorg coffee and the coffee industry of Southern India from Coorg seed. Nak Nad variety was some time since introduced into Mysore with great success, and has, I believe, practically replaced the old Chickmagalur. The Nak Nad has a fine bold bean, with large broad leaves, commonly nine inches long by four broad, or almost as large as the Liberian. The Chick seldom has leaves six inches long; they are, as a rule, narrower in proportion than the Nak Nad, and the tree crops in alternate years to a marked extent.

Seed should be selected from another estate, or preferably district. In and in breeding, according to Darwin, leads to the deterioration and extinction of the species.

The arrangement of the nurseries now demands our attention. Preference should be given to a light sandy soil, not too far from water. Where an old soil has to be used, it can be rejuvenated by burning the soil and adding a little cattle manure, or good vegetable mould or jungle soil. If infested with land crabs, the burning generally gets rid of them, or the bed may be sprayed with kerosine oil, or treated with sulphur and lime. Badly drained nurseries are a fruitful source of weakly plants, which result in failures when put out in the field. Keeping plants too wet induces leaf-disease, white mealy bug, &c., and seriously interferes with the health of the supplies; if they are unhealthy in the nursery, good results in the field are not likely to be got.

Steeping the seed in a weak solution of lime water, to which 1 oz. of nitre and 1 oz. of copper sulphate are added per gallon, facilitates germination, and protects them from the attacks of insects. Other substances have been used, but the above is one of the best. Overcrowding the nursery is false economy of the worst description; the plants should be kept at least six inches apart in the beds. One of the reasons why basket plants are more sturdy than those in the beds is that in general they have more room, and the air can be circulated freely round them, which is not the case where plants are closely packed in a bed; the drainage is also better, and the soil seldom sour. In a great many nurseries that I have seen, the sun has been too carefully excluded; this tends to make the plants tender, and stunts the growth, as the leaves do not

perform their functions vigorously in the absence of sunlight. Shade the plants by all means in hot districts, but do not shut out all the sun light.

Light, air, moisture, and soil are necessary to the plants, and they must per force be supplied, or healthy plants cannot be grown. If plants are grown in baskets, they should be raised off the ground six inches to a foot on a grating. The baskets may be dipped in a solution of copper sulphate to preserve them from white ants. When planting out with baskets, it would be advisable to look to the basket bottoms, and if they are in any way sound, cut them off before putting them in the ground. I have known a basket quite sound and whole twelve months after it was put out; needless to say the supply failed. Having a good supply is half the battle, and the success of the future tree mainly depends on it, and the way it is put out in the field. The supply pits are to be made. On virgin land this is not a very important matter, but on old land where vacancies are to be supplied it is. If they are to be made at all, it will be worth while to give a little time and attention to them. Where possible they should be dug in the hot weather, or as soon after crop as possible. Depth is all important; you can widen a hole after a plant is in, but it is very difficult to deepen it. At least eighteen inches should be cut out in depth from the original surface, and two feet would probably be better. The bottom of the hole should be broken up with a pickaxe or fork. Smooth bottoms are a prolific cause of turned top roots and unhealthy trees. If the plants are put out in the baskets or with ball, pits are necessary, and if they are of insufficient depth or have smooth bottoms, no good will result from these expensive methods of planting. If good pits cannot be cut, it is better to open up the ground by inserting a fourteen-inch foot fork and slip the plants in behind it. If care is taken to keep the roots straight, very good results can be got. One planter of experience in South Coorg can point with justifiable pride to a field planted in this way. The effect of old coffee on the growth of supplies is very great, and they require to be kept clear of weeds, and carefully manured to give satisfactory results. The following manure will be found very useful; it is the diffusive manure mentioned in my paper on manuring of coffee:—

- 1 cwt. bone meal.
- 1 „ pure fish.
- 1 „ superphosphates 40 per cent. soluble.
- $\frac{1}{2}$ „ sulphate of ammonia.
- 2 „ kanite 25 per cent. sulphate of potash.

A quarter of a pound of this mixed with 2 lbs. of burnt earth will be sufficient for each supply; or 1 oz. sulphate of ammonia, 2 ozs. superphosphate, and 1 oz. fine bone meal mixed with 4 ozs. wood ashes and 2 lbs. burnt earth will prove more suitable on some places where the supply of nitrogen and sulphur is short.

Cattle manure is not always to be recommended for application to supplies, as it has a great tendency to facilitate the development of white mealy bug and fungoid growths. I know many people will quote instances where it has been used most successfully; but that has not always been the case, and the results got amongst old coffee by using chemical manures have been such as to fully warrant an extension of their use. They do not favour the development of insect and fungoid pests, and can be adjusted to suit the requirements of the plants and soil with the greatest ease.

The effect of shade on the supplies is most marked. Old Atty and Jack trees are fatal, and any shade that is surface feeding or too dense retards the growth or stops it altogether. It is much easier to raise supplies where they are lightly shaded than it is to get them up under it when heavy, as long as they are sheltered from the wind. In sheltered places with a northerly aspect which do not get the afternoon sun, shade is not required, and decidedly checks the growth of supplies.

Where any extensive area of old land has to be supplied, it is advisable to cut out all the old Jack and Atty trees, reduce the shade to a minimum; while mealy bug attack the roots is the cause of quite one-half of the supply failure in South Coorg. Let anyone towards the close of the planting season, or when replanting plants of the season's putting out, carefully examine the roots of the plant that failed, and in all probability find that the bark has been eaten off by the mealy bug; and very possibly he will find the insect adhering to the root. I have seen the tap root of a supply almost devoid of bark, and most of the feeder roots gone. Drainage and clearing are generally effectual in getting rid of the pest, or the ground may be sprayed with bisulphide of carbon emulsion.

In exposed places many plants are windrung and fail from this cause alone; but a board of stick or shingle placed windward side will often save them. On such places, unless the soil is excellent, it is rarely worth while to plant up old land, as the plants have a continual fight for existence. To avoid wind blown ridges, where the soil is poor, swampy places at the edge of the estate, and places where there is only a thin cover of soil over slab rock, and to concentrate the work on good, well saturated land, is the cheapest policy. It is better to have a piece of land under guinea grass or fodder supply than waste labour by continually replanting. These remarks are made chiefly in respect to old estates, where the difficulty of raising supplies are so much greater than on virgin land. To adapt the seed to the soil is of much greater importance on old estates than on those which are just opened. A change of soil is all important when planting up or replanting old land. Where it is brought from districts differing greatly in climate and condition, it may be necessary to acclimatise it before the full benefit of the change is obtained.

TEA.

A useful Book.

We have received for notice in our columns a very useful little book on tea, entitled "Tea Planting from Seed to Crop" by Mr. A. Joseph, formerly of Ceylon. It is in English with a Tamil translation, and contains a great deal of practical information on every branch of tea-planting, the use of writers, tea-makers, &c., &c. The work contains 47 pages, and will shortly be obtainable, at one rupee per copy, from our Madras office.

Japan's efforts.

The 70,000 dollars granted by the Japan Government for the betterment of the tea industry is to be expended almost altogether in advertising and distributing samples in America and Canada. In commenting on this, the *Japan Times* remarks that the far greater importance of improving the tea-manufacture has not received prior attention. For Japanese teas are without doubt well-known throughout the length and breadth of North America, and equally well-known as the now general complaints as to their inferior quality.

SPREAD OF TEA CULTIVATION IN PEERMA.

CONSEQUENT on the reinstitution of Land Sales by the Travancore Government during the last two years, large areas of land are now being felled for tea cultivation. Prior to that time the spread of tea cultivation was limited to a few small clearings annually. The advent of large wealthy companies into the district is largely responsible for the rapid increase now taking place. As everywhere

the private proprietor is gradually being ousted, and I do not think the time is far distant when all Peermaad will be in the hands of companies. The total areas at present under cultivation in the district is, inclusive of this year's earnings, close on 5,500 acres; of this amount nearly 970 acres are under coffee. Of the area under tea 1,500 acres thereabouts are under two years' old. The estimated yield for current year is placed at $1\frac{1}{4}$ million lbs., making the average yield about 400 lbs. per acre.

It is not many years since only two factories in the district possessed machinery, and by no means all of them were efficient. But within the last year or so great changes have taken place in this respect; factories have been enlarged to meet the ever-increasing yield, and machinery is now to be seen in every factory, with one or two exceptions. Owing to the inefficiency of the water-supply during the dry months of the year, and also owing to many factories having been built some distance off water, in the days when machinery for tea manufacture was hardly thought of, if at all, many estates have provided themselves with oil engines. There are at present five of these engines of various makes in the district, and I am told another is to be erected this month. The various makes of these engines are Griffin's Simplex, Hornsby-Akroyd, and Tangye's.

To compare the relative merits of the different engines is impossible without a perfect knowledge of the working of each one. When they are at work I don't think there is much to choose between them. They all seem to go well and give next no trouble at all. In fact an engine-driver can be dispensed with.

The Tangye appears the simplest make, in that it has so few working parts and in the absence of fans and pumps. The Hornsby-Akroyd is also very simple, though it has a few more working parts than the Tangye, but less than Griffin's Simplex.

The cost of oil per lb. of made tea varies with the amount of tea you have to make. The more tea you make, the cheaper it is, for when these engines are working at full power they use very little more oil than when only working at half power. Tangye is the latest engine of this type, and the well-known firm of Davidson and Co. are agents for it. I give below a summary of the working of this engine for the month of May:—

Engine worked 29 days on an average of 4 hrs. 58 m. per diem.

11,013 lbs. tea sifted and 9,908 lbs. of tea manufactured, machines at use being a Brown's Triple Action Roller, Little Giant Roller, Davidson's Large Tea Sorter and Souter's Roll Breaker. Quantity of oil consumed being 14 cases inclusive of oil used for lamps in factory. The cost per lb. of made tea was 1.32 pies. A.

MESSRS. COLLINGWOOD & Co. have opened business on Mount Road Madras, as Pharmacists and Manufacturing Chemists. They inform us that "Small profits and quick returns" will be their motto, and desire us to intimate to planters that they are prepared to issue supplies from newly-imported stock of patent proprietary articles, drugs, soaps, perfumery, surgical and scientific instruments, veterinary preparations, &c., at very reasonable rates. Moreover, in the case of all orders for drugs, &c., for planters that amount to Rs.100 and upward, they will supply free bottles, tins, pots, &c., cases, packing and transit to the railway station here. This seems liberal. We are assured, too, that the pharmacy will be under the control of a qualified Domiciled European Proprietor, and under the constant supervision of qualified and experienced chemists.

THE SIMPLEX OXIDISER.

IN presenting its readers with a capital portrait of Mr. Nathan Sharpe, the inventor of the Simplex tea machinery, the *Indian Planters' Gazette* has an interesting article on Mr. Sharpe's patent oxidiser. The article is so full of practical interest that, despite the great pressure on our space, we feel no hesitation in reproducing the major portion. The four essentials for oxidising or fermenting leaf are coolness, moisture, a gentle draught and darkness. These are all embodied in Mr. Sharpe's apparatus. He says that it is his opinion, judging from his experiences at Lungla with both fine, medium and coarse plucking, that he can guarantee a perfect oxidation of either kind in two hours and forty-five minutes, at a temperature of 80° Fahr.

Mr. Sharpe found that the curtains did not require saturating, but only to be kept moist. By so doing, the saturation point was kept below that of the rolled leaf, enabling just the desired amount of superfluous moisture from the leaf to be taken up by the slight current of air passing through the machine. Mr. Sharpe maintains that, in the ordinary way, covering with damp cloths, not only absorbs the moisture, but together with it a good deal of the liquor, which is proved by the discolouration of the cloths always met with. In Mr. Sharpe's machine, however, there is no possibility of any of the liquor being wasted, as no cloths are used, or are in any way necessary. Moreover, the leaf is exposed directly to the oxygen contained in the air passing through the machine, and this coupled with the coolness, moisture and darkness, produces a bright even colouring, impossible to obtain by the ordinary methods in vogue.

In ordinary fermenting room methods the rolled leaf is spread, sometimes on cloths or blankets on tables, sometimes on the floors; in both cases invariably covered with cloths or blankets, either wet or dry. These methods prevent any air that may be moving, supplying the leaf with oxygen. The currents of air, the moisture, temperature and light vary considerably in different parts of a large room. The result is irregular times of oxidation, and irregular colours, which produce a fluctuating quality, and which, to a great extent, accounts for the difference in each day's manufacture experienced on some estates, and which are attributed to entirely different causes.

In the "Simplex" Cool Oxidiser, Mr. Sharpe claims that the *mál* (roll) is subjected to correct and equitable treatment, each separate *ghánny* (lot) of rolled leaf, obtains its full share of oxygen, by the constant, gentle supply of fresh, cool, moist air, kept at one fixed temperature, in a compact and perfectly dark chamber. An even colouring is produced in a certain regular fixed time, which Mr. Sharpe maintains results in the season's crop, maintaining a high standard of quality, and improved and steady average prices.

Besides giving the long felt want of correct oxidation of rolled tea leaf, the oxidised teas when fully manufactured have a very much blacker appearance than those fermented in the ordinary way, and this fact has been noted by one of the first Tea Broker Firms in Calcutta.

A great point about the machine is its mechanical simplicity, the only moving parts being the two air propellers. There is no gearing or other complicated mechanism to get out of order, and those who are acquainted with tea life in Indian and Ceylon estates will readily appreciate

the great advantage, to say nothing of the saving in renewals.

As every planter well knows, the leaf when it leaves the roller comes out very much heated, the temperature being about 94°. When passed through the Moreland Rolled Leaf Separator, Aerator and Sifter, it is brought down to about 90° in the space of a few seconds. On being at once placed in the Oxidiser, standing at 80°, the temperature of the leaf immediately drops 10°. This sudden chilling has the effect of enhancing the aroma of the leaf, which has a most agreeable and pleasing smell.

Mr. Sharpe maintains that it is just as essential that the rollers should be placed and worked in a room, entirely shut off from the Driers, which room should be kept darkened and cool. The Oxidisers and Rollers should be placed together in a rolling room, the air cooled by the Oxidisers being utilised to keep the room at a low temperature. The methods chiefly in vogue at present are to have the rollers and dryers too much together, the result being that, in many cases, the hot air exhausted from the driers, reaches the leaf in the rollers, and heats it more than it otherwise would, if the rollers and driers were kept in separate rooms.

DISTRICT ASSOCIATIONS.

SHEVAROYS.

PROCEEDINGS of the Quarterly General Meeting held in the Victoria Rooms, Yercaud, on Monday, July 5th, 1897, at 1-30 P.M. Present:—Revs. J. M. Kempf, M. Andersen, Messrs. W. Rahm, C. Rahm, Junr., C. G. Lechler, S. Campbell, C. D. Ricketts, W. W. Hight, E. H. King-Harman, R. Foulkes, T. B. Nicholson, C. Sice, R. Gompertz (Chairman), H. W. Leeming (Hon. Sec.), and Mr. E. P. Lake, as a Visitor.

Notice calling the Meeting was taken as read.

Confirmation, or otherwise, of the Committee's Proceedings for the past Quarter.

Mr. C. G. Lechler [on a previous resolution on the subject] having wished the sense of the Meeting to be taken, in view of the proposed construction of the Bandy Ghaut Road, as to the advisability of erecting sheds at the foot of the Ghaut for the storage of manures, &c.; it was put to the Meeting and carried *nem. con.* "that the erection of these sheds was necessary."

The Meeting then "unanimously approved of the Committee's Proceedings for the past Quarter."

Suggestion by the Honorary Secretary that the Collector, the Executive Engineer, the Superintendent of Police and the Forest Officer, of the Salem District be invited to become Honorary Members of the Shevaroy Planters' Association.

This was carried unanimously.

Election of Delegates for the Annual Meeting of the U.P.A.S.I. Mr. C. G. Lechler and the Honorary Secretary [Mr. H. W. Leeming], ex-officio, were elected as delegates to represent this Association at the Annual Meeting of the U.P.A.S.I. to be held at Bangalore on Monday, August 9th, next, and following days.

Read Circular, dated 12th May, 1897, from the Secretary U. P. A. S. I. re Mr. J. A. Harris's suggestions for—

(i) A Scientific investigation into Leaf-Disease.

Proposed by Mr. H. W. Leeming.

Seconded by Mr. E. H. King-Harman.

"That this Association, whilst not approving of Mr. Harris's suggestion at present, would propose that the U.P.A.S.I. be requested to elect a Committee, composed of a certain number of Members from each District Association, in order to investigate leaf-disease in the various coffee Planting Districts of Southern India; and that steps for an investigation by a Scientific Expert should then be considered after the Committee has sent in its report."

Carried unanimously.

(ii) The Division of the U.P.A.S.I. Funds between the Tea and Coffee Interests.

Resolved "that Mr. Harris's Scheme, for the Division of Funds, has the support of this Association."

Mr. E. H. King-Harman having requested the Meeting to accept his resignation as a Member of Committee of this Association, Rev. M. Andersen was unanimously elected in his place.

Read Circulars, dated 28th May, 1897, and 9th June, 1897, from the Secretary, U. P. A. S. I., re—(i) Mr. H. G. PARSONS' Scheme for Individual Membership to the U. P. A. S. I. (ii) Mr. G. L. ACWORTH'S Scheme for raising funds for the U. P. A. S. I.

Resolved "that this Association, whilst not in favour of Mr. PARSONS' Scheme, approves of Mr. G. L. ACWORTH'S suggestion for raising funds for the U. P. A. S. I., which is, practically, that proposal of this Association on June 8th, 1896; yet, this Meeting giving Delegates a free hand in this matter at the Annual Meeting of the U. P. A. S. I. to be held on August 9th, 1897, and following days."

8. Read and recorded the following:—(i) Circular, dated 28th June, 1897, from the Secretary, U. P. A. S. I. re the N. Wynad District Board, (ii) Circular, dated 3rd July, 1897, from the Secretary, U. P. A. S. I. re Antwerp as a market for Indian Coffee. (iii) Letter No. 25th June, 1897, from the President, Salem District Board, re A. G. NICHOLSON'S complaint regarding delay in sanctioning a road. (iv) Letter No. 28th June, 1897, from the President, Salem District Board, re Mr. KING-HARMAN'S complaint against the Hospital Assistant at Yercaud.

With a vote of thanks to the Chair, the Meeting terminated.

ROBERT GOMPERTZ,

Chairman.

HERBERT W. LEEMING,

Honorary Secretary.

THE NILGIRIS.

THE following is taken from the *Madras Mail*, as being a considerably more detailed report than the official *résumé* published by the Association:—

At a meeting of the Nilgiri Planters' Association, held in Masonic Hall, Ootacamund, on Wednesday, the 21st instant, following members were present, namely: The Hon'ble Mr. P. Hodgson, Messrs. H. Wapshare, E. G. Windle, H. D. Wilbraham, W. O. Marden, Vans Agnew, Alexander, L. W. Gray, W. L. Eaton, W. Mullaly, J. H. Pascoe, H. Sheldrick, G. A. Marsden, W. Minchin, L. C. Liebenrood, G. Oakes, C. A. Martin, R. James, J. H. A. Tremenheere, J. Wapshare, F. P. Turpin, J. G. Finlay, A. G. Nicholson, and a few others.

A Committee Meeting had been held at "Lauriston" the previous day, and some of the Resolutions passed there were confirmed on this occasion, to which reference will be made in their appropriate places.

Mr. W. Mullaly was called to the chair, and proceeded to business at once.

I. The proceedings of the last meeting were taken as read, and confirmed by a show of hands.

II. The second subject before the meeting was the Report of the South India Planters' Enquiry Committee communicated to the U. P. A. S. I. and the Hon'ble Mr. Hodgson with G. O. No. 942 of 2nd July, which informed them that although there appeared to be no necessity to keep the Report itself confidential, the Government desired that the discussions upon it by the U. P. A. S. I. affiliated Associations should be conducted in Committee, rather than publicly at the Annual General Meetings. Accordingly, part of the Agenda was considered confidentially, and the remarks made by the various gentlemen who spoke on the subject are not reproduced. Two Resolutions, adopted at "Lauriston," were confirmed. These were:—(a) That this Association accepts with satisfaction the Report of the South India Planters' Enquiry Committee, except in respect to points which will be fully noticed in its communication to the U. P. A. S. I. with the reasons that induce it to propose amendments. (b) On the subject of the Coffee Sowing Act this Association proposes amendments which will similarly be set forth in its letter to the U. P. A. S. I.

III. Funds of the U. P. S. I. A.—A letter was read, dated 28th

giving Mr. H. G. Parsons' complete scheme for individual membership and also the Chairman's letter of the 2nd June containing the following proposals for placing the funds of the U. P. A. S. I. in a new and better position. (1) That the present method of assessing and voting be altogether abolished. (2) That an annual tax of one anna per acre in cultivation be levied on each Association. (3) That a vote shall be held for every Rs.10 so assessed. It is understood with regard to the above proposals that each Association can raise its assessment in any way it likes, that its assessment may include all future annual subscriptions proposed by members to the Reserve Fund; that no Association is bound to pay the full assessment, the only penalty for not doing so being a proportionate loss of votes, and that the yearly surplus of income over expenditure is to be paid over to the Reserve Fund out of which any excess of expenditure over income in any particular year will also be met.

The Hon'ble Mr. Hodgson spoke on this subject as follows:—

GENTLEMEN.—The question of U. P. A. S. I. funds comes up again before you this year, and next to the Enquiry Committee's Report, which has been discussed in Committee, this subject of funds for the United Association is the most important one before you. That the U. P. A. cannot work unless adequately supported by a regular and fixed income is an undoubted fact, and I believe I am right in proposing that every thinking planter in the country wishes to see it accomplished, the difficulty still being to arrive at a system of payment which will be fair and acceptable to all. Mr. Acworth, the Chairman of our U. P. A., has put forward a scheme which I will now lay before you for the information of those who have not already seen it. Its principles are:—(1) That the present method of subscribing and voting be altogether abolished. (2) That an annual tax of one anna per acre on cultivation be levied on each Association. (3) That a vote for every Rs.10 so raised shall be held. (4) That the rule relating to proxies shall hold good.

You will see that this scheme is based on an acreage assessment, and it is for you to consider if, in your opinion, this is a good and fair method of raising funds. Personally, I am against the principle of acreage assessment, and I said so last year at the U. P. A. meeting, when I remarked, "acreage and crop assessments have these two disadvantages, namely that you cannot enforce them, and that they tax the man of inferior financial position the same or more than they tax the man who is in a better financial position." My friend Mr. Acworth at the time held similar views, for he said, "You cannot enforce an assessment any more than you can a donation, and even if you could it is a far from equitable arrangement." Altered circumstances have undoubtedly, and probably with good reason, so far as his Association is concerned, led to my friend's change of view, but I see no reason to alter what I said then. Take for instance my first reason, viz.: "That you cannot enforce an acreage assessment," and apply it to our own Association. You will find that with a cultivated area of 31,000 acres only some 18,000 are represented by members of our Association, and even supposing that every member agreed to pay an acreage assessment, the figures would work out very unsatisfactorily compared to what might be expected from the acreage of our District. To illustrate the unfairness to the individual I would only mention Mr. Wapshare's case. Putting his cultivated area at 3,000 acres—I believe it is much more—could we ask him to pay an annual subscription of say Rs.187 per annum as against say Rs.12-8 to be paid by an owner of 100 acres of coffee, who would enjoy equal privileges and benefits from the Association? We held a Committee meeting yesterday, and we have been able to formulate a scheme for your consideration based on a principle for which we are indebted to Mr. Gray, and which seemed to us to be well worthy of consideration. The principles of the scheme are:—(1) fixed maximum and minimum annual subscription to be paid by each Association according to its means. The amount to be decided at the U. P. A.; (2) that every Rs.10 subscribed shall carry a vote; (3) that every Association shall be obliged to pay the sum agreed upon as its minimum subscription, but may subscribe up to a fixed maximum with increased voting power for every Rs.10 so subscribed; (4) that the rule relating to proxies shall hold good.

Thus, say we fix the annual subscription to be paid by this Association for the present at Rs.500 and other Associations in proportion, with the option of subscribing up to say a maximum of Rs.800 with

additional votes as before said, we shall have an income which the U.P.A. can rely upon, and it will be capable of expansion in case of necessity, by raising the annual subscriptions all round with the consent of the various Associations. In putting this scheme before you I would particularly wish to state that I do not think we should bind ourselves now to any absolute scheme. The final decision should, I think, be left to your delegates at the approaching meeting, for this reason, that if each Association sends its delegates there to vote for a scheme, we cannot expect to arrive at any conclusion whatever. I would ask you to give your delegates discretionary powers in this matter, they of course undertaking not to vote for any measure which has been distinctly vetoed by this Association. Thus they would not be able to vote for any scheme for raising funds of which individual membership formed a component part. I would ask you now to consider the scheme I have put before you and, if approved, to give your support in a Resolution, at the same time empowering your delegates to vote for any modification of it or amalgamation of other schemes that discussion at the U. P. A. meeting may show to be the most suitable and generally acceptable to the majority of Associations.

It was finally resolved by a majority to favour Mr. Gray's scheme, and to instruct the delegates of the Association to use their discretion in voting at Bangalore on the subject, but to bear in mind that this Association is opposed to the principle of individual membership, which is the feature of Mr. Parson's scheme.

IV. Powers of delegates to the U.P.A.S.I. meetings.

A letter was read by the Chairman requesting the Association to decide whether delegates shall be free to vote according to their convictions after hearing the arguments advanced, or whether their votes are to be given according to previous instructions independently of any fresh light which may be thrown upon the subject?

On this point Mr. Edmiston proposed and Mr. Wapshare seconded a resolution to grant discretionary power to delegates to vote as this Association would wish under all circumstances, which was unanimously carried.

V. *Registration of the U.P.A.S.I.*—A circular on the subject dated 22nd May from the Secretary, U.P.A., was read, showing that until registration under the Companies' Act was effected, the U.P.A. had no legal status, could not hold property and could not invest its funds. The Hon'ble Mr. Hodgson proposed and Mr. Rhodes James seconded a Resolution affirming that the U. P. A. should be registered as a Corporation. The Resolution was unanimously carried.

VI. A copy of the Address to the Queen-Empress and photos of the casket in which it was presented were handed round for the inspection and approval of the members.

VII. A letter from the Secretary of the U.P.A., dated 28th April, proposing a *general* and a *special* form of proxy for voting at the U.P.A. was read, and the forms adopted, with an interrogation, whether the general form would be legal, after the contemplated registration of the U.P.A.

VIII. A letter was read, dated 15th June, from the Chairman, U.P.A., regarding arrangements made with the Editor of *Planting Opinion* as to publication of proceedings, and recorded.

IX. On the *Scientific Investigation of leaf disease, &c.* Proposals from Mr. J. A. Harris, Honorary Secretary of the South Mysore Planters' Association, were read asking that the services of an expert be engaged for the purpose by the U.P.A.S.I., and also Mr. R. Buchanan's proposition to the same effect. These were considered with a letter from Government to the Hon'ble Mr. Hodgson, making certain suggestions with regard to *Lady Birds* and forwarding a report from the Government of Hawaii. It was agreed that leaf disease should be a subject of investigation by the U.P.A.S.I., and the Hon'ble Mr. Hodgson made a few remarks on the letter he received from Government. He said that the papers forwarded to him showed that the late Mr. M. Lawson had considered the subject of leaf disease, but found that enquiries in 1892 made by him in India had not advanced his knowledge beyond what he knew in 1873, or on the conclusions of Mr. Ward. Dr. Cunningham had stated that leaf disease could not be eradicated with even the abandonment of coffee. He (Mr. Hodgson) was personally in favour of proposing the employment of an expert. From his interview with Sir Arthur Havelock in September last, he was convinced that His Excellency would give support to any reasonable proposal. The speaker alluded to the reply of the Honolulu Government, and letter of Mr. Marsden, Commissioner of Agricultural and Forests of Hawaii. After reading

that communication, he said, he addressed the Board of Revenue guaranteeing to pay half the cost of the importation of insects inimical to those that prey upon vegetable products. After a second interview with His Excellency, he was able to say that Government was in favour of procuring two kinds of insects through the Australian Government. His Excellency had also promised to communicate with the Government of India regarding the employment of an entomologist. Such an expert should in his (Mr. Hodgson's) opinion be able to deal with all insect enemies, such as red spider and borer as well.

Mr. Rhodes James then proposed and Mr. Oakes seconded a Resolution expressing the satisfaction felt by the Association at the interest evinced by His Excellency and the Government in the subject, and in the prospect held out of procuring an expert. Mr. Oakes added that the scale bug was on the increase in the neighbourhood of his estate and that from the coffee it was extending into the jungle. The Resolution on being put to the vote was unanimously carried.

X. Mr. J. A. Harris proposed that the U. P. A. S. I. should allot a certain sum each year to the different interests represented by it, and for carrying out investigations and experiments. This proposal was recorded after the Honorary Secretary's observation that the U. P. A. was struggling to maintain itself, and could not just now afford to lock up funds in the manner suggested.

XI. Regarding the Famine Fund the Honorary Secretary reported that the subscriptions aggregated Rs. 1,512-8.

XII. Mr. A. G. Nicholson's proposal *re* adulteration of manures was then considered. This gentleman wanted Government to be asked to adopt the draft Act regulating the sale of manures in Ceylon as published in the *Tropical Agriculturist* for March 1897. The mover stated that the draft had been prepared by lawyers, and that it provided against adulteration by insisting on a warranty by the vendor and also for the services of an analyst. It applied, he said, equally to retail and wholesale transactions. He believed the Association needed assistance in this matter. It was suggested that a few cases only of adulteration would not suffice to send up to Government to induce it to legislate, but that a great number were required. After some further discussion, it was resolved that the delegates of the Association be asked to bring the subject before the ensuing meeting of U. P. A. S. I.

XIV. The Honorary Secretary made a report on the operations of the Famine Labour Committee, and in the course of his remarks said that a good business man had been sent to Cuddapah, but that he there met with great difficulty in carrying out his instructions. His last letter said that coolies had been despatched but they had not yet arrived on the Hills. The instructions given the agent were that his selection was to be from the ryot class, and that the people should be made to understand their travelling expenses would be debitable against advances made. The Railway Company had promised a reduction of 10 per cent. on fares in the case of gangs exceeding 60 in number. At Mettapolium he had arranged for the issue of cumbies.

Mr. Rhodes James said that in the case of importations of such labour into Travancore, the travelling expenses were not charged against advances.

XV. A letter from Veterinary Surgeon W. Robertson was read, stating his willingness to settle on the Hills and give his professional services to the planters, if he was adequately supported and guaranteed a monthly subscription. He had been informed, the Honorary Secretary said, that there was a paucity of live stock on estates, and that the Association could not guarantee employment or the necessary subscriptions. His letter was recorded.

XVI. Malarial Parasite G. O., dated 19th March 1897, was read postponing consideration of this subject.

XVII. Act XIII. of 1879. Satisfaction was expressed with the rulings of the High Court on this subject. A ruling on a case referred by the Collector of the Nilgiris suggested the moral to the planters, when filing cases under the Act, to include in their complaints both original and subsequent advances made.

XVIII. A circular from the U. P. A. S. I. was read asking that statistics of cultivation might be sent in with promptitude, and recorded.

XIX. A letter from the Consul-General at Antwerp, dated 28th April last, was read and recorded *re* Antwerp as a market for Indian Coffee.

With a vote of thanks to the Chairman, a long and interesting meeting came to an end.

THE "MADRAS STANDARD"

Published Twice Daily—Morning and Evening.

THE OLDEST, THE CHEAPEST & THE MOST POPULAR OF IN SOUTHERN INDIA.

Its chief features are:

A LONDON LETTER written weekly by a distinguished Member of Parliament.

Letters from Hyderabad, Mysore (and Bangalore), Travancore, Cochin, and Pudukota contributed by Correspondents well versed in the affairs of those States.

Letters from Far and Near } Political sketches and Caricatures
and } the leading men in Southern India
Telepathic Interviews.

Portrait Gallery—Lives of distinguished men in Southern India with their Portraits. Spicy Jottings on current topics. Amusing Notes, Stories and Sketches. News from various Mofussil Stations. Interesting Extracts.

1. *English Advertisements*: 4 as. per line, first 4 insertions, 2 as. per line, fifth and following insertions.

2. *Vernacular Advertisements*: Tamil and Telugu, 8 as. per each insertion; Hindustani, Canarese and Malayalam, 12 as. per each insertion.

III. CIRCULATION OF LEAFLETS:—

1. For each circulation locally and by post Rs. 25.

2. For each do. locally only " 15.

3. For each do. by post only " 15.

(This excludes extra postage where the weight of leaflets necessitates such.)

Advertisement charges are strictly payable in advance, except approved customers.

MARKET SUPPLEMENT.

SATURDAY, JULY 31, 1897.

COFFEE.

LONDON advices, dated 9th inst., state:—An exceedingly dull tone has prevailed and even the small supplies offered at auction have been more than sufficient for the demand. Ceylon Plantation was not much competed for and values tend downward. No East India was catalogued. The sortment generally offered no temptation to buyers, consisting chiefly of desirable qualities of Central American which only partly sold at very regular prices, but generally at a reduction of 2s. to 3s. per cwt. The united proportion of colory Costa Rica brought steady rates. There have been slight fluctuations in "futures," but the downward tendency has not been stopped; receipts of the new crop are fairly ample and estimates point to a good total; prices shew a further slight decline for the week.

Imports Deliveries and Stock of COFFEE in London are as follows:—

	STOCK.		IMPORTS.	
	1897.	1896.	1897.	1896.
West India.....tons	417	424	669	978

Total	197,000	147,000	143,000	104,000
Crop	—	8,680,000	5,489,000	6,699,000

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (July 9, 1897) says:—Since our last the market has been dull and depressed and Public Sales were held only on three days when moderate supplies were offered, consisting chiefly of Central American and Columbian of common to middling qualities, of which only part sold slowly at the further important decline of 1/- to 3/- per cwt. The few desirable and colory parcels offered realised steady rates.

No East India was catalogued.

Futures.—Heavy arrivals at the Brazilian parts exercised a depressing influence, and although there was a slight recovery on our monthly statistics coming out better than was expected, prices have since given way again and are now nearly the lowest ever known. The European stocks last month show a reduction of 190 tons and the World's Visible also a reduction of 10,860 tons.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending July 7th, 1897, says:—Bank rate 2 1/2%. Bombay Exchange closes at 1s 2 1/2d. Brazil Exchange 7 1/2d. Rupee paper 3 1/2% 62 1/2. Silver 27 1/2d. per oz.

This market continues flat, and only a small proportion of the supplies offered found buyers at a further decline of 2s to 3s per cwt., all ordinary and medium kinds being very difficult of sale, good middling and fine, however, have again been well competed for at about steady prices.

Brazil markets have been weak, and close steady at the decline. Good average Santos is now quoted at 34s c. & f.

Daily receipts have averaged 9,333 bags in Rio, and 15,666 bags in Santos.

Futures, after having been weak for the greater part of the period under review, close steady at a decline of 6d to 9d, viz.:—Good average Santos in Havre, September delivery, fcs. 43.50, in Hamburg pf. 35, and No. 7 low ordinary Rio in New York \$6.85.

To-day's London official quotations are:—

	July	Sept.	Dec.	March	May
Rio	32/6	33/-	33/6	—	—
SANTOS	34/9	35/3	35/9	36/3	36/9

	150,000	123,000	128,000

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated July 9th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	47,784 packages.	150,142 packages.	5,374 packages.
1896-1897...	40,004 „	149,951 „	7,575 „
18,511 pkgs. INDIAN	Total 53,872 packages were offered in public auction this week.		
33,751 „ CEYLON			
1,610 „ JAVA			

Indian. New Season's Teas are now arriving more plentifully. The quality on the whole appears scarcely up to the average; there were, however, some Teas with good character offered from "Darjeeling" and "Assam." The market showed considerable irregularity, good liquoring Teas continued in most demand and sold occasionally at somewhat better prices; poor Teas, however, were slightly easier. The official telegram from Calcutta gives exports to U. K. from the 1st April to the end of June as 9,945,000 lbs., against 11,400,000 lbs. for the corresponding period last season.

Week's av. of New Season's Tea sold on Garden Account, 1897, 11,780 pks., av. 4d. 1896, 7,844 pks., av. 8 1/2d.

Total sold on Garden Account 1st June to date 1897, 20,894 pks., av. 7 1/2d. 1896, 17,652 pks., av. 8 1/2d.

SUPPLEMENT TO "PLANTING OPINION."

Comparative prices of Indian Tea in London:—

		1897.	1896.	1895.	1894.
DUST.	(Fair ordinary, dark liquor)	3½d	4½d	4½d	3½d
FANNINGS.	(Red to brown, strong rough liquor)	4d	5d	4½d	4½d
BROKEN TEA.	(Brownish to blackish, strong liquor)	6½d	7½d	6½d	6d
PEK. SOUG.	(Blackish greyish, useful liquor).	6½d	8d	7½d	7½d
PEKOE.	(Greyish to blackish, some tip, useful liquor)	8½d	9d	8½d	9½d
PEK. SOUG.	(Blackish greyish, inferior liquor).	5d	5½d	5½d	5d
PEKOE.	(Blackish greyish, some tip, inferior liquor)	5½d	6½d	6½d	6d

Ceylon. The heavy auction met with good attention from the trade and passed without material change in quotations, good liquoring Teas attracting the most attention and selling occasionally at rather higher rates. Less desirable kinds, owing to current low prices, met with a steady market, although in large supply. The official wire from Colombo gives exports to U. K. for the month of June as 11 500,000 lbs., and estimates the quantity available for July as 9½ to 10 million lbs. Exports to

U. K. from the 1st January to the end of June are 54,400,000 lbs., ag 52,250,000 lbs. for the same period last season. Average for week agst. rather under 7½d last year.

Ceylon Tea sold on Garden Account 1st January to date 578,156 pkgs., av. 7½d. 1896, 532,247 pkgs., av. 8½d.

Comparative prices of Ceylon Tea in London:—

		1897.	1896.	1895.
PEKOE SOUG.	(Ordinary leaf; fair liquor)	6d	6d	6½d
PEKOE	(Ordinary leaf, little twist; fair liquor)	7d	7d	7½d
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	4½d	5d	5½d
PEKOE	(Somewhat bold leaf; indifferent liquor)	5½d	5½d	6d

Java. Teas brought forward were all of direct import and comprised a very varied selection, some of them being of very useful character, while others were of only poor quality. A Broken Orange Pekoe from "Dj. Nangor" realised 1/3½, and an Orange Pekoe 1/0½ per lb. The market unchanged, but competition was fairly general.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; and Quarterly, Five Rupees, including postage.

ADVERTISEMENTS.—Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

N.B.—Remittances should be sent to the Managing Proprietor of this paper, Coonoor, Nilgiris, South India.

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 13th August 1897.

Nellampathy, British. 5th August.—Rain for week, 5.84; to date, 66.22. *Health.*—Fair, a lot of fever and dysentery about. *Labour.*—Mopla's coming up again. Malaya's offering readily.

Central Travancore. 28th July.—*Weather.*—For the last fortnight we have been enjoying splendid weather; a burst of rain has however set in again. Rainfall July, to date 37.31. Total for year, 111.80. *Labour.*—Fairly plentiful, especially Malayalees, who are just now easily obtainable owing to dearness of rice, etc., in low country. *General Remarks.*—Roads are in a dreadful state, though there are, I believe, numbers of coolies at work on them; but putting on mud and stones at this time of year is not of much use, as it only makes the roads a veritable quagmire.

Coorg. POLLI BETTA, 3rd August.—*Weather.*—Week ending 31st ultimo, rainfall 5.50 inches. Heaviest falls on 27th, 28th and 30th, 2.00, 1.40, 1.20 inches respectively. No rain on 25th and 26th. Amounts on two remaining days small. Monsoon continuing light with intervals of sunshine. Excellent for planting. *Plant diseases.*—Parts bound to have a go of "leaf" a little later on. Rot to some extent about. Some destroying borer still being done. *Labour* and health much the same as reported last week. Bazaar prices are reaching famine rates. Gram, 10/- 100 seers, common rice 8-9 seers per rupee. Rice-eating coolies are beginning to feel this.

Kadur. MUDGERE, 28th July.—*Weather.*—Rain has been fairly heavy this week, but on the whole the total for July will be below the average. *Plant diseases.*—The general hope is that after a mild monsoon as this has been, that leaf-disease will not be severe. The enemy has already appeared on some estates, but we all trust it will not be as bad as last year. Black rot is bad in most estates, and is to be found in the open as well as under shade. *General Health.*—Fever is still prevalent and many more deaths than previous years. *Labour.*—Plentiful, and gangs may be had without ad-

vancing: of course those coolies that were advanced early in the year don't appear, having got their money. *Interesting Items.*—The last Committee Meeting before the U. P. A. at Bangalore is to be held on 29th at Chikkanhully. Billets are scarce, and there are men of many years' experience leaving the district owing to "reductions."

Nilgiris.

KIL-KOTAGIRI, 1st August.—Beautiful planting weather, all the estates are having the vacancies filled in. Six new clearings are in full swing; one estate has put out 40,000 already, and more are going out every day. Rain fell on Monday and it has rained fairly well since. Coolies are in force everywhere almost. *Crops.*—Rather short through the rain that fell in the early part of the season and stopped the spike coming on. *Grain.*—Dear, coolies are complaining. Ragi 16 to 17 measures, gram 16 measures. *Health.*—Fair, a little fever about.

SHOLUR, 4th August.—The monsoon has absolutely disappeared, there being neither wind nor rain. Total rainfall to end of July 27 inches 15 cents, temperature 71° and 62°. Price of grains very much above normal. Labour very plentiful; flushes unsatisfactory, but with present weather should come on during the month. On the whole the season has been unsatisfactory. I have just received a Davidson's "Sirocco" Tea Roller, and if simplicity guarantees efficiency, it should prove a great success.

GENERAL NOTES AND ARTICLES.

THE COORG RAILWAY.

(Communicated.)

THE Coorg Planters in their Annual Report, which appeared in *Planting Opinion* of 3rd July, do not omit to refer to the oft-talked of railway for their province. They seem, however, from what was stated, to be as far off getting it as ever; and it looks very like playing with the subject when it is stated that "the line most in favour with the Chief Commissioner, Mysore Durbar; Commissioner of Coorg and others is an extension of the Arsikere-Hassan line to Sidapur (Coorg)." Then the Coorg men add: "If this line be continued from Hassan *via* Yedatore to Mysore on the east and Ammatti-Sampaga Ghât to Mangalore on the west, it will meet our requirements." They wouldn't apparently object if it went round by Cape Comorin! A long railway journey seems to be looked upon as quite a pleasure!!

In the first place it seems difficult to understand the *raison d'être* for a line from Hassan to Sidapur. From Hassan to Yedatore and on to Mysore, the capital, is easily understood, but to take a railway into Coorg at Sidapur from Hassan, looks as if there was a screw loose in the whole business somewhere, nor do things improve once they get it to Sidapur, for they speak of the line taking some roundabout course so that it may reach Mangalore. After all these years, however, the Coorg men have evidently not quite made up their minds as to which point on the coast it should be carried, for they say "that probably," (only probably) "a more direct and better service for the province would be an extension from Tellicherry *via* Coorg to Mysore." This proposal they have to add, however, "does not receive the countenance and support of

those with whom the question to a great extent depends. Now as to the comparative merits of the two proposed routes from Coorg to the coast, one would have thought there could not possibly be two opinions.

It is evidently recognised by all that Sidapur is to be a particular point in Coorg from which the line will start. From thence to Ammatti the lines are one. Here they diverge, one to Veerajapett and on down the Perambra Ghât or some neighbouring alignment into North Malabar and thence on to Tellicherry. What route the other is to follow in going from Ammatti in the direction of Sampaga I do not know, but whatever trace be adopted, it must be a matter of 25 or 30 miles. Once it gets down there, it is some 65 or more miles to get to Mangalore, and that over I should say, not at all an easy country. But meantime let us keep simply to distance. From Ammatti to Tellicherry is about 55 miles. From Ammatti to Mangalore cannot be less than 90 or 95. In fact the one is not far from double that of the other. Here is an element in itself which would tell at once in favour of Tellicherry.

But of course distance might be compensated by a large volume of traffic in produce, goods and passengers. Now, one, I am sure, who knows the two lines of country would place the one against the other in this respect. Leaving the Ghât portions in both cases out of the account, as they would yield but little traffic, on the Tellicherry route you have the town of Veerajapett second only to Mercara and some scattered villages on towards the head of the Ghât. From the foot of the Ghât to Tellicherry the district is well populated, and in the Moplahs you have an active enterprising set of traders, while the Tiers are not much behind them. A railway would be eagerly taken advantage of by them to increase their trade with Coorg and the farth interior in fish, salt, cocoanuts and other articles of co produce along with cloths and general merchandise. On the other hand you have anything but a thickly populated country in the South Canara track, and a much inferior class of natives, unlike the Moplahs and Tiers in energy and enterprise as two races could be, and there is no description of produce that would contribute largely to traffic. I feel sure that any statistics the planters have collected must confirm this.

But as if this were not enough to put the Sampaga scheme out of the running, there is the terminus at the coast. Mangalore as a sea-port is completely closed for some five months of the year during the South-West Monsoon, and in all seasons its treacherous bar renders it an unsatisfactory shipping port. This cannot be said of Tellicherry.

As to the engineering work, the difficulties, I should think would be, mile for mile, quite as great on the Mangalore route as on the Tellicherry line, while the upkeep of a long stretch of railway traversing the Ghât and low country exposed for some months every year to the full force of rains and floods of the S. W. Monsoon would be costly.

CENTRAL HOTEL,

INFANTRY ROAD, BANGALORE.

(Under English Management.)

The most comfortable and convenient for visitors.

TERMS MODERATE.

the extreme. Every mile saved in distance, therefore, under such conditions gives the shorter line an immense advantage.

Who then would for a moment hesitate as to which was the route to adopt? When so completely outmatched by the Tellicherry line, how in the name of all that is reasonable can the Chief Commissioner, the Mysore Durbar and the Commissioner of Coorg favour the Mangalore scheme? It is to be feared that if the views of these parties are what the planters state them to be, they cannot surely have had both schemes properly before them, or the most important elements must have been lost sight of.

But the fact is the Coorg Province labours under a serious disadvantage in this, and in other matters, in being under the far-off Bengal Government, and in having such an ephemeral set of Chief Commissioners to manage it. The continual changes that have taken place in the holders of this appointment tells greatly against Coorg. None of them can possibly have time, considering their other important duties as Resident of Mysore, to acquire anything like an intimate knowledge of the affairs of the province, and, besides, their interest is probably weakened by the prospect most of them have that their stay will only be temporary.

I fancy the Mysore Durbar is too much occupied with its own particular railway projects to give sufficient attention to that of Coorg. At the same time the Tellicherry line is one from which great benefits to Mysore would accrue. It would place the capital and many of the neighbouring districts within easy reach of the coast and provide a convenient outlet for much of their produce while affording the means of obtaining supplies both European and local. The town of Mysore and district lying in near proximity are about 300 and more miles by railway from Madras, their nearest port. The Tellicherry-Coorg line would bring them within 110 or 120 miles, some of the western districts 75 to 90, of the seaboard.

But confining the scheme meantime to Coorg, if a road be made to connect Santacooa and North Coorg with Sidapur, it will bring these districts 15 or 20 miles nearer a shipping port than they have been. They have generally sent their produce to Mangalore, 90 and more miles distant. By the Sidapur route Santacooa would only be about 75 miles from Tellicherry and districts lying north proportionately nearer. The road from Santacooa to Sidapur is one that should have been made long ago, but as the engineer of the province once remarked when it was mentioned by an outsider, "but the planters have never suggested it." I see it is now amongst the list of roads they wish undertaken. The Tellicherry line, therefore, has overwhelming advantages for Coorg.

The Coorg men, too, have only to remember that the Arsekere-Mangalore scheme, so far favoured by the Government that it went to the expense of a survey, has been abandoned. This new line to Mangalore *via* Sampaji I should say is a much worse one, and if the Government do go the length of a survey, which I much doubt, it will be quite as readily abandoned.

Let the Coorg planters work up the details of the Tellicherry scheme and make it clear to those "with whom the question to a great extent depends" that it has great and indisputable advantages over the other scheme, advan-

tages not only to Coorg but to a large area of country in the Mysore province.

STEAM.

The Anamalais.

With reference to the 80 square miles or 50,000 acres open for election by planters in this district, Mr. E. G. Windle, Hon. Secy., Nilgiri P. A., writes some interesting notes from Kotagiri on the 30th ultimo to the *Madras Mail*. Stating that he is the only one of the original applicants who has begun to open out in the district, he claims some little authority in stating that the area of land really suitable for tea or coffee is far under the gross 50,000 acres. He advises the utmost care in its selection. Health is very good, and fever practically absent from February to June. Climate remarkably even. Wind, on *well-selected land*, is absent, though a great deal of the 80 miles is wind-blown. Rainfall probably a little under 100 inches, heaviest in June and July, but with probably a good N. E. This year the fall from February to June was 11.18 inches, but this is probably abnormal. Felling is expensive, as the jungle is so heavy. Soil, sandy loam of great depth, with perfect drainage. Labour all imported. At the close of his letter he reiterates his warning as to the careful selection of land, as injudicious openings may do great harm to the name of the district.

COMMERCIAL NOTES.

THE report of the Nahor Rani Tea Company for the year ended December 31st states that owing to the unfavourable weather the outturn, especially of the Nahor Rani division, fell short of expectations, but the quality was fairly well maintained. With the exception of some invoices of "dust" disposed of in Calcutta, the teas were, as usual, sold on the London market, and in spite of depression realised an average of 10½d. per lb., which may be considered satisfactory. The result of the season's working, after deduction of the manager's commission, is a profit of £3,918. After paying on December 31st last the interim dividends, at the rate of 5 per cent. per annum for the half-year on the preference shares and 2½ per cent. on the ordinary shares, the Directors suggest declaring final dividends of 2½ per cent. on the preference shares and 7½ per cent. on the ordinary shares. Since the last report he area under cultivation has been increased by 80 acres, planted out with seedlings last year and 150 acres planted out with seed at stake last cold weather. Further clearances are being made, and it is hoped that other 138 acres will be planted out before the end of this year, bringing the total area under tea up to about 1,400 acres. The severe earthquake of the 12th ult. has done some damage to the buildings, but the Directors do not anticipate the season's working will be seriously interrupted, though there may be a considerable extra expenditure entailed in replacing and repairing these buildings. The crop for the current season is estimated by the managers at 480,000lbs.

THE report of the Singlo Tea Company, Limited, for the year ended 31st December last, states that the following shows the outturn of tea and the average gross price per pound for each division:—Singlo, outturn in lbs. 907,002, average gross price 9.33d.; Jaboka, outturn in lbs. 400,064,

average gross price 9.61d.; Kistna, outturn in lbs. 328,158, average gross price 7.97d. The Directors fully anticipated favourable results from the working of the year 1896. They attribute the failure to achieve the expected success to a want of system, and a mismanagement which resulted in a great excess of expenditure over the sanctioned estimate. The Directors have taken special measures to remedy this, and they consider the present year's prospects good. The late earthquake has not injured the properties of this Company. The board recommend, after providing for the preference dividend of $6\frac{1}{2}$ per cent., a declaration of a dividend for the year of 5 per cent. on the ordinary shares.

THE London correspondent of the *Madras Mail* sends the following interesting news:—

An important Company is being formed, under the auspices of Messrs. Arbuthnot Latham and Co., and will be entitled the Nilgiri Plantation Company, for the acquisition, carrying on, and development of the Runnymede tea and coffee, Adderley coffee, Colacumbie coffee, Glenburnie tea and coffee, Arcood coffee, Rookery coffee, Mullapore coffee, and Glendale tea estates on the Nilgiris; the Porthoondoo, Sherenilly and Nadgani coffee estates on the Neliampathies; and the Pillavelley coffee estates on the Pulneys. The total area of these estates is 3,339 acres, of which 1,870 acres are planted; and the yield in 1897-98 is estimated at 350 tons of coffee, and 95,000lbs. of tea. Assuming that the yield of coffee will be only 300 tons, then the revenue from this source will, it is believed, be about £10,811, and the 95,000lbs. of tea are expected to realise (at 12 annas per pound, local price,) £12,117. Deducting £600 for expenses in London, there should remain a net revenue of £11,517. The proposed share capital is £150,000, divided into 7,500 cumulative 7 per cent. preference shares of £10 each, and the same number of ordinary shares of the like valuation; but the present issue will be only 4,500 of each class of shares. Power is also taken to raise 350 first mortgage 5 per cent. debentures of £100 each, the whole of which are now offered. The £11,517 will suffice, therefore, to pay the 7 per cent. interest on the 4,500 preference shares, 5 per cent. interest on the debentures, and leave £6,517 for dividend on the ordinary shares and for reserve. The ordinary shares are not to receive a greater dividend than 10 per cent. until a reserve fund of £10,000 has been accumulated. The vendors are mostly members of the Stanes family, who have done so much in the last thirty years to develop the resources of the Nilgiris; and the general management of the Company's business in India will be conducted for five years by Mr. A. E. Ramsay and Mr. J. Stanes, who agree to retain for that time £20,000 out of their shares in the Company. No account is taken of the raw leaf on Runnymede and Glenburnie, which is sold and manufactured at Glendale, and is estimated at 50,000lbs. for the current year, equal to 12,500lbs. of made tea; nor are 150 to 200 acres of young coffee, coming into bearing on different estates, included. The value of the coffee estates is estimated, on the authority of Mr. A. N. Groves, of Coonoor, at £108,000, or about £60 per acre; and the price of the Glendale estate is valued by Mr. W. L. Edmiston, of Kotagiri at £9,000, but the vendors refused to accept less than £10,000 for it, and the Directors have agreed to pay the larger sum as they have been informed by Mr. R. Stanes that the average net profits for the years 1895 and 1896 were equal to 14 per cent. on this price, although the estate is not yet in full bearing. The crop of tea is nearly all sold in India, and a large local connection has been worked up at very remunerative prices. The properties are to be taken over as from the end of last March. Mr. L. Gough Arbuthnot, of Messrs. Arbuthnot Latham and Co., is the Chairman; and Mr. E. L. Marshall and Mr. J. B. Keith (Chairman of the Anamalai Coffee Company) are the Directors in London.

LETTERS TO THE EDITOR.

NOTICE TO CORRESPONDENTS.

["MIDDLE VIEW'S" letter declined with thanks. He refuses to withdraw his statements *re* the sobriety of his fellow-planters, but would substitute the words "a number" for "the majority." We should say it would have been more graceful and true of him to have changed the word into *minority*.]

NITRATE OF SODA.

DEAR SIR,—Can you or any of your readers inform me the results of "Nitrate of Soda" in helping on young supply, especially in a new clearing? and the safest dose per plant, 8 to 9 months' old after date of germination.

THAIRBIDDY ESTATE,
SANTAVERI, BERUR, S. M. RY.,
2nd August, 1897.

Yours faithfully,

SAM J. WILSON

SOME MISSIONARIES.

DEAR SIR,—It would be only just to record that there are Missionaries and Missionaries. There are men of the type Schwartz, of Travancore, whose name yet lives amongst natives of that district.

The Government of Madras had to fall back upon a man Schwartz as their ambassador to the ferocious Tippoo, who notified the Government that he would kill any European who dared to show his face. When informed that Schwartz would not, Tippoo replied, "That is a man of God, he may come when he pleases."

Schwartz was never seen in a suit of clothes that cost more than 8 rupees, and he lived on the simplest diet without falling into any of the absurdities of the Salvation Army.

Such a man was the late Bowen, of Bombay.

Yours faithfully,

ONE WHO KNOWS

COST OF LIVING ON PLANTATIONS.

SIR,—I exceedingly regret having so deeply offended your correspondent "Ad Rem," but surely such an old hand as I seems to be, should know that abuse is no argument. I thought neither "On the Cheap" nor myself pretended that living cheaply was exactly enjoyable, we merely pointed out how it might be, and has been, done. Absurd stress has been laid on my omission of the dhoby's charges. He costs me exactly four rupees for three washes a month, as from long experience I have found that to insist on the weekly wash is to attempt the impossible. Instead of that, I merely have to lay in a large stock of clothes. Not out of the 50 rupees a month, mind you, for I distinctly stated that clothes weren't to be got out of this sum at all. My bill of fare runs somewhat as follows, and may interest your indignant correspondent to know the composition of the "last straw":—

Chota Haziri.—Porridge, a chop or steak, bread and butter, and jam (home-made), and tea or coffee.

Breakfast.—Risssoles, or chop, or joint. Curry and rice. Bread and butter and cheese.

Tiffin or tea.—Bread and butter, jam and cake, also cold meat if joint is on cut.

Dinner.—Soup, joint or made-dish, curry and rice and bread and butter and cheese or plain pudding.

As for drinks, an occasional peg.

My bazaar bill now costs me (for meat, rice, fruit, groceries) Rs.3-8, or say Rs.16 per month. Soap, butter, jam, bread, or coffee, milk, &c., Rs.10 per month. Liquor and smoking Rs.15. Dhoby, Rs.4. Boy, Rs.15. Total, Rs.60. Add, Rs.15, estate clothes and boots, you arrive at my Rs.75 per month, which I estimated would keep a young planter very comfortably. Personally, I think that Rs.100 is the lowest I should offer a European of over 18 months' experience in planting. But as a beginning, Rs.75 should not be sneezed at, especially if yearly additions are promised—if work is satisfactory—of Rs.25 per mensem.

By the way, a "Planter's Wife" gave us some excellent directions some time back how a young planter should be enabled to keep a respectable and comfortable house on Rs.100 a month or so. While Rs.100 is better than Rs.75, and Rs.

han Rs.50, no man need starve or even stint himself if he has Rs.50 a month to his name.

EX-CREEPER.

PLANTERS AND HEMELEIA VASTATRIX.

SIR,—You may be surprised that I—Hemeleia Vastatrix—should write, but my excuse is that I am so delighted at seeing there is great want of unanimity among the Planting Community as to any measures being necessary for my suppression. The correspondence in reference to short crops in recent issues of *P. O.* has been very interesting to me, especially as I see different causes assigned; but to whatever cause the short crops are attributed, I can safely lay claim to a very fair share of the damage: the funny way I have had lately of attacking coffee late in the season, after deluding coffee planters into the belief that they were going to escape, has been extraordinarily successful, even more so than when I went for coffee early, as then the trees had some time to recover before blossoming. Late leaf disease is, I find, far more effectual than the somewhat crude method I adopted previously of attacking coffee earlier. When I saw in *P. O.* that the N. Mysore P. A., I think it was, proposed taking measures to secure the employment of an expert to investigate my cause, and to compass my destruction, I was considerably alarmed, as I was afraid that an unanimous appeal from the Planters to the Madras Government would have led to their joint co-operation, modern science would have soon cut short my career; but now I am no longer frightened, as I see the Wynad P. A. has pronounced an enquiry futile, and the Central Travancore P. A. says it is no use, as an enquiry took place in Ceylon some twenty years ago. I can't tell how delighted I am, Mr. Editor, at this helpless and hopeless attitude assumed by these Associations; it is such a striking tribute to my success, and recognition that I have completely knocked them out of time; but I hardly expected them to throw up the sponge in the way they have done. I used to hear it was a proud boast of Englishmen that they never knew when they were beaten, and many battles had been won through this virtue of keeping on pegging away; but apparently I have in some cases to deal with a degenerate race. The reason assigned by the Central Travancore P. A. is, to my mind, most extraordinary, namely, that an enquiry had been held in Ceylon years ago. One might imagine from that that the high-water mark of science had been reached at that remote epoch, and that from that date scientific discoveries had been *nil*. What amount of weight ought to be attached to a decision of the Central Travancore P. A. in reference to a matter of vital interest to the Coffee Industry of S. India can no doubt be calculated by your readers to a nicety. An investigation was made twenty years ago with a view of improving me off the face of creation, and the attempt failed, therefore a modern investigation is no use! It is really too comical and you must excuse my mirth, Mr. Editor—when I think of the enormous strides science of every description has made since I baffled investigation. Take the case of agriculture alone. Twenty years ago the soil itself was only considered a mass of dead matter, a chemical and mechanical mixture; no one even dreamt that each inch of soil was tenanted by millions of microbes; the action of legumes was unexplained, and I could go on enumerating many other beneficial discoveries, only it is sheer waste of time to devote either time or space to refute the ludicrous statement that finality was reached in scientific research twenty years ago; but I may warn all Indian coffee planters that if they don't discover some cure for my ravages I shall go on fulfilling my mission of damage and destruction. I need hardly tell you that I have my antidote, but I must leave it to human ingenuity to discover. Where are the crops of the good old days, got without any cultivation? Gone! and gone for ever; until an end is put to my existence. Your readers may think it strange that I should advocate an attempt to get rid of me; but when I think of the thousands and thousands of acres I have ruined,

the millions of happy lives blighted, homes broken up, hopes shattered, fortunes wrecked, the misery and destitution I have caused, it makes me repent and wish that some means could be found to extinguish me; but until that is done, I shall go on fulfilling my destiny of ravaging coffee while there is any coffee left for me to ravage. The apathy of planters is surprising, and I regret that I should be regarded as invincible. The remedy is in the planters' own hands. Act unitedly, and doubtless the sympathetic Madras Government will not be appealed to in vain. The employment of a modern scientist may or may not lead to my decease; if it does, the twentieth century would be the beginning of such an enterprise as would bring in fortunes to the planters, and an enormous revenue to Government. If unsuccessful I should, in addressing the coffee planters of India, still be able to subscribe myself then, as I do now,

Yours devotedly,
Till Death,
H. VASTATRIX.

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contain per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.65	"	Phosphoric Acid.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE.

COFFEE.

A Leaf-disease Fund.

To some over-frugal minds and penny wise philosophers, it seems a terrible thing to provide funds sufficient to defray the cost of a scientific investigation into our plant diseases. But, as a correspondent points out, over 60,000 rupees might be obtained yearly by asking Government to levy the insignificant tax of 4 annas per cwt. of coffee exported from India. Divide the sum by 4 and still more than enough remains to cover all possible expenses to be incurred. The idea of the tax may strike our readers as something disagreeably novel and without precedent, but we have only to turn to Ceylon for an instance where the same principle is being carried out with conspicuous success with regard to tea, *i.e.*, the American tea fund.

The stake played for is so huge that it passes ordinary comprehension to understand the apathy of the planting community in relation to the extirpation of *Hemeleia vastatrix*. To save themselves a couple of annas or so per cent., will they lose the chance of making South India as prolific a coffee-country as Brazil, which, without leaf-disease, it would undoubtedly be? Such indifference is almost incredible.

The Market.

Contrary to expectations, the stocks on the 1st ultimo, says the *P. M.*, *Review* of 10th July, show a reduction in all parts when compared with a month ago. The European visible supply is only some 650 tons less, but in the United States there is a reduction of 8,090 tons, while in the whole world it is put at 10,860 tons. Taking into consideration the heavy receipts that have been taking place at the Brazilian ports, this would suggest a very decided increase in consumption, notably, as was pointed out last week, in the United States.

The publication of these figures at first produced an advance in the terminal markets, but the heavy daily receipts have since had a depressing effect and quotations have again receded to about the rates of a week ago, although the market in Santos has advanced about 1s. 6d. per cent. At the auctions there has been a very poor supply, and of that only part was sold, the lower grades showing a slight reduction, but all good coloury parcels fetched good values. Fine house trade sorts are very scarce, and good Costa Rica and East India have been re-sold privately at about 2s. to 3s. advance from the recent auctions.

Java and leguminous shade.

In sending us the following cutting, a correspondent remarks: "The enclosed cutting from the *Madras Mail*, culled some three or four years back, may be of instruction to those of your readers who are interested in a discussion on this subject. Planting in Java is proved in this article, by published statistics, to be a very profitable undertaking, owing to the heavy yields of crops. May not the fact of "All the coffee is grown under *dadap shade*," have something to do with it? Perhaps Mr. B. Nelson will be able to supply us with further particulars.

"ONE INTERESTED."

PLANTING IN JAVA.

Soerabaya is a "slummy"-looking place—narrow streets—lots of mud and the roads rutty and bumpy enough to shake the liver out of one! To the stranger passing along the streets two things are especially noticeable; first, the marked absence of Chinese (happy Soerabaya!) and secondly, the happy, contented, and intelligent look of the natives of the place—from a cursory glance I should say a much superior type to the Javanese we get in the Straits. In Soerabaya I was given some coffee figures which fairly took my breath away. I have more to collect and will give the whole lot together. At present I am *currente calamo* and *currente jalana*! The country appears to be very thickly populated, the markets that we passed being crowded with women buying and selling; in some cases I should say there were over 2,000 present in one market. It is a quaint sight to see them riding along sitting astride their ponies, with a big pannier hung on either side. To show how these Javanese drivers rattle their ponies down hill, I give the following:—From Prorong to Prigin took us three hours. The return journey was done in one hour and twenty minutes! The steep portion of the ascent was done in one hour and three quarters, with much whip-thong and bad language. The same on our return was done smiling in twenty-three minutes. Before I forget it the etiquette of calling in Soerabaya seems curious. The correct hour is from 7 to 8 p.m. and you have to give notice if you intend to visit for fear of finding the ladies in sarong and kabaya. This last was told me in a whisper, so please print accordingly.

The coffee in East Java is wonderful. As in other countries, there are failures; but the successes are marvellous beyond description. All the coffee is grown under *dadap shade*; and, where the soil has any inclination to stiffness, it is constantly worked up with *changkol*. The young coffee is very forward; but perhaps figures of actual results will be more interesting than the most glowing descriptions of appearance. One estate that I went over gives the

following returns:—Total area 450 bouws. Age of coffee 12 years to 2½ years old. All expenses, including the cost of the young coffee not yet in bearing, are paid: and the coffee has further given a clear profit of two hundred and fifty thousand rupees over and above the capital invested. Ye gods and little fishes! Let us hope that the Malay Peninsula may erupt heavily. The old saying "It's money that makes the mare to go." I am sure that volcanic action that makes the coffee to grow. I am more or less sensitive about being called an Ananias; so I give the following figures taken from a Dutch Directory. The results are extraordinary, but I simply tell the tale as it was told to me. The appended table will, I am sure, be of interest to many a planter:—

TABLE OF RESULTS FROM SEVEN COFFEE ESTATES IN EAST JAVA.

Estate.	Elevation. ft.	Bouws.	Crop in Pikuls.					
			1884	1885	1886	1887	1888	1889
Limburg ...	1,200	600	1705	500	2041	5342	6160	5700
Ayer Dingin ...	3,500	503	3200	3300	5280	3913	4657	3145
Pangadjaram ...	2,500	462	2160	2230	4500	1964	7970	5550
Minjin ...	3,000	500	1600	3108	4150	1656	5620	532
Monorarie ...	3,500	650	3900	4300	1500	3600	2430	2200
Karang Nongko ...	800	316	...	3800	6000	2400	5000	4000
Kati Manis ...	2000	550	6000	3350	6000	1600	8000	3100

Let any practical planter work out these figures, and he will find a very healthy average at the end of them. The estimate for Limburg this year is 11,000 piculs; and there is every reason to expect that it will be realised. I have seen no poor soil. All is very rich, and of volcanic formation. The strongest complaint that I heard was that there was too much ash in it. Considering that analysis of the coffee bean shows over 30 per cent. of potash, it must be indeed abundant to be a sense of complaint! The hospitality of East Java is unbounded. Horses, carriages—everything in fact—are put at your disposal, and the merest stranger treated as visitors right royally. Another man and myself went to an estate the manager of which was unknown to us. We introduced ourselves and asked to be allowed to see his coffee. He took us over the whole himself, and then, after liquoring us up and asking us to smoke up a cigar (seegar obstaken), he insisted on lending us his carriage to go on with, as we should find it inconveniently hot to go riding.

The Java system of cultivation is thus: they work the soil, the bush. But little is done to the bushes after topping, except taking off the suckers: but the soil is kept constantly worked and open. Very little manuring is done: in fact one planter said to me: "If my coffee needed manure I should abandon it at once." I went over one estate that had just given ten piculs per bouw. The coffee looked well and in good heart, and able to be the same next year. Bawean is in regular communication with Java, and is only 8 or 10 hours' steam from Soerabaya.

The climate of the hills is delightful: cool and bracing: and I think that, if Singaporeans realised that such a delightful little sanatorium as Prigin could be reached at such a cheap cost, many would avail themselves of it. I also heard much of a sanatorium at Tosari, 6,000 ft. elevation, but had no time to sample it myself. The country swarms with game. A few days ago a planter shot three tigers three nights running. You can scarcely go a hundred yards without finding pigtrack; and there is other game in abundance. I have omitted one thing which struck me especially, and that was the extraordinary readiness of the Javanese to give you their figures. If you say, "By Jove! that sounds healthy," the reply is "Well, here you are; you can copy the figures if you like," and out come the books. One man was so kind as to have accounts, which were in Dutch, copied out in English for me. During my trip I came in contact with Scotch, English, Dutch and German; and upon my word it is hard to say which showed the greatest kindness to a stranger in a strange land. Before I close these jottings I must sound a note of warning. Let no aspiring young planter wishing to better himself, or out of a berth, say to himself, "Here is a paradise for a coffee planter, I will go and for a billet." Unless a man knows the Dutch language and customs, and at least one dialect of Javanese, he will have to begin at the bottom of the ladder on a salary of something like sixty rupees a month. Preference is also given to a man who has lived for a time either in Holland itself, or in Netherlands Indies. The etiquette in Du

Officialdom is somewhat complex: and a planter is frequently brought into contact with the officials, both in regard to his land and other taxes, his labour, and in many cases his water-supply. These dealings require much tact and "a deal o' salutin'."—*Singapore Free Press.*

TEA.

The Tea Duty. The chances of the Tea-duty being reduced in the near future seem, according to some optimists, considerably better than they were a short time ago, though we may confess that it will be found extremely difficult to make good the four millions odd to be sacrificed.

The London Market. INDIAN TEAS.—Says the *P. M. Review* of 10th ultimo:—The market has been more liberally supplied, and Wednesday's sale was the largest held during the present season. Over 8,000 packages were offered, consisting chiefly of new Teas, only about 3,200 being of last season's import. The large supply presented a varied and representative assortment, but, owing to the poor quality, most grades were dull of sale, and prices were somewhat easier. Good liquoring Pekoes, and Pekoe Souchongs from the Assam districts, were in demand, and the few desirable Teas met with active competition. Later a better selection of all descriptions may be looked for, as it is early in the season to expect attractive liquoring kinds with sufficient strength and quality. Common and Medium Broken Pekoes went off flatly at irregular and easier rates, the Teas on offer being poor in character. To ensure a demand from the trade generally for these grades, it is absolutely necessary that the leaf should not be too small, of good appearance and with thickness in cup, and until this is the case they will not go freely into consumption. Fine to finest Teas, both leaf and broken, including some tippy parcels from the Doom Dooma estates, were in strong demand, stocks of these kinds in dealers' hands being particularly low. Darjeelings were difficult to sell, the majority lacking the characteristic flavour so desirable in these grades. The following figures for the six months ending June will be of interest compared with the same period last year: Imports, 33,753,000 lbs.; Home Consumption, 62,517,000 lbs.; Exports, 2,731,000 lbs., as against 28,162,000, 61,598,000 and 1,681,000 lbs. respectively. Of the 18,000 packages offered at auction about 15,000 were sold.

CEYLON TEAS.—The quantity catalogued this work has again been large, but, contrary to expectations, the demand was fully equal to the supply, and previous prices were well maintained. Competition was good throughout the sales, and a desire to buy at the present rates was exhibited generally, as a strong feeling prevails that the lowest point in this market has now been reached. The medium and lower grades of both Whole and Broken Leaf continue to show exceptionally good value, and as it is more than probable that higher prices will shortly have to be paid for them, the present low range should stimulate the demand from the country, and a larger business in the immediate future seems likely. At the public sales 33,750 packages were offered, of which about 2,100 were withdrawn.

CONGOU TEAS.—The market continues extremely quiet, there being very little demand except for a few special descriptions. At auction a rather larger assortment was offered.

DISTRICT ASSOCIATIONS.

NELLIAMPATHY.

PROCEEDINGS of a General Meeting held at Valavachen Bungalow on Monday, July 19th, 1897. **PRESENT:** Messrs. A. Barnes, F. Everington, H. de C. Denny, R. D. Fenton, W. A. Gilbert, A. C. Griffin, F. Jones, E. Jones, M. H. M. Lamb, W. Morres, P. W. E. Watts, G. Welchman and J. C. Abbott, *Hon. Secretary.* Mr A. C. Griffin in the Chair.

Association Accounts.—For the past year were submitted by the Honorary Secretary and passed.

Hon. Secretary.—Mr. Abbott was re-elected, and a vote of thanks for his services during the past year was carried unanimously.

Bangalore Meeting.—Messrs. J. C. Abbott and P. W. E. Watts were elected as delegates, and the sum of Rs.150 each voted for their expenses.

Coffee Outturns.—Some discussion took place about these, from which it appeared that the outturns from estates using special bags were decidedly better than from those using ordinary bags.

Hospital.—The Honorary Secretary was requested to send round a circular to ascertain what members would be prepared to subscribe on an acreage assessment, towards the Rs.200 a month required by the Cochin Government, as a contribution to the maintenance of the proposed hospital.

Planting Opinion.—Resolved that this Association approves of the U. P. A. S. I. circulars being published in *Planting Opinion*, and thinks that members should support this paper.

U. P. A. S. I.—Read letters from the Secretary with reference to—The Report of the Committee of Enquiry, Statistics, Scientific Investigation, *Planting Opinion*, Address to Queen-Empress, and the Annual Meeting.

Statistics.—The Honorary Secretary stated that statistics for this district had been forwarded.

Rates of Pay.—Mr. Fenton drew attention to the rates of pay on some estates in this district, and after some discussion it was resolved, "that the usual rates and allowances should be adhered to, but in the event of any deviation from these rates in special cases, notice should be at once given to the Association."

Meetings.—The Honorary Secretary stated that as the number of members of this Association had considerably increased lately, it was no longer convenient to hold meetings at private bungalows. Resolved, "that a suitable building be put up at the expense of the Association. The amount required to be raised by an acreage assessment."

A vote of thanks to the Chair terminated the proceedings.

(Signed) A. C. GRIFFIN, *Chairman.*

(") J. C. ABBOTT, *Hon. Secretary.*

SHEVAROYS.

PROCEEDINGS of a Special Committee Meeting of the Shevaroy Planters' Association, held in the Victoria Rooms, Yercaud, on Monday, July 19th, 1897, at 1 P.M. **PRESENT:** Messrs. C. Rahm (Jun.), C. G. Lechler, R. Gompertz, (*Chairman*), J. C. Large, Revs. J. M. Kempf, M. Anderson, and Mr. H. W. Leeming (*Honorary Secretary*).

1. Notice calling the Meeting was taken as read.

2. Read Letter No. ⁸⁸⁷/_{B & S}, dated 5th July, 1897, from the Collector of the District, Salem, re the proposal to charge a commission on Currency Notes presented for encashment at the Yercaud Sub-Treasury.

Mr. R. Gompertz's reply to the above having been read, it was unanimously resolved:—

"That the Honorary Secretary be requested to forward a copy of Mr. Gompertz's letter to the Collector as representing the views of this Association. Further, that the Honorary Secretary be instructed to read the above correspondence at the Annual Meeting of the U.P.A.S.I. on August 9th next and following days; and that the Secretary be asked to place this subject on the Agenda Paper."

3. Consideration of the South of India Labour Commission Enquiry.

Mr. R. Gompertz having read a letter on this subject, it was unanimously resolved:—

"That Mr. C. G. Lechler be requested to read this letter at the

Annual Meeting of the U.P.A.S.I. on August 9th next and following days, as it expresses the views of the Association on this matter."

With a vote of thanks to the Chair, the Meeting terminated.

(Signed) ROBERT GOMPERTZ, *Chairman*.

(") HERBERT W. LEEMING, *Hon. Secretary*.

NORTH MYSORE NATIVE.

At the Annual General Meeting of the North Mysore Native Planters' Association, held at the Chickmagalur Club on the 26th May 1897. PRESENT: Messrs. C. Veeratha Gowda, (*President in the Chair*), C. Srinivasa Rao, V. Arnagiri Naik, T. Poopannashetty, M. Jagganath Rao, T. Ragavendrappa, G. Abdulkader Sahib, S. N. Chokanna, S. Raja Rao, M. Ganesha Rao, G. Abdul Kalik Sahib, W. Shama Rao, C. Jeffer Sahib, C. Ramaswami Iyengar, and C. Vasdeva Rao, (*Secretary*).

After the notice calling the Meeting was read, the Honorary Secretary read his report as follows:—

GENTLEMEN,—I have much pleasure in laying before you the Annual Report and accounts for the current year.

Subscriptions.—You will see that after paying our subscription to the U.P.A.S.I. for this year, we have a balance of Rs.95-10-0 to our credit for the coming year. I must again draw the attention of those members who have not paid up their subscriptions, to do so at once, as we are put to great inconvenience by not having paid our subscriptions to the U.P.A.S.I., and the Secretary has more than once sent in reminders to us. As I must send a remittance in full to the Secretary of the U.P.A.S.I. before the 15th June, I trust members will all pay up sharp to enable me to do so.

Last year we paid Rs.150, but it was found necessary to raise all subscriptions by 50 % so we have this year to pay Rs.225.

United Planters' Association Reserve Fund.—Subscriptions were called for to raise a Reserve Fund, but none of our members have responded. All the other Associations have come forward most liberally, and we ought to try and do something. The older Associations of course have funds to draw upon, but we are unfortunately still struggling to keep our heads above water, and must be satisfied to pay our way for the present.

Delegates for the U.P.A.S.I. Meeting.—I must ask you to elect two of our members to represent us at the meeting to be held at Bangalore. I may inform you in connection with this that other Associations make an allowance to pay some of the expenses incurred by their delegates attending the meeting. I hope this Association will adopt this plan and an allotment made this year to pay the travelling and other expenses.

Individual Membership to U.P.A.S.I.—With reference to the Individual Membership I have written to the Secretary to say that none of our members wish to become an individual member, and I myself am of opinion that the U.P.A.S.I. should be an "Association of Associations" and Individual Membership would be a mistake.

South of India Planters' Enquiry Committee.—The Report of the Committee has gone up to Government—we sent up an application praying that a Meeting should be held here, the centre of the planting Districts of Mysore, to enable the Committee to take the opinion of the Native Planters, Maistries and Coolies. Our application, I regret to say, was refused. I think you will all agree with me when I say we were quite unrepresented, and with the exception of the few English-speaking members who sent in their answers to the list of questions, the opinions of the Native Planters were not taken at all. We have Planters whose experiences of Coffee extends over 50 years and Maistries that have been recruiting labour for over 30 years, and their opinions and ideas of how the advance system started, if of no value, would certainly be of great interest.

The opinions of Maistries and Coolies would have given Government an insight into the other side of the picture and would have disabused the Government of the idea that the Coolie leads a life of slavery and oppression. The Committee lost an opportunity of putting on record the opinions of both employers and employed and the chance of getting together the information may never again occur. The Hon. Mr. Hodgson, the Planting Member of Council, has written through the Secretary of the U.P.A.S.I. to say that the Report of the Committee has been sent on to the Government of Madras by the Government of India. So I trust we shall have something definite on the subject at an early date.

Indian Famine Charitable Relief Fund.—The Secretary of the U.P.A.S.I. has sent me a circular asking us to send subscriptions to the Famine Fund, but as most of our members have subscribed to the District Fund, I have written him to that effect.

Coffee Association.—It is proposed to form a Coffee Association on the same lines as the Tea Association, but I have no particular of the matter. It will be fully discussed at the next meeting of U.P.A.S.I.

Address to the Queen-Empress.—It has been decided to send an address through the U.P.A.S.I. to the Queen-Empress and a Card costing Rs.500 has been ordered to be made by Messrs. P. Orr & Sons. The funds for same to be met out of the Reserve Fund. Copy of the Address with an amendment has been laid on the table. I have ordered 12 copies of the Illustrated Paper in which it is proposed to reproduce a Photo of the Casket for distribution among our members.

Statistics.—Forms of Statistics have been received and circulated among you, which I trust you will all fill up and return at once. The particulars are required to be embodied in the next Book of Proceedings of the U.P.A.S.I.

Leaf-disease.—A copy of a most interesting and important letter by Mr. Harris, Secretary of the South Mysore Planters' Association, has been sent to us, referring to the necessity for Scientific Investigation into the above. We have all suffered alike, and prospects for the coming year have been ruined by the virulent attack of Leaf-disease we had lately. Government should be asked through the U.P.A.S.I. to assist us by obtaining the services of an expert to enquire into the matter. It is of the greatest importance to us, this Association should do all in its power to render all the help it can.

Registration of the U.P.A.S.I.—It is proposed that the U.P.A.S.I. be registered under Section 26 of the Indian Companies Act. The funds in the hands of the Association are considerable, immediate steps should be taken to obtain Government sanction for Registration.

Mangalore-Arsekere Railway.—Mr. Graham Anderson has sent us a pamphlet and memorandum with reference to the above. I should, I think, press for the extension of the line to Chickmagalur that has been so long promised by the Dewan, and the matter should be brought forward at the Dussarah Assembly.

Roads.—I am glad to be able to report to you that the extension of the Baba Booden Hill Road has been opened out to 6 feet wide, connected with the Lingadhulli Birur Road, bringing the Railway within reasonable distance of all those living in the Jagar Valley. I hope that the Road will be opened out for Cart traffic by next season.

Our thanks are due to the Government for carrying this project out.

Abkari Rules.—I hear it is proposed by Government to institute a system of Tree Tax for Bogni Toddy, and that all trees are to be marked. And that "Proprietors of Coffee Gardens will be allowed to tap free of Tax 5 trees." It will be a great hardship to many of the Native Planters and to all the Mulnad Gowdas, so many of whom belong to this Association, if any restrictions are made as to the consumption of the toddy produced on their own trees. According to our Pattas and Grants the toddy trees growing on our Estates belong to us and not to Government, and we are to have the use of the produce for *bonâ fide* home consumption, that is we are not allowed to compete with Government by selling it.

As the Deputy Excise Commissioner aptly remarks, "Bagni Toddy has been the customary food and drink in the Malnad tracts for a long past," yet it is proposed to place restrictions on such an essential article of diet, and practically force the owner to buy the produce from his own industry and property from the Government.

It is also proposed that Proprietors "will be required to allow free access to their Estates without reservation to the Excise Officers." This I think is distinctly infringing on our rights, and Government should be asked to consider the matter, as I do not think any of us are prepared to allow "free access to our Estates without reservation to the Excise Officers."

Although I did not give you notice of this matter being brought up before the meeting, information of which I have only just received, yet as it is of such importance to us, I am bringing forward a proposition that before Government passes final orders, the opinions of all the various Associations and all others concerned and those most interested, the Malnad Gowdas, be for obtained.

In closing my report, I regret to have to call your attention to the very bad season we have passed through, and from all accounts the prospects for the coming year are far from cheering. On all sides a most virulent attack of Leaf-disease, and a too early insufficient rain followed by a drought of over two months have ruined what promised to be the long-looked for and longed-for bumper year. Prices, too, have fallen. Famine in the North and the Plague in Bombay have caused a great dearth of money, and we must congratulate ourselves on having

so far tided over the worst season on record. One good effect of the bad year, and I trust the improvement will be permanent, is that labour promises to be plentiful. Advances have been cut down by the European Planters and the wages to coolies taking advances reduced. If we all join in this and work together with combination amongst us, we ought to be able to reduce the price of labour and the cost of working our places. Grain is very dear on all sides, and large quantities are being exported from the province, for which we shall suffer later on.

The Government of Mysore has come forward at a most critical period with its timely aid in establishing Agricultural Banks. Two have been opened in the Coffee Planting Districts, one at Sucklasapur and one here, and the relief given by them to such as have become members has been incalculable. Had not the Government come to the assistance of the planters at a very critical time, the suffering and loss to a large number would have been very great. The doors of the Banks and Firms are closed to the greater number of us, and we have been driven for years into the hands of Sowcars, who have had us entirely at their mercy. The profits on coffee during the last five years, with the high prices ruling, have been very great, still these high prices have not been able to meet the drain of the exorbitant interest charged by the Local Bankers. For years the country has been drained of its money, and this year when the Plague broke out in Bombay and the Sowcars left it, the Merchants in Mangalore were not able to obtain and send advances, we found out how the country had been depleted of money. However a new and brighter era has opened out to the Planter and Agriculturalist in Mysore, and the thanks of all are due to Her Highness the Maharani-Regent and her Dewan for taking the first step in introducing these Banks into the Province, and I may say into India,—a step the Government of India has not been able to take.

Both the President and myself have tendered our resignations, and I must ask you to elect Officers for the next year and Delegates to attend the Meeting of the U.P.A.S.I.

Proposed by Mr. S. N. Chokanna and seconded by Mr. M. Ganash Rao, that the account and Report be accepted and passed, and a vote of thanks given to both the President and Secretary, and they be asked to again accept office for the coming year. Carried unanimously. Messrs. P. Veeratha Gowda and Vasudev Rao agreed to serve again.

Proposed by Mr. Veeratha Gowda and seconded by Mr. Abdul Khalik Sahib and carried that Messrs. S. N. Chokanna and Vasudev Rao be elected Delegates to attend the meeting of the U. P. A. S. I. in Bangalore.

Proposed by Mr. C. Srinivasa Rao and seconded by Mr. C. Vasudev Rao that subscriptions be raised for the U.P.A.S.I. Reserve Fund from such of the members as are willing to pay. After discussion it was decided that on account of the bad season and scarcity of money the matter be allowed to stand over till next year, when steps be taken to raise funds (1) either by increased Annual Subscription, (2) by an acreage tax or (3) percentage on crops, so that the Association may be in a position to send an Annual Subscription.

Proposed by Mr. T. Poopanna Chetty, seconded by Mr. W. Shama Rao and carried that it is considered inadvisable by this Association to allow Individual Membership of the U.P.A.S.I.—Carried.

Proposed by Mr. Arnakiri Naik that a Coffee Association be formed on the lines of the Tea Association, but after a long and warm discussion the Meeting was of opinion that there were more pressing matters requiring the resources and attention of the U.P.A.S.I. at the present time and that the matter be allowed to stand over.

Proposed by Mr. Veeratha Gowda, seconded by Mr. S. N. Chokanna, that Government be addressed through the U.P.A.S.I. asking for the services of a specialist to enquire into the causes of and suggest remedies for Leaf-disease. Carried.

Proposed by Mr. Veeratha Gowda and carried unanimously that the U.P.A.S.I. be registered as proposed by the Secretary.

Proposed by Mr. C. Srinivasa Rao and seconded by Mr. Arnagiri Naik that Government be approached on the subject of the long promised Railway to Chickmagalur. The town is daily growing in importance and a large trade is done with all parts of the country, and early steps should be taken to have a short line surveyed at once. Messrs. P. Veeratha Gowda, Poopanna Chetty and C. Srinivasa Rao were requested to form themselves into a Committee to collect statistics at early a date as possible and the Secretary be instructed to

address the Government on the matter. Proposed by Mr. Poopanna Chetty and seconded by Mr. Vasudev Rao that the attention of Government be brought to the deplorable state of the Malnad Roads. It was brought to the notice of the meeting by members that in many places side drains are entirely neglected, the centre of the road being the only drain for taking off the surface water, in other cases, silt from side drains is heaved in on to the ruts, material is stocked on the Road, and barely any room is allowed for traffic, and were the small amount of repairs done seasonably, the side drains all open and ready to carry off the storm water at the commencement of the monsoon, the roads would not be cut up and made impassable for the whole season as they are now.

In this connection Mr. Poopanna Chetty suggested that Government be asked to spend a certain amount of the Local Funds on the Roads in and to the Villages from which the Funds are collected. Most of the Planters have made Roads to their estates and opened up wheel traffic to Villages in all parts of the Malnad thus bringing them within touch of the Main Road. There is a large amount of traffic on these roads and they get very much cut up. In the course of a year or two they become almost impassable. If a certain amount of the Local Funds were allotted for the repair of these roads, simply for keeping the drains open and removing of slips, it would be of great assistance, and other Planters and Ryots would be encouraged to open out roads to other parts of the Malnad.

The Secretary was instructed to address the Deputy Commissioner on the matter and to take steps to have it brought forward at the next Dasseru Assembly.

Proposed by Mr. C. Vasudev Rao, seconded by Mr. Shama Rao, that the Deputy Commissioner be addressed with reference to the proposed Tree Tax on Bogni Toddy and as to the restrictions to be placed on the number of trees to be allowed to the Proprietors praying that the opinions of all concerned be obtained before final orders are passed. Carried unanimously.

After a vote of thanks to the chair the meeting terminated.

C. VASUDEV RAO,

Hon. Secretary,

North Mysore Native Planters' Association.

HE DID NOT GO TO AUSTRALIA.

NOTHING is easier than to recommend a man to go to Australia. A dozen words or so out of your mouth and you have done it. But for him to act on your advice—that is a gray horse of another colour. You see, Australia is half-way round the world: and to pull up stakes here and go there—family, interests, and all—is a job no man takes in hand save for the strongest sort of reasons.

Yet that is what Mr. Emrys Morgan Price, grocer and tea merchant, of Trehafod Road, Hafod, S. Wales, was advised to do by a doctor at Merthyr. Now, we don't say but that the result, if Mr. Price had gone, would have proved the doctor's judgment to be sound; but as it happened Mr. Price came out all right in the end by just staying at home.

The facts are briefly these: In August, 1881, the customary choral competition took place at Abergavenny, and Mr. Price attended. In some way—he fails to state how, and it doesn't matter—he took cold and had a chill. When he arrived home at Dowlais he could scarcely breathe. To draw his lungs full of air was quite impossible. In fact, he felt as if he were suffocating. Of course there was no more thought of singing; the question was one of getting breath enough to live on. He at once tried that good old-fashioned remedy, mustard plasters, putting them on his chest and perhaps on his back between the shoulder blades. They relieved him for the time, as we might expect. But mustard plasters do one thing—no more. They draw some blood from the inflamed parts to the surface; that's all. When they have set up a bit of mild counter-irritation they are done; they don't get down to deep causes. And here there was a deep cause. We will point it out presently.

There was a constant whistling noise in his throat, he says. You hear it in children when they have croup. It means that the air passages are contracted and the breath has to pass violently through a small orifice. Disease has often strangled people to death that way. "Next," he says, "a violent cough set in. I coughed and spat up thick phlegm night and day."

This meant more and worse inflammation, and shows us the spectacle of Nature trying to get rid of the product—the phlegm or mucus. But to cough night and day! Think of it. What becomes of a man's appetite and sleep? You can imagine. No wonder the doctor at Merthyr was anxious and suggested a change of climate.

Still, Mr. Price, as we have said, remained at home and consulted other physicians, one at Dowlais and one at Hafod. All the doctors agreed that their patient was suffering from acute bronchitis, and very properly treated him for that. Yet somehow their medicines failed to effect any real and radical good. That they were temporarily helpful we may not doubt. But, you see, bronchitis, once seated, is an obstinate and progressive ailment. It has a tendency to take up new ground and to get down on the lungs, the reason being that the lining of the air passages and of the lungs is all one thing. So an affection of any part of it, if not cured, spreads like fire in dry grass.

"As time went on," says Mr. Price, "I got weaker and weaker and my breathing became distressing to hear. All my friends thought I was in a consumption, and as a sister of mine had died of that complaint, I naturally felt alarmed. Indeed, one night in July, 1885, I was so bad that my wife thought I was dying."

Happily the lady was mistaken, yet death sometimes comes with fearful suddenness in that complaint, and her fear was very reasonable. At that time, please remember, our good friend had suffered about four years, and was in a state of low vitality. The whole body was feeble and exhausted, and there would have been nothing surprising in a fatal termination. But a better result was in store, as we shall now see.

Mr. Price's letter, dated August 16th, 1893, concludes in these words: "Better and worse I continued in the power of this malady year after year, and had given all hopes of ever getting better. In February, 1883, after having endured it 5½ years I read of a person at Pontypool having been cured of the same thing by Mother Seigel's Curative Syrup. I got a supply of it, and in a few days I felt relief. I kept on with it and gradually improved. *In six months the cough had left me and I was a well man.* Since then I have been sound as a bell. If you like you may publish my statement and I will gladly answer any inquiries. (Signed) Emrys Morgan Price."

Good! That is pleasant and cheering to hear. One word—an important word. Bronchitis, pneumonia, rheumatism, gout, nervous disorders, liver complaint, kidney trouble, and most of our familiar diseases are caused by poison in the blood; and the poison is produced by stomach fermentation, indigestion, and dyspepsia. Consumption itself comes in the same way. Mother Seigel's Curative Syrup drives out the poison and stops the manufacture of more. That's why it cured Mr. Price and will cure anybody.

TO STAMP COLLECTORS.

5,00,000 Foreign Stamps, (well-mixed)

Includes some very good varieties. The best offered at the price, which is extremely low.

No. 1a. Containing 100 Stamps, Rs. 1-4 (post free).

Contracts cannot be entered into for less than a month, nor less space than quarter of a column at the above rates. discount of 5, 10 and 15 per cent. will be allowed on advertisements ordered and paid in advance for 3, 6, and 12 months respectively.

II. LINE RATES OF ADVERTISEMENT:—

1. English Advertisements: 4 as. per line, first 4 insertions, 2 per line, fifth and following insertions.

2. Vernacular Advertisements: Tamil and Telugu, 8 as. per each insertion; Hindustani, Canarese and Malayalam, 12 as. per each insertion.

III. CIRCULATION OF LEAFLETS:—

1. For each circulation locally and by post Rs. 25.

2. For each do. locally only " 15.

3. For each do. by post only " 15.

(This excludes extra postage where the weight of leaflets necessitates such.)

Advertisement charges are strictly payable in advance, except w. approved customers.

MARKET SUPPLEMENT.

SATURDAY, AUGUST 7, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (July 16, 1897) says:—Only a moderate amount was offered in auction this week consisting chiefly of Colombian and Central American part of which was bought in, but the remainder sold in some cases at slightly dearer rates. On the whole the market, although slow, showed some recovery from the depression noticed last week. About 680 bags East India were catalogued consisting partly of second hand parcels. The few good and colory lots realised steady prices, the remainder, chiefly undesirable, sold slowly or were bought in.

Futures.—Rather smaller receipts at the Brazilian ports and steady markets in Rio and Santos caused a recovery here of about 1/- and the general tone is better.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending July 14th, 1897, says:—Bank rate 2 1/2%. Bombay Exchange closes at 1s 3 1/2d. Brazil Exchange 7 1/2 1/2d. Rupee paper 3 1/2%. 63 1/4. Silver 27 1/8d. per oz.

The moderate quantities offered at auctions have gone off quietly at about previous prices, the small proportion of good and fine being well competed for.

Brazil markets are steady at the decline.

According to Messrs. Duuring and Zoon the European stocks on 1st inst. shewed a decrease of 1,250 tons, and the visible supply of 11,910 tons, the figures being 141,750 tons and 237,750 tons respectively, against 143,000 tons and 249,660 tons on the 1st June.

Daily receipts have averaged 11,286 bags in Rio, and 17,576 bags in Santos.

Futures have been steady, and quotations shew an advance of 6d to 9d, viz.:—Good average Santos in Havre, September delivery, fcs. 44.50, in Hamburg pf. 36 1/2, and No. 7 low ordinary Rio in New York \$6.90.

To-day's London official quotations are:—

		July	Sept.	Dec.	March	May
Rio	...	32/6	33/-	33/6	—	—
SANTOS	...	35/6	36/-	36/6	36/9	37/3

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated July 16th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	55,287 packages.	180,756 packages.	6,672 packages.
1896-1897...	45,085 „	171,639 „	7,575 „
7,503 pkgs. INDIAN	Total 39,415 packages were offered in public auction this week.		
30,614 „ CEYLON			
1,298 „ JAVA			

Satisfactory progress in the use of both Indian and Ceylon Tea has been made in North America during the last few years. The following table is encouraging, and appears not only to justify the expense incurred by India and Ceylon in forcing their Teas in this market, but rather to stimulate them to even greater exertions. The small quantity exported direct from India and Ceylon via China to North America is not included in the table.

Transshipments and re-exports Indian and Ceylon Tea from 1st January to 30th June.

	INDIAN.		
	1897.	1896.	1895.
Transshipments to N. America	1,890,940	1,115,981	338,275

Total lbs. ...	3,182,689	2,024,834	1,690,533

Indian. The quantity brought forward has been comparatively small and consisted mainly of New Season's Teas. These met with good attention from the trade, and sold at slightly better prices wherever the quality was good, but quotations for poorer grades were unaltered.

Week's av. of New Season's Tea sold on Garden Account, 1897,
4,462 pks., av. 8 1/2d. 1896, 3,254 pks., av. 9 1/2d.

Ceylon. The auction was again heavy, comprising 30,614 packages against 33,751 last week. Competition was more animated, and bidding general throughout the sale. Teas with good quality attracted more attention, and sold at better prices. Other kinds sold at slightly higher quotations wherever any improvement was noticeable in liquor, the poorer grades showing no change in value. On the whole there are signs of probable improvement in quality, such as generally takes place about the time of the year. Average for week 7d., against 7½d last year.

Ceylon Tea sold on Garden Account 1st January to date 1897, 607,159 pkgs., av. 7¾d. 1896, 553,552 pkgs., av. 8¼d.

Comparative prices of Ceylon Tea in London:—

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; and Quarterly, Five Rupees, including postage.

ADVERTISEMENTS.—Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

N.B.—Remittances should be sent to the Managing Proprietor of this paper, Coonoor, Nilgiris, South India.

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 20th August 1897.

S. E. Wynaad. PUNDALORE, 11th August.—*Weather.*—Since my last report there is no change in the weather. Constant rains are still overflowing the paddy fields. On the 9th, 10th and 11th instant we had the heaviest showers, followed by strong wind. *Crop.*—The transplanting of paddy is still being prevented by the excess rains. Provisions are selling very dear and affecting us greatly. *Labour.*—Plenty. *Health.*—Very good.

Coorg. PULLI BETTA, 11th August.—*Weather.*—Heavy rain started on the 5th with 1.50 inches. It kept going strong till yesterday. On the 8th the fall was 3.50 inches, and on the 10th, 2.60 inches. The remaining days after the 5th, it was much over an inch. A lighter state of affairs set in to-day. *Plant-diseases.*—A good bit of leaf rot about. Hardly any leaf disease showing up yet. Coffee still looking very fine. *Public health.*—Much the same as already reported. *Labour.*—Coming in slowly, but estates fairly well supplied on the whole.

Nellampathy. 11th August.—Rain for week, 22.97; to date for year, 126.27. A very heavy burst set in on Thursday and has continued right on to to-day, when it seems a little milder. The record day was reached for this end on Monday, when over 7 inches were measured. Work has been hindered dreadfully, as on such days as coolies did turn out, they stood shivering and did very little work, but on some days no one was out at all, which on these occasions is the cheaper way of working, I think. My rainfall, it will be observed, is somewhat larger than it used to be, but this is more the fault of the rain-gauge I had than of the weather. I have got a proper gauge now, however. *Plant-diseases.*—Still a lot of leaf-disease showing, and it would seem more is appearing every day. Borer, too, is at work here and there, but not badly. *General Health.*—Fair. *Labour.*—Plentiful, 'Mops' coming in rapidly again.

Nilgiris. SHOLUR, 10th August.—My pen was hardly dry from writing the last report, when the weather changed, for it has been blowing hard and raining without cessation ever since, rainfall during August to

date being 5.29, making 32.44 for the year. Temperature 46° and 59°. *Labour*.—Plentiful. *Health*.—Good. Prices of grains still high, and wind too high for tea to flush well.

COONNOOR, 11th August.—We have had a most unusual amount of rain this month, making up for what we ought to have got in July. The rain is most welcome to coffee, as the long drought was drying up the young berries. Leaf-disease markedly to the fore. Tea almost stopped flushing. Black bug spreading gradually. Red spider very bad; flush worm simply awful. *Health*.—Indifferent. *Labour*.—Ample.

KOTAGIRI, 12th August.—Weather in July: 19 wet days aggregating 3.54 for the month and 27.80 to end of July. August so far good. Monsoon current still strong, 9 wet days out of 12 aggregating 2.94 already; nice rains for ripening crop and for planting. Not many new clearings this side, but Kil-Kotagiri going strong in new land, and failures being replanted everywhere.

GENERAL NOTES AND ARTICLES.

THE ANNUAL MEETING OF THE UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA.

THE Secretary's report for 1896-97 and the Agenda paper laid on the table on the opening day of the Annual Meeting of the U. P. A. S. I. showed that the proceedings were likely to be of unusual interest and importance. Several new subjects were subsequently added to the Agenda, and these served to call attention to the strong leaning that planters now manifest towards the *practical* side of progress. They are not content to theorise, they wish to remedy past errors and to introduce improvements that shall place their industry in the front rank of modern advancement. They have had to "put their house in order," revise their rules, frame a new financial policy and provide for the welfare of the Central Association to which they already owe much, and from whom they expect so much more. Side by side with this, they have had to consider and remark upon the report of the South of India Planters' Enquiry Committee and to record what has already been done with respect to the Labour Question, coffee-stealing and sundry fiscal and other matters of varying importance. But what was brought most prominently forward at this year's meeting was the urgent necessity for practical improvements. Great as is the need of planters in respect to the Labour laws, &c., it is felt by coffee-planters that unless they take immediate steps to protect their property, any reforms of the law, any advantages that might be derivable under more favourable circumstances from the possession of well-filled coffers, may come too late; for in the meantime insect-pests of sorts are playing havoc with plants and crops. The subject of Scientific Investigation thus assumed a quite exceptional prominence, and the plain words of Mr. Cameron, the well-known custodian of the botanical gardens at Bangalore, who attended by request, will no doubt tend to make planters give increasing attention to high culture, to practical experiment, to careful examination and analysis of soils and manures, and to further investigation of diseases and pests, and probable remedies.

This, then, is the chief characteristic of the annual proceedings in August 1897: that a distinct bias towards practical experiment and work was shown: a bias which, we venture to say, will become more and more marked as the years roll by, and planters realise how much they had to "un-

learn," how much they have still to learn. It is an advanced stage in education when a man who has hitherto prided himself on his mental requirements finds how little he really knows. Many planters have reached this stage, and the remarks of Mr. J. A. Harris about the stupendous folly and ignorance that they had manifested in the past evoked approval that showed that the delegates assembled had no shame, but were prepared to acknowledge how much they are still to be learnt. They have educated themselves as to the Government, but both have still a great deal to learn. It is something to know that both planters and Government seem to have realised this, and that both show indication to remedy their deficiencies. The report that will be published elsewhere will, when carefully read, bring some illustrations of these remarks to light. We do not propose to comment upon it in detail or to summarise even the conclusions arrived at or the discussions that led to them. Planters who are not sufficiently interested to read the report, would gain nothing by having the perfunctory food of a summarised review administered to them. They must assimilate the whole of the proceedings, or at least be content to stand aside and let their more progressive brethren forge ahead. For our own part, we cordially endorse the general approval of the report of the S. I. P. E. C. which is reflected in the Association's hearty vote of thanks to the Commissioners. No more admirable piece of work has been done with respect to the planting industry. We endorse also every remark made in favour of further scientific investigation, the gropings of the amateur as well as those of the expert—for at best both are usually but groping in the dark. We concur also in what was said about the analysis of soils, &c., but we fear a wrong line has been taken with respect to the adulteration of manures. It is too probable that, even were an expert employed to analyse manufacturer's samples, manufacturers in India, *à fortiori* those in Europe, would refuse to guarantee delivery of equal to either their own analyses or those of the Association's chemist. By encouraging manufacturers who give no fair play, and by discouraging and trying to avoid all who may be even suspected of deliberately palming off inferior to sample, planters will safeguard their interests more effectually than any chemist could hope to do, and his decision was unhesitatingly accepted by suppliers as well as by buyers.

For the present we need add but little to our comments on the proceedings. It would be preferable that the proceedings themselves should be diligently studied by the planters. We may, however, remark that the U. P. A. S. I. has now formally recognized a section—to be called the U. P. A. S. I. section—of this paper as its medium of communication with the various District Associations and with individual planters. From time to time, therefore, U. P. A. S. I. circulars and correspondence will appear in these columns, in a section under the control of the U. P. A. itself. To us, this is an important matter, and an experiment the result of which will be of interest to others besides ourselves. We thank the Association for the qualified support and approval that it has agreed to give to *Planting Opinion*, and shall strive to make this paper follow the excellent example of the U. P. A. S. I. proceedings, by becoming more and more interesting and useful. At the least, we may fairly hope to do something towards creating an interest in the U. P. A. S. I. in some quarters.

where at present there is none, and towards stimulating such as already exists. For our own part we regard the proceedings of the Annual Meeting of the U. P. A. S. I. in 1897 as crowning a year's excellent work, and affording a great incentive to further endeavour and still harder work in the year 1897-98.

A defective rain-gauge.

Our Nellampathy correspondent asks us to put in a paragraph about the figures given by him of the local rainfall. He states the rain-gauge used was purchased from a well-known Calcutta firm. To satisfy certain doubts of its correctness, he wrote to the Madras Observatory, who informed him that, with the diameter given, 1 oz. of water should show 9 cents and not $6\frac{1}{4}$ as stated by the firm in question. This culpable mistake of the vendors of the rain-gauge resulted in the total rainfall being measured as 66.22 instead of 103.30, the correct figure.

Red ants.

At low elevations red ants are often a very great nuisance to coolies, as they make their nests among coffee or tea bushes alike, and being extremely fierce, give the unhappy cooly a very lively time. There are various ways of getting rid of them, one being to burn out the nests, another to drop a few grains of arsenic into the nests from above. In a Ceylon exchange, however, we note that some planters actually encourage them. One of them does this by providing himself, when going a jungle walk, with a long stick with a piece of meat attached. This he thrusts into any nest he finds and takes back the ants attached to his plantation, where they straightway form nests.

U. P. A. S. I. LEAVES.

[GATHERED BY THE SECRETARY, U. P. A. S. I.]

THE Annual Meeting has come to an end, and delegates have already begun to wend their way back to their respective estates. The attendance was not large, but it was decidedly a strong body of men that met this year to discuss the important report of the S. I. P. E. C., the financial question, and the grave subjects of leaf disease and insect pests. The report is hopeful; the financial position, though it might certainly be better, is not unsatisfactory, but leaf disease and the green bug are the shadows of the picture, and they have been laid on with no unsparing hand. There can be no doubt that they call for the most earnest attention of all coffee-planters, and tea-planters will doubtless stand by their brethren of the berry, knowing that every plant has its day, and that a time *may* come &c. Let the rest be left to the imagination.

Considering the amount of work done, the meeting was a short one. Its influence is likely to be enduring, however, for important matters will now have to come before the District Associations for full consideration.

The names of those present and the general tenor of the debates will be given by the Editor elsewhere. I need only add that the Planters' Dinner, held at the Club on 9th inst., was a very successful affair. It was wisely decided that there should be no speeches, and 'The Queen' and 'The Planters' were the only toasts. There was a very wel-

come sprinkling of non-delegates, and the diners numbered 28 in all. Mr. Romilly, the Chairman of the U. P. A. S. I. for 1897-98, was, of course, in the chair.

THINGS NOT GENERALLY KNOWN.

So much has been read of the lady-bird in the columns of our Indian papers, that anything throwing further light on the subject will no doubt be very welcome to people interested in the question.

It is not the lady-bird herself which destroys the scale, but her voracious progeny, which like all young and growing creatures, is simply insatiable. This can be proved by anyone with a little patience, watching a family group; the parents will take an hour over a single scale, and seem to have dined with the disappearance of it. "You are on the wrong tack" said a friend who had lately arrived in this country, "it is the new birds, the young ones, that eat scale and bug in quantity."

With birds it is the same thing; not the old birds, but the earlier fledglings devour the millions of grubs that are so destructive to vegetation.

It is a thousand pities that we have no Act protecting birds in India, and especially on the hills, where thousands are wantonly and cruelly destroyed.

Of course they are mischievous, too, but that can be overcome, without their being bird limed or shot; both ways are cruel.

A good way to keep them off fruit is to get several balls of fine tacking cotton (cheap stuff) and weave it to and fro between the branches of fruit trees or in front of your rows of peas. Once the birds get a fright by being entangled, they give your garden a wide berth. After innumerable experiments and endless expense, this way has been found perfectly successful by a well-known grower of fruit on the hills.

Here is another thing not generally known, and many a planter has bewailed the loss entailed, by discovering too late, that his nutmeg estate contains an immense number of male trees, which are of course perfectly useless. A case in point goes far to prove that a failure of the above kind can be remedied, and in such a way as to entail next to no loss.

A large nutmeg planter was relating his experience to a well-known Forest Officer (now, alas! dead) who was remarkable for his resources. The planter went on to say there was nothing for it but to cut out every male tree, and lose more than two-thirds of the estate.

"On no account," said the Forest Officer, "don't dream of anything so destructive and wasteful; take my advice, graft with female scions, and let me know the result." The planter's face brightened and he thanked him warmly, and in due course wrote, saying the experiment had turned out most admirably, and the greatest success had followed, and added, "you have saved me thousands of rupees and time by your practical knowledge."

FLEAS AND THEIR TRANSFORMATION.

"KEATING'S POWDER" is, we know, said to be an insecticide of the first degree, but one needs pounds of it to meet with

the requirement of the present plague of fleas that seem to have sprung out of the dust of the ground.

One begins to doubt if there is a "lesser flea" to annoy him as we are annoyed. In some houses in Ooty the insects simply swarm; a disused godown is often a favourite breeding ground. You may go in, clothed in white, and come out with a dark brown-looking garment on that moves ever upward. Where do they come from? and from what are they evolved? have they any enemies? Now why should this be: some day we shall be inoculated and rendered proof, for fleas have their likes and dislikes and they detest some people, and avoid them as mosquitos do.

Wormwood is an abomination to our apterous enemies, but it does not grow in the station, though acres of it may be found in the Badaga fallow fields.

The varieties of fleas are many. The porcupine and rat have a species peculiar to themselves, most loathsome to behold; large yellowish brown, fat bodied insects; luckily these keep to themselves, for one wonders how one escapes the rat flea when the rodents scamper all over the house; perhaps the wild flea is the house flea. The Bazaar chicken is generally the introducer, and sharp domestics at once apply a finger dipped in castor oil around the eyelids and wattles or comb. A flea can't abide oil, and a smear of it cuts off his respiration, and he may die of "poisonous perspiration" (small though he is) according to the article in a leading paper the other day (not about fleas).

If this world is one of correspondences, then surely is the flea the Kangaroo of the insect world; it would be far more satisfactory if he could bark and not bite; no one would mind his noise; but his bite is truly horrible to some people who suffer as much as others from a bee sting; and after careful watching one comes to the conclusion that they seem so far to be immune from native enemies. Of course dogs and cats crack their bodies between their teeth when they feel the creatures biting them, and their bodies can be picked off a mat showing the death they have died. Human beings don't exactly care to do this. Monkeys and savages are rather given to the practice, and the *black Todas* of Ooty don't seem to have any other way. But like the old Lady-bird and her scaly dinner the process is tedious, and certainly will not help to keep down the swarms that infest our mountain home at present.

Like the Japanese we shall have to sew ourselves up in huge linen bags tied securely round the neck, and round that exposed part you draw a magic circle of oil. Of course the fleas will hop or skip it, and land on your head, that is to be expected. You must sacrifice some part of your person.

It is difficult to know how to deal with such minute enemies so well versed in the art of self-preservation. You try to catch a flea, say on a wide expanse of bed sheet; he skips, and disappears, and you will find he marked the darkest shade for his landing place, either a corner, or a garment or a stripe on your blanket.

The wild sweet flag and garden mint the flea dislikes, and a good plan is to powder the leaves or crush into a paste and rub over your mats, but don't have the stuff wet, or it will stain horribly. Dogs suffer dreadfully and almost die from depletion of blood. Kittens do die straight off; their tiny bodies cannot stand the drain.

The poultry flea is another species altogether, more like a tick in habit, and his bite is sharper a thousandfold; a tab with a hot needle dipped in acid is about the sort of

pain experienced when a foul flea fixes on to you, and comes to stay indefinitely, his visit lasting several weeks sometimes, and a visit to the poultry yard is often purgative in the flea season thriving in his surroundings; any way a civilized insect is not so disgusting to behold.

If people would have the eggs burnt the multitudes might be kept down; the eggs sink in carpets and can be shaken out; but it must be done in three days at least or they hatch and the tiny larva soon attach themselves in the shape of miniature cocoons to woollen rugs, etc. On examination the creature will be found to be like a caterpillar, rolled in a silken case. When it is first hatched it is very small, soon begin to skip and look about for food.

LETTERS TO THE EDITOR.

NOTICE TO CORRESPONDENTS.

["MINE, BANKIPUR." Yes, notes on Deer shooting duly received many thanks. We are waiting an opportunity to put them in, but space is small and our Business Manager inexorable. Wish you best luck in new billet. "BUTTER COY." All success to your venture: think it will come out well all round. "BUG." Your powders received with thanks, experiments will be made if possible. We should advise, however, in order to ensure thorough trial, your placing at the disposal of the planting paper free samples of your remedies. If the results prove satisfactory, no doubt a large demand will arise. We may mention that it is quite impossible to experiment exhaustively with the tiny quantities sent. "YER R. G." Your complaint is unluckily no new one. But if you care to examine any recent copy of this paper, you will see that the advertisements are so placed that they in no way interfere with the proper filing of the paper. In other words, that not being "paged," and having both sides of the sheet occupied with advertisements, they can be easily and safely removed. Though on the other hand we have been assured that readers find the advertisements of great convenience as current lists.—Ed.]

A CORRECTION.

DEAR SIR,—There are three mistakes in my letter of 10th ult; would you kindly insert a note correcting them.

In the 10th line a sentence begins "on my return"; in the word printed "more" should be "worse", and the last word should be "nor has it since." My surroundings, too, are "parkly" but "paddy lands." Apologizing for the trouble

I am, Yours faithfully,

JNO. G. HAMILL

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contain the following per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.68	"	Phosphoric Acid.

Orders should be booked early for the coming crop of seedlings of the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere else than from the MANAGER, ARIENKOW ESTATE.

COFFEE.

The Coffee Duty.

One of our correspondents suggests action by the U. P. A. to secure the repeal of the Coffee Duty in England. He writes: "It is such a small duty and brings in very little to the Government."

ent and would free our article for the breakfast table. I think if ere would be some chance of its repeal if pressed on the Govern- ent, as there is no duty collected which is so expensive for them collect, the expense is out of all proportion to the return. All the fee landed in England is landed in Bond under the supervision of e customs officials. I don't know what amount of coffee bonded home goes into home consumption. Is it 10%? All the rest is ported and transhipped in Bond; so the Customs have to deal th the whole amount, and collect duty on about 10%.

"The benefit to the Planter would be a great reduction in warehouse arges, for with the repeal of the duty coffee could be handled as sily, and there is no reason it should not be done as cheaply as tton or any other duty free commodity."

Market.

There has been some improvement in the demand, says the *P. M. Review*

the 17th ult. :—

Prices on the terminal market have steadily advanced, although Tuesday there was a slight reaction caused by an estimate of the ext Santos crop, which was put at 4,000,000 bags. The low prices ye, however, again attracted more attention, and, with a decided nness on the part of merchants in Brazil, quotations close at an vance of about 1s per cwt. above last week. The auctions have en very poorly supplied, and have contained little beyond olombian and Guatemala descriptions. These have sold at steady ices, and occasionally rather dearer, but, even at the advance, ere are some cheap parcels offering at from 65s to 75s. Really eful home-trade sorts of the finer grades are becoming scarce, and any importers are withdrawing these Coffees until the autumn, hen there is generally some improvement in the demand.

Troubles of Brazil planters.

Some patriotic British planters may feel an unholy joy in reading of the troubles that attend coffee in

Brazil, despite their huge crops, says the *H. and C. Mail* :

"A conference of representatives of the coffee-planting interest was recently held at Rio de Janeiro to consider the depressed condition of the coffee-planting industry in the provinces of Rio de Janeiro and San Paulo Santos), the chief producing districts. Details of the discussion indicate that the general conclusion arrived at was that one of the chief causes of the depression had been the excessive production this year, which, it was argued, had driven coffee prices down to an unprecedentedly low level. Another cause was said to be the fact that labour had become much dearer than formerly. Moreover, the planters are now compelled to part with their coffee as soon as it is harvested, in order to provide for current expenses and to cover advances already obtained from the commission-houses. They are thus brought to a state of financial dependence on the middlemen, by whom the prices of the coffee are practically fixed, without regard to the producers who are helpless in the matter. As remedies, an improved organisation of credit facilities and the erection of ware-houses, in which the coffee may be stored instead of being pressed for sale, were recommended."

COFFEE LEAF DISEASE IN JAVA.

II.

In a former issue we gave some account of Dr. Burck's investigation into the great coffee scourge, leaf disease. Although happily leaf disease has not yet, and we hope, never will appear in this Protectorate, yet on this subject all planters will read the result of such experiments as those of Dr. Burck with interest as they often give valuable hints on preventative measures and cultivation generally.

In continuation of the former paragraphs we now give Dr. Burck's summary and also the remarks of the Editor of the *Agricultural Bulletin of the Malay Peninsula* on the whole investigation.

SUMMARY.

Any planter can keep his nurseries free of disease at a little expense by sprinkling them with tobacco water and so start the plants in life in a healthy state. Young plantations can be similarly treated and any spots arising from insufficient wetting of the leaf can be cut out with the scissors or burnt out with sulphuric acid as described above. In fruiting plantations heavy attacks can be prevented by enclosing the gardens by hedges which can be composed either of coffee trees kept free of disease by tobacco water, or of arnotto or some such shrub, Teosinte grass or of trellises with creepers. If these attempts to arrest and prevent the disease are carried out by all cultivators, it is by no means improbable that the disease will be so reduced that it can never form any obstacle to culture, and loss from it will always be a negligible quantity.

NOTES ON THE FOREGOING.

The abstract of Dr. Burck's works I have made is very much condensed from the original. The substance has, however, been reproduced, but I have omitted portions which have no bearing upon cultivation in the Straits Settlements. The whole system of cultivation differs considerably in the two countries. In the first place the seasons are entirely different; here are no distinctly wet or dry seasons but on the whole the seasons are uniform. Again Liberian coffee has alone proved successful here and the damage wrought by the disease is much less with this species than with Arabian coffee. From latest advices, however (1891), we gather that the Arabian coffee in Java seems to be dying down, and slowly but steadily succumbing to the disease. If so, it is much to be feared that Arabian coffee will ere long be absent from our markets, as Java produces the largest quantity next to Brazil.

Another distinction is in the soil upon which the coffee here has to be grown. Java is a volcanic region and volcanic soil is far more suitable for the cultivation of coffee, as well as for several other cultures, than the so-called laterite of which the greater part of the Peninsula consists.

At the same time any light thrown upon the habits and requirements of the fungus is of great value, and Dr. Burck's suggestions seem to me to possess, even for the cultivation of Liberian coffee here, a great deal of value and importance. All who have seen a view of the coffee fields in Ceylon must have noticed the entire absence of any hedges or jungle breaking up the enormous tracts of coffee cultivation. The ground is, it is true, very undulating and hilly, but there is no attempt made to separate the fields at all by hedges. The whole country is open to the sweep of the prevailing wind to carry the fungus spores from end to end of the island, and indeed the undulating nature of the ground is in favour of the spread of the disease. Professor Marshall Ward, when he was investigating the disease in Ceylon, pointed out this very thing, and urged the formation of hedges. It is not probable that this simple method would have so far arrested the disease as to save the now ruined cultivation in Ceylon, but it would, doubtless, have lessened the violence and rapidity of the attack, and given some chance of combating the disease, by breaking up the whole into more manageable plots. It must be remembered that it is very rare to find any one species of plant growing in masses together unmixed with any other, in a natural state. The effect is somewhat like that of herding many animals of one kind together in the same space. However for crops such as coffee it is essential to do this. They are required to be grown under unnatural conditions, but as this is unavoidable, it is still possible to break up the plantation at least to a small extent by having belts of jungle here and there running through the plantations. The quantity of coffee lost by not putting these belts under cultivation is trifling compared with the advantage to be derived from them. These belts will arrest the spread of fungus spores and blight. They will also be of signal use in

attracting the insectivorous birds which will aid to keep down the insects that injure the coffee, and they will also be useful as supplies of sticks, poles, etc., required from time to time in the plantations. It is of course possible that monkeys and musangs will resort to these jungle patches, and sally forth at night to devour the coffee, but they are tolerably easily kept down in small woods, and it is usually when there is extensive forest near the plantation that they are so injurious. Where the jungle has been destroyed and where there are no bushes to make screens, I would suggest the planting of such trees as *Adenanthera Pavonina*, *Saman*, *Tombusu*, *Erythrinas*, *Jack trees*, etc., in thick rows, so as to break up the plantations. Nor would I restrict the use of jungle belts to the cultivation of coffee only. With all crops cultivated here on a large scale, I think it would be advisable to break up the plantations, if possible. It may be that with some cultivation no enemy worth considering is yet known, but no plant is entirely free from enemies either fungul or insectal, and although it may seem strange to say that a small jungle belt can and will act as defence against strong winged insects, yet such is the case, for the insects when they rise in the air high enough to clear the jungle, are very liable to be borne far away over the plantation, and if even they do invade the plantation they come but a few at a time and can be easily dealt with.—*Central African Planter*.

SCIENCE AND COFFEE.

BY THE LATE MR. WILLIAM PRINGLE, M.S.C.I.,

(SOMETIME AGRICULTURAL CHEMIST IN COORG, SOUTH INDIA,
TO MESSRS. MATHESON AND CO.)

(Reprinted from the "Madras Mail.")

NOTE.—These papers are being published in pamphlet form: register orders with Messrs. Addison & Co., Mount Road, Madras.

VII.

THE LEAF DISEASE OF COFFEE.

COFFEE leaf-disease, *Hemeleia vastatrix*, has produced such dire effects on the coffee of Ceylon and Southern India that a brief outline of the leaf history of this deadly parasitic fungus will probably prove interesting. Those who wish for fuller information should take the trouble to read Mr. Morris's and Mr. Marshall Ward's reports. I have carefully gone over the ground traversed by the latter gentleman, and can fully corroborate his statements. When a field of coffee is attacked by the disease, the bright glossy green of the leaves is changed to a dull yellow, and on examination the under-surface of the leaves is seen to be covered more or less with an orange coloured powder. This powder is composed of myriads of spores of the fungus *Hemeleia vastatrix*. One of these spores, sown on the underside of a leaf of a tree, if the conditions of light, heat, moisture, and texture of the epidermis be suitable, will in ten to twenty hours germinate, and penetrate the stoma of the leaf. If the medium on which it is planted prove unsuitable, it dies or may remain inert for months. On a coffee leaf of the Arabian species, after germination, in from three to five days, a mycelium or filamentous growth is formed, consisting of microscopic tubes. When these have absorbed all the food contained in the cell in which they were first formed, sucking organs are developed, which penetrate the neighbouring cell walls feeding on the juices of the plant. As the cell's contents are removed and taken up by the fungus, so the mycelium extends, pushing its suckers into the surrounding tissues. When the cells are emptied a yellowish spot appears, generally visible about two to three days after the parent spore is planted. The rust patch is formed in about two to four days after the appearance of the yellow spot as a rule, when the conditions are favourable. If the weather is unfavourable, or the medium on which the spore was sown unsuitable, the development is greatly retarded and a yellow spot may show on a leaf for two or three weeks before any spores are shed; or they may not form at all.

The rust patch is formed when the spores are forced through the stomata. As the mycelium spreads and increases in size, more spores are developed, and the patch of rust grows larger, radiating from a central point. As the work of destruction is carried on within the leaf by the mycelium, quite evident that remedies applied after the spores appear on the epidermis of the leaf are useless; they must destroy the tissues to reach the foe within. Any agent to be of use must be on the leaf before the spore finds a resting place. When experimenting on the development of the spores on a coffee leaf, I took a clean seed and raised it in a case prepared on Tyndell's method, with the result that I got a plant free from disease growing in sterilised soil. The spores only appeared where planted on the leaf, nowhere else, and Mr. Marshall Ward's results were fully borne out. Thus the disease is constitutional; the spore of the parasite must be deposited on the leaf before the disease can appear. A weak tree suffers more than a strong one from the loss of its leaves. A tree weakened by injury to its roots, due to removal of the surface soil by wash, digging, or other causes, recovers less rapidly, and if the attack of leaf-disease, or succession of attacks, be virulent, it will in all probability succumb. The lower vitality of the tree attacked the smaller its chance of recovery. A half-starved coolie readily falls a victim to fever, cholera, &c., while if well fed he more easily resists the attack of disease. So it is with the coffee tree.

The conditions most favourable to the development of the spores are a close, steamy, hot, stagnant atmosphere, and subdued light. Heavy dews followed by hot days, if a shade is over the coffee, aid in the fructification of the fungus. As a rule leaf-disease is bad in South Coorg twice a year, after the early rains, and during the autumn showers. In hot weather estates are practically free from it, though I have found the disease spots and rust patches in every month of the year. Shade, under which the coffee of South Coorg is grown, affects the disease in certain ways. It acts as a wind shield and retards the passage of the spores from one estate to another. If the coffee is one continuous sheet, the disease may start at one corner of the estate and roll right over it when the conditions are favourable. I have visited an estate on the 1st of the month, when leaf-disease was to be seen, though to any extent; fourteen days afterwards the estate was rid of it from end to end; by the end of the month it had resumed its appearance presented at the beginning. This estate suffers from these periodical attacks, which always began at one corner and swept over the estate in regular progression. Further examination showed that it was not the only estate affected in this way, and in every case the starting point of the attack was where the shade was thick, with damp and sour ground. The air was, especially in the early morning, laden with moisture, with often not a breath of wind. As the sun rose the possible conditions for the development of the fungus came into play. Here shade did more harm than good. Being too thick it prevented the free admission of light, conserved the moisture to an undesirable extent, and aided greatly in the production of the moist heat essential for the germination of the spores. Under the circumstances, the course to be pursued was first to render the conditions unsuitable to the fungus by regular removal of the shade and draining the land, then to apply the remedies. The reason why the lower leaves of the tree suffer most is that the great resting place of the spores is on the ground, on dead and dying leaves resting thereon. The coolies pick up the spores and dust as they walk through the coffee, and the spores find a resting place on the lowest leaves. These are shaded by the upper branches, and intercept the moisture evaporated from the ground, so that in general there are not only more spores on the lower leaves, but the closer they are to the ground the more favourable the conditions are for their development. Unless the ground and the

es are treated, to say nothing of the neighbouring estates, it will be impossible to eradicate leaf-disease. But an estate can be kept practically clear of the pest by one application to the ground and two to the leaves per annum. In France remedies are applied to the vine four times per annum with great success. The work is not expensive, only labour must be there to do it at the right time.

The *Hemeleia vastatrix*, or a fungus so closely allied to it that I can see no difference between them, is to be found on at least three jungle trees. Unfortunately I know next to nothing of any, so cannot classify them. It was on the goni (*Ficus zorencus*?) that I first found the spores; whether these are a first sort of spore or the second sort of spore which prefers another pest, I am not sufficiently well up in cryptogamy to determine, but the spores taken from the goni and sown on the coffee leaf developed there.

I had a few failures in transferring the spores from the coffee to the goni, but on the whole results were satisfactory. The *Ficus* *globurata*, when a young plant was taken, could also be infected. If the leaves are old, the yellow spots will show on the leaf with but very few spores being formed. Liberian coffee, which has a much tougher leaf than the Arabian, displays much the same characteristics as the atty and goni.

The damage done by the *Hemeleia vastatrix* is entirely that of depriving the tree of its leaves. You can make a coffee tree look by varnishing its leaves on the under-surface and so preventing its breathing. Consequently, in selecting a remedy there must be taken that it does not clog up the spores of the epidermis. It would do more harm than good. Stripping the tree of the diseased leaves ranks in the same category. A tree must have its leaves, which are its lungs, in good order, or it cannot develop its fruit. If all the blossom that appears really sets crops of from five to ten tons per acre would be common. As a matter of fact, only from one or two to ten per cent. set, and of that does not come on. Now the true use of a manure is to enable the crop to set its blossom, and to assist in the development of a healthy bean. My experimental plots being systematically manured were able to set a larger proportion of the blossom than the estates, though both received the same work, the only difference being in the manures and manuring. Though pruned and handled down to the level of the estates they had a finer show of leaf and wood, and recovered from an attack of leaf-disease more rapidly. The results from the estate where leaf disease was worst, taking the crop of 1887 to 1888 as the basis, and stating results as percentages on that, for both plots and estate, we get the following result:—

	1887 to '88	1888 to '89	1889 to '90	1890 to '91.
Estate	100	63.1	34.2	8.5
Plot	100	90.9	239.5	36.3

This shows the value of steady systematic manuring broadcast annually, and this year the plots have a splendid crop on them. It requires time, patience, and careful observation to get reliable results, and the results to be of value must form a series obtained by steady systematic work. Not knowing how the various manures would act on the coffee tree, I began with only mail plots of 3.200 trees, or rather the space occupied by that number when the estate was originally planted. Each manure acted on two plots of 100 trees each, and the results individually taken are not conclusive. Therefore I had to take for comparison the aggregate results, including good, bad, indifferent, and unmanured plots for comparison with estates, which in most cases did not receive the manures I recommended owing to failure of supply of fish and other causes.

Now, as to preventive measures. Steady systematic manuring annually holds the first place; drainage is in some cases quite as important; and the careful regulation of shade under the conditions under which the coffee is grown suitable to it and unsuitable to the fungus, then special remedies can be successfully applied. Six months ago I did not know how the

practical application of remedies was to be managed. Sponging the leaves over took from 15 to 20 minutes per tree, spraying with a syringe took from 5 to 10 minutes and was not thorough. Labouring under the difficulty, I did not consider that any practical good was to be gained till this point was settled; for, as Mr. Ward says, it is not the most difficult thing to find a substance to destroy the fungus, but it is somewhat difficult to comply with the other conditions laid down.

But I managed even that; and in February last two spray machines were sent out from England by Messrs. Matheson & Co. which fulfilled all the conditions necessary for practical work. All that is now required is to test the remedy and method of application on a wholesale scale. I have been engaged in practical work ever since I left school, and I can honestly say that leaf disease is preventible by practical measures if there is labour to carry through the work at the right time.

TEA.

Machine-made Chinas.

Various lots of the new season's make have arrived in London, and have sold at an appreciable advance over the old style of hand manufacture. But the quality is still a great deal below that which was expected to be attained by the use of machinery.

Profits of Tea Companies.

From the para. given below may be inferred the fact that the low elevation estates still give larger profits than the high elevation ones, despite the higher price gained by the latter, and the consequently larger margin of profit. It is all explained of course by the yield.

A summary of the returns shown to investors by ninety-four Indian and Ceylon tea companies appears in a financial contemporary, says the *H. & C. Mail*. The companies enumerated represent a total paid-up share capital of £7,261,635, on which last year a net profit of £719,426 was made, or an average return of 9.90 per cent. The Indian companies, the teas of which last year sold at an average price of 8½d. per pound, are represented by a capital of £4,730,523, and made last year a net profit of 9.45 per cent. The Ceylon teas, the average price of which in 1896 was 8½d. per pound, made a return of £272,229 on a capital of £2,531,112, or 10.75 per cent. It is further noted that the cheapest of the Ceylon teas, those which sold under the average of 8½d. per pound, were the most remunerative from the investor's point of view, giving a return of 12½ per cent., against 9.10 per cent. obtained from those selling above the average price, and against 11.62 per cent. made by the best class of Indian teas—those which realised an average of over 10½d. per pound.

The Market.

Says the *P. M. Review* of the 17th July:—

INDIAN TEAS.—The quantity brought forward has been small, the public sales only having comprised 7,600 packages, of which about 6,300 were new season's, and the remainder chiefly consisted of last season's "Calcutta-bought" parcels. There was a slight improvement in the demand, and the bidding was brisk for desirable Teas, although, taken as a whole, the quality was disappointing. There was a good demand for a few consignments of good liquoring Doors, and it is quite evident that the trade is in a position to buy freely as soon as desirable kinds are offered of improved quality and strength. Some very low-class Pekoes and Pekoe Souchongs were included in the sale, and for these there was little demand, and previous rates were barely maintained. Darjeelings were not plentiful, and, being again poor in character, brought but moderate rates. Fine and finest grades of all descriptions are particularly scarce, as there is only a limited stock either of Leaf or Broken kinds over 1s. and, consequently, the few fine invoices secured good prices. Judging from the catalogues already issued next week's

sale promises to be on a larger scale, and a better assortment of various descriptions may be looked for. At public auction 6,000 packages were sold, and 1,600 were withdrawn. Recent advices from Calcutta indicate the probability, owing to the earthquake, of some delay in the arrival here of part of the crop, especially from Darjeeling and Dooars, but only a slight deficiency in the out-turn is anticipated.

TEA MANURING.

WE have frequently noticed in our columns the interesting series of letters on this subject that appeared in the *Ceylon Observer*, which has been ably reviewed by that veteran adviser in chief to Ceylon, Mr. John Hughes. The following notes form the gist of his remarks, pressure on our space having forbidden their earlier appearance.

The first point, before commencing manuring, is to find out what the soil lacks, for it is certain that supplying certain costly plant food to soils rich in these ingredients is positive waste. With tea, the three most important elements needed are nitrogen, phosphoric acid and potash. Lime is not specially required. But whatever the system adopted, the only real test is by results, *i.e.*, whether it *pays*. And to find this out, it is of no use to reckon the gross value of the tea. Two hundred pounds of tea extra yield multiplied by the price realised does not represent the *net* value, for cost of picking, manufacture, packing and freight must all be deducted.

The two chief kinds of manures used are *bulky* and *concentrated*, erroneously called "artificial" by planters. The first consists of cattle dung and lime refuse; the latter of bones, fish and poonac. It is absurd to call the remains of animals and vegetable productions as artificial, nothing on the contrary can be more natural. These three concentrated manures are valuable according to their richness in phosphates of lime and nitrogen per 100 parts.

	Phosphates.	Nitrogen.
Bone meal ...	50 to 53	3½ to 4
Fish meal ...	14 to 18	6 to 7½
White castor ...	4 to 5	7 to 7½
Brown castor ...	3 to 4	4 to 4½

Bones are highly phosphetic; castor poonac highly nitrogenous, while fish occupies a middle position.

Manuring should be done regularly and in small quantity. If nitrogen only is required, well-crushed castor cake is the best. If phosphoric acid, so essential to quick flushes, use a mixture of bonemeal and superphosphates. If potash, the dominant mineral element in the leaf, use sulphate of potash. Nitrates should be avoided in Ceylon, because of the heavy rainfall which would wash them out of the soil. The best Ceylon soils contain as much as 50 in 100 parts of dry soil [as good as cattle manure.—Ed., "P. O."], while the poor contain only 10 per cent. And as every 10 per cent. represents in round numbers 2 tons per acre to the depth of one foot, soils may vary as above as much as from 2 tons to 10 tons.

The following table given by a planter relates to the effect of manure upon different plots of old coffee land 35 years' old now in tea:—

	Per acre.				
Before manuring ...	204lbs.	304lbs.	143lbs.	188lbs.	305lbs.
After manuring ...	425 "	726 "	310 "	317 "	637 "

The same writer adds that of the artificial manures used, castor cake and crushed bones gave the biggest increase. In the first flush and young leaf there is more potash and

phosphoric acid with but little lime; but this is reversed when the leaf gets older and coarser; 500lbs. Ceylon F. Souchong removes 441lbs. of organic matter and 291lbs. mineral matter. The organic comprises 19½lbs. nitrogen while the minerals include 11lbs. potash, 4lbs. phosphoric acid and 3lbs. lime. These figures indicate, says Mr. Hughes, the importance of a bulky organic matter containing about 4 per cent. of nitrogen and 5 per cent. of mineral matter. [To this we must take exception. The necessity for "bulk" is not proved in the slightest. It seems as if Mr. Hughes intended it to be believed that plants cannot form organic matter, or in other words grow at all, unless there is a corresponding amount of organic matter in the soil. The truer way of giving what we conceive may have been meaning would be that a perfect tea-manure should contain four parts of nitrogen to every five of minerals. Ed., "P. O."] Crushed oil cakes thus afford excellent manure. [How about the potash which they lack?—"P. O."] We may mention, in case any of our readers are desirous of consulting Mr. Hughes, that his Analytical Laboratory is at 79, Mark Lane, London, E. C.

THE UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA.

FIRST DAY.

(From the "Madras Mail.")

BANGALORE, 9th August.—The Fourth Annual General Meeting of the United Planters' Association opened to-day at the Cubbon Park at 11 A.M. There were present the following delegates:—

Central Travancore ...	G. L. Acworth.
Coorg ...	W. H. Sprott, A. Lambert, A. Boppana, C. E. Murray, Aynsley, H. G. Parsons.
Kanan Devan ...	Baron J. von Rosenberg.
Lower Pulneys ...	H. O. Newport.
Nelliampathis ...	J. C. Abbott, W. Morris.
Nilgiris ...	Hon. Mr. H. P. Hodgson, E. G. Windham.
N. Mysore ...	O. Scot-Skirving, F. S. Hay.
" Native ...	S. N. Chokanna, C. Vasudev Rao.
S. Mysore ...	Jno. G. Hamilton, J. A. Harris.
" Native ...	—
Shevaroyas ...	C. G. Lechler, H. W. Leeming.
Travancore ...	—
Wynaad ...	Geo. Romilly, J. W. Hockin.
North Wynaad ...	—

AGENDA.

1. Secretary's Report and Accounts.
2. Election of Office-bearers.
3. The Report of the South of India Planters' Enquiry Commission.
 - (a) The Labour Question.
 - (b) Coffee-stealing.
4. Coffee-stealing.
5. U. P. A. Finances:
 - (a) Method of raising funds.
 - (b) Partition of funds between Tea and Coffee.
 - (c) Reserve Fund.
 - (d) Reporter's Fee.
6. Registration of the Association.
7. Constitution of the Association.
 - (a) Revision of rules: (a) general, if Registration be decided (b) with special reference to the formation of the Committee.
8. The Casket and Address to the Queen.
9. Subscriptions in default.
10. Scientific Investigation.
11. Malaria.
12. References to the High Court under Act XIII. of 1895.

3. Employment of Counsel *re* Act XIII. of 1859.
4. Roads and Communications.
5. "Planting Opinion."

ADDED DURING THE MEETING.

6. Government Cinchona Bark.
7. Import Duty on Chemical Manures and Tea Seed.
8. Adulteration of Manures.
9. Commission charged on Currency Notes on the Shevaroy's.
10. Export Duty on Bones.
11. Closing of the Mints.
12. Reserve Fund.

The Chairman (Mr. G. L. Acworth) formally expressed the pleasure he gave him to open the Annual General Meeting.

The Hon'ble Mr. H. P. Hodgson moved and Mr. H. G. Parsons seconded that the Secretary's Report and the Accounts be taken as read. The motion was carried.

The procedure of all previous meetings was then confirmed, a formality which until the present occasion had been overlooked.

The Chairman then rose and addressed the meeting as follows:—

GENTLEMEN,—You have heard the Secretary's Report, and I think you will agree with me that during the past year our Executive have not been idle, but that much useful work has been done. The interest of District Associations in this, the head Association, continues to increase, a gratifying fact. But with the increase of interest comes an increase of work, and, to a certain extent, of responsibility, as my successor will find. It is true we have a Committee, whom your Chairman can and ought to consult on all important matters, but occasionally a case arises which must be settled off-hand and in regard to which it is impossible to communicate with a Committee, etc., scattered as is ours. It is in such matters that the Chairman must exercise his discretion and responsibility; and, in doing so, should he not meet the views of all, do not blame him. Whoever he may be, you may rest assured that the line he adopts will in his opinion be for the benefit of the greater number. There is another question, which to my mind falls within the province of the Chairman in consultation with the Secretary to decide. This is what circulars or other matters of general interest it is advisable or otherwise to publish in the Press. I mention this, as I myself was taken to task during the past year for exercising this responsibility, and, in spite of the criticisms passed on me, I still think I was right. Should this meeting differ with me, it will be well before we separate that you should define exactly what are and are not the Chairman's duties, but in my opinion he ought to have a perfectly free hand in this respect. Should it be necessary to consult the Committee on every occasion, so long a time will elapse before all opinions are received, that in nine cases out of ten the subject under reference will have lost a great part of its interest before it appears in print. Gentlemen, the past year has been a memorable one for us, for it has seen the production of the Report of the Committee of Enquiry, which you will shortly consider, and which for so many of us is so vital a matter. Our heartiest thanks are due to H. E. the Governor and the Government of Fort St. George for their courtesy and consideration in securing for us permission to discuss and criticise the Report. Our very cordial thanks are also due to His Honour Sir William Mackworth Young and his fellow Commissioners for the careful and exhaustive enquiry they held, and for the very able Report they have produced. The past year has also seen the birth of the Reserve Fund. May it grow and flourish! Our finances are certainly in a far more hopeful position than was the case a year since, but they are still capable of improvement, and it is earnestly to be hoped that at this meeting we shall come to a decision which will prove satisfactory to all and yet place us beyond anxiety for the future. Another matter for your consideration is the Registration of this Association, without which we apparently hold no legal status. Should you determine that Registration be advisable, it will probably be necessary to make a few alterations in our Rules. In conclusion, gentlemen, I thank you for the very high honour you have done me in appointing me your Chairman for the past year. I thank the Committee for the kindly consideration they have extended me, and, if the same hearty co-operation is accorded my successor, I can only say, that, though he may at times find his duties heavy, he will not find them unpleasant. It only remains for me to place my resignation in your hands, and to ask you to be good enough to fill in the balloting paper for the election of officers for the current year.

The Hon'ble Mr. H. P. Hodgson proposed a cordial vote of thanks to the outgoing Chairman. He thought all would acknowledge the active interest he had taken in the Association's affairs, and the tact and wisdom he had displayed in working out the matters of detail that had passed through his hands during the year. Personally he (Mr. Hodgson) could speak to the great assistance he had received from Mr. Acworth, and the sound advice and great sympathy and interest he displayed in all their business relations. He therefore proposed a hearty vote of thanks to Mr. Acworth and he was sure it would be endorsed not only by the delegates present, but by every member of every District Association in Southern India. (Cheers.)

Mr. G. L. Acworth in a few graceful words acknowledged the vote thus passed.

ELECTION OF OFFICE BEARERS.

The Election of Office-Bearers was then proceeded with, with the following result:—Chairman, Mr. George Romilly (unanimously); Vice-Chairman, Mr. H. G. Parrons; Secretary, Mr. H. Ormerod (unanimously). The newly elected Chairman acknowledged the honour that had been done him in the following terms:—

GENTLEMEN,—I naturally am proud of the honour you have done me in electing me as your Chairman for the ensuing year. Though the Association has made steady way since it was launched in 1894, I feel that its position is not yet absolutely secure, and in consequence I do not underrate my responsibilities. We have had a practical lesson during the past year of how much does depend on the Chairman, and it is with great diffidence that I venture to accept office as a successor to Mr. Acworth. He not only was able to address these meetings with ready eloquence, but he has carried on the business in the interim with an energy born of enthusiasm for his cause. If I fail to come up to his standard you must forgive me, but I shall do my best on your behalf, and I am glad to think that I have in our planting member a friend with whom it is always a pleasure to work.

Mr. G. L. Acworth then rose to propose that the Accounts of the Association should be audited by a professional auditor. He moved at the request of the Secretary.

The Chairman said there could be no question about the desirability of such a course, and the motion was unanimously adopted.

On the motion of Mr. G. L. Acworth, seconded by the Hon'ble Mr. H. P. Hodgson, the following were added to the Agenda Paper:—The Government Cinchona Bark Question, Export Duty on Bones, Duty on Chemical Manures, Adulteration of Manures, Currency Note Question on the Shevaroy's, and Closing of the Mints.

THE PLANTERS' ENQUIRY COMMITTEE REPORT.

The next subject on the Agenda Paper was the consideration of the above Report. At the request of the Government of Madras it was decided to hold the discussion entirely in Committee and the rest of the first sitting was occupied in discussing it.

On resuming the general meeting Mr. G. L. Acworth proposed a vote of thanks to the Commissioners in the following terms:—

GENTLEMEN,—Through the courtesy of the Chairman it is my great privilege to rise for the purpose of proposing a vote of thanks to H. H. Sir William Mackworth Young and his fellow Commissioners. Gentlemen, from this Report I anticipate the best of results, not merely from the Report itself, though nothing could be said too highly in its praise, but also from the character of the authors of the Report, the gentlemen selected respectively by the Government of India, and that of Fort St. George to conduct the Enquiry. Nobody who has had the good fortune to come in contact with Sir William either in his private or official capacity can fail to have been impressed with his exceptional ability, his exceptional industry, his exceptional suavity and courtesy. I cannot but feel that the Government of India must have realised the gravity of the situation, when they nominated such a gentleman President of the Commission of Enquiry, and the event has proved that through the length and breadth of India no more fitting person could have been found. Whatever may be the opinion of gentlemen as to the suitability of some of the suggestions embodied in the Report, there can be but one opinion as to the Report itself, and that is, that it is a monument of patient and thorough investigation, and as a history of our industry cannot fail to be of interest to any intelligent reader, whether a planter or otherwise. What I have said of the selection of the President of the Commission by the Government of India applies equally to that of Mr. Dumergue by the Government of Fort St. George. In Mr. Dumergue we had the good fortune to have a Commissioner who both in Travancore and Wynaad had come much in contact with planters, and knew

much of the ins and outs of our system of working. But that was not our only advantage, Mr. Dumergue can do nothing in a half-hearted manner. I speak of him after an intimate friendship of nearly twenty years, and I know well that he obeys the precept "whatsoever thy hand findeth to do, do it with thy might." In work or play Mr. Dumergue is a man of intense energy, and when to this are added his very great abilities, I am sure you will agree with me that no better appointment could have been made from the Madras Service. On Mr. Hockin's merits I fear it hardly becomes a planter to dilate, for he was our own nominee, and in eulogising him we may be thought to be beating our own drum and praising our own astuteness. But we must not forget that Mr. Hockin cheerfully gave up many months of his time to our service, exiling himself from his family and his work. Mr. Chairman, in the Report we have considered we have a record for all time, and the benefit conferred on the planting community by the labours of the Commission is so great that it is difficult to find words adequate to express the gratitude we feel. I propose, however, that the Secretary be instructed to convey to the three Commissioners in the most expressive manner the very heartiest thanks of this Association for the careful and exhaustive enquiry they held, for the consideration they showed for the convenience of the planters during the enquiry, and for the production of a Report, which as a history of the industry is admirable, and in its logical deductions therefrom a model.

The Hon'ble Mr. H. P. Hodgson seconded the vote. He said it was quite superfluous to say anything after what had fallen from Mr. Acworth. He quite agreed with Mr. Acworth when he said they could always look back on the Report, whatever happened, with pride, because it thoroughly proved that their agitation for the last 30 years was a right and just one and all that they claimed was what men of common sense and intelligence would have expected Government to have given in support of an industry so large as theirs. The motion was unanimously passed with acclamation.

Mr. J. W. Hockin, who was one of the Commissioners, acknowledged briefly and suitably the vote on behalf of himself and the other Commissioners.

COFFEE STEALING.

Mr. J. G. Hamilton (S. Mysore) moved "That a Sub-Committee consisting of the Chairman, Vice-Chairman, the Planting Member of Council, and two members (the mover and Mr. H. O. Newport) be appointed to consider the systems now in use for protecting coffee in transit and to prepare a system for universal adoption to be submitted to the meeting for approval."

The Hon'ble Mr. H. P. Hodgson seconded the proposition, which was carried. The Meeting at this stage adjourned for lunch.

FINANCES.

On re-assembling the question of Finances was discussed.

METHOD OF RAISING FUNDS.

Mr. G. L. Acworth opened the discussion on this subject. He said:—

MR. CHAIRMAN AND GENTLEMEN,—It may be a matter of surprise to you all, that I come forward with so moderate a financial scheme after my demand of last year. I would, however, wish you to understand, that necessity is the compelling motive, and that so far as I am concerned, my opinions have in no way altered. We have now actually formed the nucleus of a Reserve Fund, but my plans for the rapid accumulation thereof having been rejected, the next best thing is to endeavour to persuade you to do that slowly and quietly, which you decline to do with speed. I may be twitted with inconsistency as regards my suggested method of raising the money, for I last year, in the interests of the small proprietor, spoke against acreage assessments, but I have never pretended to be and never hope to be consistent. To come to my plans:—I propose abolishing the present method of subscription altogether, as also to reduce the value of votes, and in lieu thereof to levy a tax of one anna per acre, and to constitute every Rs.10 so raised a vote. Now I claim for this, that the value of the vote is so moderate as to enable the smallest and poorest Association to place itself on our roll, a very great advantage, when you consider that in the next few years new districts are likely to be opened up, that in such districts there will be heavy outlay and no returns for some years, and that it is only natural that in these cases young Associations should shrink from paying Rs.50 or Rs.75 for a vote, when they would be not unwilling to buy a vote or two at Rs.10 each. I claim this as a very great

advantage, for so long as there is one District Association represented on our list, we are not really and truly the "U. P. A." I claim secondly that the tax is so light a one, that no individual proprietor of an established concern, either small or large, will object to it. It has been argued that the tax will fall heavily on the landholder. This I cannot agree with and most emphatically. Surely everybody must be aware, that the tendency of the Association for small concerns of all kinds to amalgamate for the simple reason that by combination they can be worked more cheaply and efficiently and can show a better return than when standing alone. The fact which admits of no contradiction, and whether the large concerns be in the hands of a body of shareholders or in those of a single fortunate proprietor does not matter one jot. It has a great advantage over its small and neighbouring rival. But even were this the case, there is no compulsion on the large proprietor. He is merely to say, "I do not see my way to paying the whole of the assessment, but send you a moiety as a token of my support." Another objection has been, that large Associations, such as the Nilgiris and Mysore, will swamp the smaller ones. Of this I am not afraid, nor does my own Association, a small one, dread it. Our planters' interests are identical, whether we are members of small or large District Associations, and if we smaller ones do not afford to disregard the danger, surely the larger need not take it into consideration. And now I come to the vexed question of individual vote. Gentlemen, I claim that by adopting my proposal you do actually introduce it. Any District Association will be given perfect liberty to dispose of its votes to its private members in any way it pleases up to the value of its subscription without altering the constitution of this, the head association, which will still remain an Association of Associations. This question will therefore be settled at rest. Finally as regards our income. We ought under the scheme to raise between Rs.10,000 and Rs.15,000 a year. This would cover all our expenses, office and so on, and yet enable us to lay by a substantial sum annually to the Reserve. I am not at least anxious that this Reserve should be sat upon by the planters, as *Planting Opinion* recently expressed it, and should never be averse to its being usefully employed. But I think there is a tendency, a rather dangerous one, to invent methods of spending money simply because we have it. I must say I should like to see our Reserve a little larger before we dip into it to any considerable extent, and I consider we ought to ascertain our position very carefully, before we undertake to guarantee an annual subsidy for the employment of an expert for scientific investigation, or for any other cause. Personally, I would rather see this Association dissolve never to raise its head again than that the stigma of a broken plan should be fastened on the community. Mr. Chairman, my scheme is so simple a one as to make long explanation and argument needless, but I may mention that it has already been successfully attempted, and that it is on exactly the same lines as those of the Indian Tea Association, a body, the power and value of which all are readily acknowledge. Gentlemen, I thank you for the patient hearing you have given me, and will now put my Resolutions before the meeting. They are: (1) That the present method of subscription and voting be altogether abolished. (2) That an annual tax of one anna per acre be levied on each Association. (3) That a vote shall be held for every Rs.10 so raised. (4) That the rule relating to proxies shall hold good.

Mr. H. G. Parsons seconded Mr. Acworth's proposal. He said that it was perfectly evident to him that the individual members' scheme, which was so much associated with his name, had not the remotest chance of being adopted, though he was still of the opinion that it was an excellent method of raising funds. Mr. Acworth told them that according to his scheme individual members would be indirectly admitted and he felt certain that it would prove a very excellent measure. One great point in favour of the scheme was that it would enable each Association to raise funds in its own way. He thought it would be difficult, not to say undesirable, to say that because one Association found one way of raising funds for a certain object suitable to itself, that it should therefore seek to enforce that method on another Association. The object being to raise funds for the needs of this Association the objection to admit individual members, directly or indirectly, was more or less imaginary. At the rate he could never bring himself to agree to the whole of Mr. Acworth's scheme, and all that he asked was that it might be given a fair trial for 2 years; if at the end of that time the objections

ged held good, he would be the last person to advocate its continuance.

The Hon'ble Mr. Hodgson opposed the scheme and proposed an amendment to it in the following terms:—

GENTLEMEN,—I propose an amendment on Mr. Acworth's scheme which is now before the meeting. I do so primarily because the instructions from our Association do not allow us to support a scheme for raising funds of which individual membership, or voting power, forms a component part. It is the only point upon which our Association has not given us a free hand to exercise our judgment in matters before this meeting. This alone shows how divided the feeling against the principle is in our District. Personally I am in favour of individual membership with properly controlled voting power, but as I have said, I am bound in this respect to waive my own views and to act to orders, and in any case should never wish to see an important alteration in the constitution of the U. P. A. such as this would be, introduced by a small majority. Now, however, you may take it there can be no doubt that you accept Mr. Acworth's scheme as it is now before you, without reservation, you are admitting the principle of the individual vote. You allow the individual to *purchase a vote and use it* at our meetings. It makes no difference whether he purchases it through his District Association or from the U. P. A. direct. Nor does it alter the position if his vote is recorded through the appointed delegates of his Association instead of through the Chairman of the Meeting, *the individual vote is used* at the meeting to decide any question before it. Mr. Acworth's scheme as it stands, therefore, contains the elements of Individual Membership and on that score we are bound to oppose it. As we are hopeful, however, that by meeting with other in the various points of difference, we may be able to work out an amalgamation of a scheme which we have to put before the meeting, and which in its general principles has been adopted by an Association, we would prefer rather than to oppose Mr. Acworth's scheme *in toto*, to put an amendment to the effect that an amalgamation of Mr. Acworth's scheme and the one we are putting before you be effected and that the details of the amalgamation be considered in Committee. Before I can ask you to support this amendment I must state the various points which we propose should be amended, and in order to do so I will take the headings of Mr. Acworth's scheme as given in his circular dated the 9th of June, 1897, any of which you have all seen. (1) "That the present method of subscribing and voting be altogether abolished." We propose that the present method of voting, through a selected number of delegates, appointed by each Association, be adhered to. And in making this proposal we believe that we are in sympathy with the wishes of a large number of Associations, judging by the circulated proceedings of District Associations. (2) "That an annual tax of one anna per acre in cultivation be levied on each Association." Now with regard to this means of raising funds it may suit some Associations. I can say positively that it will not suit ours. According to Appendix 3 of the Report of the Enquiry Committee—the Nilgiri District is credited with a cultivated area of 37,381 acres, but of this area only 18,000 acres are at present represented by members of our Association, and of this area large blocks are held by certain proprietors who would not be willing to consent to an acreage assessment. Manifestly it would serve no useful purpose, nor would it benefit the finances of this Association, which is the object we have in view, to impose a system of raising funds which we know beforehand will not work, and will not be supported by the men who are to be asked to provide the money. We therefore propose that the subscriptions to the U. P. A. *should be on a fixed minimum*, the amount of such minimum to be according to the means of each Association, with a fixed maximum for all Associations. The minimum might be fixed at 20 per cent. of the average under cultivation assessed at 1 anna per acre and the maximum at the full 1 anna per acre. That every Association shall be obliged to subscribe its fixed minimum, with the option of purchasing votes (pay for every Rs.10 subscribed above its minimum) up to the maximum allowed. One very apparent advantage of the fixed minimum is that the U. P. A. would have an assured income at any rate amounting to the aggregate of the minimum subscriptions payable by the Associations on the rolls, whereas without such provision it could be within the power of any Association, however large, to say, this year we want our money ourselves. There is nothing of importance coming up this year, and we will only take say 2 or 3, 10 rupees votes—and the U. P. A. might find its funds seriously curtailed. By fixing the maximum at an approved sum, we limit the

purchasing power of every Association, and thus check a possibility, that some seem to fear, though I confess I do not, of a rich Association desiring to carry a certain Resolution, purchasing an overwhelming majority of votes in order to do so. (3) "That a vote shall be held for every Rs.10 so raised." This we can accept as it stands protected by the proposed amendment of clause 1. (4) That the rule relating to proxies shall hold good. We accept this. The above are the 4 clauses of Mr. Acworth's scheme, and I have dealt with each of them. With the modifications I have sketched out, the details of which can be worked out in Committee, I would suggest the insertion of a clause 5 to the effect that the subscription list for voluntary donations be kept open. I think we might elaborate a scheme which will meet the views of nearly every Association, or at any rate will go nearer to providing a means of raising funds suitable to all Districts, than anything we have arrived at yet. Having explained matters so far I will put the amendment, which is, "That an amalgamation of Mr. Acworth's scheme and the scheme proposed by the Nilgiri Delegates be worked out, and that this meeting go into Committee to discuss the details, and arrange an amended scheme to put before the general meeting."

Mr. J. A. Harris seconded Mr. Hodgson's amendment and agreed entirely that the scheme proposed was a great improvement on Mr. Acworth's proposal. He took exception, however, to one point in the amendment and that was the proposal to make the minimum according to the paying capabilities of each Association. He would prefer a definite minimum and maximum being fixed and it was possible that he and Mr. Hodgson could eventually meet this. The objection he had to Mr. Acworth's scheme as it stood was that it would depreciate the position of the delegates. In regard to Mr. Acworth's scheme he said it appeared to be a compromise between Mr. Parsons' scheme and the present system, but it was entirely marred by the introduction of the individual element. The U.P.A. was an Association of Associations and not of individual members, and it would interfere with the balance of voting power. He then proceeded at some length to exemplify how this would take place.

Mr. Hay (N. Mysore) supported Mr. Hodgson's amendment, being as he said of the same opinion as that expressed by Mr. Harris of S. Mysore.

Mr. O. Scot-Skirving also spoke in support of the amendment.

Baron von Rosenberg said he was instructed by his Association to support Mr. Acworth's scheme, but at the same time to oppose any scheme of individual membership, and as Mr. Acworth's scheme comprised individual membership, he announced his intention of supporting Mr. Hodgson's amendment.

Mr. Acworth was explaining, when he was ruled out of order, and the meeting resolved into Committee, when it was sought, successfully, to amalgamate Mr. Acworth and Mr. Hodgson's schemes.

On resuming the general meeting, the following proposal by the Hon'ble Mr. Hodgson, seconded by Mr. Acworth, was adopted:—

- (1) That the voting be by selected delegates.
- (2) That every Association be assessed at a minimum of 1 anna per acre on $\frac{1}{2}$ the area under cultivation represented by members of the Association, and that a maximum of 1 anna per acre on the total area under such cultivation may be subscribed by an Association and that a vote shall be given for every Rs.10 so subscribed.
- (3) Each Association shall be allowed to send 5 delegates.
- (4) That the rule relating to proxies shall stand.
- (5) That the Donation list be kept open for the Reserve Fund.

PARTITION OF FUNDS BETWEEN TEA AND COFFEE.

Mr. J. A. Harris withdrew his proposed motion on this subject as he believed the meeting considered his action to be somewhat premature.

THE RESERVE FUND.

This matter also was allowed to stand over till after the discussion on the registration of the Association.

REGISTRATION OF THE ASSOCIATION.

Mr. Acworth, in proposing that the U. P. A. should be registered under the Indian Companies Act, explained the disabilities under which they now laboured in investing their funds and the advantages not only in this respect but in giving them a legal status that would ensue from registration.

The Hon'ble Mr. Hodgson seconded the proposal, which was carried. The meeting at this stage adjourned till 10-30 A.M. to-morrow.

SECOND DAY.

BANGALORE, 10th August.—The delegates met again to-day at 10-30 A.M., and proceeded with the transaction of business on the agenda

paper. The Chairman announced that the discussion on Scientific Investigation would be taken up at 11 A.M. to-morrow, when Mr. Cameron, the Mysore Government Botanist, would be present.

CONSTITUTION OF THE ASSOCIATION.

The meeting then proceeded to revise the rules in view of the fact that Registration had been decided upon. The amended rules will be printed and circulated, and be confirmed by the meeting on Thursday.

THE CASKET AND ADDRESS.

Mr. Acworth explained that the cost of the Casket and Address to the Queen-Empress had been met out of the current funds of the Association, and he asked the meeting to confirm this payment.

Mr. Parsons seconded the motion, which was carried.

Mr. Acworth then stated that some donations had been received privately, but as they had not been utilised, he asked the meeting to authorise the Secretary to return them. This was done.

MALARIA.

The Hon'ble Mr. Hodgson stated that last year the Association had passed a Resolution asking Government for a scientific investigation of malaria on the same lines as that carried on by Surgeon-Major Ross and others. But on the 19th March this year Government had stated that owing to the strain on its Medical Department, the subject could not be taken up at present, but it would not be lost sight of. It was a matter of the utmost importance to planters, and he thought they ought to pass a Resolution asking Government again not to lose sight of the matter but to take steps to appoint a Medical Officer to carry out the enquiry as soon as possible. He would suggest further that in view of the great interest which Dr. Ross had taken in this matter, carrying out investigations at his own expense and in his own time, a hearty vote of thanks should be offered to him for the disinterested way in which he had carried on the investigation of the malarial parasite.

The following Resolutions were accordingly adopted:—"That the Secretary be instructed to convey to Surgeon-Major Ronald Ross the thanks of this Association for the public-spirited manner in which he, at his own expense, has carried on the investigation in regard to the malarial parasite—an investigation which is so much for the benefit of the public."

(2) "That the Secretary be instructed to again address the Government of Fort St. George on the question of the further prosecution of the investigation of the malarial parasite be not lost sight of."

REFERENCES TO THE HIGH COURT.

Mr. Acworth explained how the recent reference to the High Court under Act XIII. of 1859 came to be made and the action the Association took in having its views placed before that tribunal.

Mr. J. W. Hockin said that the statement of the Government of India, that if the High Court decided that if warrants could be served outside the jurisdiction of the issuing Magistrate the law would require alteration, appeared a matter for discussion. He thought they might ask the Government of India to obtain their opinion before any change was contemplated.

The matter was discussed in Committee and the proposal allowed to drop.

EMPLOYMENT OF COUNSEL.

Mr. Acworth explained with regard to the above reference to the High Court that it had been necessary to incur certain legal expenses, and he asked the meeting to authorise the Secretary to pay these expenses.

The proposal, after a brief discussion, was seconded and passed.

ROADS AND COMMUNICATIONS.

Mr. H. O. Newport asked that the matter of the Ahtoor Ghant Road should be allowed to stand over till next meeting, as in the present straitened condition of the Government's funds his Association did not care to press the matter. He asked, however, that the question of the construction of the Dindigul-Podanur Railway might be kept before Government and not allowed to be shelved.

Baron von Rosenberg said that at a meeting of his Association held during the year it had been decided that more prominence ought to be given to the subject of roads and communications by the United Planters' Association. The matter was briefly mentioned in the Secretary's Annual Report, and he had been asked to press the subject on the attention of this meeting. The fact that this was

a year of famine should not prevent their keeping their application in a state of continuity. Generally procrastination in matters of sort was a mistake, and if such procrastination was sanctioned by this Association, it would be gratefully accepted by the Boards and other bodies responsible for the construction and proper upkeep of roads. His Association was strongly of the opinion that the United Association could help them greatly in this matter, and its representations would carry weight when those of individual Associations would fail. In Travancore and other Native States probably no notice was taken of the applications of individual Associations, he felt sure that if the United Association would take the matter up and move in the more important projects, the Governments, Local Boards and Public Works authorities and others concerned would be more willing to listen to their applications. He therefore moved "That the Secretary of the U. P. A. S. I. be instructed to forward to the proper authorities such correspondence on the subject of roads and communications as might be sent up by District Associations, but that the Secretaries of District Associations be asked to limit such correspondence to important cases only."

Mr. G. L. Acworth said it was with the greatest delight he had heard Baron von Rosenberg's speech. At the beginning of his in his Annual Report, he brought a heavy indictment against the Travancore Durbar against their treatment of them in the matter of roads. "Just before I brought forward that statement, I saw a letter in the *Madras Mail* written by Baron von Rosenberg in which he stated that his Association had nothing whatever to complain of, and that the Travancore Government's dealings with them were perfectly satisfactory, whereas Baron von Rosenberg has now stated that very little notice is taken, especially in Travancore, of the complaints of individual Associations." That was just what his Association complained of, and it was gratifying at last to find Kanan Devan coming forward and supporting Central Travancore. They had a British Resident at their back and with Kanan Devan to assist them ought now to get their requirements attended to.

Mr. Parsons supported the Resolution.

Baron von Rosenberg said the letter he replied to in the *Madras Mail* was not Mr. Acworth's but another letter which ought not to have been published; it was scurrilous and abusive and would do them harm with the Travancore Government, not only in the application for roads but in everything else. Besides, in that letter he did not refer only to roads but to many other matters in which the Travancore Government had been of great assistance to them. It had been very liberal with regard to hospitals and dispensary, Magisterial work and Police, in all of which it had shown a wise progress with the extension of the District. In the matter of roads, however, he had always held that they should induce the United Planters' Association to come to their aid.

Mr. Windle having supported the proposition, it was put to the vote and carried.

"PLANTING OPINION."

Mr. Acworth explained that arrangements had been made with the conductors of *Planting Opinion* to reserve a certain section of it for publishing matters of interest to the several Associations and that Section would be entirely under the control of the U. P. A.

The subject was considered in Committee.

GOVERNMENT CINCHONA BARK.

Mr. Hodgson explained the several steps of the Madras Government policy in regard to the question of purchasing bark from private growers of cinchona and proposed the following Resolution:—"That this Association records its satisfaction and approval of the action of Government in purchasing bark from private growers instead of opening new land and purchasing new estates, and recommends the change of policy as likely to foster and encourage the cinchona industry in private hands, and is the best means of securing a continued supply of cheap febrifuge for the people."

The proposal was seconded by Baron von Rosenberg and carried.

DUTY ON CHEMICAL MANURES AND TEA SEED.

Mr. Hodgson explained the stage at which the question of exempting chemical manures and tea seed from import duty had arrived. Before leaving Ootacamund he had received a demi-official letter from the Revenue Secretary stating that the matter had been referred to the Government of India with a strong recommendation.

THE CLOSING OF THE MINTS.

Mr. G. L. Acworth introduced this subject in the following speech:—

GENTLEMEN,—The question of the closing of the Mints and the financial enhancement of the value of the rupee was debated by this Association in 1893, and it was suggested by Mr. Clarke that a Committee be appointed to draw up a Memorial to the House of Commons on the financial policy of the Government. The Resolution was, however, vetoed, and, I think, very properly so, partly because the policy of the Government had not received a fair trial, partly because the Resolution was on the wrong lines, as it would be of no use for any Association to act alone. Matters have, however, materially changed during the past four years, and the position of the rupee has now become critical. I therefore make no apology for introducing the subject once more, though I have no intention of detaining you any length of time, or of wearying you with statistics. It is quite sufficient to state the case broadly, and I am the more encouraged to do so, as I see that at last the financial world is waking up, and that the Chairman of the Bank of Bombay has practically denounced the policy of the Government. Although there have been during the past four years been varying fluctuations both in the value of silver and that of the rupee, the general tendency of the one has been to fall and of the other to rise, until at last we have reached a position, that the price of silver has dropped to 25 $\frac{5}{8}$ per oz., and the rupee has risen to an artificial value of 1s. 3 $\frac{1}{16}$ d., whilst experts think it is likely to touch as high as 1s. 4d., a difference between its official and real value of no less than 6d. in every rupee. Gentlemen, the Government is to be congratulated on its policy in so far as regards its present and fleeting interests. But I am quite certain, certain as I stand here, that, if the present state of affairs continues much longer, that it will have far more cause for bitter regret than it ever had for congratulation, or than it ever would have had if it had had the courage to abide by the laws of political economy, and had not listened to the outcry of interested Services, backed by its own difficulties. Do not think that I am blaming the Services, nothing is further from my thoughts. I look on the two most magnificent Services in the world; their case is a cruelly hard one, and their action has been perfectly natural. Had I had the honour to belong to one of them, I should most certainly have joined them in the pressure they placed on Government. But nothing can reverse the policy of the Government itself. To relieve its own immediate necessities, it adopted a fatuous policy, a policy as fatuous as that of the Lord Protector Somerset in the 16th Century, when he debased the coinage, or as fatuous as that of James II., when he melted down brass cannon and imagined that by calling a piece of metal, worth 1d., one shilling, he could persuade his own subjects, the merchants of Europe, to accept it in exchange for their goods at its face valuation. The attempt to appreciate silver is an attempt to depreciate gold, and I say that the policy of the Government of India has been as fatuous as that of these worthies, as under a clothing of drapery, which concealed the enormity of the crime, it adopted a policy which has ended in placing on the producer of this country a tax which now varies between 40 to 60 per cent. according to circumstances. Does any reasonable person suppose, that, under the conditions of production nowadays, any country is able to face such a terrible and crushing export duty, for it is nothing else? Can we, ourselves, who are now fighting with Brazil and China for our very existence in the markets of the world, long continue the battle under such a handicap? It is absurd to suppose it for a moment, and I say that the policy of the Government is a fatuous one, for it is killing the goose that lays the golden eggs. India is nothing if not an exporting country. She has practically no manufactures, and her exports are her life blood, her bones, her sinews and her marrow. Gentlemen, I speak in the interest of the whole of the producing classes of India. I speak also in the interests of the Government of India itself, for I believe that, if the present policy is long continued, the products as we have in which we compete with other silver using countries must die a natural death from the heavy taxation imposed on them, and the enormous corresponding bounty given to those countries. Gentlemen, at the time of the closing of the Mints I was much astonished that the mercantile communities of the great centres did not oppose the action of the Government and combine in a remonstrance, even as they did when the cotton duties were imposed. I presume what they desired was a stable exchange, that they were weary to death of the violent fluctuations therein which hampered their operations, and that they never imagined that the difference between the actual and artificial value of the rupee would assume such gigantic proportions. The experience of the past four years, however, has proved that the rupee fluctuates as violently as ever, and that in this respect the merchant has been in no way benefited.

Should the same fatal policy be continued, the experience of the next four years is likely to prove that the bounty given by India to the silver using countries will go far to throttle any trade in which we compete with those countries. The merchant then will suffer more heavily than ever, and I therefore believe we shall have them, the Bankers, and the Millowners' Association on our side, while I presume there can be no doubt that such bodies as the Indian Tea Association and the Ceylon Planters' Association would join us in a remonstrance to the Government of India, or better still, in a petition to the Secretary of State and the Houses of Parliament. I therefore propose:—"That the Secretary be instructed to communicate with all the large producing Associations both of India and Ceylon as also the Chambers of Commerce with a view to ascertain their feelings on this question, and with the object of endeavouring to form a combination for the purpose of representing to the Secretary of State and the Houses of Parliament the critical condition of the producing industries of this country, and to forcibly point out that, if the present policy is long continued, the export trade of India must seriously suffer, with the result that the final position of the Government of India will be worse than if they had never made the fatal blunder of tampering with the currency."

Mr. Hodgson said he was quite unprepared to speak on such an intricate subject, but he was quite prepared to support it by seconding Mr. Acworth's Resolution. He was sure all would feel sympathy with what Mr. Acworth had said. They were suffering enormous loss from the disparity between the real and fictitious values of the rupee, and this disparity seemed daily to be growing greater.

The Resolution was carried with acclamation, and the meeting adjourned till 11 A.M. to-morrow.

THIRD DAY.

BANGALORE, 11th August.—The delegates sat again to-day at 10-30 A.M.

THE RESERVE FUND.

Mr. J. A. Harris proposed: "That for the guidance of the Committee dealing with the Reserve Fund, this meeting wishes to place on record (1) that the Fund will be regarded as having been established for the purpose of providing for extraordinary expenditure; (2) that extraordinary expenditure shall be understood to mean such objects as the Committee consider cannot be fairly charged to current expenses; (3) that under no circumstances shall the Reserve Fund be drawn upon unless two-thirds of the Committee are in favour thereof."

The Hon'ble Mr. Hodgson seconded the Resolution, as he thought it advisable that some line should be laid down for the Committee to work on, while at the same time it was necessary not to tie their hands too much.

The Resolution was carried.

EXPORT DUTY ON BONES.

Mr. O. Scot-Skirving opened the discussion on this point and pointed out that the export of bones from the country was heavily handicapping the planter, and proposed: "That the Association again address Government on this matter to see if a remedy could be devised which would retain manures for agricultural purposes in this country from which it was now being exported."

Mr. Parsons supported the proposition.

Mr. Acworth opposed the proposition on the ground that it was contrary to free trade, and they were never likely to get it.

Mr. Hodgson agreed with Mr. Acworth and said it was a mistake to ask Government to legislate against its principles.

The Chairman put the Resolution to the meeting, and it was carried by 15 to 8 votes.

CURRENCY NOTES ON THE SHEVAROYS.

The question of Government's intention to re-impose a charge of commission for changing currency notes in the Yercaud Sub-Treasury was dealt with in Committee and a Resolution passed supporting the action of the Shevaroy Planters' Association.

SCIENTIFIC INVESTIGATION.

This subject took up the greater part of the day's Proceedings. It was divided into two parts, viz., Leaf Disease and Scale Pests. Mr. J. Cameron, Superintendent, Mysore Government Gardens, was present during the first part of the discussion and gave the meeting the benefit of his views on the subject.

LEAF DISEASE.

Mr. J. A. Harris said :—

GENTLEMEN,—I rise with great diffidence to open this discussion. I am perfectly aware that there are others present far better qualified to do so than I am. The fact that I am the representative of a district which has suffered most acutely from leaf disease during the past year is the only claim I have to introduce this subject. Since I first proposed a discussion on it I have been in communication with various correspondents, and have made myself better acquainted with what has been published relating to *Hemeleia Vastatrix*, and I have reluctantly come to the conclusion that further investigation by an expert would not be likely to add much to what is already known. Most of you are doubtless familiar with Mr. Marshall Ward's Report, but, for the benefit of those who may not have perused it recently, I place it on the table, and refer them specially to the summary of the conclusions he came to, on page 29. It will be seen that he has clearly established the life history of *Hemeleia Vastatrix* and I believe it to be the opinion of experts that nothing more remains to be done in this direction. You will observe that Mr. Marshall Ward was of opinion that the origin of leaf disease was to be traced to an invasion of spores from the jungle, that it did not permeate the tree, but confined itself to the leaves, and that no external applications could have permanent results unless the sources of re-infection were removed. All the experiments, many and costly, which he carried out, failed to remove the source of infection; lime and sulphur appeared to kill the parasite—but the benefit was only transitory, as the trees became re-infected with rust as bad as ever. I believe that other similar experiments had proved the same result, viz., only a temporary cure. It may be argued from this that there is still scope for the expert, but I am inclined to the belief that, since the disease is not constitutional, but external, attacking only the leaves, a cure of a permanent nature is not likely to be discovered; and that we should turn our attention, as intimated both by Mr. Marshall Ward and Dr. Trimen, to maintaining our trees in such strong vitality as will enable them to resist the attacks of this pest. The question as to how this may best be done is a wide one, but may briefly be answered thus, by careful cultivation and judicious manuring. I propose referring somewhat briefly to the former and at greater length to the latter. I use the word "cultivation" in a wide sense, and include pruning, digging and shading operations. With regard to pruning, I would draw your special attention to Mr. Marshall Ward's opinion that we should aim at making our plants grow leaves during the time that the disease is least likely to be propagated, and that we should avoid the growth of young and succulent wood when the spores are most blown about—with the object of having our trees at the time of visitations covered with matured leaves both able to resist the disease and of having them as far as possible free from young ones on which the spores germinate with great rapidity. This I am convinced is sound advice and should be carried out as far as labour supplies and seasons will admit. I think there is a decided tendency on the part of planters, in Mysore at any rate, to have too much wood, and a year like the past, when we have all suffered so severely from *Hemeleia Vastatrix*, accentuates the evil caused thereby. Excessive wood not only reduces the crop-bearing powers of a tree, but supplies so much superfluous surface for the parasite to feed on. The reflection that one branch of a coffee tree may bear at the rate of 1 cwt. an acre, and 10 branches $\frac{1}{2}$ ton per acre is calculated to raise a doubt in our minds as to the soundness of our pruning operations. Mr. Ward recommended the collection and destruction of fallen leaves. In Ceylon on some estates they actually burnt them, but this would be highly objectionable in Mysore, where we frequently get bad attacks of leaf disease in the hot weather, unless the leaves were carried away and burnt outside the estate, which would be laborious. It is rather curious to notice that in Ceylon the worst attacks of *Hemeleia Vastatrix* were usually in the S. W. Monsoon, during the months of June, July and August, whereas in Mysore, and I believe in other parts, the worst visitations come in September, October and November, and sometimes extend over January and February. Moisture, heat and air being necessary for the germination of the spore, I presume that the damp chill of our S. W. Monsoon checks it. With reference to digging operations, the late Mr. Pringle was of opinion that deep cultivation checked the disease, which I consider a very moot point, the tendency nowadays being to avoid stirring up the soil more than necessary. Draining in moist land is certainly beneficial. The old-fashioned

method of mamoty digging right up to the stem of the tree, though it may not directly have affected leaf disease, was doubtless injurious, in that it disturbed and destroyed the mass of fibrous roots, and prevented them from performing their fruit-bearing functions. The question of shade is a very important one in relation to *Hemeleia Vastatrix*, but is so much governed by local circumstances that I do not purpose entering into it, but will pass on to consider the all-important question of manure. The object of manure may be said to be to supplement the soil with such elements as are necessary for the maintenance of the tree in such vigour as to enable it to put forth leaves, bear fruit, and resist the ravages of disease. The two chief points to be decided are: (1) The best time for putting manure out, and (2) What manures should be applied. As regards the first point there is some diversity of opinion. The late Mr. Pringle advocated application during the first breeze of the rains at the end of July or August, in order to supply the tree with food as soon as possible to make up for the monsoon loss. Mr. Pringle specially recommended the application at this period of nitrogenous manures, as if applied after crop the nitrogen comes into action immediately showers fall, and checks the formation of blossom, and fosters the growth of wood. He attributed the failure of blossom to a great deal to this cause. I do not feel competent to decide this question, but I am inclined to believe Mr. Pringle was right, though I consider September, as far as Mysore is concerned, a better month than August for applying manure, as we frequently get heavy rain in the latter month. Applications must, however, be greatly influenced by the supply of labour. On many estates in Mysore it is impossible to put out all the manure that is available directly the S. W. Monsoon is over, consequently the usual practice appears to be to do as much as is feasible in September and the remainder after crop. Under these circumstances, care should be taken to apply what is suitable at each time. Another point to be borne in mind in applying manure is that already alluded to while considering pruning, viz., to aim at having matured leaves on the trees, and an absence of young wood at the time when an attack of *Hemeleia Vastatrix* may be expected. Now I come to the second division of this question, viz., What manures we should apply. To decide this we must determine three things: (1) What are the elements of the soil; (2) What are the component parts of the manures at disposal; (3) What is taken up by a coffee tree. I trust I shall offend no one when I say that I believe there are few planters who have satisfactorily mastered these points. I believe there exists an immense sum of ignorance among us regarding them, and I claim to be as great a sinner as any. We are all acquainted with the genus of planter who stakes his faith on manure! manure! and who piles it in regardless of the elements of his soil or the requirements of the plant. Another gentleman, a little more enlightened, seeks to apply a manure which contains a portion of all the elements that are considered necessary. Is such a system as this worthy of so enlightened an agriculturist and of such an industry as the planters of South India carry on. I say so emphatically! It is groping in the dark with the meanest light within our reach. The remedy is in our hands. I feel assured it lies in the application of scientific principles to our agricultural pursuits. There may be, no doubt there are, some of our body who have considerable scientific knowledge, but many, I am convinced, possess little or none, and have not the means of attaining any. I require therefore some one to tell us what to do, and this brings me to the one practical proposal I have to make, viz., that the plant industry of Southern India requires the services of an Agricultural Chemist. Let us just consider in connection with the three points I have mentioned above what he could teach us. And first as regards Nos. 1 and 2, the elements of soil and manure. Dr. Voelcker says "The infertility of a soil is often explained by an analysis. It may be suffering from the want of some material indispensable to the growth of plants, or it may contain something poisonous to plants. In either case chemistry is generally able to enlighten us, and to point out means of remedying the evil. Of a soil whose fertility is impaired we can all pronounce that it wants manuring, but with the assistance of analysis we may also learn what substance the soil is deficient in, and what kind of manure it wants, with his knowledge we may restore its fertility with the most economical manure." If a soil is rich in one element it is sheer waste of money to apply a manure containing a large proportion of that element, and if a soil is lacking in any one element no manure is of much value that does not contain that element. Considerations such as these must convince those who have worked blindly of what stupendous folly we have been

ty. We have spent thousands of rupees year by year in the application of manures, and have been all the while ignorant what our manure was crying out for and perhaps what the manures contained. There is the other point, what the tree demands. The late Mr. Pringle maintained that the leaves and branches took a great deal more out of the tree than the fruit, and that too much stress had been laid upon the composition of the latter, and not enough attention given to the former. Here again is further scope for the expert. One of you may perhaps be inclined to argue that analysis of soil is good, and analysis of manure is good, but why go to the expense of employing an expert? In reply, I would point out that there are many and cogent reasons for getting a thoroughly competent man in Home. In the first place, I doubt if the analysis of a sample of manure sent Home can be a true one, the mechanical conditions of it must undergo changes during transit; 2nd, a man on the spot would be in a position to observe the organic condition of the soil, which would enable him to give us a more accurate and valuable report. 3rd, in most soils there is an immense quantity of matter which at certain stages of decomposition fosters the growth of fungi, to which class, I believe, with leaf disease and leaf rot belong, and useful information regarding the treatment of this should be obtained at his hands. Again, experiments of different sorts might be conducted in connection with manures and as regards the requirements of the tree, as Mr. Pringle suggested, a standard for one artificial manure might be established. Moreover, those of us who are ignorant of agricultural science require practical assistance even when possessed of certain data, that is to say, given a soil analysis, a manure analysis, or an analysis of what the tree demands, we should be materially assisted by being guided as to what quantity of the analysed manure or analysed soil required to meet the analysed demands of the tree. In the coffee industry, at all events as regards the province of Mysore, I am in my opinion at the present time passing through a crisis. Few of us are working virgin land, and the distinctly increased debility of our trees, both young and old, manifested by their less successful resistance to disease, seems to indicate exhaustion of soil. It moves us to bestir ourselves, and to use our best energies and intelligence. But by ourselves we are impotent to cope with so intricate a question as this. Dr. Leather, the Government Agricultural Chemist, in his Report recently published, states that there is probably no part of agricultural practice so imperfectly understood as soil exhaustion, and that the degree varies greatly with the crop grown. Here is another and powerful argument in favour of my proposal, which, after all, involves nothing more than what others at Home have recourse to, viz., agricultural chemistry. You may perhaps be disposed to say, "Your conclusions may be perfectly correct, but we fail to see the bearing they have on Hemeleia Vastatrix." If so, I would refer you to my opening remarks, when I stated that in my belief our best hope of contending successfully against the disease lies in careful cultivation and judicious manuring. I pointed out a few matters regarding the former for your consideration. As regards the latter, I have ventured to criticise severely the mode of procedure common to many of us, and endeavoured to show that we are in urgent need of elucidation which we can only receive from the hands of a thoroughly competent Agricultural Chemist. I do not propose to lay before this meeting a definite scheme as to how we may accomplish this object. I shall for the present merely move a resolution involving the general principles of my proposal, trusting that the result of this discussion will be the evolution of a scheme which will be practicable and in accordance with the interests of all concerned. I will, however, broadly indicate the lines on which I consider effect may be given to my proposals. I am perfectly aware that a great difficulty faces us at the outset, and that is the raising of the necessary funds, but I feel assured that this great Association will not allow a matter of such momentous interest to be shelved, because it appears at first sight that Funds will not be forthcoming. In the first place I think we should approach the various Governments under whose rule we are and solicit their help, giving due emphasis to the enormous interests concerned, the benefits likely to be derived. Then I think the U. P. A. should be prepared to guarantee a certain amount of work, presented in Rupees, and to pay all initial expenses, and those connected with such experiments as it might be deemed desirable and feasible to conduct. This is not such an alarming proposal as it appears, for of course those individuals who required analysis would pay the fees themselves, or direct to the analyst or to the U. P. A., as might be arranged. I could further suggest that District Associations should be invited to subscribe towards defraying the expenses that would be incurred

were this proposal to be carried out. Generally speaking, I shall be strongly opposed to the U. P. A. now that it has placed itself on a firm financial basis, soliciting donations, but I think such an object as that now under discussion may be fairly made an exception. It is highly probable that one district would be interested in a much greater degree than another, and would be eager to contribute; opportunity should certainly be offered to it to do so and commit proposals to consideration. I beg therefore to propose:—

"That this Association is of opinion that the time has arrived when the service of an Agricultural Chemist are essential to the future welfare of the Planting Industry in Southern India."

Mr. E. G. Windle seconded Mr. Harris's Resolution. It was, he said, the most important subject that had come before the meeting. It was not possible for them to do their planting in a scientific manner until they got the assistance of an agricultural chemist; it was doubtful if they could proceed much further.

Mr. Parsons agreed in the abstract with what had been proposed, but before going to the extent it was proposed to do, he thought they ought to help themselves as much as possible by experimenting themselves. The first thing a specialist would do would be to ask them for the result of their experiments. Besides, he was not sure that an agricultural chemist was the proper man to deal with leaf disease. The man they wanted was a Botanist. Personally, he believed the best thing that could be done was to introduce better strains of coffee, and he was carrying on experiments on these lines himself on a small scale which he was glad to hear from Mr. Cameron were fairly successful.

Mr. Hay cordially supported the remarks made by Mr. Scott-Skirving in support of Mr. Harris's Resolution.

Mr. Hodgson quoted from a G.O., dated the 16th January, 1892, in which the late Mr. M. A. Lawson had said that nothing beneficial would accrue from any further investigation into the life history of Hemeleia Vastatrix and therefore Mr. Harris was right in abandoning his proposal to have an expert to investigate into the subject in favour of an Agricultural Chemist on superior cultivation.

Mr. Hockin said his was the Association that advocated the introduction of blight proof variety as a better cure for the ills of Mysore than the engagement of any specialist. He stated it as his experience in Wynad that leaf disease was always more prevalent in wet seasons than in dry, and three or four months' drought at the beginning of the year was always instrumental in keeping the blight down and giving good crops. He advocated, with Mr. Parsons, the introduction of better strains of coffee as a cure against the disease. He thought they could in this direction get more help from a man like Mr. Cameron than from an Agricultural Chemist.

The meeting then went into Committee to discuss the matter. Before Mr. Cameron left, it resumed into General Meeting to hear what he had to say on the subject. He thanked the meeting for giving him the opportunity of being present and hearing the discussion, which had been ably carried on. He thought what was wanted was a combination of the remedies suggested that day. They required good cultivation, the aid of an Agricultural Chemist and an improvement in the strains of coffee. It was doubtful if they could eradicate leaf disease altogether. It could only be done in two ways—one was by the discovery of an agency that would destroy the spores of Hemeleia Vastatrix, the other was by the drastic remedy of removing the coffee altogether for a long period and substituting some other crop. He advocated the formation on first class estates of experimental nurseries and gardens for the crossing of strains and producing blight proof varieties and gave an instance of some exceedingly good results he had seen from cross fertilization on Mr. Brooke Mockett's estate at Munzerabad.

The Chairman proposed a hearty vote of thanks to Mr. Cameron for being present and giving them the benefit of his advice on the subject.

The meeting then resolved into Committee again, when the following resolution was passed which was afterwards confirmed in General Meeting:—"That a Sub-Committee be formed to consider the various proposals put forward, and to advise as to the result in General Meeting and that for this purpose Messrs. Harris, Windle, Acworth, Parsons, Hockin and Leeming do form the Sub-Committee."

SCALE PESTS.

The Hon'ble Mr. Hodgson said that the delegates had seen the correspondence that had taken place between the Madras Government and the Commissioner of Agriculture, Hawaii, with regard to employing the services of an entomologist and the introduction of

lady-birds in the destruction of scale pests, subsequently a G. O. had been issued, dated the 27th July, which ran as follows:—"In view of the decided opinion expressed by the Commissioner of Agriculture, Hawaii, that the work of searching for and introducing the natural enemies of the insect pests should be entrusted only to a skilled entomologist, one who has made the life habits of the beneficial and injurious insect a special study, lest injury instead of benefit might arise, H. E. the Governor in Council considers it unsafe to apply for or introduce lady-birds from Australia except under professional advice and the supervision of an expert. If when the services of such an expert are procured he advises that a consignment should be obtained, H. E. in Council will be ready to take the necessary action in the matter and to contribute half the cost as proposed by the Hon'ble Mr. Hodgson. With reference to the Hon'ble Mr. Hodgson's request that the Government of India should be addressed in order that enquiries should be made of the tea planters in Bengal as to their willingness to share the cost of an entomologist with the planters of South India, H. E. in Council would observe that it would be preferable if such negotiations were carried on directly with the planters of Northern India. Having regard, however, to the public benefit which would probably result from the labours of such an expert, the Government is desirous of seeing one employed at an early date, and as the Department of entomology is under existing administration under Imperial direction, a specialist being entertained in the National Museum at Calcutta to carry out investigation on behalf of all provinces in India, the Government of India will be addressed with a view to ascertain whether the services of the Imperial Officer in question can be spared for carrying on Entomological investigation in this Presidency, and if not, whether it will now be possible to appoint another officer for that purpose. The Government observes that in the paper read by Mr. H. O. Newport at a meeting of the Lower Pulneys Association on the 29th February, 1896, he stated he was having two varieties of lady-birds sent out from Australia and that on their receipt he proposed to experiment with them and to communicate the results obtained to the Association. The Hon'ble Mr. Hodgson will be requested to be good enough to ascertain and state whether any further action was taken by Mr. Newport in the matter and if so with what result." In the first part of the G. O. Government had come to a decision that it would not be wise to attempt to introduce the lady-birds from Australia except under the advice of an entomologist. It was apparent that Government had reconsidered its decision, because in a conversation he had had with the Members of Government in June last it was almost decided that the two varieties that had done such good work in Hawaii should be introduced immediately, and he undertook to guarantee half the cost of importing these insects. He further mentioned that he would like the correspondence on the subject which had passed between the Government of Madras and the Government of India for information and that it should be sent to the Indian Tea Association in Calcutta. His reason for doing this was because in his letter Mr. Marsden had said that red spider among other pests had been eradicated, and he thought that if the planters in North India saw this they might like to join in paying some portion of the expenses necessary. It was decided by Government, however, that they should address the planters of Bengal direct, and he would therefore propose that the Secretary be instructed to forward copies of the correspondence to the Secretary of the Indian Tea Association for their information. The latter part of the Government Order was very satisfactory. It said that Government was desirous of seeing an entomologist appointed at an early date, and had already communicated with the Government of India as to the best means of obtaining one. That showed that the Madras Government had taken a great interest in this subject and he could speak himself of this being the case. He had had several opportunities of talking the matter over with the Members of Government and had always received careful attention and sympathy. Mr. Newport, who had a great deal of knowledge on the subject of lady-birds, would speak on the subject. All he (Mr. Hodgson) would say then that this scale pest was increasing rapidly, and in Districts in which it existed it was almost as serious a matter as leaf disease was in the Districts where that existed, and everything should be done to eradicate it.

Mr. H. O. Newport said:—

GENTLEMEN,—In supporting Mr. Hodgson's remarks I should like to say a few words on the subject. At last year's meeting I read a paper referring to a new species of lady-bird that I had discovered feeding upon the green scale in the Lower Pulneys, and which I subsequently found to be the *Chilocorus nigritus*, and at the same time

brought to notice the grand success that had attended the introduction of foreign coccinellidæ into the Sandwich Islands as a cure for coffee scale and blight, and I read extracts from some copies of the *Hawaiian Planters' Gazette*, and Professor Koebele's Report on which papers were sent to me by Mr. James Stanes, who was in Hawaii and saw for himself what the lady-birds had done and was doing there. I was then asked to continue my experiments. I regret to say that I have been unable so far to bring about any practical result. The lady-bird that I noted had not been previously observed to prey upon the green scale, *Lecanum Viride*. It was doing good work, however, and protected the species I found as I could. They increased slightly but not rapidly enough to make any appreciable difference in the scale, which increased terribly. The lady-birds did good work where they were to be found; the green bug disappeared for some three or four months during the monsoon and I found then that the lady-birds hibernated also. The few specimens I had I was unable to keep alive; I had none of the scale to feed them on. When the scale reappeared I found the lady-birds did not come out at once, but took some time longer to hibernate, and when they did appear, increased in number very slowly. My want of success in this matter I put down to my ignorance of the subject for, as I stated last year, I am not an expert entomologist,—or indeed an entomologist at all. It is possible that there may be a good deal in the suggestion of *Planting Opinion* where it said that the slowness of increase may be due to the presence of parasites. The fact of their being indigenous would point to the presence of some such parasite or natural enemy. On this I had not sufficient technical knowledge to determine. The matter had been then—or even if it were now—taken up by an expert, there is, I think, every chance of something being made of it, and our indigenous scale feeding insects made use of. However, it may be, my experiments in this line have not been productive of any lasting effect. Seeing that the green bug appeared so much more than the lady birds this year, I tried other methods of exterminating the bug. I obtained through the kindness of Messrs. Leighton & Co. of Madras, a spray solution from the Chiswick Soap Company, "Spimo," and sprayed this evil smelling liquid on to the tree in proportion of 100 parts to 1 as directed by the Soap Company. This had no effect whatever; in fact the bug seemed to multiply on it! Stronger solutions had better results, but even then I did not succeed in killing out all the scale on any one branch or leaf. I also tried a mixture of kerosene and soft soap in water in various proportions—also an infusion of quassia bark. Also mixtures containing in various proportions, turpentine, tobacco decoction, sulphur, lime, etc. Some of these seemed to have temporary slight effect, but none did any lasting good. With regard to the spray solution I tried, I found that it was very difficult to spray the coffee sufficiently through to reach all the small crevices of the stalks and leaves, and was much hampered by the closeness of the trees bearing coffee. This I fancy will be found the great drawback together with the difficulty of finding a mixture or solution that will really kill scale to any spraying operations and finally the impossibility of carrying out such operations in districts such as the Lower Pulneys, where water is scarce, and the great expense involved even in places where water is to be had even if in sufficient quantity for long transport. Besides this I have had some correspondence with Mr. E. E. Green, of Ceylon, on this subject, and he sent me some varieties of a blight that he had found attack the *L. Viride* in Ceylon. This I affixed to the leaves covered with any green bug and tried to propagate. I even sewed the two leaves together—thus affected by the blight to the underside of the leaf attacked by the virulent green bug. Mr. Hodgson also sent me some specimens of another blight that he had found upon the black bug and coffee in the Nilgiris, but neither of them was successful in transferring the bug on my estate. This, however, I think may be due to dry weather. A letter appeared in the *Ceylon Observer*, dated the 6th February, to which I replied in *Planting Opinion*. Since then I have had some correspondence above referred to with Mr. Green. I have not, however, yet been able to send him the living specimens of *C. Nigritus* as asked for owing partly to late appearance and partly to want of time. So much for my experiments. The conclusion I have come to, therefore, gentlemen, is that not only, as I said and thought last year, lady-birds would be the easiest and most effective way of getting rid of our scales, but that it is the only possible way of doing so. Our Hon'ble Member in Council took up the matter as you know after the last Annual General Meeting, bringing it up first at his District Association at a Meeting at which I had the plea

ing present, and subsequently taking it up direct to Government, and he was fortunately able to instil interest then in the matter and get them to act upon his suggestion. I need not read you the letter at the Government of Fort St. George wrote to the Commissioner of Agriculture of the Sandwich Islands, nor need I read to you the exhaustive and satisfactory reply sent by Mr. Marsden to our Government, as these papers have been published both in the daily papers and in *Planting Opinion*. I regret that Mr. Marsden, in sending the papers that we enclosed with his letter to the Madras Government, did not also send copies of the *Hawaiian Planters' Monthly* for April, August, and October, 1895, as these contain a lot more information, and in my opinion give a lot of useful and necessary information about the colonisation of these useful predaceous insects. I have, however, published these extracts in my first pamphlet on the subject, dated February, 1896, in pages 11 to 20 (and I believe Mr. Hodgson has already placed them before Government). To show you that lady-birds do most effectually and thoroughly exterminate the scale pests on coffee as well as borer, red spider and other injurious insects on coffee, tea, sugarcane, oranges and all iron trees, I should like to read you some extracts from the papers and reports enclosed by Mr. Marsden in his letter to the Government of Madras. [Mr. Newport read several extracts from the *Hawaiian Planters' Monthly* and other papers.] This all, I think, goes to prove conclusively that the lady-birds if introduced will do all that we want and more. And now, gentlemen, just a word or two to show you the gravity of our situation here in South India. There is a tendency, I am afraid, among planters to think little of this, and few really know and appreciate the gravity of the case. Possibly some may think that I am carried away with my subject and painting a blacker picture than is necessary or is warranted, or possibly some may think I am inventing an ingenious method of relieving the P. A. of its newly-obtained Reserve Fund. But joking apart, it is not so, I can assure you, and if, in trying to give you some idea of what the introduction of the green scale, *L. Viride*, has really meant to us I refer frequently to my own district and my own estate, it is only because it has been the first District attacked and the effect on my own trees is what I have been able most thoroughly to follow. I trust that you all, gentlemen, will see it in its right light, and that as a serious and solemn warning that is *not* to be lightly disregarded. A fearful enemy has crept among us and he must be grappled with firmly and strongly and conquered, and that *at once*, before greater harm is done, or we shall be driven back step by step, and before long have to give up our estates and seek some other means of livelihood. How this green bug came into India is still an open question, but there is little doubt that it has been brought over from Ceylon by coolies. The Madura District is, as you know, the source of the principal labourers on the Pulney Hills, and the probability is that the eggs of this scale have been brought over by some of them in cloths or cumbles. I have already described the bug itself in the pamphlets I have circulated. Its life history has been gone into very fully by Mr. E. E. Green, of Ceylon. The effect on the coffee is in a few words this: it attacks early in the year and spreads rapidly; being green and keeping to the underside of the leaves, it is often not noticeable; for months it remains like this and a field of coffee is soon run over by it. The stock will not look any the worse. The leaves will not fall off at first and remain green and apparently flourishing—but the poison is there. As the rains commence, the bug begins to leave and its awful effect begins to be apparent. The leaves get covered with the transparent sticky excrement of the bug, which soon turns black. Then the leaves begin to fall, the wood shrinks and the whole field in a few weeks become sticks. Some trees die out at once, but not all; they recover later on but not till after a hard struggle, which absorbs all their strength and leaves them no sap to put into new crops. The bug-attacked tree *does not bear for two years* subsequently to its attack by the *L. Viride*. Last year we had a bad attack of bug in the Lower Pulneys. It came on as the young berries were beginning to form, and the effect was to destroy the young leaves, which then dropped, leaving us only 35 to 50% of the crops to come into the store. Of the young crop we actually had on the trees estimated crops of 30 tons were reduced to 10 or 12; of 20 tons to 7 or 8. This year on one estate of 250 acres it is doubtful if even 5 tons will be picked; on another estate of 100 acres 6 tons, and another property of 260 odd acres only 1½ tons. These figures speak for themselves. Gentlemen, estates are working at a loss now from the effect of the awful scale. Coffee stealing nowadays does not leave any wide margin between income and expenditure.

and we have found ourselves perilously near to the line below which coffee planting will cease to pay at all. Even if this bug spares our trees, it does not spare the crops, and if something is not done, and that quickly, we on the Lower Pulneys will have to abandon our estates and leave the District. Green bug has increased fearfully and rapidly during the past year. Many times the acreage that was affected when I last addressed you on the subject is now riddled with green bug. It is spreading North, East and West. It has appeared on the Sirumallais, to the East of the Lower Pulneys, has gone to Aycoody to the West and has now reached the Nelliampathies also. I think you will allow, gentleman, that this is truly a serious and alarming state of affairs. The remedy, however, is here, and the matter is so grave a one and affects such deep interest that we shall not, I feel sure, appeal to our Government for assistance in the matter in vain. We are not merely sitting still and expecting others to come forward and help us. We are not hesitating about putting our hands into our own pockets. We are prepared, even in our small District and in spite of losses, to raise some Rs.4,000 or Rs.5,000 towards the employment of expert assistance if necessary. One gentleman owning 100 acres or less of coffee has declared that he is prepared to put down Rs.1,500 or even as much as Rs.2,000 alone. This too will show, I think, that the matter is really serious. A great deal of thanks is due to Mr. Hodgson for the able manner in which he has taken up the subject and the interest he has taken in it, and the interest he has been able to get the Government to take in the subject. I trust that he will carry on the good work he is doing and will keep the matter before Government, and at the same time impress upon them the grave necessity for speedy action in the matter. I am given to understand that Government have decided not to import any experimental consignments of lady-birds without the advice of an entomological expert, and that the employment of an expert will need reference to the Supreme Government. This I am afraid means loss of time. I hear also that the Madras Government is in communication with the authorities at Calcutta with the object of engaging if possible the services of some entomologist in India. We can but regret that Professor Koebele cannot leave Hawaii and come to us, but at the same time must acknowledge that the Hawaiian Government would be weak to allow the services of so efficient and successful entomologist to be taken elsewhere. I should like however to bring to your notice the name of Mr. E. E. Green, of Eton, Pundaloya, Ceylon, a gentleman who has studied the subject of Coccidæ in Ceylon, who is thoroughly conversant with this particular subject and an eminent and successful entomologist. I think I am right in saying also that he is the Honorary Entomologist to the Government of Ceylon. I should like to suggest that the Government of Madras address Mr. Green on the subject and ask him if he would be willing to come over and undertake the working out of this subject on the lines of the experiments so successfully done in Hawaii. That to save time—and possibly expense too—Government employ the services temporarily of some local entomologist in Australia to collect and forward consignments of lady-birds and Mr. Green be asked to receive these in Ceylon, bring them over to India and set them to work here in our affected parts. The question of having reliable data for an expert to go upon, if engaged, has been raised. In this matter we have not only precedent in the work done in Honolulu, but have reliable data and information with regard to our scales in Mr. E. E. Green's Book:—"The Coccidæ of Ceylon" now, I believe, in the publisher's hands.

Mr. Acworth said he had great sympathy with the planters of the Lower Pulneys. He believed green bug was even a more serious evil than leaf disease. Leaf disease they had always with them, but now he firmly believed that green bug would travel northwards just as leaf disease had done and would thus add to the trouble. The Lower Pulneys were prepared to come forward with Rs.3,000 or 4,000 to send a special person to Hawaii to collect the lady-birds and bring them back and distribute them, and he thought this was an occasion on which the Reserve Fund could properly be called upon to supplement this contribution by the Lower Pulneys. He therefore proposed "That a small Sub-Committee be appointed to decide upon an amount to be taken from the Reserve Fund to be added to any sum raised by the Lower Pulneys and other Associations for the purpose of immediately introducing the lady-birds."

The Resolution was seconded by Mr. Hodgson and carried.

Mr. Abbott explained that the green bug had appeared in the Nelliampathies, but after the monsoon it had disappeared, he hoped never to return again. It had not done much damage.

Mr. Hodgson moved and Mr. Newport seconded the following proposition, which was carried:—"That the Secretary be instructed to forward copies of the correspondence on this subject to the Secretary of the Indian Tea Association, Calcutta, with a view to obtaining the support of that Association in the matter of the employment of an entomologist and the subsequent introduction of the national enemies of the various insect pests inimical to tea and coffee."

Mr. G. L. Acworth said it was all very well for them to pass Resolutions on the subject, but they could do nothing without the help of Government in the matter of lady-birds and in fact every matter brought before it. For the last five or six years the Government had shown great sympathy with planters and that had specially been the case under the administration of H. E. Sir Arthur Havelock, and he had therefore to propose a formal vote of thanks for his kind sympathy and the attitude he had taken. He therefore proposed and Mr. E. G. Windle seconded the following Resolution which was carried:—"That this Association would wish to record its thanks to H. E. the Governor and the Government of Fort St. George for the active interest it has taken in the subject of the introduction of lady-birds and other natural enemies of the insect pests to which tea and coffee are subject, and for the promise of practical help as conveyed in the G. O., No. 634, of the 27th July, 1897."

The meeting then adjourned for lunch.

After lunch Mr. E. G. Windle in a long and elaborate speech dealt with the subject of the adulteration of manures and moved the following proposition, which was seconded by Mr. F. S. Hay:—"That, if the necessary support can be obtained from planters and the firms engaged in the manure trade, the U. P. A. S. I. engage or subsidise a suitable Agricultural Chemist for the purpose of analysing manures, soils, etc., by a standard method and advising on all points of planting chemistry."

After some discussion the following Resolution was passed in Committee and confirmed in General Meeting:—"That this matter be enquired into by the Sub-Committee appointed to consider the question of leaf disease, and if it is resolved that an expert shall be employed, that the Sub-Committee do also suggest what sum should be allotted from the Reserve Fund in aid of that purpose."

The meeting then adjourned till 10-30 A.M. to-morrow.

LAST DAY.

BANGALORE, 12th August.—The delegates sat for the last time this morning at 10-30 A.M. and disposed of the business before them.

THE RULES.

The revised Rules were passed and adopted with an addition to Rule XII.

LADY-BIRDS.

Mr. Acworth brought forward the Resolutions of the Sub-Committee appointed to consider this subject. They were as follows:—"That this Association do allot Rs.2,000 from the Reserve Fund to be added to any other sums raised for the purpose of introducing *Coccinellidæ* in Southern India with the object of combating scale pests. (2) That the Planting Member of Council be instructed to approach H. E. the Governor to ascertain to what extent the Government of Fort St. George will afford financial assistance. (3) That in the event of a sufficient sum being raised a qualified person, preferably Mr. Newport, be despatched to Australia and elsewhere to collect and bring back the *Coccinellidæ*."

The Hon'ble Mr. Hodgson drew attention to the fact that the Government of Madras in its Order of the 27th July had stated that it was prepared to pay half the cost.

The second paragraph of the Resolution was accordingly withdrawn.

Mr. Windle seconded the Resolution, which was carried.

THE PLANTERS' ENQUIRY COMMITTEE REPORT.

The Meeting resolved into Committee when the Secretary read the draft letter to Government embodying the result of the deliberations of the Meeting on the Report. The letter was adopted.

LEAF DISEASE.

Mr. J. A. Harris brought forward the result of the deliberations of the Sub-Committee on this subject. They were as follows:—

(a) That the Secretary be instructed to ascertain what each District Association would be prepared to subscribe annually towards defraying the salary of an Agricultural Chemist to be employed for the purpose of directing cultivation with the object of combating leaf

disease and other pests. (b) To ascertain what the Government of Fort St. George and those Native States in Southern India interested in the matter are prepared to give towards the purpose. (c) That in the event of the replies proving satisfactory a donation of Rs.2,000 per annum if necessary be given from the Reserve Fund for this purpose. (d) That the Secretary do ascertain the expense of employing a thoroughly qualified expert, and communicate the result to the District Associations concerned.

In bringing this proposal before the Meeting, he said he would make a few remarks. In the first place he would point out that what the Sub-Committee proposed was in accordance with the suggestion given yesterday by Mr. Cameron. He (Mr. Cameron) had suggested that there should be more careful cultivation and that they should endeavour to introduce new strains of seed. The first two proposals would give effect to Mr. Cameron's recommendations and there would be little opposition to those proposals. It would then be advisable to ascertain what their ways and means were likely to be, and he had a strong reason to believe that District Associations would strongly support the proposal referring to that; and he thought from the sympathy which the planters had received from the Government of Fort St. George during the past few years, it was not unreasonable to suppose that to the same extent it would sympathise with him in this matter, and would render them as much assistance as it reasonably do, and he felt sure that Native States would follow the example. The third proposal was more open to criticism as it involved a large call on the Reserve Fund. But, he maintained the importance of the object for which he asked the allotment was adequate to the extent of the call which it was proposed to make. He mentioned, he said, that the opinion of the Sub-Committee was that the call should be spread over three or four years as they were of opinion that an Agricultural Chemist could not perform the duties they wanted him for in a shorter period, and also that they could get the services of a qualified man for a shorter period. In this connection he read a letter from the Director of the Botanical Garden, Peradeniya, Ceylon, on the impossibility of absolutely stamping out leaf disease. He mentioned this because Mr. Parsons seemed to think yesterday that he took too gloomy a view of the leaf disease in Mysore. In Ceylon they had an industry entirely exterminated by leaf disease, and the result of experiments was that no specific remedy for it could be found. The result of the discussion yesterday showed that Mr. Cameron was of the same opinion, and that strengthened the proposal put forward by the Sub-Committee that the best course to take would be not to try and find a specific remedy, but to improve the methods of cultivation. It might be contended—he thought—that during the course of the debate yesterday—that it was impossible to find funds for the purpose they had in hand. Personally he did not think that was likely to be the case. He was perfectly satisfied that in order to get a thoroughly qualified man they would have to pay a large salary, but, as he had said before, he thought the District Associations would pay liberally. They were most deeply interested and felt that unless something was done the future of the Ceylon industry would be imperilled and he felt sure that if the matter was placed before them in the proper light they would come forward to give assistance. He would ask the meeting to remember that they would have to pay the Chemist a large salary a certain proportion of this would be recouped out of the fees that would be charged for his services. He therefore moved that the Association adopt the proposals of the Sub-Committee.

Mr. H. G. Parsons read the following recommendations:—(a) That the Mysore Government be addressed with the object of ascertaining whether the services of Mr. Cameron may be utilised for supervising experimental plots for the improvement of the strain of coffee plant in various planting Districts. (b) That if necessary a sum of Rs.1,000 be drawn from the Reserve for this purpose.

Mr. Harris said that it was considered by the Sub-Committee that both these proposals should be considered together.

Mr. H. G. Parsons said his feelings were more in favour of the latter part of the Resolutions than the former. He was quite of opinion of Mr. Harris that the services of an Agricultural Chemist of the best sort might be desirable, his only doubt was whether the latter Resolution, he thought they should start immediately with experiments, and he would particularly point out the fact that the experiments should be undertaken by themselves under the guidance and direction of Mr. Cameron. It would, of course, take some time to prove these experiments; but it would be interesting and likely to lead to useful results. With regard to Mr. H.

marks on what he (Mr. Parsons) said yesterday as to taking tooomy a view of the situation, he would say that he had not seen sore and could only hope that Mr. Harris's impressions did not together represent the true state of the case. With regard to disease having destroyed the Ceylon industry, he did not think present they could compare the two in any way whatever. What isted to destroy the Ceylon Coffee industry was the change in ate. That is to say when Ceylon had the same dry weather y had in India, their crops were enormous, but when the weather nged and they had rain every month, leaf disease got a hold and n that time coffee steadily went down. That was not the case the Coffee Districts of Mysore, and as long as they had dry sons leaf disease was not the scourge they were inclined to think as.

Mr. Hay supported Mr. Harris's resolutions.

Mr. Sprott read the following notes on spraying as a preventative leaf disease:—

have been told that it might interest and perhaps be of some use he members of the U. P. A. S. I. if I put down a few notes about spraying with sulphate of copper and lime, which we have been rying on on our group of estates for the last six years. You st please to bear in mind that I know nothing about science and e not the pen of a ready writer, and all I can give are a few etical facts from my own observations. I am so convinced of utility of spraying, that we have gone on steadily increasing the mber of our machines and the area done every year, and now ve a dozen of them at work on our different estates. In the umn of 1891, Mr. H. A. Mangles sent me out two of the Eclair apack Sprayers, and suggested we should try the effect of the uille Bordelaise, which has been so successful in checking the yloxera in vines, and the potato blight. I started to try it in auary, 1892, using 4 lbs. sulphate of copper and 4 lbs. lime to 25 lons of water. I have since found that the addition of a double adful of common refuse jaggery makes it stick better and last ger. It was rather late in the season, but I started spraying and some patches which had leaf disease, and it certainly seemed stop it spreading. I started again as soon as we get a little fine her after the monsoon, beginning on an exposed ridge where f disease always shows up first, and had a long strip sprayed all ng the ridge. It was mostly done a second time about October, d leaf disease did it very little harm that year. Since then we ve done this ridge every year, as soon as possible after the mon- on, and sometimes twice, with the result that the coffee has im- oved and thickened, and though the coffee is over 30 years old, it ps better and looks stronger and more vigorous than it was t years ago. We have kept on steadily doing those parts where f disease usually appears first, and where it has been taken in e, that is, before the leaf disease has appeared, the attacks though t entirely prevented, have been very mild, and not done much age on these parts. Every planter knows that there are certain rts of the estate, where disease appears year after year, chiefly posed ridges or edges of roads before other parts, and which are rseries to breed it. By spraying these, I am sure a great deal of ease can be prevented, and the poor pieces benefited. I believe e late Mr. Pringle gives the average life of a coffee leaf as onths, but I have often seen leaves looking strong and healthy in ay that were sprayed in August and September. Nurseries, too, en suffer from leaf disease, and it will be found very beneficial to ray them two or three times with a weak solution and to oughly spray them shortly before they are put out or else to dip e leaves in a bucket containing the solution, after they have en dug up. This saves the plants to a great extent from e severe attack of leaf disease, which they so often get after the d of the monsoon, but care must be taken not to make the solu- on too strong, or otherwise it will burn the tender shoots. About o-thirds of the quantity previously given is enough. I saw this ry strikingly illustrated on one of our estates about 3 years ago. ar plants had been dipped in the solution as they were taken out the nursery, and had been sprayed some time before. Our neigh- urs' plants all round had a severe attack of leaf disease, but ours e not touched and were very successful. I was also once enabled detect a plant stealer. He had stolen some of my sprayed plants, hich were found in his clearing, and I was able to identify them d get him convicted. Four coolies with three Eclair machines, if ater is within a reasonable distance, can easily thoroughly spray lf an acre of coffee, more if the trees are at all thin. The sulphate copper costs in England 19s. per cwt. f.o.b. and it costs roughly

about Rs.7 per acre to thoroughly spray the coffee, but of course it varies on account of carriage of water, character of land and coffee. The Eclair machines cost, I think, about 30s. in England, and last a long time, only the india-rubber parts have to be renewed, and they can be got from the makers very cheaply. It is, of course, impossi- ble without a large number of machines to spray all parts in time before leaf disease appears, or to do it so thoroughly that none will appear but the spraying seem to lessen the effects of the disease, and wherever the solution touches the disease it kills it. The disease often appears on leaves which have been sprayed, but it was probably of a much lighter colour than usual, and has fewer spores and the leaf does not fall off. I was told by a Nilgiri planter that he had been using the solution very successfully for rot, but have not tried it much myself, as the difficulty is to apply it during the monsoon. I think a very appreciable difference can be made in the effects of the disease by spraying, but it must be remembered that the time to do it is before the disease appears, to get the full benefit of it, and that it should be done a second time if possible. Half an hour's sun will dry the solution on the leaves and it will stop there for months on the underside of the leaf. It is quite easy to spray so that the underside of the leaf is touched. This is my first attempt at anything of this kind, so must ask your forbearance at my attempts to put things before you. (Cheers.)

Mr. Acworth said the interesting statement read by Mr. Sprott put a different aspect on the Resolutions drawn up in Sub-Commit- tee, and he could not help thinking that Mr. Harris and Mr. Hay would be the first to admit the fact. If they could get such good results from spraying it would be a pity to go to the expense of getting out an Agricultural Chemist. They might try for six months or a year, in Mysore, what effect spraying would have. If it was beneficial, they would only have wasted money in sending for an expert.

Mr. E. G. Windle said he had listened with great interest to what Mr. Sprott had said. It was not altogether new, and it was very possible that what might suit one District would not suit another. That might be the reason why the same experiments tried by some in the Nilgiris had not succeeded. He thought it fair to mention this now, and he would not have mentioned it, but for Mr. Acworth's remarks.

The meeting then went into Committee where after some discus- sion, Mr. Harris's and Mr. Parsons' combined Resolution was carried and adopted in general meeting afterwards.

COFFEE STEALING.

Mr. J. G. Hamilton read the following Report on the small Sub- Committee appointed to consider the subject of Coffee Stealing:— "That Mr. Hamilton's proposals formulated at the Annual General Meeting of the South Mysore Planters' Association be circulated to subscribing Associations with a view to ascertain whether they meet with general approval. Should this prove to be the case it is recom- mended that the Executive of the U. P. A. S. I. endeavour to secure their recognition by the Governments of Madras, Mysore, Travancore and Cochin."

VOTES OF THANKS.

Mr. Acworth said:—Before this meeting closes I should like to have an opportunity of moving a vote of thanks to the various Firms who have so liberally come forward to support our Reserve Fund. It is true that they are more or less interested in planting, some of them own property, but others are mere agents and hold no property, still one and all came forward liberally to help us, and it is to be hoped that they will continue their help. The Firms I refer to are Messrs. Arbuthnot and Co., Messrs. Parry and Co., Messrs. Binny and Co., Messrs. Morgan and Sons, Messrs. Aspinwall and Co., and Messrs. Peirce, Leslie and Co. These have all come forward with handsome donations. (Cheers.)

The vote of thanks was accorded with acclamation.

TO THE PLANTING MEMBER.

Mr. Acworth said I have another vote of thanks to propose and I must say I have never proposed a vote of thanks with greater pleasure than I rise to propose the vote of thanks to the Hon'ble Mr. Hodgson for the excellent work he has done for the Association in the past year. (Cheers.) It has been my good fortune to be closely connected with him in the business of our Association, and I can only say that with a gentleman like the Hon'ble Mr. Hodgson it is a pleasure to work. His promptitude in business is beyond praise, his temper is unfailing, his tact is admirable, and his advice, on the many occasions I had to ask for it, was excellent. I would ask you to consider how

important a thing in a person holding the position of a Member of Council is the quality of tact. It has proved especially beneficial in this particular instance. Mr. Hodgson has practically scored off his own bat what this Association has been endeavouring to bring about for several years past, and that is the cessation of the cultivation, or rather the cessation of the expansion of the Government Cinchona Estates, and to induce the Government of Madras to buy its supply of bark from the private growers. Mr. Hodgson has done this entirely himself, and I must say that all Cinchona growers ought to be exceedingly grateful to him. Mr. Hodgson has moreover interested himself in every single concern of the Association, and I therefore beg to propose a hearty vote of thanks to him, and at the same time would express the hope that he will see his way to continue in the office he now holds. (Cheers.)

The Hon'ble Mr. H. P. Hodgson, in acknowledging the compliments, said :—

GENTLEMEN,—I really hardly know how to express my feelings and to thank you for the kindly reception just given to the vote of thanks proposed by Mr. Acworth. I can only say I feel doubly grateful for it and equally proud. I am afraid that Mr. Acworth in the kindness of his heart has very much overrated the services I have rendered (No! No!) and I am quite sure he has very much overestimated my personal ability (No!) However, whatever my ability may be, I may say it is my earnest wish and desire to use it for the interest of the planting community, to push and promote it as far as possible so long as the planters themselves take an active interest in their own affairs. So long as they sympathise with the work carried on by the Executive of this Association, so long will I be only too pleased to do all that in me lies to assist and help. You can give me no better proof of your appreciation and no better reward for the services I have rendered. I can assure you that the reception you have accorded me to-day is a larger reward than anything I could have expected for what I have done for you. (Cheers.)

TO THE SECRETARY.

Mr. H. G. Parsons. Before you close this meeting, I have also one Resolution to propose. I think you will all agree with me that our cordial appreciation of the services of our Secretary during the year be accorded by this Association. All will admit that the work has been uncommonly heavy, but he has taken the greatest interest in it. When you read the letter to Government which lies before you I am sure you will all admit that great ability has been employed in its composition, and the Sub-Committee heartily acknowledge the assistance he rendered and offer him their grateful appreciation of his services.

Mr. H. Ormerod acknowledged the compliment briefly and suitably.

TO THE CHAIRMAN.

The Hon'ble Mr. H. P. Hodgson. There is one more vote of thanks we ought to pass, it is the vote of thanks to the Chairman (Hear, hear). He has conducted the somewhat difficult business of this meeting with tact and ability—to say nothing of the able manner in which he conducted the dinner the other evening (Laughter and cheers). I think when we know more about him at the end of the year we will be able to pass a vote of thanks more in detail and more in keeping with his deserts. At present we are all agreed in passing a hearty vote of thanks for what he has done at this meeting.

THE CLOSING ADDRESS.

The Chairman in reply, and in closing the meeting, said :—

GENTLEMEN,—I thank you very much for your kind expression of appreciation of my services while in this chair. I think I told you at the beginning when I accepted office that I was not likely to underrate the responsibilities attached to it. It will be a year full of importance for us. The agitation of the last 30 years about our labour laws has at last culminated. The Government of India when it deals with the Report of its Committee of Enquiry is bound to take legislative action of some sort. We have clearly indicated the lines on which we would wish that legislation to be, and it remains to be seen if the Government of India will approve of them. At any rate, I am glad to think that we ourselves know our own minds and have been unanimous in approving of the Report taken as a whole and of its chief recommendations. We are like one who has long been engaged in a law suit and has at last gained a verdict in his favour, but awaits the judgment of the Court. I sincerely trust that it may be so satisfactory as to find us unanimous in welcoming it. We have not gone one step beyond the Committee in making our suggestions to the Government of Madras, and in

consequence I trust that in that fair and liberal spirit with which late they have treated all our representations, they may again give the weight of their influence on one side. (Hear, hear.) Personal regret that the constitution of our Association has been changed, however slightly. I always liked Mr. Acworth's original scheme, but wanted no other. Although he has been unable suddenly to set up a big Reserve Fund, we can still build it up, like the ant heap, particle by particle. This coming year we are promised a subcommittee larger than our expenditure is likely to be, and the Reserve Fund still open for donations, and you must remember that we have decided to draw on it largely for the necessary object of trying to save our industry from pests, and I trust that this fact will bring it to the minds of those concerned the absolute necessity of increasing this Reserve Fund. One advantage of our new rules is that the district, however poor, though it may be restricted in its financial power, can always be represented by five members and so make its voice heard, and I trust that the personal interest of the Association which Mr. Parsons wishes to foster, may be fostered by more gentlemen attending the meeting next year as representatives of their Associations. Mr. Acworth has made an eloquent plea against the financial policy of the Government of India, with which we are all in accord, but in which we can do little good unless other producing Associations, the Merchants and Chamber of Commerce Chambers of Commerce throughout the Empire join hands with the representative of the great farming class. One of the most interesting discussions that we have had was on our plant diseases, a discussion made doubly interesting by the attendance of Mr. Cameron. I welcome these interesting discussions as a new departure commenced last year by Mr. Newport, and improved on considerably this year. The Sub-Committee appointed to consider have reported very favourably on the matter, and if their recommendations are carried out, I trust that we may succeed in arresting the insidious advances of disease, for, as it was repeatedly said during the debate, our very life depends on it. It would indeed be hard to win our battle for legislative power in our control of labour, when capital was gone and labour ceased to be of paramount importance. Myself, I do not in the least think this likely and still more am I confirmed in this opinion after hearing Mr. Sprott's interesting note. The bug may be destroyed altogether, and though I do not think you will ever eradicate the disease, I agree with Mr. Parsons and Mr. Sprott, that its damage may be minimised and in the comparatively dry climate of Madras it can never be the scourge that it has been in Ceylon. I will not dwell on the various matters discussed in detail, but as Mr. Hodgson has said our thanks are due to H. E. Sir Arthur Havelock and the Madras Government for the consideration we receive at their hands as practically shown in the matter of purchases of Cinchona. I should like to endorse Mr. Acworth's remarks in this matter as thanks are due to the energy with which our Planting Meeting Mr. Hodgson, has conducted the matter, and I am glad to think that at the expiry of his term of office next February he is willing to serve again. Our affairs political having been *sub judice* during the past year have naturally not received much notice from the press, but when the time comes, I have no doubt we shall be able to rely on the *Madras Mail* and other friends in the Press, for its able assistance in the future as in the past. I should like to thank Mr. Bremner, our able reporter, as he has done an easy task sometimes when we are in Committee as I can see from his occasional appealing glances to the Chair. Gentlemen, my friend Mr. Parsons lent me a book at the beginning of the Meeting on the duties of a Chairman, in which I read that a Chairman should not try to influence the votes, and in consequence I have kept clear from debate as much as possible, but this is a matter of little importance when you consider that we have passed some 30 Resolutions and have only once had a close division, and that was on the question as to whether we should ask Government to put an export duty on bones, a subject I am glad to say on which we would have been unanimous, if it had been a mere matter of our own interest. We were only divided as to whether we should put our own interests in opposition to the broad laws of political economy and public utility. I take this opportunity of thanking Mr. Parsons for the assistance he has given me in my duties as Chairman throughout the Meeting. In conclusion, gentlemen, as I told you at the beginning I am not a ready orator like your late Chairman, but I intend to work hard in the coming year on your behalf, and trust that our interests will suffer through any want of energy or judgment on my part. I declare this meeting closed.

The meeting then dissolved.

PLANTING OPINION.

A WEEKLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, AUGUST 21, 1897.

[No. 21.]

CONTENTS.

SEASON REPORTS—	PAGE

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage.

ADVERTISEMENTS.—Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

N.B.—Remittances should be sent to the Managing Proprietor of this paper, Coonoor, Nilgiris, South India.

MANAGER'S NOTICE.

Back Numbers: A few odd Back Numbers offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs.3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs.3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 27th August 1897.

Nilgiris. SHOLUR, 19th August.—The rain has been persistent since last report, with little or no sun, the weather being unfavourable for flushing. Rainfall during month 8·77, making 35·92 to date. Highest and lowest temperature 68° and 59°. Grains.—Still dear. Labour.—Plentiful. Health.—Good.

S. E. Wynaad. PUNDALUR, 18th August.—Weather.—Since the 12th, we are having sun and rain, jackals wedding is the talk among children. Last night, from 7 to 11 P.M., we had very heavy showers. To-day it is very hot. Crops.—Owing to the break in the weather the tea that was backward in flush is beginning to flush rapidly. Grain is getting dearer and affecting us severely. Plant-diseases.—Leaf-rot among the crowded plants. General Health.—Very good. Labour.—Excess.

Coorg. POLLI BETTA, 18th August.—Weather.—Rainfall for week ending 14th instant, about 11 inches—one of the heaviest weeks there has been. Heaviest fall on 7th, 3·50 inches; next heaviest on 9th, 2·65 inches; but rainfall differs greatly according to situation, many circumstances influencing it. Plant-diseases.—It is to be hoped that the leaf-disease will come and that we will be over with it by October. There are several individual trees to be noticed in different fields very bad with "leaf," but the coffee on the whole is still looking extremely fine. Labour.—Coolies are crying out about the high price of grain.

Nellampathy, British. 18th August.—Weather.—Rain for week, 8·60; to date, 134·87. Yesterday began a heat which looks like continuing for some time, and so long as it does not continue too long, everyone is thankful. There has been rain every day (more or less) since 23rd July. Plant-diseases.—Leaf-disease seems to be getting worse, and it was bad enough in all conscience before, a little leaf rot showing here and there. General Health.—Bad. The heavy weather we have just had has knocked up a lot of coolies, and I have never found so many ailments at this season. Labour.—Fairly plentiful, of all sorts and sizes. Interesting

Items.—Mr. Rees, Resident for Cochin, and Mr. Browning are up here on a visit, and intend seeing a little of "our 'appy little 'ome."

North Wynaad.

MANANTODDY.—*Weather.*—After a July of average rainfall for Forest District of 55 in. and many moresunshiny days than usual during that month and up to 2nd instant, a regular "good burst" set in on 3rd and worked itself up gradually into a furious state, but for the last three days the weather has been mild with rare intervals of sunshine. Rainfall for first week of this month, 20.50 in.; for second week, 28.45 in. The total for the year to date of 162½ in., already exceeds the average for a whole year. Until the last heavy burst, which in two weeks has given 11 in. above the total average fall for August, the monsoon had been everything that could be desired for agricultural operations generally. *Plant-diseases.*—Coffee is very healthy, with the exception of a little "black-rot" in wet and clayey parts, and has been somewhat "wind-blown" by late heavy gales in exposed situations. *Labour* is plentiful. *General Health.*—Fairly satisfactory. *Grain.*—Working up to famine prices, as the local grain crops were sent out of the district in the fine season. *General Remarks.*—It is rather remarkable that my records of monsoon rainfall show that the heaviest falls happen near or about full moon. This monsoon has been no exception to what seems almost a general rule, i.e. :—

Full Moon.		Heaviest daily fall	
June 15th	...	June 18th	Inches 8.20
July 14th	...	July 11th	" 6.35
Aug. 12th	...	Aug. 9th	" 7.65

I got another bit of my *English Mail* to-day. No *Madras Mail* of 9th inst. yet received—thanks to Post Office disorganization due to floods, &c.

GENERAL NOTES AND ARTICLES.

Estate blankets.

We have received from the Bangalore Woollen Mills a sample coolly cumblly 7 × 3 × 9, priced at the very moderate rate of one rupee eight annas, so as to compete with the bazaar article. The pattern of the bars at either end can be altered to suit the different estates. For the price, the cumblly sent us gives excellent value, but we think that a slightly thicker article, even if more expensive, would prove more popular.

Peripatetic accountants.

It needs no elaborate argument to demonstrate that the majority of planters are not professed accountants, and that as estate book-keeping, if done in proper business-like way, is not easily mastered by amateurs, it would save proprietors much of their manager's time were these released from wrestling with figures. The easiest way to do this has already been suggested by a correspondent, i.e., to employ duly qualified accountants to make monthly visits round the district and keep the estate books in trim. The remuneration must be, we fancy, in the shape of fees from the estates visited, with a guarantee from the local Association that the total salary shall not be below a certain fixed minimum. In one district at least the idea has "caught on," and we should not be surprised to hear the subject brought forward at the next meeting of the Nilgiri P. A. If a fee of say Rs.5 per mensem per estate were arranged for, the income realised by the

accountant would, in this district, be very respectable indeed.

Mate: a possible rival.

Some over-zealous friends of the great coffee and tea planting industries have essayed to instil a fear into their supporters that coffee and tea may yet become drinks of the past. And all on account of "maté" which the Paraguayans have, with praiseworthy but unsuccessful enterprise, been trying to induce the public to consume. "Maté" is an apology for a tea prepared by the Indians from the leaves of the *Ilex paraguayensis*, which are dried and ground in mills and sold for export. According to Dr. Caminha, maté is less exciting than tea or coffee, about as stimulating as green tea, and more diuretic than coffee. Some think that mateine, the active principle of maté tea, is the same alkaloid as caffeine, others that it is different, because it acts directly on the muscles, whereas caffeine only acts upon them through the nerve centres. Be that as it may, mateine would appear to increase the vital activity in every way; and it does not cause sleeplessness, even when taken in a large quantity.

Red ants.

With reference to the proposition made that red ants might be introduced on to cocoa estates as destroyers of the insect pests that injure the cocoa trees, noted in our last issue, Mr. J. Green, of Pundaloya, utters a note of warning in the *Ceylon Observer* as to the dangers of such a practice. He says :—

Although they will undoubtedly destroy many small insects, on the other hand these so-called "tigers of the insect world" (would not "wolves" be a better simile?) are most distinctly guilty of encouraging the presence of some of our most injurious insect pests. Their relations in connection with "scale-insects" and aphides have often been misunderstood. This same "red ant" was once before largely introduced into the coffee districts by some ingenious individual under the mistaken idea—based upon imperfect observation of its habits—that it would prey upon and finally exterminate the coffee-bug. This was an excellent arrangement for both the ants and the bugs; but the result—from the planter's point of view—was not so satisfactory. Firstly, the coffee was rendered almost unapproachable by the ferocity of these supposed allies; and, secondly, the "bug" increased and waxed fat, if possible, faster than before. "Scale-bugs" and aphides are to the ants what herds of milch cows are to us: and, as such, are tended and cultivated most carefully. In return for the plentiful supply of "honeydew" yielded by their "insect cattle", the ants will defend them from their natural enemies. I have often noticed that "scale-bugs" attended by ants appear to be in a much healthier and plumper condition than those which are left to shift for themselves. Colonies of "scale-bugs" and "mealy-bugs" are often included within the nests of the ants; and, when the ants outgrow their quarters and migrate to other parts, they carry with them some of their cattle to form the nucleus of fresh herds. If the ants are to be got rid of after destroying the nests, search should be made upon the neighbouring branches for any bugs, and these also destroyed; otherwise, the ants will surely make their way back to the source of attraction. The fact that the small "sugar-ant" (*Plagiolepis longipes*)—one of the weakest looking of its kind—can attack and overcome the ferocious "red ant" (*Ecophylla smaragdina*), is a most curious and interesting one—and rather mysterious too. For the smaller ant, to all appearance, without any efficient means of offence or defence, its mandibles are comparatively small and weak, and it is unprovided with a sting. But the fact has been observed more than once that I have been told by one very careful observer of a regular warfare conducted between the smaller and the larger species, in which the former invariably come off victorious, to the gradual extermination or expulsion of the latter. I have myself seen a large cockroach speedily collapse under the attack of three or four of these weak

looking little ants. Possibly these natural enemies might be employed with advantage in ousting the 'red ants' from any particular locality where their presence was inconvenient.

UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA.

ANNUAL REPORT, 1896-97.

THE following was inadvertently omitted from our last issue:

GENTLEMEN,—The year 1896-97 has been an eventful one to the U. P. A. S. I. Indeed, one of the most gratifying indications that this Association meets a need, and is likely to render great service to planters in Southern India, lies in the fact that each succeeding Annual Meeting attains greater importance than that of the previous year.

It will be convenient to give in the first place a brief *resumé* of the subjects discussed at the last Annual Meeting, with notes of what has since been done in respect to them. In some instances, finality has not been reached, but one or two matters may be regarded as completely disposed of.

Proxies.—A form of proxy was adopted last year; as the rule concerning notice in respect to proxies seems to provide for a needlessly long notice, and might well be re-considered, the matter is to be brought up for re-consideration this year.

Constitution of the Association.—There has been much discussion as to the advisability or otherwise of admitting individual members and giving them power to vote. This is one of the chief subjects for consideration at the present meeting, for it re-opens in great measure the discussion of last August as to the constitution of the Association. Different schemes have been propounded, and at the present meeting Mr. Acworth, who has from the first displayed great interest in this question, will open the discussion, and put forward a revised scheme. In this connection, too,

Registration has been suggested, and if certain technical difficulties can be surmounted the U. P. A. will no doubt soon take rank as a corporate body, the various District Associations having, on the whole, received the suggestion with favour.

U. P. A. Funds.—Accounts will be presented, showing how the General and Reserve Funds have been utilised, and how they now stand. The expenses of the Address and Casket presented to Her Most Gracious Majesty in commemoration of her "Diamond Jubilee," of a reference to Counsel *in re* Act XIII. of 1859, and of the printing of numerous copies of the Report of the South of India Planters' Enquiry Committee, are written down for the present against General Funds, but these are so reduced that the Association will have to consider the expediency of meeting part, at least, of the above out of the Reserve, or by a special subscription. Some subscriptions towards the cost of Casket, &c., have been paid in. It is for the Association to decide what shall be done with them.

Railway Extension.—The Resolution passed last year was put before the proper authorities. It has not been thought desirable to press this point, or that of

Roads and Communications during a year of Famine and Plague, when Government's financial resources have been greatly strained. There is no lack of sympathy, but latterly the Government has not had the power to help, though it has certainly had the desire.

Tea Prompts, &c.—On the advice of persons competent to decide, this question has been dropped, as any alteration in the present method would be detrimental to the interests of the producer. Coffee is, however, on a different footing, and the decision respecting tea prompts does not debar the Association from considering what improvements can be made in conditions, &c., as regards Coffee. During the year a circular was issued showing how this subject had been taken up at Home, and

coffee planters will have seen that their interests are being watched.

Government Cinchona Gardens.—The representation made to the Government of Madras has, thanks largely to the earnest support given to it by the honorable Planting Member, borne fruit. Government lately advertised for tenders, and it is hoped that planters will now find an occasional market locally, when the supplies raised on the Government Cinchona Gardens prove insufficient.

Malarial Parasite.—The Resolution on this subject was duly forwarded to Government, but progress was checked by the abnormal strain put upon the Medical Department by Famine and Plague. Surgeon-Major Ronald Ross has, however, proceeded with his investigations, and a brief paper by him has been submitted for consideration during the present meeting.

London Chamber of Commerce.—Mr. Mangles having accepted office as joint representative with Mr. J. C. Sanderson, sundry matters have been intrusted to his care. He has not yet had time to deal thoroughly with any of them, but there is every ground for hope that Mr. Sanderson and he will render valuable service, the fruit of which will become visible ere long.

The Duty on Chemical Manures.—Government has not yet replied to the representations of the Madras Chamber of Commerce and the U. P. A.

The Planting Member of the Enquiry Committee.—Final settlement of the question of this gentleman's expenses was advised to District Associations during the year.

Statistics.—A few of these have come in; all that are ready will appear in the annual book of proceedings. They show a very decided advance on any statistics previously published.

Decrease of Consumption of Coffee. Adulteration of Coffee.—Papers circulated during the year showed that the wishes of this Association had been to a great extent anticipated by the London Chamber of Commerce. Steps have already been suggested for popularising London as a Coffee port, and Messrs. Sanderson and Mangles will no doubt take care that the subject is not allowed to drop.

Advances.—Act XIII. of 1859 has come in for fresh criticism, and an important ruling in connection therewith has been given by the Madras High Court of Judicature. Details will transpire during the discussion of the subject.

Coffee Scale and Lady Birds.—Mr. H. O. Newport has supplemented his valuable researches by publishing a very interesting pamphlet containing details, and stating his conclusions. It is discouraging to know that very few planters have given the practical support that reveals itself in a demand for copies of the work. Thanks to the Hon. Mr. Hodgson, however, Government has given the subject some attention, and though there appears to be no hope that the services of Dr. Koebele, who has done such good work in Hawaii, will be available, it has been suggested that the Association should consider if it would not be advisable to try to obtain the assistance of some other entomologist, to pursue scientific investigations into this and cognate subjects.

Forest Reservation in Mysore.—The Mysore Government has not replied to the representations made to it.

The S. of I. Planters' Enquiry Committee.—The Report has been issued, and numerous copies have been circulated with a view to a thorough discussion. The general conclusions of the report are strikingly favourable to the contentions of the planting community; the recommendations made will come up for

**CENTRAL HOTEL,
INFANTRY ROAD, BANGALORE.**

(Under English Management.)

The most comfortable and convenient for visitors.

TERMS MODERATE

discussion and criticism at a later stage of the present proceedings.

Famine Fund.—Collections on this account have totalled the very satisfactory sum of Rs. 5,628-2-0.

Reserve Fund.—A total of Rs. 10,575-12-0 has been collected, and so far only Rs. 1,750 has been spent (the amount of the expenses of the planting member of the Enquiry Committee). The enlargement, the utilisation and the investment of this Fund are among the subjects to be brought before the present meeting.

"Planting Opinion."—Arrangements have been made whereby a useful channel of communication with individual planters has been placed under the control of your present Secretary. The proprietors of the above paper, which is now issued weekly, are willing that it should be the recognised organ of the U. P. A. S. I. if this Association desire it to be so, and a feasible plan of working be agreed upon.

The accounts of income and expenditure during the past twelve months are laid on the table for your scrutiny and approval.

In conclusion, your Secretary desires to express his thanks for the cordial and courteous assistance he has received from the various Honorary Secretaries of District Planting Associations. Owing to the raising of funds for Famine purposes and the Reserve Fund, the work thrown upon these gentlemen must have been unusually heavy, and they have earned a hearty acknowledgment of the manner in which they have assisted your Secretary to prevent the work and the records of the U. P. A. from falling into arrears.

LETTERS TO THE EDITOR.

WANTED: A DUTCH INTERPRETER.

DEAR SIR,—Had you in your issue of 7th inst. explained the meaning of some of the terms ("Bow" for instance) employed in the letter headed "Planting in Java," it would have made that letter more interesting and more understandable.

I am, Dear Sir,

GADBROOK, NELLACOTTA, }
13th August 1897. }

Yours truly,
W. HAMILTON.

[Can any of our more learned readers oblige?—Ed.]

SOME QUERIES.

DEAR SIR,—Why are the notes by "Planter's Wife" now omitted? Why has the *Planting Opinion* been turned into a weekly paper? It was far better as a fortnightly, and I have heard several of your contributors and subscribers say they are going to discontinue their subscriptions when their present subscription is finished.

If you ask your readers to send you a post-card saying whether they prefer a weekly or fortnightly *P. O.*, I think, you will find I am right in saying the latter is the most popular.

Yours faithfully,

11th August 1897.

"NORMANTON."

[Our last number has answered your first query. Regarding the weekly issue, we hope to so enlarge and improve it that we trust it will become a greater favourite than ever. A little patience, please, and more support is all we ask!—Ed.]

JAVA COFFEE AND E. LITHOSPERMA SHADE.

DEAR SIR,—I am afraid I cannot answer "One Interested" query as to whether I can give any further particulars about the remarkable success of the Java coffee under dadap (E. L.) shade but I can quite believe that the shade tree has a good deal to do with its success, from my own experience.

The glowing accounts I heard from a friend of Java coffee and E. L. shade induced me to try it as a forlorn hope for saving the coffee, and as coffee *except* under E. L. has gone to the wall although heavily manured with cattle manure, and coffee under E. L. has come round and grown into fine bushes from mere skeletons *without manure*, I think there must be a great connection between the flourishing coffee and the shade tree. The recovery of the coffee naturally led to an inquiry into the cause, and as the shade tree was the only visible cause, the loppings were analysed, and I think the analysis explains the success. The analysis also lead to the employment of the loppings as a green manure where previously they had been allowed to rot as a mulch, causing of course a great loss of ammonia. The recent discoveries of the connection between nodules and nitrogen led to the discovery that E. Lithosperma possessed the power of stimulating bacterial activity and hence of assimilating atmospheric nitrogen to a very unusual degree. An unlimited supply of nitrogen gratis, with the unlimited supply of minerals in the soil, leads to coffee cultivation without manure, which I believe to be as scientifically correct as it has proved itself practically possible. An interesting fact that proves the advantage of E. L. as a coffee shade is that the attempts to plant Arabica coffee in this neighbourhood during the last few years have all ended in failure, except the E. L. shade clearings which are still to the fore and are likely to continue to flourish.

I hope shortly to send you figures of the weight of an acre of loppings per acre; they will still further explain the success of the tree.

ARIENKOW, SHENCOTTAH, }
13th August 1897. }

Yours faithfully,
B. NELSON.

COFFEE CONSUMPTION IN INDIA.

SIR,—It has often occurred to me that there must be a considerable consumption of coffee in India. We have statistics which show the quantity exported annually, and an attempt is occasionally made to arrive at the produce of each district. In one district, when I had the means of checking the returns by the exports, I found these very much out. As to the portion which never goes out of the country but is consumed therein, I have never seen any return. Estimates may have been made, and it would be interesting if you, sir, or any of your readers have if they could be produced in the columns of the *P. O.* for the benefit of the planting community and other readers.

That a large quantity is used in India, I think there can be no doubt. Talking to a Mussalman the other day about coffee, I questioned him as to what extent it was used by his people. He immediately said they all drink coffee, and to emphasize the extent of its use, he added, "from here to Calcutta they drink it," and many, besides Mussalmans, have their morning coffee. The native consumer is, I believe, content with a very wishy-washy infusion. Still, seeing the numbers that use it, the annual consumption must aggregate no small quantity. Take for instance 1,000 tons and give each consumer only one pound per annum. You would have 2,240,000 consumers—a handful out of a population of some 300 millions, not to mention Cabul. One pound per annum is of course an absurdly small quantity to allow per head, but I use these figures simply to show at a glance how readily a large quantity of coffee could be accounted for. Make the consumption per head of the 2,240,000 six or seven lbs. and you have 6,000 or 7,000 tons, to about the production of Coorg. And who would say that is an excessive estimate? In fact it looks a ridiculously inadequate

mate, if we believe so many of the native population drink coffee. I must admit that the question is a puzzling one, for where does all this come from, which coffee statistics never seem to take into account?

The greater part I reckon is native-grown kinds, as it is the native and inferior sorts that are mostly used. Garblings, black, and other refuse sorts are generally sold on the Coast and on the interior at the end of the season. A great part is sold to the Arab traders who visit the Coast each season, part is shipped to Europe, and part, I suppose, goes into home consumption; but the whole is but a trifling part of the crop.

One cannot help thinking that as much as 6,000 or 7,000 tons of coffee at least must be consumed in India, and yet this seems too small a proportion of the season's crop not to be noticeable. Does it all come from the coffee districts, or have the natives a few acres in the shady parts of their gardens all over India which they use to supply this large consumption?

A HARD NUT.

LEAF DISEASE.

I.

DEAR SIR,—We are told that the plague and other diseases which live in the soil and air breed freely in a humid warm atmosphere, but that a certain number of degrees of heat kills them.

Leaf disease generally appears after the monsoon, and at a certain time of the year when the ground is humid and warm (earlier in low warm than in higher and colder localities). Why should we not call Nature to our aid and see if her counter-check, "Heat," can help us in destroying in the hot weather the germs of the disease which at that time of the year are all dormant and lying on the ground, till the season for revival comes round again.

Last December, when the weather was getting dry and leaf disease seemed to be going off, some unlucky showers about Christmas brought on a renewed and virulent attack, some estates suffering terribly, the damp warmth set up perhaps conducing to the revival of the disease germs.

The plan I propose, though not a new idea in one way, is no doubt startling, and not practicable at present on the majority of estates, but can be experimentally tried in parts of some old estates, with ordinary shade where the coffee (especially Chick) is umbrella-shaped and so tall that one can almost walk upright under it, and where there is a fair quantity of *Dargoo* or dry leaf and prunings on the ground.

In such parts (the more isolated the better), I propose that a picked gang of coolies, under European supervision, run fire through the place, having previously taken precautions to remove large quantities of shade loppings and bits of wood lying on the ground, (which latter might catch fire and go on smouldering,) and sweeping away the dry leaves for about one foot all round the stem of the tree.

Fire running through two or three inches deep of *Dargoo* does not ascend much higher than six or eight inches, and is soon over, so would not create enough heat to affect the branches and leaves of the tall tree. If there be too much dry leaf on the ground, some can be removed and carefully burnt in open patches and on the roads.

I have seen a light fire run along the ground in ordinary coffee and only scorch a few of the lower leaves. I have also seen coffee burnt out to all appearances, but after being sawn down, send up luxuriant suckers which kept free of leaf disease, while the coffee surrounding had a touch.

This drastic remedy would not do in young clearings with much timber about or where there were a great many supplies. In time the timber could be cut up and buried in renovation pits or trenches.

The coffee being tall, the coolies careful, and armed with suitable green boughs for damping the fire, if too furious, there

is no reason to fear burning the trees in any way. Fire paths could be swept, and a block at a time done.

Of course if the plan proved successful, or the disease mitigated considerably, and before it could be generally adopted, "umbrellas" would have to be the order of the day, and why not "umbrellas," they bear just as well, and in some instances better than ordinary low topped coffee. No lower primaries (which generally don't bear much) being in the way, cultivation of the soil is facilitated.

I have mentioned that the more isolated the field or patch of coffee chosen for experiment the better, because there would be less chance of the disease being communicated from the rest of the coffee, when the season comes round again.

I shall be interested to read "planters' opinions" on this plan of using under the coffee a natural remedy.

BENKI.

[A short time ago we advocated in these columns a very similar, but not so drastic, measure as that urged by you.—Ed.]

II.

DEAR SIR,—A friend of mine has just returned to Bangalore, after having visited some of the coffee estates, and he gives a very gloomy account of the havoc wrought by leaf, and gives it as his opinion that unless something is done, and that quickly, to check its spread, that coffee in the South will be a thing of the past. He also stated that none of the coffee examined by him equalled the coffee grown in and near Bangalore.

I do not profess to be an authority, never having seen a coffee plant until I started a garden at Doddaballapur, and you may remember writing to me some two years ago for particulars, having, as you then stated, heard good accounts of the growth of the plants. Regarding this, I shall not say much, except that had I not under advice lopped my plants they would now have stood from 10 to 12 feet. Anyhow, I lopped at 5 and 5.6. The primaries are over 4 feet in length. Last year I plucked 8 cwt. the acre from my 1894 plants. This year the yield will be equally good, with not a sign of leaf. Now as regards leaf itself, my experience may be useful.

When I planted out my coffee, I gave each tree half a basket of cattle manure; that was in 1894. In 1895 I manured with bone and poonac and had leaf. This attacks every plant under shade, without, however, touching over 2,000, which were in the open and cattle manured, though these were planted not four feet away from those which were so seriously attacked. Last year a gentleman who wanted to purchase the garden, but who has since purchased another property of mine, closely inspected each tree, freely turning over the leaves, and by his having done so expressed surprise that there was no indication of leaf, which he saw was then very bad in other plantations. Fortunately for me, however, just as he was leaving the gardens he saw one tree with the disease. He pounced on the leaf and shouted "leaf," explaining at the same time that he did not wish to take off from value, but what he was surprised at, when he had so minutely examined a very large number of plants, was that I was free. Anyhow, my next visit clearly satisfied me that it had spread, for then, instead of only one plant, no less than 13 had it badly.

My next step was to open out the roots and work in a full basket of cattle manure. Three chatties of manure were given to each plant and the roots remained exposed until the third day, when the earth was thrown in. The disease disappeared at once, without going the round as it did the year previous. My trees in the open again escaped and they have thus not once been visited. From my experience with leaf I have drawn three conclusions, which may be briefly stated to be:—

1st.—That bone and poonac may have something to do with the disease, as since I have used the cattle manure I have not been visited.

2nd.—That shade is not wanted under irrigation, and only

very thinly where coffee is grown under the usual conditions of rainfall.

3rd.—That trees should not be topped so low as two, three or four feet, but allowed to grow to from five to six feet. I always thought that plants topped as above would probably, by highly manuring, give excessive crop for a given number of years and then die out, through over-bearing, or some other disease.

My idea has always been, ever since I took to coffee, that with small trees—the manure (bone, pounac and other artificial manures) would not tend to long life.

There may be some who will ticket me a duffer, but I cannot help that. I know absolutely nothing of coffee; but if my experience proves useful, or if any hint can be drawn from it, useful to the planters, I shall have served the purpose for which I have written.

I believe that the planters have so far been conservative. The older planters have given advice in good faith to the younger. These in turn have passed on the ideas of shade, lopping, artificial manures, until the very care and attention so long paid are gradually killing out the plants. This much I do know. Planters differ so much at the present moment that if a young planter was to get the advice of say six old and experienced men, he would find it difficult to understand what he had to do to get up a garden.

The point that struck me from the first was why not allow coffee plants to grow up as nature intended that they should? Surely it was not intended that coffee, a fruit bearing plant, should be treated differently to all others.

We take no special care of our mango, orange, guava or other trees, and I know as a fact that coffee will grow a good size and bear well if left to nature, having had in the garden which I have recently sold trees over 12 to 15 feet in height and bearing year in and year out from 3 to 4 lbs. of berries. These trees were never watered or attended to except in the matter of manure, and they were over 16 years' old.

I sign my name, which you can if you like publish, but I must ask planters to remember that I have gained the little experience I now possess since I started as a planter. That I have followed no one's advice, but trusted a good deal to nature to do for me all that I could not understand. A crop of 8 cwt. in the second year and the same, if not a better crop, free from the disease and borer in the third year speaks for itself.

I can supply in any quantity. Allow all the trees to grow to say 6 feet and over—in fact to thoroughly investigate leaf disease I don't believe a specialist necessary. I am sure we have sufficiently experienced men to trace; take for instance Mr. Nelson, who could locate the cause and thus bring back coffee to its old condition.

Yours truly,

J. PARTRIDGE.

BANGALORE.

[The rest of your letter we have omitted, as bearing too closely on questions which we reserve for our advertisement columns. If you could, however, write us again on this subject, i.e., your ideas of discovering the causes of leaf disease and borer, by investigating the conditions of coffee where these pests are absent, we should be glad to publish the letter.—ED.]

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppinge, &c., contain per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.68	"	Phosphoric Acid.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. Germination guaranteed.

Only thornless variety extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE.

COFFEE.

Local consumption.

A correspondent draws attention to the very profound ignorance prevails on this subject, i.e., the consumption of coffee in "Hard Nut" roughly guesses it to be from 1,000 to 6 or 7 lbs. per head, is excessive. It is far more that the actual number of consumers is greater by far the 2,240,000 assumed for convenience in calculation. Without any reliable data it is of course quite impossible to make any accurate estimate, but we think we err on the side of safety, if we venture to place the Indian consumption of coffee at 20 to 30,000 tons per annum.

King Coffee.

The sweeping assertion made in the *Ceylon Observer* that coffee is no longer "King" in the East, and promptly denied to us, has been taken up by the *Calcutta Planter*. The most imperfect idea of the conditions under which cultivation is carried on in South India. Of the 3 cultivated plantation acreage in the Madras Presidency, Coorg, Mysore, Travancore and Cochin, 283,432 acres of coffee, while of tea there are only 16,277 acres. Madras districts, the Nilgiris and Wynaad alone produce tea, and the increase in the former district is certainly great deal slower than the increase in coffee, though the reverse in the Wynaad. In Travancore the approximately three times as much tea as coffee, Coorg, Mysore and Cochin tea is only being talked about nothing more. Much capital has been made out of small and decreasing exports of coffee, but it is ridiculous to suppose that these represent the total crops. According to authoritative valuations on the South Indian plantations the amount of produce consumed in the country is about 37 per cent. of the whole exports, in order to secure a profit of only 5 per cent. on the capital invested.

Coffee is undoubtedly no longer as flourishing as of old days before leaf disease made its unwelcome way to the land, but for the next many years at least it will remain King, though various heirs presumptive cast eyes on its crown.

The Market.

The better demand notice of the week has continued, says the *Review* of 24th July, and a larger business has been done than for many weeks past. The market for Brazil king has been particularly strong, and the price of good average Santos cost and freight, has advanced 5s. from the lowest point. This has been partly reflected in the terminal market, a report of frost having occurred in the interior of Santos caused an advance of 2s. 6d.; the highest point has, however, been maintained, and another report contradicting the first has led to a fall of 1s. per cwt. Such rumors are often circulated at this time of year just before the flow takes place, and it is quite impossible to place any reliance on them. It must, however, be admitted that quotations are very low, and that whatever takes place with the crop there is not much margin for lower prices, which present rates must tend to stimulate consumption in America and also on the Continent. There is no reason why consumption here should not also improve if grocers reduce their lowest price to 1s. per lb. or even less.

they could easily do, leaving a good margin of profit buying fine Santos, between 40s. and 50s., equal in value to what they were freely buying in the early part of this year at 75s. to 85s. The auctions have again obtained only small lots of undesirable quality for the part; the few parcels of good home trade sorts realised full rates.

SCIENCE AND COFFEE.

BY THE LATE MR. WILLIAM PRINGLE, M.S.C.I.,
FORMERLY AGRICULTURAL CHEMIST IN COORG, SOUTH INDIA,
TO MESSRS. MATHESON AND CO.)

(Reprinted from the "Madras Mail.")

RE.—These papers are being published in pamphlet form: register with Messrs. Addison & Co., Mount Road, Madras.

CHAPTER VIII.
THE COFFEE BORER.

THIS insect is the larva of an elegant beetle generally known as the "fly" from its likeness to a horsefly or wasp. Scientifically it is one of the Coleoptera, of the genus *Clytus*, and is represented in America by the hickory tree borer, and locust borer. The generic name *Xylotrupes*, signifying wood borer, has also been applied to this insect, and if people are not satisfied with Dunning's name *Clytus coffeophagus*, I would suggest the name *Xylotrupes coffea indica*, simply meaning the borer, India, which leaves the question of sub-order and genus open. But planters are very little interested in names, a beetle which has wrought such havoc, killing off estates, decimating others, and even in those most free from it causing an appreciable loss, is to them the "coffee borer" in larva state and the "borer fly" when it has developed into a beetle. During my four years' residence in Coorg, I have been collecting statistics of damage done by borer and experimenting with remedial agents. I have been successful beyond

anything I hoped for, not only in unravelling the history of the beetle, but also in applying remedies. It is easier to deal with than leaf disease, *Hemeleia vastatrix*. It is possible in from three to five years to reduce the losses of the trees on the estates by treating the trees for leaf disease and borer simultaneously, by from 50 to 75 or 80 per cent. calculated on the present loss. More it is useless to expect, as a great many trees die out from overbearing and other causes. The following is an approximate statement of the trees ripped out, and entered as "Borer" in South Coorg from estates under European management:—

Year.	Rainfall inches.	Crop cwt.	Per cent. of trees on acreage.
1885	62.31	5	8.3
1886	57.82	3½	6.9
1887	71.00	4½	7.0
1888	50.66	2½	8.8
1889	65.98	2½	8.9
1890	50.68	2	8.5

Neither the average crop nor the rainfall appear to have much to do with borer failure. But when the details are examined, a very close connection is found to exist between the weather and both crop and borer. I cannot in the brief space allowed me fully discuss the meteorological features of the question in this paper, but will just say that when the number of sun spots were at the maximum, the crops were good; as the number decreased so did the crops, and as they are now on the increase, crops will probably prove good till the maximum is again passed. For the purposes of this paper we will consider that the average of the various styles of planting give 1,500 trees per acre original planting. It takes fully three years for supplies amongst old coffee to come into bearing, and I would not be far off the mark if I said 50 per cent. fail in South Coorg. However, to carefully understate the case we will suppose all to come on. Then the land out of bearing per acre of cultivated coffee was:—

In 1887 equal to	... 22.2 per cent.
" 1888 "	... 22.7 "
" 1889 "	... 24.7 "
" 1890 "	... 25.2 "

All this is paying taxes, absorbing work and manure, and taking the best energies of our planters to prevent it increasing. The insect was the subject of Government inquiry some years ago, when Dr. Bidie investigated the matter. He, however, had not the opportunity to sit down and work out its life history, or probably his work would have been as complete as that of Marshal Ward in regard to *Hemeleia vastatrix*. In 1887, in the month of May, I obtained my first specimen of beetle, and I soon found that as far as the estates with which I was connected were concerned, it caused greater destruction than leaf disease, in spite of their being under shade. I began a careful study of the life of the insect and, though one or two minor points are still undecided, on the whole its history is fully worked out. In the central district of the Bamboo the beetle appears later than in the hot eastern district, but sooner than on the ghats. My remarks apply to the central district. After the first or second week in June, depending on the monsoon, the beetles disappear. Stragglers are to be found all the year round, but it is not till the end of August that there is any certainty of finding specimens of the autumn flight, and it is well on into April before the spring host appears. The maxima are two, one at the end of May, one at the end of October; the minima occur in January, February and July. To make the influence of the weather on the beetle's development clear, I append a table drawn up from personal observation:—

Month.	Weather.	Temperature	Beetles.
January	... Dry	... 60° to 99° Fh.	Very scarce.
February	... "	... 50° to 90° "	"
March	... Showers?	... 55° to 90° "	Scarce.

Month.	Weather.	Temperature	Beetles.
April	... Showers	... 66° to 90° Fh.	Few.
May	... "	... 75° to 95° "	Plentiful.
June	... Monsoon	... 60° to 70° "	Few.
July	... "	... 60° to 70° "	Very scarce.
August	... "	... 70° to 80° "	Scarce.
September	... Heavy showers	... 65° to 90° "	Few.
October	... "	... 65° to 90° "	Plentiful.
November	... Showers?	... 70° to 85° "	Very plentiful.
December	... ??	... 55° to 85° "	Few.

Where a note of interrogation follows the weather remark it means that the showers were uncertain. There is occasionally a much greater variation in the temperature than that given; for instance, in May I have known the thermometer to be over 104° in the shade, and I have in January seen it down to under 40° Fahrenheit. Broadly speaking, the temperature represents the averages of the maximum and minimum observations which do not, as a rule, vary in South Coorg more than five or ten degrees from those given. A consideration of the foregoing explains why shade (recommended by Dr. Bidie who saw its good effects on the Polli Betta where it had been planted by Mr. Minchin, who, I am informed, saw its good effect in Munzerabad) is so useful in retarding borer development. The mean minimum temperature must not fall below 65° Fah. or the development of the beetle is retarded; and shade by shutting out the sun's rays lowers the temperature. The eggs if kept at a temperature of 36° Fah. for 24 hours are all killed; few resist a temperature of 40°, but if the temperature is maintained at from 80° to 90° almost all the eggs will give forth larvæ in about ten days. Hence, when a very dry season with hot east winds occurs borer failures are more numerous. It is also the reason why borer has been so much worse in the Bamboo districts than in the forest and ghauts, and is the chief reason why shade is necessary in the hot eastern districts. The beetle when depositing its eggs selects a crack or crevice on the sunny side of the tree and avoids that upon which the monsoon rain beats. Every shower destroys the eggs which have not been so placed that there are kept dry. Shade does great good by retarding the development of the eggs, so giving the trees a greater chance of being freed from them by the rain. To satisfy myself as regards the influence of moisture I conducted a series of experiments on the influence of moisture on the development of the eggs, which I will briefly describe. Twelve borer trees taken out in May were chosen for the experiments; they were as equal as possible in size; the primaries were cut off. No. 1: Four of the stems were placed standing, in a dish with soil up to the old ground level, and on the top of each was placed a pad of wool. The whole was inclosed in a muslin cage which was kept about one foot clear of the trees. No. 2 was the same as No. 1, only the pad of wool was omitted. No. 3 was the same as No. 2. In Nos. 1 and 2 the soil was kept constantly damp, and in No. 1 the pad of wool also. No. 3 was quite dry. Previous experiments had shown that a temperature of 80° to 90° was most favourable to the development of the eggs, and I maintained that temperature as nearly as possible. No. 1 was damp all over. No. 2 was damp at the root. No. 3 was dry. A beetle escaped from one of the trees in No. 3 in August, and on the 9th September 1888, I cut up the trees—which were brought in on the 13th May 1888—with the following result:—

	Larva.	Pupa.	Beetle.	Totals.
No. 1	20	3	0	23
" 2	63	7	1	71
" 3	191	12	3	206

The average per tree is No. 1, 5.75, No. 2, 17.75, and No. 3, 50.12. This shows that a tree left lying on the ground during the monsoon, when it is kept constantly damp, does not develop many beetles; but such a tree, if left out during the dry weather, will develop almost all the eggs deposited on it. This points to the urgent necessity of burning the trees as soon as they are pulled out.

The greatest number of borer I have found in one tree follows: the trees were taken out on the 8th July 1887 cut up on the 8th September 1887:—60 borer (grubs or pupæ, 1 fly (beetle or imago), or a total of 83 in the various phases of development.

One beetle escaped before I cut it up, so there were all 84 borer in that one tree. This tree was carefully dried, an equitable temperature varying from about 65° to 70°. Under favourable circumstances the life history is as follows: The beetle deposits the eggs in a crevice of the bark on the sunny side of the tree; in about ten days the larvæ hatch, but it may require 15 to 20. The larva works on its side, cannot advance unless there is a resistance behind; the newly-hatched insect obtains from a projection or corner of the bark; in 24 hours or less the creature is buried under the bark. Once in the tree it advances, compacting the sawdust the matter it excretes, by admixture with a gummy substance, which, aided by the pressure of the insect forcing it against the wood it is devouring, becomes almost as hard as the surrounding wood, and fills the tunnel behind the insect.

This work goes on from three to five months, when the larva has reached its full development, the larva having advanced within about 1½ inch of the bark undergoes, transformation, entering the pupa stage. In this form it is covered by a transparent envelope, and lies with its head towards the entrance and the tail towards the entrance; it remains in this state until the temperature is suitable, probably about three weeks, when it undergoes its final change into the adult, which eats its way out. If the larva has not worked enough to the bark before changing it may fail to escape, being more wood than it can consume. From egg to beetle the average duration of the individual life is about six months. The majority of the race developing in May and October. As I have already exceeded my limit I must conclude, though I have not given a description of the beetle and borer grub, and merely an outline of the most important facts.

In a subsequent note to the *Mail*, Mr. Pringle adds:—In the 9th, in the article "Borer," there are two errors. I would be much obliged to you if you would kindly correct them. "average per tree in No. 3 is 51.50" (not 50.12) and "larva having advanced to within about ¼ (one quarter) inch of the bark." I may say the borer is sometimes found on the stems of trees barely 1 inch in diameter; in the forest there is scarcely one-eighth of an inch between the inner bark and the outer bark. In the letter signed "Gobra" in the 11th issue, the writer says he "considers the letters which appeared on the subject very interesting but rather theoretical." No doubt, but if theory did not work in practice would make but little progress. It is the duty of the technologist to bring theory to the test, and answer the omnipresent question "Will it pay?" That question followed me from an engineering works, through chemical manure manufactories, to my labours in connection with the cultivation of the plant. It is a practical question, and men must answer it practically. If the letters have only shown the plain which direction they can most profitably work at the questions, they will not have been written in vain. I heartily endorse the remainder of your correspondent's letter, which is very much to the point, and I hope there will be more of the penny wise and pound foolish policy of starving the estates. Good work and manure produce good results.

MESSRS. VEST & Co. have favoured us with a sample box of "Empress" Stationery, which they describe as their own production, the box having been designed and manufactured on their premises. In quality and value it is excellent. Fifty sheets of good green note paper and 50 envelopes (1 sheet and 1 envelope together under ½ tola) at Re. 1 is cheap enough for anybody.

TEA.

ipe leaf.

urious, considering the impossibility of making the best teas out of either immature or over-ripe leaf. It would perhaps serve a useful purpose if some of our experienced planting readers would give the public the benefit of their views thereon.

outh India.

Messrs. Arbuthnot and Co.'s Monthly Circular, which unluckily generally reach 10 days later than other home circulars, dated London, 16th July 1897, says:—

Only about 2,000 packages were brought to the hammer, for which an average of 6 per lb. was secured; whereas in May 6½ per lb. was obtained for 4,300 packages. This falling off in price is disappointing, but is principally attributable to the inferior quality of most of the offerings.

The majority of teas from Travancore were of a somewhat unattractive character, but those shipments which possessed desirable qualities were well competed for, Aneimudi, Isfield and Seafeld producing some of the best results.

From the Neilgherries and S. Wynaad consignments put forward were small. Tudor Hall sent a useful invoice from the former, but the others call for no special notice.

ome of our competi-
tors.

From time to time attention, perhaps inordinate, has been given to the Carolina, U. S., experiments in tea-growing. Everything has succeeded on the Summerille tea farm save one thing: and that is, the cost of production, which is stated by the American Secretary of Agriculture to be at least 8 times as high in picking alone as in Asia. Unless the oft-prophecied mechanical plucker turns out to be a practical reality (not the semi-useless hears arrangement), we are quite safe from that quarter.

In Java, however, things are very different and the planters there are striving might and main, and with very fair success to both improve and increase their output. In a Ceylon exchange we note that Mr. J. H. S. Davidson, nephew of Mr. S. C. Davidson, the inventor of the well-known "Sirocco" Machinery, has left for Java in order to superintend the erection of extensive orders for Sirocco Tea Machinery including a number of the newly patented automatic dryers, which machines have proved themselves unequalled in India during the past season. One factory alone about to be fitted will require machinery for 1,000,000 lbs. per annum. On one Indian estate alone this new machine dried over 700,000 lbs. tea last year, which in the London market averaged ½d. more than teas dried by other large tea dryers. Mr. Davidson will also take charge of the erection of a number of Davidson's Patent Rollers, Oxidizers, Downdraft and Updraft Siroccos, Sorters, Packers, etc., numerous orders for all of which machines have been booked for that Island. Mr. J. H. S. Davidson has been a practical planter and engineer for over eight years, and he will no doubt be able to give a lot of assistance to Java planters.

The Home Market.

INDIAN TEAS.—A fairly good selection of the more useful kinds was brought forward at the public sales, says the *P. M. Review*

of the 24th ult., and the market has shown more animation. Most of the Assam growths were of good average quality, and in consequence of the market being somewhat bare of the better medium and fine grades, competition was active and satisfactory prices were obtained. As the trade generally hold exceptionally small stocks of these teas, there is every prospect that firm prices will prevail for some time, and the demand will probably be quite equal to the supply until the arrivals are on a much larger scale. The Dooars teas now coming forward are on the whole better than the earlier imports, and as most of them possess fair strength they were well competed for and fetched good prices, especially the more useful sorts. The character of some of the Sylhets and Cachars has improved, and these kinds sold steadily at about late rates, while the Darjeelings are generally poor, and attracted but moderate attention at the comparatively low prices current. The prospects of a large and increasing supply diminishes, as it would appear, from the more detailed accounts of the damage done by the earthquake, that there will be considerable delay in the transit of the teas from many districts. At the public sales held on the 22nd inst. in Calcutta 19,000 packages were offered, and excepting for the fine teas, which sold at higher rates, there was no material change in values.

CEYLON TEAS.—With only a moderate supply on offer the values of Ceylon Teas have again hardened, and prices at public sale were generally in favour of sellers. In some instances, however, the quality showed a slight improvement, but where such was the case, although only to the extent of ¼d. per lb., as much as ½d. to 1d. was paid above previous rates. Fine teas are much wanted, and as only a very limited quantity worth over 1s. is to be met with, the few parcels offered attracted general attention, resulting in keen competition at greatly enhanced values. The lower grades of both Whole and Broken Leaf are still cheap, and a good business has been done in them. At the public sales 22,200 packages were offered, of which about 1,500 were withdrawn.

THAT MASTERFUL YANKEE.

THE writings of Mark Twain are full of instruction as well as humour. Possibly you have read that wonderful story of his called "A Yankee at King Arthur's Court." The hero is a skilled mechanic, the foreman of a great factory in America. He is accidentally killed, as we would say; but, instead of getting his body deposited in the grave, as happens to the most of us, he comes to life again, and finds himself at the Court of King Arthur in England in the sixth century, 1,300 years before he was born. That was a time of deep ignorance and superstition; people were but children then. So with his knowledge and his nineteenth century training he soon becomes master of everybody and everything. He controls the Government and runs the whole country—exactly as a college professor would be superior to all the children if he should take it into his head to join a class at a parish school. Now let us see what this idea may mean to you or to me.

In the autumn of 1873 Mr. James Murphy, of 49, Townsend Street, Dublin (present address 5, Synnott Row, Synnott Place, Lower Dorset Street) had a severe attack of rheumatic fever and was under treatment at the Sir Patrick Dunn's Hospital for three months. Then he left the hospital, but not the man he was before the disease fell upon him. Afterwards he was never free from it. For a while he

would be comparatively well, then down on his back again. It would depend on the weather and other circumstances, you see.

Of his worst times he speaks in this way: "My ankles and feet were hot and painful, and would often swell to three or four times their natural size. Occasionally the pain extended to the hips, and I had to be swathed in wadding from the thighs down to the ankles. In this way—now able to get about and now confined to my bed—I suffered for *over seventeen years*. The joints of my fingers and toes became displaced, or seemed to be so."

We don't need to point out what a cripple this sort of thing makes of a man. If he were wounded and torn in battle or by machinery he couldn't be worse off. Yet the number of people thus disabled is immense and, while rheumatism is peculiarly the disease of adults and old persons, the young (even children) do not escape it. If the disease were only understood—but let us not get ahead of our story.

"At Christmas, 1890," continues Mr. Murphy, "I had a dreadful attack, and was *confined to bed for seventeen weeks*."

This took him clear through the rest of the winter and one month of spring up to the first of May. What a dreary, miserable season it must have been! There is no merry Christmas or jolly coming of the buds on the trees for a man in that situation. Still, it might have been prevented if he had known then what he found out later.

"All this time," he goes on, "I was in the greatest agony. I couldn't move myself in bed, and finally got so bad I couldn't lift my hand to my mouth, and had to be fed like a baby. Night after night I got no sleep, and often wished myself dead. As for work, I thought I should never do a stroke again. The doctor who attended me gave me medicines, but I seemed none the better for them. I had long since lost all faith in rubbing oils and embrocations; I had spent pounds for them without benefit."

"One day, whilst still suffering great pain, I came upon a book telling how cases like mine had been cured by Mother Seigel's Curative Syrup. Not knowing what else to do I bought a bottle of Mr. Mannin, the chemist in Brunswick Street. After taking the medicine a day or two I had less pain, and I was able to leave my bed, and *fourteen days later I had not an ache or a pain of any kind, and got back to my work*. Since that time—now two and a half years ago—I have had no return of my old complaint. I never felt better in my life than I do now, and I thank God that I ever heard of Mother Seigel's Syrup. You are at liberty to publish my statement. I have been in the employment of Mr. Robinson, coal merchant, for the past ten years. Yours truly, (Signed) James Murphy, Dublin, June 23rd, 1893."

The mysterious American at King Arthur's Court was powerful because of his knowing what nobody else knew. Had Mr. Murphy known years before that rheumatism is caused by impurity of the blood, and that Mother Seigel's Curative Syrup cures it, he could have defied and banished that agonising ailment. We print these facts in order that his present knowledge may also be everybody's knowledge.

TO STAMP COLLECTORS.

5,00,000 Foreign Stamps, (well-mixed)

Includes some very good varieties. The best offered at the price, which is extremely low.

WM. RUTHERFORD & CO., SIMLA (PUNJAB).

THE "MADRAS STANDARD"

Published Twice Daily—Morning and Evening.

THE OLDEST, THE CHEAPEST & THE MOST POPULAR OF IN SOUTHERN INDIA.

Its chief features are:

A LONDON LETTER written weekly by a distinguished Member of Parliament.

Letters from Hyderabad, Mysore (and Bangalore), Travancore, Cochin, and Pudukota contributed by Correspondents well versed in the affairs of those States.

Letters from Far and Near } Political sketches and Caricatures of the leading men in Southern India
and
Telepathic Interviews.

Portrait Gallery—Lives of distinguished men in Southern India with their Portraits. Spicy Jottings on current topics. Amusing Notes, Stories and Sketches. News from various Mofussil Stations. Interesting Extracts.

Contracts cannot be entered into for less than a month, no less space than quarter of a column at the above rates discount of 5, 10 and 15 per cent. will be allowed on advertisements ordered and paid in advance for 3, 6, and 12 months respectively.

II. LINE RATES OF ADVERTISEMENT:—

1. English Advertisements: 4 as. per line, first 4 insertions, per line, fifth and following insertions.

2. Vernacular Advertisements: Tamil and Telugu, 8 as. per each insertion; Hindustani, Canarese and Malayalam, 12 as. per each insertion.

III. CIRCULATION OF LEAFLETS:—

1. For each circulation locally and by post Rs. 25.

2. For each do. locally only " 15.

3. For each do. by post only " 15.

(This excludes extra postage where the weight of leaflets necessitates such.)

Advertisement charges are strictly payable in advance, except approved customers.

MARKET SUPPLEMENT.

SATURDAY, AUGUST 21, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (July 30, 1897) says:—consequence of the August Bank Holiday, Public Sales are suspended on Tuesday, 27th inst., to Thursday, 5th prox. The small supplies brought forward met a good demand and a very steady tone prevailed.

Nearly 1,500 bags East India were offered and attracted good competition, values being obtained for medium qualities, whilst fine color sorts realised extreme prices.

The small quantities of Central American sold steadily at rather higher rates.

An easy tone has prevailed in the Terme Market owing to the heavy Brazilian receipts, and quotations show a fall of 1/- to 1/6 since our last.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending July 28th, 1897, says:—Bank rate 2%. Bombay Exchange closes at 3½d. Brazil Exchange 7½d. Rupee paper 3½%. Silver 26½d. per oz.

Since our last Report this market has been steady, with a fair demand for all kinds, especially for the better qualities, of which the supply continues very moderate. Brazil markets are very steady.

Daily receipts have averaged 12,428 bags in Rio, and 21,714 bags in Santos.

The large receipts of the last few days, combined with contradictions in the report that the frost in Brazil had done damage to the trees, have depressed the market for "Futures," which closes quiet with a decline of 6d to 1s 9d, viz.:—Good average Santos in Havre, September delivery, £45.00, in Hamburg pf. 36½, and No. 7 low ordinary Rio in New York 95.

To-day's London official quotations are:—

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated July 30th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	86,344 packages.	238,857 packages.	8,351 packages.
1896-1897...	69,409 „	227,500 „	9,859 „
13,968 pkgs. INDIAN	Total 51,531 packages were offered in public auction this week.		
35,884 „ CEYLON			
1,679 „ JAVA			

New markets for British grown Tea continue to expand, and the quantities of both Indian and Ceylon, taken during the first six months of this year, show considerable increases over those of the corresponding period last year. The recent low prices have therefore probably had some beneficial effect in promoting the growth of this very important branch of the trade.

Indian. The new season's Teas are now beginning to arrive somewhat more freely, and as they contain a considerable quantity of good liquoring Teas the market has assumed a more healthy tone and buyers are beginning to purchase more freely, the competition in the sales being decidedly more general than of late. Many arrivals from Assam have been of very fair quality. All Teas with good liquor attracted considerable attention and sold at dearer rates; common kinds, however, have not materially changed in value.

Week's av. of Tea sold on Garden Account, 1897, 9,740 pks.,
av. 8½d. 1896, 4,944 pks., av. 9½d.

Ceylon. The auction was a very heavy one and comprised 35,884 packages, against 22,217 last week; bidding, however, was very animated owing mainly to slight improvement in the general quality of offerings, many Teas showing decidedly better flavour than of late. Good Teas were in strong demand at better prices, while the demand for the commoner

grades remains practically unchanged. Average for week rather 7½d., against 8d. last year.

Ceylon Tea sold on Garden Account 1st January to date 660,469 pkgs., av. 7½d. 1896, 608,225 pkgs., av. 8½d.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage.

ADVERTISEMENTS.—Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c. Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 3rd September 1897.

Nilgiris. SHOLUR, 26th August.—Rainfall for month, 13.11, making a total of 40.26 to date. There was a slight break, lasting four days, but on the 23rd it started again in the old persistent fashion, which is simply ruinous to tea flushes. If we had a few days real good sun, flushes would, I believe, be extraordinary. Grains getting dearer in spite of the rain. *Health.*—Good. *Labour.*—Plentiful.

Coorg. POLLI BETTA, 24th August.—*Weather.*—During the past week and up to to-day the weather has been light. The rain has come mostly in the evenings. There have been several rainless days. This is just as it should be after the severe drenching of the previous week. *Plant-diseases.*—Leaf-disease has made a start, but coffee is on the whole still looking very fine. Prices of grain are still ruling high. *Labour.*—Coming in slowly. With few exceptions there is perhaps sufficient for present requirements, but more will be required later on. Contractors are employed. *General Health.*—Fair. Coughs and some fever prevalent.

Kadur. MUDIGERE, 24th August.—*Weather.*—For the past week has been fine and sunny, good growing weather after the heavy burst last week, when many estates registered 6 inches a day! Showers came up from the N. E., and the S. W. is clear as a rule now. *Plant-diseases.*—Leaf-disease showing up on some estates, which is most disheartening, for coffee has been looking well and good wood on. *General Health.*—A good many cases of fever still, and cholera has broken out in Chickmaglur, there being ten deaths last week. *Labour.*—Plentiful, but locals are still employed in their own fields. *Interesting Items.*—The Volunteer Camp of Exercise comes off on the 6th—13th at Chickmaglur, and a Fancy Dress dance is looked forward to. Snipe are in; the first bird was shot on the 23rd August, two days later than the 1st last season.

Nellampatty. 25th August.—*Weather.*—Rain for week, 2.10; to date, 136.97. We have had a very bright break for about a week, but luckily for clearings it seems over or just about over. Yesterday we had 1.93 and a little

more this morning. *Plant-diseases*.—On some places leaf-disease seems to have abated a bit, but there is a great deal of it still visible everywhere. *General Health*.—Fair. *Interesting Items*.—Just indignation prevaieth! It is very hard that such a hitherto steady and respectable community should be suspected of harbouring such a daring romancer as the correspondent to the *Madras Mail*, who signs himself "Planter, Nellampatty Hills," under the Elephant-Bicycle story. In our own small way we could, at a stretch, tell a "tara diddle" or two, but now we seem to have unearthed a first-class "Biblical character" all to ourselves. Plucky people he and his wife must be to cycle the Palghat road. We presume they also cycled down the ghat—to keep up with the rest of the story.

OURSELVES.

Our change from "a fortnightly" into "a weekly" has not passed without criticism. We have been congratulated on the change, we have also been blamed for making it; but those who have taken exception to our action would seem to have done so under a misapprehension of the facts. The change made is assuredly for the benefit of the reader. If he is a busy man, as nearly every one of our readers no doubt is, he gets his planting "literature" served up in two weekly lots instead of one fortnightly lot. Should he not have leisure to read one week's issue when it arrives, he can await the next, and then be in no worse position than if there were one of the former forty-page issues to be got through. One fear expressed is that we shall be unable to find pabulum enough to fill our columns every week. This to some extent counteracts another opinion expressed, *viz.*, that a weekly is more than busy men can get through. As a matter of fact, we rely on planters to help us, not merely to fill the columns, but to make the contents interesting, instructive and useful. Instead of censure, we would invite honest criticism. Whenever we fail to please it is from no lack of good intentions. If planters will say what they want, or what they do not want, we will endeavour to meet their wishes, while steering clear of the danger to which good old Æsop called attention long ago, that the efforts to please *every one* may easily lead men into pleasing *no one*. Some planters want a strictly *planting* organ, others like a little variety. Some consider the planter's wife as well as the bread-winner himself; others would confine the paper within narrower limits. All, perhaps, are agreed that such an organ as *Planting Opinion* endeavours to be should throw its columns open for the discussion of planting affairs *by planters*. This is what the management chiefly aim at: they ask planters to avail themselves of the opportunity, and, by discussing affairs of general interest in correspondence or by means of special articles, to help to make the paper useful to the whole community. Proof of what planters *can* do in this way is to be found in Ceylon; and there is an immense amount of talent in Southern India that might easily render yeoman's service to a good cause, were it not persistently hidden under a bushel, as it now too often is.

GENERAL NOTES AND ARTICLES.

The Sea Railway to Ceylon. During a recent visit to Colombo, Mr. Knight, the well-known Travancore planter and formerly of Ceylon, vehemently urged that Ceylon should in its own interests strongly discountenance

the scheme of the proposed railway from India to Ceylon. He states with great force that the very inaccessibility of Ceylon renders desertion of coolies from plantations almost impossible, whereas in South India, the ease with which coolies can regain their villages does much to prevent this crime. As to the expense of coolie labour in Ceylon being lessened by the railway, Mr. Knight points out that though the cost of wages is 25 per cent. more than in India, yet by means of the better discipline quite 50 per cent. more work is obtained from them.

Rain-gauges. With reference to the unfortunate error in measuring rainfall last week by our Nellampathy correspondent, any such mistakes could be easily avoided by reference to the following table, kindly prepared for a correspondent by Michie Smith, Government Observatory:—

Diameter of funnel in inches.	oz. of water for 1 inch of rain.	cents of rain for 1 inch of water.
12	65.26	1.532
10	45.32	2.206
8	29.01	3.448
6	16.32	6.129
5	11.33	8.826
4.7	10.00	10.000

For any size (d) of funnel, to find the equivalent ounces of water for 1 inch of rain, multiply the square of the diameter by 0.4532.

Castilleja rubber and Croton tiglium. In the last report of the N. Agri-Horticultural Society appeared an interesting letter from Mr. L. W. Grey, of Ponnani, Nilgiris, which is worth quoting:—

You asked me for particulars of my Castilleja Rubber. Six trees planted in 1889 at an elevation of 3,000 feet, flat land, North of Ponnani, rainfall 40 inches, supplemented with irrigation in hot weather, March, April. They flowered for the first time last May, and seed ripened in June. I got 350 seeds, but some were lost. The seeds are now germinating in the nurseries. The growth of the trees is as follows:—

1.	40 feet high	28 inch girth	3 feet from ground.
2.	37 "	27 "	" " " "
3.	24 "	30 "	" " " "
4.	24 "	30 "	" " " "
5.	20 "	20 "	" " " "
6.	19 "	20 "	" " " "

I think the above may be considered good growth. No particular care has been taken of them. They are full of sap, but how to tap them is what puzzles me. No doubt we shall hit upon a plan ere long.

My croton Tigilium. Some 12 trees have seeded freely this year, and this seed is now quoted at 85/ per cwt. in the London market, but being a drug, the market is easily brought down. The Castilleja Rubber does not seem to hurt coffee as the trees growing under it are first rate."

Uses of Grevillea robusta. The uses of the Grevillea robusta, says a correspondent of the Ceylon paper. It furnishes excellent timber—which is much worked. A large withering house on, perhaps, the best estate in Dimbula, has been built of this wood. The timber looks sound and dark in colour, although, no doubt timber—*as the trees could not have been over 27 or 30 years old*—

Grevillea is valuable in the field, as its light shade, planted at say 30' to 36' apart is rather beneficial to tea otherwise. But the great good it does, is the bringing of plant food from the subsoil, and distributing the same in the form of fallen leaves,—(has an analysis of shed Grevillea leaves been yet made?)—which, too, are useful in preventing surface "wash"—while decomposing on the ground.

The tree thrives best in light, porous, stony or sandy soil least so in clayey soil. It is easily raised from seed, and after being planted out—if badly shaken by the rude monsoon winds—it should be cut down to within a few inches of the ground—when it will grow afresh. We can't get everything, you know; and don't deserve to! It would be too good if *Grevillea* furnished a good fuel! Well, it does not. It dries up very much after felling, and although when seasoned burns very well in furnaces, the heating power is probably half that of old dry *Doon*: but I can't give figures.

To these uses may be added that of affording excellent light shade for coffee, and also, the possible source of supply of a most valuable gum.

The sleep of plants.

Like animals all plants require intervals of repose during which the vital functions are slowed down, and the organic structures undergo repair. Some plants repose during the rainy season, others during periods of drought, but while some plants sleep during the cold or the comparatively cold season of the year, others again take their rest when the average temperature is high. It occurred to a Norwegian observer to investigate the sleep of plants, more particularly with the object of shortening the period of repose, and this he aims to have attained by subjecting the bulbs or buds to the action of chloroform vapour. He asserts, indeed, that plants thus treated subsequently develop more rapidly than those whose repose has not been intensified by the narcotic action of this drug, and the observation is not without considerable interest. If his observations are trustworthy, it follows that sleep in plants is not strictly comparable to that of animal life, for we do not suppose that the period allotted to sleep by animals could advantageously be shortened by the administration of an anæsthetic. Sleep, on the other hand, is a relative rather than an absolute condition. Its value as a restorative depends in a very marked degree on its intensity, and certain individuals derive more benefit and recuperate their jaded energies more effectually in five or six hours than others do after twice as long. This recuperative energy is asserted to be an indication of a high standard of vitality, and common observation certainly lends colour to the view that diminished recuperative power is indicative of physiological deterioration.

Plantains.

We have written many times of the great possibilities of plantain planting in South India, but so far without attracting any serious attention. Yet the export of the banana and the plantain forms, as our contemporary the *Madras Times* points out, an important and profitable branch of the commerce of Nicaragua, Mosquito, and British Honduras, enormous quantities of the luscious fruit being shipped to the United States and Europe, England being about the largest European consumer. Not only in South America but everywhere where the banana is grown, the cultivation and harvesting of the fruit is easy and inexpensive, requiring no more than a little care and close supervision during the planting of the suckers, the tending of the growth, and the gathering and packing of the fruit for exportation. The profits are found to be large and secure, the gain being declared to be as much as 150 per cent. on the outlay in the first 12 months, and springing to

the astonishing sum of over 900 per cent. in the second year, all this being clear profit for the planter. For results such as these—even if we allow a goodly discount for roseate estimates—it would be worth while working hard and running big risks, but here is an industry in which neither hard work nor great capital is required in order to yield a magnificent return. The Nicaraguan banana planter neither toils excessively at his business nor risks much capital. He works gently and without excitement for a period something under a month in the year, and is at liberty during the remaining eleven months and odd days to work or not, as best beseemeth him. India's facilities for disposing of her fruit with advantage are nearly as great as those of any of the South American States, and certainly as great as those of Australia, while cultivation, if it were carried out on the most improved methods, would be easier and considerably more certain than in the Island Continent. Yet things are by no means on India's side. Australia has begun growing the mango for the European markets, and the natives of the Central American States furnish Europe and America with the banana. Both fruits are natives of India. The mango, of course, belongs pretty well to India alone. As for the banana, there is a coarse species indigenous to Africa, but America's banana is of the more delicate Asiatic species, which was taken over to the banana-less new world by Spanish settlers. In India, however, the planter has done but little, commercially, with his trees.

U. P. A. S. I. LEAVES.

[GATHERED BY THE SECRETARY, U. P. A. S. I.]

ALTHOUGH the statistics already in hand are fuller than any yet published, several districts have still furnished none. It is very desirable that gaps of this kind should be filled at once. The Book of Proceedings for 1897 will be issued very soon, and as it is not proposed to publish statistics again next year, it would be well that this year's figures should be as near complete as possible.

Orders for the book should be registered as soon as possible, either with the Secretary of the U. P. A. S. I., or with Messrs. Addison & Co., the printers.

Copies of the *Graphic*, containing an illustration of the U.P.A. Casket, are available. Application should be made to the Secretary.

CULTIVATION OF COCA ("ERYTHROXYLON" COCA).

A PLANTER writes to ask the *Ceylon Observer*:—"What was the reason that the cultivation of *Coca Erythroxylon* (for cocaine) was not seriously taken up? I see by an old volume of the *T. A.* that an experimental lot of leaves sent home in 1885 was valued at 13s. per lb. The plant is said to be almost naturalized about Peradeniya." Our correspondent will find a full history of our Ceylon experiments so far as they have gone in our "Planting Review" in "Handbook and Directory," pages 132-133. The one or two Ceylon planters who have gone in for coca have no doubt done very well; for the export of "coca leaves" has increased from 956 lb. in 1890 to 3,392 and 3,397 lb. in 1895 and 1896 respectively. The fear of overdoing the market (after the experience of cinchona) had no doubt kept planters generally in suitable districts—from Dumbura to lower Pussellawa (?) or so—from going in for coca. We see that cultivation is extending in Peru: in fact we may as well quote what is said in

the very latest Journal of the "Society of Arts" (July 30th) on the subject:—

THE PRODUCTION OF COCA IN PERU.

Before the discovery of cocaine and its anæsthetic properties, the consumption of coca was limited to the demands of those provinces in Peru in which the mining industry was carried on, the miners refusing to work unless they were supplied with coca. Twenty years ago, according to the *Economista* of Lima, the cultivation was only engaged in districts which enjoyed the most favourable conditions of climate and labour. In the province of Otuzco, the systematic cultivation of coca was only carried on in the haciendas of Choquisongo and Sanjumas, and the production amply sufficed for the needs of local consumption and the mining industries of Salpo and Saypullo. For some time past the production of coca has greatly developed, and the province of Otuzco is at the present time the most important producing district in the north of Peru, its production exceeding even that of the provinces of Huamachuco and Cajabamba, not only as regards quantity but also quality. The number of plants is 270,000, and the majority of the plants in this province have not yet attained their full development. The coca from these districts is brought by two houses of Trujillo for the cocaine factories of Lima, and as they enjoy a sort of monopoly, the prices vary at will. The proprietors of the haciendas of Huayobamba and Cayhanchal are proposing to establish cocaine factories in close proximity to their plantations, which may have the effect of lowering the prices. With the exception of the hacienda of Chuquilhanqui situated on the river of that name, all the other coca plantations are found along the river Chicama. To obtain the best result, coca should be cultivated in places where the temperature rarely falls below 240 Centigrade (750 Fahr.) and frequently rises as high as 30 (86 Fahr.) As regards the altitude of the plantations those of Calancas and Huayobamba are for the most part situated at an elevation of 3,000 to 4,000 feet above the level of the sea; a few are found as high as 5,000 feet, but the product in these cases is of an inferior quality. The haciendas of Chuquilhanqui, and a few others of minor importance, are situated at an altitude of about 2,000 feet. The quality of the coca varies according to the soil. That obtained from dry ground is better than the product of a moist soil. It is for this reason that the Chuquilhanqui coca, although frequently attaining a height of about 9 feet, is far from possessing the strength and aroma of that produced in Calancas and Huayobamba. In the districts of Pampas and Calancas, there are about 80 small proprietors of coca plantations; at Compín the number exceeds 100, while at Chuquilhanqui there are hardly 20, the cultivation of coca having only within the last few years been introduced in the latter district.

The latest quotation for coca leaves in London is only 7d. to 8d. per lb.

LETTERS TO THE EDITOR.

NOTICE TO CORRESPONDENTS.

[R. E. G. "MYSORE TRIP": Letter received, with thanks, but is too short to publish as it stands, so we await continuation. VAN RESD. Declined, with thanks. A PLANTER'S FRIEND. Why not write direct to the paper in fault; we do not consider it expedient to give wider publicity to that journal's misstatements and personalities.]

A TALE OF A SHOOT.

SIR,—Your copy of 31st July is to hand, and I glean therefrom, under "Nellampathy British, Interesting Items," "that the Cochin Rajah is going up to shoot in the tail end of the year." This should prove an "interesting item," and, presumably, the presence of all the planters there has been requested to see the "end" of the poor "tail"? We poor Nilgiri Planters feel quite out of it. Is this sport peculiar to the Nellampathy District? Supposing though the "tail" becomes lively—whisks about—and won't be shot, what does the Rajah do? Cut it short? N. S. R., take the hint.

BARBER.

7th August 1897.

["BARBER" must hail from North of the Tweed. What more truly interesting item could one expect from the remote region referred to than

that the head of the State intended to shoot in (fortunately not at) the end of the year? ED.]

SNAKES!

SIR,—Bill Blunderbose, the Boniface of a Bush-run in back-blocks, has had some thrilling experiences with snakes. He is more versed in their natural history and pleasing manner than most people I have met. He was out one day in the sun. It was piping hot and Bill was on foot, for no horse could climb the mountain of flesh which he called his body. He sat down on what he thought was a log and concluded that he would smoke. Taking out his pipe and finding some ashes in a bowl he knocked it smartly against his log. Suddenly the bowl slipped away from under him and sent him sprawling. Getting up in great indignation he saw the log glide away, and to his horror he found he had been sitting on a snake. "Snakes are big in those days," he remarked. "Never see any so big now-a-days, but they are like everything—they be going down. No," he said angrily, answering the incredulous looks of his listeners, "I had not taken any whisky that day nor seen any one taking it, but I like to see you take something to put into your mouth and not keep them wide open a-catching flies. Which is all the folks is good for."

The hint was taken, some one duly shouting, and the man, appeased by finding that some cash had come in in consequence of his story, started to tell another.

Yes, snakes is queer customers; they don't always act as you would expect. I was out one day and sat down on a log. No, there was a log and not another snake, mister; so mind your business and I puts my gun against a tree hard by. I sat a-thinking. What about? Never mind, it was not about you; when out on a snake from under the log right between my legs. I got up—snake he was a bit abroad too and went straight for me and up he goes and goes right down into the barrel with the end of his tail a-sticking out at the end. Well now, there is a deal in presence of mind. What does I do? Why I take my gun and pulls the trigger, and I never saw that snake again.

It seems strained, but it amused his

HEA

THE COFFEE CAMPAIGN.

SIR,—It is of course natural that the coffee planters of Southern India should wish to see the use of the fragrant beverage extended, as it means larger consumption and better prices. But what seems to me the chief obstacle in the way is the high price at which the article already stands, and I fear this high price which accounts to a considerable extent for the "chicory and coffee" mixture which one of your correspondents, "Cup of Coffee," sometime ago deplored as having taken its place at home of the "delicious, exhilarating and refreshing beverage" he is accustomed to on the tôte.

The campaign in connection with tea is on a somewhat different footing from that of coffee. The Indian and Ceylon tea planters have so increased the production that tea is sold at low prices compared with former years. They therefore offer the public an article not only superior from their improved methods of cultivation and preparation, but cheaper than before, and these prices are such as to bring it within range of the poorer classes. The "Tea Campaigner" therefore must have mill after mill to reach the public within his reach, while the "Coffee Campaigner" can only with his high prices come within hail of the thousands.

I think it will be found that coffee has stood at a high price for a good many years. The time was in the days of the high yields in Ceylon and Jowa, and when Brazil was also producing largely, prices were 30 to 40 per cent. below what they are at present, and that too with exchange about or above two shillings to the rupee! Taking East Indian now at an average, 90 shillings per cwt. in the London market, add to this

a pound, equal 28 shillings per cwt. You have a wholesale price to begin with of a little over a shilling a pound. Before it reaches the table of the consumer, what with carriage, charges and profits to the various dealers through whose hands it passes, the price cannot be less than 1/6d. to 1/10d. per lb. The same quantity of tea at the price will go farther, will make more cups of an agreeable beverage with much less trouble, so that it has every way (apart from the matter of individual taste) the advantage for the million, and it is the million you want to reach. No, what is wanted is an increased yield per acre, and this is the direction in which the planter must continue to apply himself with unremitting energy. Let the Indian Planter make the most of the good prices now obtainable. Let him by all means push the sale of his produce into new fields. But do not let him be too sanguine of the result, for until he can offer the public his fine coffees at rates which will bring them more within easy reach of the multitude, the ground gained will not, in the long run, meet his expectations. His present position is a fairly good one. He is getting high prices and a very favourable rate of exchange, while he still pays moderate rates for his labour. He cannot make money under present circumstances and with the increased knowledge he has gained in the cultivation of the article, he may not have another chance for a long time to come. Where the area of suitable land is limited, but when the vast virgin forests of tropical Africa are laid under contribution and cultivation is extended into the immense reserves of South America, we must look for a large addition to the world's annual supply and with a larger supply lower prices.

"A HARD NUT."

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.68	"	Phosphoric Acid.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE.

COFFEE.

Early leaf disease.

A South Travancore correspondent remarks that (in common with some other South Indian districts) this year's attack of leaf disease happened two months earlier than last year. As the sooner it is over, the sooner the coffee picks up, and hopes for good crops next year.

An irrigated garden.

A Correspondent writes from Bangalore:—On Sunday, the 15th instant, a party of gentlemen, including Col. Donald Robertson, British Resident in Mysore, Col. J. P. Grant and Messrs. E. R. Kindersley, A. Lambert, H. H. Sparkes, Campbell-Walker, H. Raikes, Glengall Madden, and Godfrey were invited over to a picnic party by Mr. Justice Meenacshaiya, of the Mysore Chief Court, at his coffee gardens near Tumkur. The Southern Mahratta train was taken from the City Station in the morning, Mr. Lindsay, the District Traffic Manager, accompanying the party, as Mr. Meenacshaiya had chartered a "Special" for the return journey, and Herehalla reached, where the party breakfasted at the station and proceeded thence to the

Estate, (in dogcarts and tongas) about 4 miles distant, arriving there about noon. Most of the gentlemen being planters, were of course interested as to what could be done with coffee at an elevation similar to Bangalore almost, and only about 40 miles distant from here, and it was an agreeable surprise to them to see such a luxuriant growth of coffee. Of some 30 acres planted from 5 to 6,000 trees will be two years' old in October next, but they look more like four-year trees we usually see in the coffee growing districts of Southern India and having a deal more primaries than ordinary coffee; and, considering their age, the proprietor is quite hopeful of a ton crop; next year, with the full 30 acres in bearing he expects from 6 to 7 tons, and the trees look healthy enough for that. The whole garden is perfectly free from such pests as borer, bug and leaf disease, the planter's enemies. To account for such a state of affairs there is something in the back ground, viz., natural irrigation. The estate is situated on the slope of a hill from the top of which runs a stream, the Talapoori, which gives a never-failing supply of water from the hills and the constant flow is impounded in artificial reservoirs, with sluices for regulating the irrigation, which is mostly by gravitation, that is to say, there is no necessity for baling or carrying the water to the plants. There is also a second stream a little lower down, which commands the irrigation of another 15 acres, and terminating in a waterfall, where at present there is a bathing house, and which the owner will eventually utilise for pulping his crops. There are 20 acres in course of planting out this season, and the entire estate is protected by a barbed wire fence.

Mr. Meenacshaiya, some of your readers must know, had a very highly cultivated garden on the Oosoor Road, a few miles out of Bangalore, which he disposed of not long ago. He is a very successful coffee grower, and I am sure that anybody intending to embark in the industry will not regret a visit to his plantation near Tumkur.

As to the picnickers, they returned in the evening by Special train, having refreshed themselves at the station, and expressing themselves highly pleased with their outing.

SOUTH INDIAN COFFEE AND PEPPER.

In his interesting Annual Statement of Exports of Coffee and Pepper for the year ending 30th June 1897, the total figures of which approximately represent the crops of these products in India for the year in question, Mr. Ralph Tatham, of Tellicherry, shows the distribution of shipments to foreign ports and gives the figures relating to exports for the two previous years for the purpose of comparison.

Coffee. The crop of 1896-97 was remarkable as being the smallest exported from India for many years, the total quantity not exceeding Cwts. 211,760, or some thirty-one per cent less than the previous crop, which itself was not a good one. Of the quantity shipped this past year Cwts. 117,182 may be regarded as Plantation, and the balance Cwts. 94,578 as Native Coffee, the value of the former being Rs. 79,68,376 and of the latter Rs. 55,80,102, calculated at Rs. 68 and Rs. 59 per cwt. respectively, which I consider an average value for the year, allowing for the difference in prices obtained for the produce of the several districts in which the crops were grown. The total value of past year's crop may therefore be taken at Rs. 1,35,48,478 as against that of last year, which I estimated at Rs. 2,24,61,857, but as already shown last year's crop compared unfavourably in quantity with that of the previous year and in addition the Coffee Market was weaker to the extent of an average of some nine Rupees per cwt. The considerable reduction in the export from the ports of Mangalore, Tellicherry, Calicut and Madras point to the fact that the crops in the districts of Mysore, Coorg and the Nelliamp

pathies, which find their outlet at the ports in question, were exceptionally short; whereas judging from the shipments from Beypore the crops from the Neilgherries and Shevaroy's were greater than those of the previous year.

Pepper. The total exports of this spice amounted to Cwts. 222,383, or some forty-one per cent in excess of what was shipped last year, the value of which at an average of Rs.17-8 per cwt. amounts to Rs.38,91,702. The shipments from Tellicherry were the largest.

Mr. Tatham's statistics show that London is still the recipient of most of the coffee, but that, outside India, Havre takes the greater part of the pepper. Exports to the chief ports in 1896-97 were as follows:—

	Coffee.	Pepper.
	cwt.	cwt.
London	103,655	20,003
Marseilles	12,980	
Havre	54,457	79,125
Trieste	5,839	1,000
Hamburg	3,691	13,606
Turkish, African, Arabian and Persian Gulf ports ...	10,988	1,883
Bombay and other Indian ports ...	29,583	146,338

As regards the extent to which the various Coast ports contributed towards the total exports, we are able to gather the following information from the elaborate statistics under review:—

	Coffee.			Pepper.		
	1894-95	1895-96	1896-97	1894-95	1895-96	1896-97
	cwt.	cwt.	cwt.	cwt.	cwt.	cwt.
Mangalore ...	112,349	128,375	83,350	1,600	2,671	2,287
Cannanore ...	2		3	28,806	26,366	52,178
Tellicherry ...	34,496	57,080	37,944	46,178	52,623	69,518
Badagara ...				5,867	7,919	20,623
Calicut ...	54,905	49,258	36,494	6,527	18,696	19,026

Madras ...	43,889	37,743	18,883	31	62	47
Totals ..	291,621	307,417	211,760	151,439	157,911	222,383

NYASSALAND.

DESPITE every drawback, the coffee industry of British Central Africa is yearly increasing in importance. Those who have recently been reading Sir Harry Johnston's book, says a writer in the *Madras Times*, will look with special interest to the report of Consul and Acting Commissioner Sharpe, which brings the history of British Central Africa up to date. Coffee cultivation is, we are glad to see, steadily increasing. The value of the coffee exported has increased from £9,290 to £16,426 in the past year, and a considerable amount of new land has been opened out and planted with coffee, which will begin to bear fruit some two or three years hence. The Commissioner estimates that the production of coffee will now be a constantly increasing quantity. Civilisation progresses by road-making and the spread of currency. There is now, for the first time in history, a good broad road joining Lakes Nyassa and Tanganyika—a road which, the Collector reports, is good for "horses or bicycles." A Central African bicycling tour is therefore becoming a matter of practical politics. As for currency, there are now British sixpences and shillings, coined at the Royal Mint, in circulation among the natives of Central Africa, and (so the Commissioner reports) with the most beneficial results. Sir Harry Johnston drove out the rupee, which had endeavoured to get a foothold, by fixing its local value at 18½ to the pound sterling, and now the Queen's shilling takes its place. The natives thoroughly appreciate its uses.

Even in the North Nyassa district labourers prefer to be paid in coin. The Yaos thoroughly appreciate having a currency. It has proved, in fact, a great step towards civilising the native of this part of Africa. He is now able to accumulate his earnings, which formerly, in the days of a calico currency, was an impossibility. He can, moreover, hide his wealth. Many native workers in the Blantyre district have stores of money hidden away, or in the bank. I have

received a number of applications from well-to-do natives for purchase of blocks of Government land of about 100 acres each. A considerable number of natives have bought land, paid for it, and received formal transfers. Most of these are, of course, the more than usually intelligent natives, who have realised the profits made from coffee planting.

COFFEE CULTIVATION WITHOUT MANURE.

A CRITICISM.

IN his reply to my criticism of his lucubrations on the subject in which I charge him with saying that manuring with E. L. cuttings and leaves was equivalent to an application of nitrates ready made, Mr. Nelson says that he may have said that it practically amounted to an application of nitrates as the cuttings decayed away so rapidly. What he actually said was this. I quote from his article in *P. O.* of March 6th, 1896:

"The leaves and cuttings decay at once and the nitrogen which they contain is made available to the coffee tree. I believe, for immediate solubility and availability, they be fairly considered as nitrogen in the most expensive form, nitrates. . . . Thus E. L. is a tree that can be made to produce coffee with two manurings yearly with nitrates. . . ."

As there is not a word in the article referred to as to the cuttings having to undergo the process of nitrification before they could become available to the coffee, I naturally concluded that the idea was that there was no such necessity. To my objection that the well-known dangers of an excess of humus would be liable to arise from constantly applying E. L. cuttings, he replied that this is impossible and says that, on the contrary, it is difficult to preserve what humus there is on coffee land, and is very little risk of increasing it to an undesirable extent. I find it impossible to agree with Mr. Nelson here will appear presently. As to the difficulty of preserving humus on the soil, he refers to articles by "Humus" in *P. O.* I prefer to go on the more authoritative data furnished by Dr. Voelcker in his report on the Improvement of Indian Agriculture." He says on page 270 of the Report:—"In Appendix B, I give some detailed analyses of Munjerabad coffee soils, and I would, in passing, comment on their richness in vegetable matter and in nitrogen resulting therefrom." When it is stated that these analyses were made of soils taken from different parts of Mr. I. Elliot's "Bartchenhulla" Estate, which I understand was commenced in 1856, it will be seen that the alleged difficulty of preserving humus is not proved. The estate is shaded with ordinary recognised good kinds of shade trees, and, it may be supposed, was worked in the most approved style.

Now for the analyses.

SOILS DRIED AT 212°F.	No. 1.	No. 2.	No. 3.
* Organic matter and combined water ...	7.15	13.73	
Protoxide of Iron ...	trace.	1.54	
Peroxide of Iron ...	5.04	11.83	
Alumina ...	20.39	11.53	
Lime ...	.20	.82	
Magnesia ...	.28	.32	
Potash ...	.25	.10	
Soda ...	.12	.12	
Phosphoric Acid ...	.13	.15	
Sulphuric Acid ...	.03	.02	
Nitric Acid ...			
Chlorine ...	.01		
Insoluble Silicates and Sand ...	66.40	60.34	
	100.00	100.00	100.00
* Containing Nitrogen ...	.032	.20	
Equal to Ammonia ...	.039	.24	

In his remarks at the foot of these analyses, Dr. Voelcker mentions that No. 1 is considered good coffee soil, and that coffee does not do well in Nos. 2 and 3. And from this he naturally infers that "*the supply of nitrogen is of lesser importance in the case of coffee*" (italics mine) and says that the superiority of soil No. 1 to Nos. 2 and 3 "would appear to rest on the excess of potash, the lesser proportion of iron salts, and very probably also in the fact that these latter are present in the more fully oxidised state of peroxide and not in that of protoxide of iron."

This richness in nitrogen is accounted for, according to Dr. Voelcker, by the fact that the land is old forest land, and he is of opinion that "it is likely that lime and mineral ingredients are what the soils require rather than more vegetable matter such as would be contained in oilcake, cattle-dung, &c.," and is, in spite of the fact that cattle-dung contains all the constituents which the soil requires for growing crops and is thereby entitled to rank as a perfect and general manure. (Fream.) In his notes at the foot of the above analyses, Dr. Voelcker states that he considers there is a decided deficiency of lime in all three cases; that No. 1 hasn't a sufficiency of potash; and that Nos. 2 and 3 are especially poor in it. Phosphoric acid, he says, occurs in fair but not large amount, and that therefore bones may still be advantageously used. To rectify the deficiency of potash, he advises manuring with wood ashes or some other source of potash, and is of opinion that it would be beneficial in all three cases.

Now I would ask Mr. Nelson whether, if minerals were excluded and his plan of growing E. L. in the coffee and manuring it with the cuttings were adopted in the case of soils like those under notice—and it is to be remembered that the great majority of coffee estates are opened on the sites of old forests and that the land in Southern India is of laterite formation which shows a want of lime and is deficient in phosphoric acid and potash—I would ask whether if his plan were exclusively followed in the cases instanced, Mr. Nelson would consider it all that was necessary or required? He would probably answer 'Yes,' because E. L. cuttings, besides an abundance of nitrogen, contain all the ingredients necessary for the growth of coffee. So does cattle-dung, albeit it may not perhaps be quite as rich as E. L. cuttings, yet Dr. Voelcker objects to its being applied to land already rich in organic nitrogen. It will be interesting to enquire why this should be so. We see that in England or on the Continent green-manuring never enables the farmer to dispense with the application of minerals, although all vegetable matter, according to Professor Munro (Soils and Manures), retains a stock of all the minerals necessary to plants. This is apparent from a quotation which Mr. Nelson makes in his article in *P. O.* of March 6th from the *Royal Agricultural Society's Journal*. Here we read that Deblingar sold all his cattle and adopted green-manuring *supplemented by artificial manures* in place of stable manure. (Italics mine.) I can find nothing in any authority, and I have consulted Munro, Fream and Voelcker, as to the possibility of plants deriving mineral food from humus. Fream says:—"It was formerly thought that humus was capable of serving directly as plant food, but this has been proved to be not the case. Nevertheless, humus is of great value, because the final products of its decomposition—chiefly carbonic acid, ammonia and water—are capable of administering to the food requirements of plants." The other authorities say much the same thing in other words. This refers to humus of any description whatsoever, and would apply to the humus resulting from the decay of E. L. cuttings, the only difference between this and ordinary humus being that perhaps it yields a larger supply of ammonia. Now why is it the case that the minerals in humus are regarded as non-available? They are either apparently practically non-available, or they become available so slowly as not to be relied on to supply plants

with their requirements in this direction. The following quotation from Professor Munro would appear to partially account for this:—"The production of carbonic acid, water, and ammonia become slower and slower as the carbon, hydrogen, and nitrogen in the decayed matter are left behind in combinations more and more difficult to break up, and the particles of humus, however long they have existed in the soil, never become entirely robbed of either of these three elements." This being so and the minerals being bound up in the particles of humus, they cannot be set free till this combination is broken up. We see that in burning cattle manure (bratties) or wood, the carbon, hydrogen and nitrogen have all first to be burnt entirely away before the minerals in the shape of ashes can be set free. To sum up: it is considered necessary by expert authority that green-manuring with leguminous plants does not suffice, that it must be supplemented by the application of artificials, although humus contains a stock of all the minerals necessary to plants. As there is nothing to differentiate the humus resulting from the decay of E. L. cuttings from other humus, it may contain a larger amount of minerals and nitrogen, but it is still practically the same thing; the inevitable inference is that it is just as necessary to supplement green-manuring with E. L. cuttings by artificials as it is in the case of any other green-manuring.

It may be that I have hit upon the right explanation or otherwise, but the fact remains that experts are agreed that humus only yields carbonic acid, water, ammonia, and finally nitric acid for the use of plants and that it is not a source from which the mineral needs of plants are derivable. This being so, it becomes self-evident that "coffee cultivation without manure" is a physical impossibility and as such has to be relegated to dreamland, as something beyond attainment in the present state of knowledge at any rate.

But even if it be admitted that the minerals contained in humus are gradually yielded up, yet the amount would be so disproportionate to the yield of carbonic acid and nitrogen that the danger would arise as put by Dr. Voelcker that "over-richness in nitrogen may produce a rankness of growth, and over-development of leaf to the exclusion of berry" which would render it imperative to make a free use of phosphates and potash to rectify. To come to the practical part of the question: Mr. Nelson has now had some experience of "coffee cultivation without manure": will he enlighten us as to the crops he has obtained under the system he recommends?

There is yet another aspect of the question. I said in my previous criticism of Mr. Nelson's system that if lime were withheld from land treated on his plan, the dangers of too much humus, that is foulness and sourness, would result. He denied this and said that the cuttings decayed very rapidly and that the ammonia emanating from the mass would be rapidly converted by the bacteria in the soil into nitric acid. I am aware that trees are capable of availing themselves of nitrogen in the form of ammonia and nitric acid, but they do so mostly in the form of nitrates. If there is an insufficiency of base in the shape of lime or potash—and it must be remembered that laterite soils are poor in these substances—what then? Would not the rapid accumulation of humic acids give rise to sourness? I know that the carbonic acid emanating from the decay of humus is a useful agent in dissolving minerals from the soil, but the amount would be too gradually available to be of much practical use. Mr. Nelson points to the excellent growth in new clearings in support of his practice, apparently deeming it entirely due to the presence in clearings of an excess of humus. In clearings that have been cleared and burnt, I need hardly say that a lot of mineral food has been made available by the fire. Trees under wood and a great deal of the humus itself have been reduced to ashes, and the particles of clay which contain minerals as impurities, have been made to yield some by the heat to which they have been subjected. In the case of clearings in

which fire has been rigorously excluded, it is impossible to believe that they contain no source of minerals outside what is bound up in the humus. In new land there must be stores of available mineral food which have remained untouched by the vegetation existing previously on them. This is explained by the fact that the substitution of coffee for the vegetation previously existing on the land is a true rotation of crop. We know how rotations of crop acts beneficially. It is owing to crops taking up nourishment in different proportions, thus leaving a residue of food for the next crop.

In conclusion, my object in writing thus much is rather to draw out information than to pretend to impart instruction. I am open to conviction, and if it can be shown that I am wrong, I will be glad to chuck my theories (which I had fondly hoped were founded on the "rock of science") to the winds and "follow my leader."

H. G. R.

TEA.

Science and prices.

A Ceylon contemporary comments on the possibility of the Indian Tea Association deciding upon securing the services of Mr. Bamber, the well-known chemical expert, to visit India next tea season for the purpose of visiting various Indian tea districts, and reporting and advising on the manufacture of tea:—"Such being the case, it would seem advisable for the Ceylon P. A. to take some steps to take advantage of Mr. Bamber's presence in the East to secure similar reports upon Ceylon tea manufacture. Our industry is certainly in greater need of scientific assistance than that of our brother planters in India, seeing the much lower range of prices secured by our produce."

Travancore teas.

According to Sanderson's Mincing Lane Circular, says the London correspondent of the *Mail*, Travancore teas "continue to grow in favour with exporters every day," but of late "the quality has again been disappointing," the bulk "possessing thin plain liquor;" and great care, it is said, should be taken to keep the "whole leaf grades" as uniform as possible, and quite free of dust. A list is given of thirty-three Travancore tea "Gardens" that produce pekoes and souchongs. The average prices of the produce of these Gardens vary considerably, and range from under 5d. to over 7d. per pound. The average of the Aneimudi Garden was 7½d., that of the Bon Ami 7½d., and that of Karnum 7¼d. per lb. during the month ended the 15th instant. The general average for that month was about 6½d. as against 7¼d. for the corresponding month of last year. But the average prices of all teas show a decline in that month, for that of Indian tea fell from 8d. to 7½d., and that of Ceylon from 7½d. to 7d.

Tea Companies.

In an excellent article on "Tea Companies in India and Ceylon," the *Investors' Guardian*, in its issue of the 10th ult., points out the excellent investment thus afforded to the public. After giving an elaborate classification of numerous companies, our contemporary remarks:—

The classification according to the price of the teas produced on the various gardens gives some remarkable results. The Indian companies which produce the best class of teas have obtained a profit on an average of 11.62 per cent., and the cheaper teas gave a return of 9.17 per cent., the better class of tea yielding 2½ per cent.

more than the inferior quality. In the case of Ceylon, however, the reverse holds good. The companies which have produced tea at the average of 8.25d. per lb. have given a much better result for the investor than the better class, the percentages being 12.5 for the former and only 9.1 for the latter.

What of tea-growing as an investment? The statistics above point to it as being a very remunerative undertaking. Tea growing, we believe, is a sound industrial enterprise, and although there are influences, both advantageous and disadvantageous, which will greatly affect the future of the industry and which need to be very carefully considered, under present circumstances we think the debenture stock and the preference shares afford opportunities for safe investment. An average return of 10 per cent. on a capital of 7¼ millions is sufficient evidence of the satisfactory security which the preference shares at least offer as an investment. A considerable proportion of this 7¼ million being preference capital, the dividend upon which is fixed, the amount required for that dividend would be much less than 10 per cent., leaving a large amount than a ten percentage for the ordinary share capital, the surplus constitutes, in effect, an annual reserve for the preference shares. In other words, the security for the preference shares in the aggregate in the above companies is very much more than 10 per cent. which net profits seem at first sight to indicate. Ordinary shares are, of course, more liable to fluctuations, but their value as permanent investments will be inquired into in a subsequent article.

Commenting on the above, the *Times of Ceylon* says: "There is little to add to the above, but especially noticeable is the fact that the return on Ceylon Tea shares was in 1896 10.7 per cent., or 1½ per cent. more than the return on the higher priced Indian teas. Also that the companies that have produced tea at the average of 8.25d. per lb. have given a much better result for the investor than the better class, the percentage being 12.5 per cent. for the former and 9.1 for the latter."

SHORT STORY.

SPOTTED DEER (AXIS MACULATUS) SHOOTING IN MYSORE.

In the early seventies these beautiful animals were found in large herds in some parts of the Mulnaad (a country) of this splendid Native State.

In 1873, I noticed that the Gowda shikaries, near Chikmagalur, used in the dry season to go out with bullocks and return with them laden with spotted deer and other meat, and I ascertained that they shikared round the great Iyen Kerry. This splendid artificial tank, seven miles round, formed by a dam 1,700 feet long, at the Veda river, lies some 12 miles N. E. of Chikmagalur, the headquarters of the Kadur District, and metropolis of that King of Coffee districts, North Mysore.

Other water being very scarce in that vicinity in the dry season, game in vast numbers used to come down from the surrounding hills and frequent the scrub jungle which partially surrounds the tank. The Gowdas used to shoot in tamarind trees, the ripe fruit of which is much eaten by all the deer tribe, and of course pot stags and does indiscriminately. I visited this charming game country with my friend in April 1873, and am afraid to mention the quantity of game we saw. I certainly counted 32 deer in one herd, and my friend and I bagged three fine stags out of it. I have not since had an opportunity of visiting this place, but fancy it can hold nothing like the quantity of game it did, as the pitiful indiscriminate slaughter that has been still going on has almost rid the whole country of all game. There are still places near Sakvalli, and in that neighbourhood, where herds of 8 and 10 spotted deer are to be found.

at good stags are few and far between. The best head I ever heard of being shot in the Mysore country measures 18 inches from burr to tip, and I fancy that must be a record head. I shot one once that was half an inch less, but that was not in Mysore. It seems that the farther north one gets, spotted deer, unlike sambur and bison, carry better heads.

Spotted deer are not easily bagged and can carry a lot of lead. I once, and only once, found a stag with a herd of bison, and as there was no bull worth shooting, I fired at him with a 12-bore rifle as he stood facing me. He turned round and bolted, and on going to the spot I could find no blood, thought I had missed, but the tracker found some white hairs cut off by the bullet, and on looking we found the stag some two hundred yards away, quite dead. The bullet had entered the chest, passed clean through the body, and come out below the tail. On another occasion I fired at a stag with a Martini rifle. He was standing amongst a lot of does, and I took most careful aim behind the shoulder, and expected to see him drop dead, but was much disgusted to see him bound into the jungle. My tracker, however, ran forward and I was surprised to see him hamstringing a doe that was hit in the neck and had fallen some five yards beyond where the stag had stood. I was very sick at this, and thought my bullet had gone over the stag and hit the doe. The tracker, however, after he had cut the doe's throat and made certain she was dead and "could not run away," proceeded to the spot where the stag had stood, and finding blood we followed it up and found the animal quite dead about a hundred yards away in the jungle shot through the body. The bullet had gone clean through and struck the doe's neck beyond. This is not surprising, as everyone knows the penetrating powers of a Martini-Henri rifle with a solid bullet. But confound that doe for coming in the way behind.

Spotted deer, unlike sambur, will never lie up when wounded, but will keep on running as long as life lasts. So a wounded animal should always be followed up at once. Sambur, invariably after going a certain distance, lie down in water if there is any, get stiff and are easily come up with and killed. Therefore, always give sambur time to sicken, lie down and stiffen after you have wounded them before following them up. Unlike sambur, spotted stags are often dangerous when wounded, and should be approached with caution. With their long finely-pointed antlers they can inflict dangerous and fatal wounds. I once knocked one over with an old single barrelled muzzle loader. He lay kicking on the ground and I incautiously ran up to him intending to knife him, when up he got and came at me. Fortunately one of my dogs, a "Bangalore Bull Mastiff," collared him by the throat and pulled him down.

The call of this deer is a peculiar high-pitched sharp "coo" often repeated and which is well imitated by native trackers to call to each other in the jungles. The rutting stags, however, make a most diabolical row, something between the howl of a hyena and the cry of an old hoarse jackall, and I have known many low country natives and some Europeans ascribe it to something supernatural.

Spotted deer appears to feed at all times of the day and

night and are very fond of visiting fruit trees such as goney, tamarind, &c., which ripen their fruit in the hot weather, in the middle of the day, when I have frequently shot them. A friend of mine once had a stack of paddy straw inside a hut on his coffee estate which was all eaten by spotted deer at night. There was no door of course to the hut and the animals visited it every night until all the straw was finished. Let me strongly advise every one on no account to tame and make a pet of this animal, for of all the destructive brutes I ever came across, it is the worst. It will first demolish all your fruit and flower garden, not to mention vegetables. It will then take up its quarters in your house, demolish all papers it can get hold of and then turn its attention to your clothes and linen. I once had one. When I came home one day I found her with all my dogs—they had been trained not to molest tame animals—lying round a fire in a spare room used by me as a sort of drying room and laundry. I noticed the cuffs had been "chewed" off several flannel shirts, and I walked up and stirred her up with my foot with the intention of giving her a good licking and driving her out, when up she got, and standing on her hind legs, attempted to "paw" me. I landed her a kick as hard as I could, and she rolled over on her side and began groaning; but while I was looking about for a knife to finish her with, she got up and bolted. I saw nothing of her for the rest of that day, but that night she came and ate down some choice fruit plants. I am thankful to say a panther killed her shortly after.

D.

"A GOLDEN LEGEND."

A TALE OF THE WYNAAD GOLD DAYS, FOUND IN THE DIARY
OF AN OLD PLANTER.

I.

'Twas up to Ooty fair he rode
From land of Coffee trees,
A youth whose garments showed decay
In different degrees;
A hat he wore with broken brim,
A face sun-burnt and gay;
His horse so used to shocking roads.
That nothing did him stay.
And oh! this planter lad was brave,
Nor fear'd the world to scan,
For in his pocket carried he
A mystic talisman.
He galloped o'er the breezy hills
Like any Tam O'Shanter,
He promised him no end of fun,
Did this light-hearted planter.

II.

Re-dressed and shaved, he scarcely knew
Himself, a gorgeous swell
Stood smiling at him from the glass,
The new kit fits so well.
He said, "I think I'll stroll about
And fashion note at play,
The Badminton and Tennis Courts
Are not so far away."

And there it was he met his fate,
A perfect little Beauty,
In costume quite too lovely and
The very pride of Ooty.
But oh! that planter lad so brave,
At once the siege began,
For in his pocket carried he
A mystic talisman.
In three short words the question asked
She answered "yes" instantler;
Then straightway to the General went
That most intrepid planter.

III.

Said he, "oh! General! great and brave,
The Hero of much slaughter,
I've come a little boon to ask,
I wish to wed your daughter;"
The General stared, he likewise glared,
And roared like British Lion,
"A planter, like your impudence,
This little game to try on.
A Coffee Planter!! Heaven and Earth
Approach my little fairy!
Go back, Sir, to your proper sphere,
Nor dream of wedding Mary!"
But oh! that planter lad was brave,
Nor quailed at scoff or ban,
For in his pocket carried he
A mystic talisman.
Thus to the wrathful sire he said,
In tone of easy banter,
"I also grow cinchona, and of tea I am a planter."

IV.

But nothing Agricultural
He found would prove a charmer;
The General yelled with straining lungs,
"You are but a common farmer;
No doubt you live like any pig,
In hut of dab and wattle,
And light it up with tallow dips
Stuck in an empty bottle."
"No, No," replied the planter lad,
"My house is brick and mortar,
With decoration in high art,
Fit for a General's daughter."
And oh! that planter lad was brave,
He chaffed the angry man,
For in his pocket carried he
A mystic talisman.
And whilst the General raved and swore,
Like a demented ranter,
He simply smiled and let him swear
This even-minded planter.

V.

And presently he calmly drew
From out his pouch a packet,
And said, "perhaps, you'll look at this,
And stop that awful racket;"
Then he displayed a bit of quartz,
With yellow gold, 'twas shining;
"I've got," he said, "a reef of that,
And all the rights of mining.
Enough Brythe declares it's safe to pay
And Segler swears its charming,
And Piman thinks the net returns,
Will almost be alarming!
Suppose we form a company?
You head it—eh! old man!

And give me your fair daughter for
This precious talisman?"
"Done," cried the eager General.
Thus in a common canter,
He gained the day, and won his bride,
This most successful planter.

ROUND THE BUNGALOW.

NOTES BY A PLANTER'S WIFE.

HOME TREATMENT FOR COLDS.

THERE is probably no better means for loosening the grip of or preventing it from tightening, than the "old woman's remedy" of a hot foot-bath and hot drinks, such as herb tea. In a foot or pail one-third full of comfortably warm water, dissolve two tablespoonfuls of mustard. Soak the feet and ankles in the water for twenty minutes, with hot water added from time to time, raising the temperature as high as it can be borne. Wrap a heavy blanket around the patient meanwhile; if there is oppressive heat on the head, apply a wet napkin. Keep up the treatment for ten or fifteen minutes, and, towards the last, when the patient is nearly ready for bed, give a liberal hot draught. Ginger tea is a favourite, so is hot lemonade. White wine whey is a useful drink in colds and mild febrile affections, and is made thus: Boil half a pint of milk in a saucepan, and while it is boiling add a wineglassful of strained whey. Strain, and sweeten as agreeable.

Glycerine for coughs. In severe paroxysms of coughing a spoonful of glycerine in a glass of hot water will give almost instantaneous relief.

Facts about eggs. Eggs should never be cooked before they are twenty-four hours' old, and they are better if kept forty-eight hours, or until their whites are set. The old way of testing eggs—that of putting them in water—is not the best. If they are fresh enough for cooking they will sink; the contrary, if the eggs rise to the surface, air enough has penetrated the shell to make the egg unfit for use, although its yolk may look perfect, and no odour can be detected. Decomposition begins when the contents of the shell are exposed to the external air. The fact of the egg floating in water is proof positive that it has been lightened by air.

The digestibility of hard-boiled egg is a favourite theme. Eggs should never be actually boiled, as the excessively high temperature of the water hardens and toughens the whites at once, rendering them indigestible. If they are submerged in water just below the boiling point, and kept at that temperature for half an hour, they will be nearly as digestible as raw eggs. A good rule to cook eggs for invalids is to pour boiling water into a tin pail having a tight cover, put the eggs in the pail carefully, cover it tightly, and let it stand entirely away from the fire for five minutes. The whites of eggs cooked in this manner will be perfectly coagulated, soft, tender, and easily assimilated.

Domestic use of eggs. To clean vinegar bottles and cruets, or egg-shells in a little water are as good as white of egg with plaster of Paris stir mends broken china. For a burn apply the white of an egg mixed with varnish to exclude the air, or a mixture of the yolk of egg with an equal part of glycerine. If this is put in a bottle and corked tight it will keep for years.

"PLANTING OPINION" OFFICE,
3, ESPLANADE ROW, MADRAS

will keep some time in a cool place. For inflamed eyelids the white of an egg beaten up to a froth with two tablespoonfuls of seawater is a capital thing; it should be applied on a soft rag, changing as it grows dry. For a boil take the skin off a boiled egg, listen it and apply. It will draw off the pus and relieve the pain in a few hours.

I came across the following hint to travellers the other day, which seems too good to be lost:

Hint to travellers. Never use leather straps to trunks which have to go through the Custom House, but instead cord the boxes with the thickest and strongest rope that can be obtained, and knot them with inextricable knots, and give a coat of tar or oil on the knots. The officials have a great hatred of them, and out of pity for their own fingers let these trunks alone, and pass on to those fastened with straps.

Bird lime. Bird lime is composed of linseed oil boiled very carefully and slowly till it is of the required thickness and ropy enough to hold a bird. You must be careful not to have too strong a fire, or the stuff cakes and spoils.

THOMSON'S ANTI-MALARIAL PILLS

THE PLANTERS' FRIEND.

The only known Antidote against Malarial Poison.
A sure and efficacious Remedy for Malarial Fever, enlargement of the Spleen, Malarial Cachexia (Anæmia or Malarial Fever) and other Malarial symptoms.

Sold in bottles containing 100 pills, Rs.2-8.

(This excludes extra postage where the weight of leaflets necessitates such.)

Advertisement charges are strictly payable in advance, except by w. approved customers.

MARKET SUPPLEMENT.

SATURDAY, AUGUST 28, 1897.

COFFEE.

LONDON advices, dated 6th August 1897, says:—The spot market opened yesterday, when public sales were resumed. No Eastern Coffee was offered, the supply consisting almost entirely of Central American qualities, the greater part of which sold at firm prices to an occasional advance. The receipts in Rio and Santos have continued extremely heavy, and the market for "futures" has further declined; a better tone prevails, however, at the finish and prices close a little above the lowest, viz.:—

London.....Santos.....September delivery...	35s 6d
New York.....No. 7 Rio...	" " 7.25 cents
Hamburg.....Santos.....	" " 36½ pf.
Havre.....Santos.....	" " 44½ francs
Holland.....Good ordinary Java.....	47 cents.

At the Dutch sale in Rotterdam on Tuesday 19,162 bags 192 cases Java sold at irregular rates, but good ordinary brought about valuations, viz., 47 cents, against 46½ cents realised in June.

Imports Deliveries and Stock of COFFEE in London are as follows:—

	STOCK.		IMPORTS.

— " CEYLON } auction this week.
245 " JAVA }

Owing to the Bank Holiday, business during this week has been practically at a standstill.

Movements of Tea at the London Warehouses during July were 1,000,000 lbs., the amount of Indian and Ceylon Tea delivered being two pounds in excess of last year's figure.

Indian. The small quantity offered included a first rate selection of Assam; as much as 2/11½ was paid for a parcel of 25½ chests of Pekoe from the Samdang division of the Doom Dooma Co.; high prices were also paid for other good liquoring parcels. Season's Export from Calcutta to U. K. up to the end of last month are wired as 25,990,000 lbs. against 26,330,000 lbs. last year.

Week's av. of Tea sold on Garden Account, 1897, 3,120 pkgs., av. 11½d. 1896, 4,898 pkgs., av. 11d.

Total sold on Garden Account 1st June to date 1897, 51,370 pkgs., 1896, 43,412 pkgs., av. 9d.

Comparative prices of Indian Tea in London:—

	1897.	1896.	1895.
DUST. (Fair ordinary, dark liquor)	3½d	4½d	4½d
FANNINGS. (Red to brown, strong rough liquor)	4d	5d	4½d
BROKEN TEA. (Brownish to blackish, strong liquor)	6½d	7½d	6d
PEK. SOUG. (Blackish greyish, useful liquor)	6½d	8d	7½d
PEKOE. (Greyish to blackish, some tip, useful liquor)	8½d	9d	8½d
PEK. SOUG. (Blackish greyish, inferior liquor)	5d	5½d	5½d
PEKOE. (Blackish greyish, some tip, inferior liquor)	5½d	6½d	6½d

Ceylon. None were offered this week but over 42,000 packages of Ceylon Tea were printed for sale on Tuesday next, the largest quantity ever catalogued in one day. The official telegram from Colombo states that shipments of Ceylon Tea to U. K. during July amounted to 10,250,000 lbs. Seven and a half to seven and three quarters million pounds are estimated for the month.

Java. These kinds met with rather more attention, and prices in some instances showed a slight improvement.

IMPORTANT NOTICE.

The Business Offices of this paper having now been moved to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c. Letters to the Editor should be addressed to Coonoor, Nilgiris.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 10th September 1897.

Nellampathy, British.

1st September.—*Weather.*—Rain for week 6.24, to date 143.21. It seems as if we had reached the end of the S. W. and were just about to commence the N. E. These last few days have been dull with very little wind, and what there has been has been shifting about. *Plant-diseases.*—As last reported. *General Health.*—Bad: a lot of sickness about both among Europeans and coolies. *Labour.*—Plentiful.

Nilgiris.

COONOOR, 2nd September.—*Weather.*—Very cloudy and rainy weather with no prospects of a good break. Most unusual (of course, weather always is unusual!) for the time of year. Rain welcome to both coffee and tea, but we all want a little sun. *Crops.*—Coffee picking up from its very severe go of leaf disease. Fairish blossom set on high elevation gardens. Tea beginning to flush decently again. Red spider very bad in places. Black bug off colour a trifle. Flushworm still unusually prevalent. Price of grain still very high. Badaga grain crops very good this year. *General Health.*—Indifferent. *Labour.*—Ample.

OOTACAMUND, 1st September.—Rainfall for month 15.57, making 42.72 to date. Temperature highest and lowest 74° and 60° respectively. Weather as vile as ever since last report, with a persistent cold wind and continued, unsuitable for flushing and making manufacture of decent tea almost an impossibility. Grains still rising in price. Health good, and coolies plentiful.

KOTAGIRI.—*Weather* in Kotagiri station, 18 wet days in August with a rainfall of 5.46 in. for the month, making to end of August 33.26 in. against an average fall for last 25 years of 26.58 in. only. Rainfall on the coffee on slopes at lower elevation down Kotagiri Ghaut, Kil Kotagiri, Orange Valley, &c., somewhat lighter by about six inches, but still satisfactory and above the average due. Our heavy rain, to bring up yearly fall to the average of 58.92 in., is ahead of us with the coming N. E. Monsoon. *Planting* has been in full swing this month and plants put out both on new land and vacancies doing first rate. Winding up with *handling.* Crop ripening, coolies told off daily, fly picking. *Tea.*—Some concerns have already passed their last year's yield, no difficult task some say, seeing last year's output was so meagre; still, yield satisfactory. *Local crops* fair, *local labour* fully employed *pro tem.*

MARKET SUPPLEMENT.

SATURDAY, AUGUST 28, 1897.

COFFEE.

LONDON advices, dated 6th August 1897, says:—The spot market opened yesterday, when public sales were resumed. No Eastern Coffee was offered, the supply consisting almost entirely of Central American qualities, the greater part of which sold at firm prices to an occasional advance. Owing to the Bank Holiday, business during this week has been practically at a standstill.

Movements of Tea at the London Warehouses during July were factory, the amount of Indian and Ceylon Tea delivered being two pounds in excess of last year's figure.

Indian. The small quantity offered included a first rate selection Assam; as much as 2/11½ was paid for a parcel of 25½ chests Pekoe from the Samdang division of the Doom Dooma Co.; high were also paid for other good liquoring parcels. Season's Export to Calcutta to U. K. up to the end of last month are wired as 25,990,000 against 26,330,000 lbs. last year.

Week's av. of Tea sold on Garden Account, 1897, 3,120 p av. 11½d. 1896, 4,898 pks., av. 11d.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

P.O.B.—Remittances should be sent to the Manager, “Planting Opinion,” Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been moved to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c. Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 10th September 1897.

Nellampathy, British.

1st September.—Weather.—Rain for week 6.24, to date 143.21. It seems as if we had reached the end of the S. W. and were just about to commence the N. E. These last few days have been dull with very little wind, and what there has been has been shifting about. *Plant-diseases.*—As last reported. *General Health*—Bad: a lot of sickness about both among Europeans and coolies. *Labour*—Plentiful.

Nilgiris.

COONOR, 2nd September.—Weather.—Very cloudy and rainy weather with no prospects of a good break. Most unusual (of course, weather always is unusual!) for the time of year. Rain welcome to both coffee and tea, but we all want a little sun. *Crops.*—Coffee picking up from its very severe go of leaf disease. Fairish blossom set on high elevation gardens. Tea beginning to flush decently again. Red spider very bad in places. Black bug off colour a trifle. Flusworm still unusually prevalent. Price of grain still very high. Badaga grain crops very good this year. *General Health*—Indifferent. *Labour*—Ample.

OOTACAMUND, 1st September.—Rainfall for month 15.57, making 42.72 to date. Temperature highest and lowest 74° and 60° respectively. Weather as vile as ever since last report, with a persistent cold wind and continued, unsuitable for flushing and making manufacture of decent tea almost an impossibility. Grains still rising in price. Health good, and coolies plentiful.

KOTAGIRI.—Weather in Kotagiri station, 18 wet days in August with a rainfall of 5.46 in. for the month, making to end of August 33.26 in. against an average fall for last 25 years of 26.58 in. only. Rainfall on the coffee on slopes at lower elevation down Kotagiri Ghaut, Kil Kotagiri, Orange Valley, &c., somewhat lighter by about six inches, but still satisfactory and above the average due. Our heavy rain, to bring up yearly fall to the average of 58.92 in., is ahead of us with the coming N. E. Monsoon. *Planting* has been in full swing this month and plants put out both on new land and vacancies doing first rate. Winding up with *handling*. *Crop* ripening, coolies told off daily, fly picking. *Tea.*—Some concerns have already passed their last year's yield, no difficult task some say, seeing last year's output was so meagre; still, yield satisfactory. *Local crops* fair, *local labour* fully employed *pro tem*.

THE RISE IN EXCHANGE.

It is astonishing how little has been written about Exchange from the planter's point of view. Mr. G. L. Acworth spoke on the subject at the Annual Meeting of the U. P. A., but his remarks do not appear to have evoked either criticism or commendation from the daily press. Perhaps, the preponderating influence of the official classes accounts for this? Then, too, it is probable that the predilection of merchants leans towards a high Exchange rather than a low one, for though many an Anglo-Indian merchant makes his money in the Export trade, most wish to enjoy their savings eventually in Europe. The higher the exchange, the greater the sterling value of these savings. This may affect the planter also. But in order to *make* large profits he desires a *low* Exchange. He can do nothing to control it, unless he can obtain the co-operation of merchants and others. What, then, is he to do, when such co-operation is denied him? At the very least, he can manifest an interest in what is of vital concern to him. We should be very glad to see planters exchanging notes as to the way in which they, or their agents for them, work their Exchange operations: how they conduct the financial transactions indispensable to the realisation of proceeds of their crops. Some, no doubt, take advances; some draw them in sterling at the exchange of what we may call 'an early day'; others let the exchange be settled when remittances from Home are finally made or paid. Do these differences result from chance alone, or are they the outcome of forethought as to the probabilities of Exchange? Do individual planters *vary* their system, according to their anticipations of the course the rupee will take? It seems to us that remarks on this point, in the first place strictly from the planter's outlook, would be of general interest to the community, and that a comparison of notes on the subject might serve a very useful purpose. No amount of discussion can affect the future of Exchange. Yet every planter has something either to teach or to learn, and if a discussion on Exchange merely enlightens the community as to probabilities, it may assist them to lay their plans so as to be able to profit by the new knowledge gained. The probabilities referred to may be little better than chances, so uncertain is the course of Exchange. Those who wish to "trust to luck" can still do so, however; while men who prefer to try to see ahead may endeavour to weigh one probability against another, with a view to forecasting the general trend of Exchange, and adapting their plans to their anticipations.

GENERAL NOTES AND ARTICLES.

Tobacco in Borneo.

We fancy that tobacco cultivation in India is much on a par with cotton. Excellent varieties of both *can* be grown from fresh imported seed, but, being left to the ignorant ryots, neglect of

preservation of the good seed rapidly leads to its deterioration. It is difficult to suppose that a climate and soil equal to either those of Java and Borneo cannot be found throughout the length and breadth of India and Burma. What Borneo and Sumatra have achieved already may be noted from the fact that the Deli Maatschappij has recommended a dividend of 42·7 per cent. for 1896!

At the recent meeting of the London Chamber of Commerce, Mr. W. B. Pryer delivered an address on 'Prospects of Commercial Development and Planting in British North Borneo.' Mr. James Chambers (President of the Chamber) took the chair. Among the speakers was Mr. J. R. Freeman, who, as perhaps the largest user in the past of Borneo tobacco, could speak with some authority on it. It stood only next to Havana; but that position could only be maintained by retaining the excellent quality which it possessed if properly cultivated. There had been rivals to Havana in the past, but he would warn those interested in Borneo that the reputation of the tobacco would suffer if any attempt were made to produce a larger quantity than there was suitable land to provide. Borneo tobacco was superior to that of Sumatra. The latter could only be used for covers, where the Borneo leaf possessed a special flavour, and its future was bright in view of the reduced supplies from Cuba owing to the insurrection. He thought there had been a little laxity on the part of Borneo estates, who had reduced the market value of their tobacco by not paying the same attention to its classification and packing as was paid by Sumatran producers. Mr. R. B. Martin, M.P., said he came to that meeting principally with the object of hearing the views of those actually engaged in business, and welcomed all suggestions for the better development of the Borneo trade. He agreed with Mr. Freeman as to the quality of Borneo tobacco and as to its future. There was a great future also for other products.

Tobacco of last June says:—The appreciation in value of Borneo and Sumatra tobacco continues, prices as high as 4s. 4d. per lb. being obtained at both of the last two sales in Amsterdam. As compared with last year's the average price is astonishing, being 158 cents. per ½ kilo. against 100 cents. Holders of shares in the tobacco-producing estates of Borneo and Sumatra can well afford to regard the situation with equanimity. The great Deli Maatschappij recommended a dividend for 1896 of 42·7 per cent., and a reserve of half as much again as the capital of the company. What will its next dividend be?

Cultivation.

We have often been struck by the inability, more or less frankly expressed, of practical planters to explain satisfactorily what principles some of their usual routine work was based on. In forking or digging for instance, whether light or deep, before or after the monsoons, the most contradictory answers have been given us. Yet it is obvious enough that if the rainfall is usually more than is required every effort should be made to retain as little in the soil as possible, and let all digging operations be finished long before the rains commence, so as to get a compact surface for the rain to flow over. On the other hand, in most tea-districts, for instance, where the rainfall is usually deficient, deep forking should be resorted to *before* the rains, so as to absorb all moisture possible. After the rains are over, the plan-

the wet district should cultivate as deep as possible so as to get rid of the superfluous moisture in his soil. While in dry districts, he should cultivate very lightly, but as deep as possible, so as to "mulch" the surface and prevent evaporation.

For this light cultivation we would recommend special implements being made, 18 inches in breadth, with small prongs about 4 inches long set in the cross bar some 1½ inches apart. Where the land is at all level, much better and cheaper work could be done by using a modified "horse-drawn" light enough to be dragged by a single coolie, the man directing it from behind. The cost of weed-destroying would be almost entirely saved, while, in dry districts, the gain in crop in times of drought would be immense. To illustrate the peculiar value of such light cultivation, we give the following extract from the *Planters' Monthly*:—You all have noticed recently going around a new system that has been adopted by a man in Chicago for cultivating the semi-arid lands of the West, where they have a rainfall of less than ten inches. He has proven by his system (I do not vouch for it) that he can carry a crop through the summer upon ten inches that fell during the winter, and his plan is a good one. Just before the summer he breaks his land deep with a pair of horses—say 8, 10, or 12 inches deep—to hold all the water that falls during the winter. At the moment he gets ready to prepare his crop in the spring, he does as Mr. Dymond says the disk does. He has a plow with a com- ing attachment, and by this he retains the moisture and prevents evaporation, and then plants his crop and secures it without a drop of rain. He can thus make a crop of corn. Experiments have been made and proved satisfactory. It is a well-known fact that we get along in dry weather by making a loose mulch of the soil and then press it after loosening it, which a disk does, and thus we have broken the continuity of the pores of the soil, the moisture capillary attraction is checked and retained there. If, on the other hand, we loosen up the soil, we increase the evaporation and drive the water off.

Continuous trenching should again be only undertaken in dry districts during the monsoon rains, and closed up immediately after the rains are over. Though in wet districts trenching is very useful in stopping wash, the same effect might be attained just as well, if not better, by digging drains instead of trenches between every alternate third row of trees. This would stop wash and allow the water to drain off readily, whereas in the trenches it would be arrested and soak into the soil. In these over wet districts, trenching might be begun *after* the rains are over, to dry up the soil, and "winter" the trees (if coffee).

A RAILWAY FOR THE MYSORE AND COORG COFFEE DISTRICT.

REFERRING to my communication on the "Coorg Railway," which appeared in *Planting Opinion* of 7th August, the following is a sketch in rough of a line which would serve the coffee districts of both Mysore and Coorg, and should commend itself, I think, to the planters of both provinces. I submit it as a practicable scheme to work with in their efforts to obtain railway communication, though there seems little chance of any proposal being listened to while the Imperial Government is engrossed with famine affairs. After famine, however, there often follows a season of plenty, and it may not be long before new railway schemes engage attention.

When alluding to a line between Hassan and Sidapur, and to be in favour with the Chief Commissioner of Coorg and the Mysore Durbar, I remarked that I could not see the

raison d'être for such a railway. In saying this I looked upon it as the Coorg men represented it, namely, as a line by itself. But it would be quite another matter if the intention were to continue it on to Tellicherry. When viewed from this point it assumes a very different aspect.

When the distance from Hassan to Tellicherry *via* Sidapur is totalled up, it comes to some 125 miles, and when we compare this with the distance from Hassan to Mangalore by the direct western route, the difference is only about 15 or 20 miles—a fact which I daresay will come as a surprise to many who have not had their attention drawn to it. If the line starting from Hassan followed a trace by Arkulgode, Ramnampur, Periapattam and thence to Sidapur, it would skirt the eastern boundary of North Coorg and come fairly within easy reach of the estates in South Coorg.

But the scheme I wish to bring more particularly to notice is of a more comprehensive character and would, I think, serve the whole of the Mysore coffee districts, north as well as south, from Koppa in the north to Coorg in the south.

Hitherto the idea has been to make a start from Arsikere on the Southern Mahratta Railway and thence to Hassan. Why this point has been selected I cannot say. There are probably inducements apart from any connection with the planting interests. But if instead of Arsikere the line branched off at Kadur to Chikmagalur, it would make all the difference, for a much more extensive portion of the planting districts could be brought within its scope. Chikmagalur is an important centre, having a number of estates in its neighbourhood and the headquarters of a large native coffee business, Businalli native coffee being well known. A branch to Chikmagalur would in itself be of great service; but instead of a simple branch if the line be continued southward to Belur and thence to a point near Polliam with a branch to Hassan, or to Hassan direct, and from there *via* Arkulgode to Sidapur and Tellicherry as already detailed, it would serve a large stretch of planting country. But more than this, the connection at Kadur would bring the estates in the extreme north of Koppa within range of the proposed line, for at present a branch is being made from Birur, a station on the Southern Mahratta Railway four miles north-west of Kadur, to Tarikere and Shimoga, and a road runs from Koppa to Tarikere, so that the men of that district could put their coffee into the railway there and have it sent all the way to Tellicherry without a break.

To repeat, say you start from Tarikere, you run on to Kadur, branch off there to Chikmagalur, and on to Belur, Polliam or Hassan, Arkulgode, Ramnampur, Periapattam, Sidapur, Veerajapett and Tellicherry.

Now let us see what are the distances, using the mileage of the present roads as a pretty close approximation:

Tarikere to Tellicherry is	...	207 miles.
Chikmagalur to do.	...	164 "
Hassan do.	...	125 "

The Polliam route would be still nearer.

Sidapur to Tellicherry	...	60 miles.
------------------------	-----	-----------

Many men send their coffee to Madras; well here are a few of the distances:

Tarikere to Madras	...	364 miles.
Chikmagalur do.	...	371 "
Hassan do.	...	351 "

Of course, against these figures there is Mangalore for estates lying close to the Western Ghats, but few of them

are nearer that port than 80 or 90 miles, while most of them would be much farther.

Periapatam would no doubt in time be linked up with Hunsur and Yedatore to the capital Mysore, and as the Coorg men say it is on the cards to make a line from Hassan *via* Yedatore to Mysore, the planting districts would have a connection both east and west.

Local men may see local difficulties as well as objections generally. These could be brought forward and discussed, but the scheme has at least this to recommend it; it would place railway accommodation within comparatively easy reach of all these planting districts. Roughly the Mysore estates, extending from Kodlipett on the south to Koppa on the north, are spread over a ribbon of country, and to simply cut across this as the Arsikere-Mangalore line was intended to do would be to afford little or no accommodation to the parts lying north or south of it. To run the line along this track itself, in place of keeping somewhat east of it as I propose, would, I apprehend, involve greater engineering work and probably engineering difficulties, besides exposing it to a heavier rainfall. Skirting the eastern verge of the coffee districts it would also serve the country lying along its eastern boundary, and viewed as a trunk line branches both east and west could afterwards be formed to afford greater facilities for any particular locality.

The portion lying in Mysore Territory would, of course, concern the Mysore Government, but if the Government of India were disposed to take the matter in hand, it could be dealt with as the Arsikere-Mangalore line was intended to be.

STEAM.

THE GOVERNMENT CINCHONA PLANTATIONS.

We quote the following article in full from the *Madras Mail*, and heartily join in our contemporary's congratulations to Mr. Standen on the remarkable success he has achieved:—

The late Mr. M. A. Lawson, who for twelve years had controlled the Cinchona Plantations of the Madras Government on the Nilgiris, died early in 1896, and Mr. W. M. Standen, a planter of some sixteen years' experience and of established reputation, was appointed to succeed him. It is an open secret that this appointment, though passed in Calcutta, did not find favour at the India Office. The Secretary of State, preferring doubtless that he should select an officer as he had selected the late Mr. Lawson, withheld his sanction, and in the euphemistic phrase of the Madras Government, the matter "was under correspondence" during the year. Finally the authorities in London gave way and agreed to the Madras Government's nominee holding office, at least on a five years' trial. It must, therefore, be a considerable source of satisfaction to the Government to find, as appears from the Annual Report on the Cinchona Plantations during 1896-97, that the results of that year's working under Mr. Standen's control have been so satisfactory as fully to justify its selection. During the twelve years of the late Mr. Lawson's control, the revenue of the Department only twice exceeded the expenditure, and then only by a sum of about Rs.1,500. In the year 1896-97, on the other hand, a surplus of Rs.69,000 has been shown, the expenditure being reduced, while the receipts were Rs.42,000 more than in the previous year. The Government, never very lavish of praise, remarks that "the administration of the Department must, in these circumstances, be considered to have been eminently successful." It is certainly lucky for Mr. Standen that he has so rapidly been able to justify his existence and to prove to his critics in the *Pioneer* and elsewhere that he means business.

The remarkable improvement in the results of the Government's Cinchona enterprise during 1896-97 appears to have been due to a very simple cause. The quantity of bark used in that year was practically the same as was used in the previous year, 238,000 lbs. as compared with 234,000 lbs. But the quantity of drugs extracted has

risen from 5,900 lbs. to 11,241 lbs., or by very nearly cent. per cent. The percentage of the yield of quinine to bark was 3·3 as against the previous year, or more than double; and the effect has been to turn the operations, which for years had been conducted at a loss into a very paying concern. The increased yield from the quantity of bark was, of course, due to the more thorough extraction of the alkaloids, and it certainly does not say much for the efficiency of the previous régime that it was left for Mr. Standen to discover this. At any rate it is well that it has been discovered at last, and it must be regarded as a triumph for the Madras Government, so important an advance has been made by its nominee. The results of the working of the Cinchona Department in 1896-97 appear to have been equally good. The quantity of quinine manufactured and the quantity sold during the year were the highest on record. The sales of the drug are now mainly conducted through the India Office. The quinine is made up in five-grain powders, and there were 1,550 Post Offices in the Presidency where these are kept. The plan is to bring the alkaloid to the doors of the people and to supply it at cost price and in small quantities. Apparently this plan is to succeed, for though it was only started in July, 1895, 4,180 packets were sold in 1896-97 as compared with 664 packets in the previous year. As the diffusion of the use of quinine among the population can hardly be other than beneficial, this aspect of the Government's enterprise in cinchona can be entirely applauded. The whole output of the Government plantations is thus utilised, and the objections to the growing of cinchona by the State have been met, for the system of Post Office distribution reaches a point which, otherwise, would never use the drug at all. The most difficult thing to ascertain from an Annual Report such as that under review is the actual state of the plantations; and this is doubtless the crux of the management. It is stated, however, that there were 31,500 more trees at the end of the year than at the beginning, and that a new system of transplanting seedlings was introduced which is expected largely to reduce casualties. As the good final results were produced without any increase in the amount of land consumed, there is no reason to suppose that the plantations are over-cut, and the general impression left by the Report is a highly favourable one.

In reply to an acrimonious attack by a correspondent on the correctness of the figures given above, our contemporary replied in a later issue. "In a letter ending with the *nom de guerre* 'Rombo Caichal, Iyah,' a correspondent in our issue of the 25th inst. suggested that the figures we lately published regarding the Government Cinchona Plantations in 1896-97 were 'so extraordinary that they seem to require confirmation before being accepted.' Particular statements to which our correspondent apparently alluded were the assertion that the quantity of cinchona alkaloids extracted during 1896-97 was nearly double that extracted during 1895-96, although the amount of bark used was practically the same. We had added that the percentage of the yield of quinine to bark was 3·3 as against 1·5 in the previous year, and our correspondent proceeded to suggest a doubt whether the alkaloids which we referred to might not be the inferior forms other than sulphate of quinine, and that the results which we attributed to Mr. Standen's management were in fact too good to be true. As our statements were based on the figures furnished in the Government Review of the Report of the Director of Cinchona Plantations, they were likely to be inaccurate; but in consequence of the insinuations of 'Rombo Caichal, Iyah' has seen fit to make, we have further examined the matter, and find, as might have been expected, that the Government's figures as given in the Review are entirely accurate. The Report of the Director of Government Cinchona Plantations shows the following results of manufacture during the two last years:—

	Bark used	Quinine	Febrifuge	Total alkaloids
1895-96	lbs. 233,800	3,600	2,284	5,884
1896-97	lbs. 238,100	7,891	3,350	11,241

From these figures it will be apparent that our statements that the yield of alkaloids had increased by nearly cent. per cent. and that the yield of quinine to bark was 3·3 per cent. in 1896-97 as against 1·5 per cent. in the previous year, were in accordance with the facts of the case. Our correspondent's further suggestion, that the yield of cinchona alkaloids to bark treated has thus enormously increased the quinine should be tested to see whether it is pure, seems to savour of some bias, making him unwilling to believe in the success which Mr. Standen has undoubtedly attained.

ever this may be, the remedy is in our correspondent's own hands. He has only to buy some of the quinine and have it tested himself. In the meantime the result of his letter is to show that improvement which Mr. Standen has effected in the conduct of his Department is, in the opinion of an obviously critical observer, extraordinary."

LETTERS TO THE EDITOR.

ANSWER TO CORRESPONDENTS.

"T. S." Many thanks for the extract, but the information given is scarcely correct. China teas certainly have been sold for 4½d. per pound this year, but for the poorer qualities this is by no means unusual. It was not many weeks ago that the weekly average for all India ran down to 4d.—Ed.]

THE COFFEE CAMPAIGN: A CORRECTION.

SIR,—I am afraid I made a slip in that letter in which I took of the coffee duty being 3d. per lb. I was trusting to my memory. It is I believe only half; that would make 14 shillings added to 90 shillings instead of 28/. It still brings the price high, but not so high as I thought. I, however, think there is little chance of the Indian planters extending business on these figures, and hence my line of reasoning might stand if the figures can be corrected.

A HARD NUT.

CONSUMPTION OF COFFEE IN INDIA.

SIR,—I have on several occasions been at the Ooty Bazaar, and less than 2 cwts. of coffee are tendered and sold weekly by a population we will take for convenience at 20,000 for the district (exclusive of Coonoor, Kotagiri and Goodalore). If my surmise is at all correct, rather more than less than 100 tons is consumed annually by the Ooty Bazaar alone. On this basis, taking the population of India at 300,000,000, we have a consumption of 75,000 tons, and whence does this come? Native-grown coffee will account for some, sale of tailings and black coffee for a good deal, and I think theft for a considerable portion: but that the Indian consumption is tons more than you estimate is manifest, even making a 25% allowance for those who do not know of or appreciate the drink.

With an experience of India from the distant Himalayas to the Cape Comorin, I have rarely found a bazaar where coffee was not sold.

SPECTATOR.

A. GRIFFIN'S IDEAS:

DEAR SIR,—There are several mistakes in my letter in your issue of the 21st, but I shall only correct those that do not make any meaning clear.

Para. 3, line 9, instead of "by having so" read "after he had done so." Para. 4, instead of "3 chatties manure, read water."

In last para. "after I can supply" add "cattle manure," though I omitted a portion of my letter which you have omitted. It should read "I do not think we need a specialist to go into the question of leaf disease." I am sure we have sufficiently experienced planters, Mr. Nelson for instance, who could by close examination of plants in gardens not affected by leaf trace cause and thus bring back coffee to its old condition.

In my letter I omitted to refer to my nursery. From this I move all shade as soon after the first leaves are shed as possible, say in six weeks from time of sowing; I then gently open to the earth, add a very small quantity of cattle manure, which is well mixed up. The plants are then regularly watered and allowed to grow up in the open. The hot sun in February, March and April, instead of burning up the young plants, causes quick and healthy growth.

This year I was very late in putting in my seed. I got them in March, but the young plants, some 6,000, now stand fully foot high, thoroughly healthy, and many have their first set of primaries. I do not think that the sun has scorched a single plant.

When the Conference was on in Bangalore, I wrote to two or three gentlemen asking them to kindly visit my garden, but did not receive a reply; possibly my letters (posted) did not reach. I should have been glad to have had their opinions, and good might have resulted. Possibly, however, they are still dead against coffee under irrigation and our system of planting.

Your correspondent "Benki" proposes a running fire through a garden; this might be useful, but the best way to try and get rid of our leaf would be to trust more to nature. I should certainly begin by thinning all shade and removing at the close of the monsoon as much of the decayed leaf and other rubbish likely to retain moisture as possible. If shade is necessary, I should have only sufficient to cut the heavy South-West winds, but not thick enough to shut off the sun. Let the plants have as much of this as possible, especially where rainfall is heavy.

A planter told me some time ago that coffee has been known to die out for want of shade. Was it want of shade that actually killed the plants, or some other cause not at the time thoroughly investigated?

At Londa, Dharwar and Bangalore we have trees certainly over 15 feet high and several years old still bearing heavy crops. These are uncared for and in the open. No one knows when they were planted, but they have the appearance of very old trees, BANGALORE.

J. PARTRIDGE.

LEAF DISEASE.

I.

SIR,—I have read the letters signed "Benki" and "J. Partridge" re leaf disease in your issue of the 21st instant. In reply to "Benki," I would say there can be no possible doubt that fire would kill the disease, being a fungoid growth, but that I do not see that his recommendation is practicable. We may presume, from experience, that the long droughts of Southern India are more or less inimical to the disease, and that exceptions to droughts only go to prove the rule. That is to say, an exceptional wet year, without the usual long dry season intervening, is just the year the enemy revels in. I am, therefore, one of those composing, I should think, the great majority of planters who look upon a dry season of sufficient length, and at the right time, as an absolute desideratum if the coffee tree is to fruit and give us good crops. Without properly wintering, it is folly to expect it to yield. It must run to leaf when constantly exposed to damp atmosphere. Of course, at the same time, it is possible to have too long a dry season from which the spike will suffer; but, on the whole, there can scarcely be any question, to judge from experience, that too long a wintering is far preferable to a wintering cut short by unseasonable rain. The dry season of 1895-96 was most exceptionally prolonged, reaching to over five months in most coffee districts, but at the end of it I thought I had never seen coffee look better during the twenty odd years I have known it. Had that dry season lasted but four months instead of over five, I have no doubt whatever it would have made all the difference in the world to most estates. As it was, many estates, notwithstanding having chronicled no rain for over five months, from my personal knowledge, picked very good crops and left handsome profits—estates which would have given bumpers had the rain come in time to suit all the spike. That season followed by the very wet one of 1896-97 has put our old friend out of gear, but I cannot see any reason to suppose seasons will not revert to normal conditions again.

Apparently, Mr. Partridge has gone in for growing his coffee near Bangalore, in what we, in these parts, call the native style, by not topping the trees; and he enunciates therefrom theories which he will, I think, soon enough find out will not stand the test of experience. He must remember that coffee has not been grown in the hills of Southern India for the last fifty years or more without men knowing something about it,

and that he himself is still in nothing more than an experimental stage in the more or less arid country round Bangalore. His friend, who has just returned to Bangalore, also seems to be partial to that part of the country, and so I wish them both good luck. More power to their elbows, and a profitable experience.

NELLACOTTA, }
23rd Aug. 1897. }

SEMPER FLOREAT.

II.

SIR,—Mr. Partridge has been kind enough to give us his short experience with leaf disease, although not himself a planter. There are many of us who might follow his example, and give our experiences likewise, no matter how open to criticism they may be, or how erroneous our deductions. There cannot be the slightest doubt that the reason men do not give their views on matters planting more publicity is because, "It is so awkward too, you know, to find your pet idea given with so much confidence to a doubting world, cut up by abnormally critical correspondents." (*P. O.*, May 22nd, 1897.) In my turn I shall become abnormally critical and send you a cutting from the *Madras Mail* taken some years ago, which will, I am afraid, "cut up" some of Mr. Partridge's deductions. Mr. Partridge writes: "The point that struck me from the first was, why not allow coffee plants to grow up as nature intended that they should. Surely it was not intended that coffee, a fruit-bearing plant, should be treated differently to all others." The cutting says, "since artificial plantations are made, nature must be aided artificially." Again, another reason given for the absolute decay of the coffee plant in Madagascar is "planted artificially, the care of bringing up the plant was left to nature alone." I have underlined several other passages in the article bearing on the same subject, which if printed in italics will save me quoting farther from it. I need hardly say that I hold the same views as our Madagascar correspondent, and repeat: Coffee cultivation now-a-days is artificial, and must be treated artificially. Did nature intend the plant to be grown in fields 5 x 5 or 6 x 6? Did nature intend that *all* should be taken from the tree, in the shape of fruit, and nothing returned to the soil? (And so on *ad lib.*!)

If Mr. Partridge's friend who visited "some of the coffee estates" (he does not say where) had visited some estates I know of in Mysore, he would have found coffee growing *naturally* to his heart's content! Long, tall, lanky trees, 12 and 15 feet high, never pruned or snickered from the day they were planted. Trees that grew and grew and bore a few berries on their *topmost* branches, then fell over with their own weight, to be replaced by a sucker, which in its turn had to grow and grow to form another tree! True, better crops could be and have been got from such trees by *manuring*, but then here steps in cultivation, which is artificial! Comparing the attention paid to the mango, orange or guava, with that paid to coffee, is like comparing the amount of attention paid to Liberian with that given to Arabica.

Mr. Partridge's crops are no doubt phenomenal, but he must bear in mind his plants are *young*, and it's not every one who can give a basket of cattle-manure to their young plants. If Mr. Partridge's trees *keep on* cropping as they do, and show no signs of becoming *played out*, then, and not till then, I am afraid, will anyone attempt to make an estate "trusting only to nature" for guidance.

It is true, I will not deny, that older planters are somewhat conservative in their ideas, and are chary of accepting new methods; but have they not some cause to be so? After a "sure method" was tried, and had succeeded perhaps so far as it was advocated, it was found that in its very adoption it brought in its train some worse plague. Theories are offered by an authority one day, only to be proved erroneous by a

greater authority the next. For instance: Mr. Graham Anderson in his "Jottings on Coffee and its Culture in Mysore" written *many* years ago, wrote: "With regard to leaf disease I shall assume it to be a pest allied to the Uridinies and therefore suggest that it takes its origin in—or that its development is at least favoured by—a *parasitic soil*" (the *it* are mine) "that its spores are absorbed by the roots and grow in the parenchyma of living plants, and thus pass through the sap vessels to the leaf." Mr. William Pringle springs into the planter's world and is recognized as a "greater authority," Mr. Graham Anderson's theory is proved to be entirely erroneous. "Thus the disease is not constitutional" writes Pringle! (see *P. O.*, page 494, August 14th, 1897) and we abide by this decision and rest convinced that it is the *right* one, but a greater than Mr. Pringle may one day arise! As to which explanation, I hope Mr. Partridge will excuse planter for being somewhat conservative!

CONSERVATIVE.

COFFEE PLANTING IN MADAGASCAR.

In 1871, the late Mr. Alfred Guenot, of Vatomandary, tried large plantations of coffee in Mahanoro District. The plants grew very well, and that gentleman had succeeded in the enterprise he would have certainly been one of the richest man who ever attempted serious planting in Madagascar. Some time after, in 1872-73, a kind of fever passed through the district of Mahanoro, the disease unknown until that time, acted strongly on the brains of the inhabitants, that an epidemic immediately broke out: it was planting coffee; almost every one wished to plant coffee; that plant responded to the desire of the inhabitants and grew luxuriantly; unfortunately this did not last long. What often happens in such cases soon occurred, namely, deceptive appearances, and then disillusion. Coffee had been, it is true, planted on a large scale, but no one provided for the means of maintaining it. *Planted artificially, the care of bringing up the child was left to Nature alone.* In a short space of time the plantations of coffee has been made, but alas! they did not last long; a few years, after a few crops all the plantations had disappeared. All the coffee-trees had died. No one searched for a remedy, or to cover the cause of the disease. All contented themselves with saying "The coffee plantations are destroyed by a disease." Only one planter, Jean Comte, now in Tamatave, was in the habit of *manuring* the coffee trees yearly. Well, he preserved his plantation, and we remember, after the disappearance of the other plantations, having twice accompanied him on his estate situated at Ambodiriana Lohariana and saw the coffee trees in a very fair state of vegetation. When the late war took place Mr. Comte was obliged to leave Mahanoro, his plantation was in full crop while long before there remained only stumps of trees on the estate of the other planters. In our opinion, the coffee-tree was destroyed by a disease which could be summarised by these words: *want of nourishment and elements.* We think that the coffee-tree could be planted and would succeed on the condition that the plantation be *manured yearly, even twice a year if possible.* The soil of this country possesses an incredible degree of fertility, but, by the very fact that the vegetation is so active the soil becomes impoverished quickly. *Since artificial plantations are made, Nature ought also to be aided artificially.* The late M. Alfred Guenot who had lost so much money in planting coffee, was of opinion that coffee ought to be tried again and was preparing to do so, when unfortunately he died. The same sort of coffee as that which was cultivated at the time he died, could, we believe, be planted afresh—the tree is not sick, since on the estates where coffee was planted, it is observed that a few have escaped the disease, undoubtedly, to having been planted in richer veins of soil. In the villages and yards one notices a few coffee-trees growing nicely, probably taking their nutritive principles from the manure formed naturally in those places. It is a good idea to introduce the coffee of Liberia, but it is no reason why the ancient sort should not be planted again. In 1880 the coffee in white shell was worth 3 dols. per 100 lbs.; at the present time, one could hardly, by offering 11 dols. or 12 dols., obtain 100 lbs. of the same produce. Most of the foreign community, if not all, make their money of tea now. We have also observed that coffee flourishes here in places sheltered from winds, and ever so little umbrageous. We believe that coffee plant would do very well as interlineary plantations.—*Madagascar News.*

COFFEE.

ains Coffee."

We notice that the success that has attended irrigated coffee-gardens at Bangalore has induced certain wealthy natives to experiment in the same direction near Coimbatore. We commend the idea to Missionary Settlements, as there is no doubt but coffee cultivation on the plains is still in its infancy.

e Hawaiian Crop.

In his annual report, says the *Produce World*, the Hawaiian Minister of Finance estimates that the Hawaiian Coffee Crop for 1896 was 757,552 pounds. There are now upwards of two hundred and fifty plantations or estates devoted to coffee growing in the islands, and there is a fair prospect that the coffee product for the next four years will be doubled each year. If so, the crop of Hawaii for the year 1900 may be easily estimated at twelve million pounds. In the opinion of some sanguine coffee planters, this is a very moderate estimate. But it must be borne in mind that coffee is a very certain crop, and it is safer always to make low estimates.

omed?

P. A. S. I., the *Ceylon Observer* states:—

It is clear from the whole of the discussion that with both leaf disease and green bug to contend with, the end of coffee in India (as in Ceylon) is approaching unless lady birds can be introduced to stop the latter."

We scarcely think this deduction warranted, seeing that the green bug has, as yet, only committed havoc in the Lower Provinces and put in an appearance in the Nelliampathis. Coffee is not doomed yet in Southern India; but he must certainly rally his best men round him and make a stand against his formidable foes. The proceedings of the P. A. S. showed that his supporters have not lost heart at—"mean fight."

om Mysore to the Coast.

Mysore planters in particular should read with interest the paper by "Steam" that is published in our present issue. We invite remarks from men on the spot on the various spots most concerned—as to whether the route "Steam" suggests is as good as he thinks it is. To judge from the map, it is all right; but there may be some objections that the map does not reveal. If there are none, and if Mysore and Coorg planters can come to an understanding as to a route that will be acceptable to both, there will be a very fair prospect of linking both these centres to the Coast, by means of the iron road, within a very short time. The chief desideratum is that there should be an agreement as to what is wanted. Then, all interested

can go ahead in an earnest attempt to get it. To agitate for railway communication between Mysore and the West Coast is one thing; to urge the construction of a line between particular places is quite another matter, and one that can be pressed forward with a greater prospect of success.

London Market.

At the Dutch sale on Tuesday, says the *P. M. Review* of 7th August, there was a fair demand and prices generally were firm. Good ordinary Java sold at about $\frac{1}{2}$ cent over valuations. In this market, when the auctions re-opened on Thursday, there was a better inquiry, and full prices were paid, especially for home trade descriptions. Privately, a moderate business has been done in fine Costa Rica and Mysore at steadily advancing rates. Owing to the small quantity of really fine Coffee this year, prices for these descriptions are hardly likely to give way now, as with the autumn demand, which will probably shortly set in, the few lots offering will most likely be soon cleared off. In the terminal market there has been a further fall, as not only has no confirmation of damage to the next Brazil crop been received, but the daily receipts have been so enormous that no confidence is placed in even the present low prices. The stocks, too, also show such a large increase during July that any upward movement has been further checked. The total visible supply of the world on 1st instant is given at 265,500 tons, an increase of 28,580 tons during July, and of 90,000 tons compared with a year ago.

Liberian in North Borneo.

The coffee grown in North Borneo, says a correspondent to the *British North Borneo Herald*, is the Liberian sort. It grows faster and is healthier and larger in North Borneo, as far as I can discover, than in any other country, and it finds a ready sale, the present price being about 64s. per cwt., against 40s. for good Channel Rio (Arabian). The following are the actual crop figures from a 170-acre estate. (A picul is 133 $\frac{1}{2}$ lbs.)

	Pcls.	cts.
Before 24 months old	1	96
Six months 25 to 30 months old	40	02
Six months 31 to 36 months old	130	35
Six months 37 to 42 months old	220	19
Six months 43 to 48 months old	304	13
Three months 51 and 53 months old	359	66

(including this January.)

This is of clean marketable coffee. This estate has not been manured, a significant testimony to the richness of the soil. We have now full particulars of the cost of planting and of upkeeping coffee and can furnish exact estimates. The trees in the photograph are three years and one month old. The amount of land in North Borneo suitable for

coffee is practically unlimited. The cultivation of coffee is being gradually extended, and may be expected to increase still faster. North Borneo is one of the few countries flying the flag that coffee will grow in, and it is on that account to be preferred to the South American Republics with their frequent revolutions, probably entailing the forced enlistment of all the estate labour. While on the subject of coffee, I may mention that the clearing of the forest for an estate is not by any men's the difficulty it is generally supposed to be. The natives are glad to get contracts to fell at four dollars an acre, however large the trees may be, and if felled in the drier weather, after a few days without rain, a burn can be had that will leave the ground almost clear enough to commence holing at once. Labour is obtainable at 30 cents or 7½d. per working day, with no extras of any kinds, the men housing themselves and finding most of their tools. This is free labour which is in increasing supply as demand increases.

TEA.

Indian and Ceylon Crops. The total sailings of tea from Calcutta from the 1st of April to 31st July was only 25,819,064 lbs. against 25,830,714 lbs. in 1896 and 28,761,862 in 1895. The exports of tea from Ceylon from the 1st January were 69,774,083 lbs. against 61 and 52 millions odd in 1895 and 1894 respectively.

Indian Tea Association. In the report of a committee meeting of this Association, dated the 9th August, we note that the contributions to the American Market Fund to date amounted to Rs.91,469. It is interesting to observe that the success that so far attended Dr. Haffkine's inoculations against cholera has led to an expression of opinion by the committee that inoculation should be practised at all the chief recruiting stations. The system will be a voluntary one, and a fee of eight annas levied (payable we suppose by the planter) per head

American demand. Statistics show that of imports of 93,998,372 lbs. tea into the United States in 1896, China contributed 50,916,111 lbs. and Japan 38,552,467 lbs., thus leaving only 4,529,794 lbs. for India and all other countries to supply. It is very evident, therefore, that the attempt of Indian and Ceylon planters to "boom" their teas in the United States is a wise one. There is room for considerable expansion of trade in that direction, and it is to be hoped that every success will attend the efforts of the Indian planter to establish a firm footing in the important American market. May South India acquire a fair share of the trade!

Company profits. In the usual table of figures giving the workings of Indian tea companies are to be found many interesting details omitted in our previous review. The profit in capital for 1896 varied from 1.69 per cent. to 23.43 per cent., while the dividends ran from *nil* to 20 per cent. The average price per lb. varied from 5½d. (profit 12.88 % and dividend 12.0 %, yield 992 lb. per acre) to 12.78d. (profit 19.30 % and dividend 15.0 %, yield 358 lb. per acre). The smallest yield was 233 lb. per acre (in Darjeeling), average price 10.80d., profit

3.53 % and dividend 5 %. The largest yield was 1.03 per acre (in Assam), average price 5.78d., profit 11.26 and dividend 15 %. The profit per mature acre varied £1-3-7 to £11-10-1. The capital cost per acre varied from £19 to £80, the yields being 350 lb. per and 635 lb. respectively. The ratio of expenses to rec varied from 57 % to 92 %.

Prices since 1893.

In their report of 6th ult. Messrs. Gow, Wilson and Sta publish an interesting table of prices obtained by In and Ceylon teas from the year 1893 to the present t We give below an abridged table giving the prices only the sales of the first week in each month:—

	1893		1894		1895		1896		1
	I.	C.	I.	C.	I.	C.	I.	C.	I.

Wanted: Inventors!

A correspondent to the Calcutta Planter makes some interesting suggestions *re* the most urgently required improvements in appliances for manufacture and cultivation:—

One of the first necessities is an improved leaf basket which will permit the air to percolate freely through the mass. The thing on a larger scale is required for the leaf carts, which are more deleterious to the leaf than the present style of basket. Doubtless the wide flat basket, now more frequently in vogue, the deep, narrow one, is an improvement in the right direction, it is not wholly satisfactory. Of course, our old friend the Parula Plucker is still as much needed as ever, but the Perfect Parula, alas, is still no nearer to us than it was thirty years ago to all appliances, and no inventor has yet come forward whose conception has been able to pass in speed, cost, and efficiency, the nimble fingers of the coolie women, and this is a strange thing to consider in the latter days when everywhere machinery for the most trivial matters is superseding human labour, however skilful such labour may be. There have been a varied assortment of pluckers, each one purporting to be the ideal one, put into the market at different times, but the fact remains that we are "as we were."

It has been asked if it would not be possible to enhance the beautiful appearance of our teas by preserving the bloom? As a practical planter, I should say, from the nature and system of tea manufacture, that such would be an utter impossibility at present. When manufacture by steam is totally superseded by electricity (it no doubt will be in the not very distant future), then it seems to me that the bloom might possibly be retained but not be lost. Considering that tea bushes are planted in equi-distant lines, it is no matter for surprise that no practical cultivator has yet invented. One would imagine that something on the principle of steam cultivators worked by a wire rope, such as are used by farmers at home, could be applied on a smaller scale to tea land, with a considerable saving of cost, and the work would be performed with a regularity and uniformity not always conspicuous in the cultivation done by hand. I have mentioned a few of our more urgent necessities, and doubtless many more will occur to the mind of others. There is a wide scope for the man with an inventive bent, and a persistent determination to perfect such invention as he contemplates.

I believe the very best thing that could happen to us would be the formation of an American Company to take over some large estate and to develop it by an American establishment. I venture to say that we should not then have to wait long for a variety of mechanical improvements which we should be astonished at not having thought of ourselves.

Home Market.

The market was practically closed until Thursday, says the *P. M. Review* of 7th ultimo, when public sales were held, comprising 3,282 packages. The teas mainly consisted of the medium and finer grades, for which there was brisk competition at hardening rates, while the lower descriptions fetched quite former values. As the supply for the next few weeks will probably not show the increase usually looked for at this period of the season, the market will no doubt maintain the stronger tendency for some time. However, the latest reports state that the damaged portion of the railroad is repaired sufficiently to allow of the free transport of teas from most of the districts, the deficiency in the imports will soon be made up, and a more liberal supply will be forthcoming. The later advices of the outturn are also more satisfactory, the weather generally is reported to be more favourable for the production of better teas, and it is, therefore, probable that the later imports will supply the market with an improved selection from most districts. The returns for the past month are, on the whole, satisfactory, the consumption showing a good increase over July of last year. Imports were 5,815,000 lbs. against 6,311,000 lbs., the deliveries were larger by 1,254,000 lbs., the quantities respectively being 9,491,000 lbs. and 8,237,000 lbs., while the increase in the stock is now reduced to 3,320,000 lbs. The public sales next week will be larger and will be resumed on Monday, and continued on Wednesday and Thursday as formerly.

CEYLON TEAS.—In the absence of public sales, the market for Ceylon Teas has been practically closed and no change can be reported. The first public auction since the holidays will take place on Tuesday next, when very large quantities will be brought forward. This, indeed, will be the largest sale on record for this description of tea. The following are the figures for the past month compared with July last year:—The imports amounted to 10,380,000 lbs., against 10,344,000 lbs., and the deliveries were 8,962,000 lbs. and 8,211,000 lbs., while the stock stands at 24,212,000 lbs., as compared with 23,515,000 lbs.

MANURING—PRUNING—PLUCKING.

AN INDIAN PLANTER, '1874,' writes a very interesting and practical letter to the *Ceylon Observer*. He wishes that the planter in India could copy the 'public spirit' of the planter in Ceylon, and referring to the voluminous correspondence on planting matters that appears in the Colombo papers observes with truth:—

"Of course the grand effect of all those letters is not so much that many planters will be benefitted by advice given, as that they will be set 'thinking,' and something always comes of real serious thought."

As regards prices of tea, too, he takes a view that time will probably prove to be correct, for he remarks that though planters growl about low prices, they have surely to come to lower still. The recent advance in exchange lends additional probability to this forecast.

Then, '1874' gives some useful hints about Manuring. He says:—

About MANURING.—There are two answers as to the object of manuring: The manager will tell you that it is to improve the bushes. The proprietor may say that it is to get a good return for money spent.

And so there will be two ways of using manure: the one, which will

improve bad bushes and take a long time to give any return, and the other to apply manure to the best bushes and get an immediate and maximum return. I would say that if you have Rs.500 to spend on manuring, put it on to the bad bushes, because even a good percentage of profit on Rs.500 would hardly be noticed in the year's accounts; but if you have from Rs.3,000 to Rs.5,000 to spend, then put it on to the best bushes, and it is possible that you will get cent-per-cent profit, and this will make a great show, and encourage you to go in on a large scale.

Strong manures are generally put down in large quantities, and the effects are supposed to last for three years or so. It appears to me that it would be wiser to use one-third the quantity and apply it annually. Then this strong manure is placed at the roots of the bushes with the idea that it will be more readily assimilated; but by digging up the soil near goop bushes, it will be found that the roots are not far from the surface at a distance of 2 feet from the stem; and these are the roots that creep about to find sustenance. So it will be well to distribute the manure all over the surface and dig (or wash) it in to within reach of these roots. Possibly the best method will be to apply the manure with water if available, or broadcast and hob it in; both these methods would cost less than the one of digging a small trench round the bush and covering up the manure.

Manure will be of some benefit when it is looked to as a source of revenue and not as a bush-improver—that is to say that money spent in manuring good tea will probably yield more percentage of profit than the same sum put into opening out new extensions. An estate will spend Rs.10,000 in extensions. I think that the same sum spent in manuring its present tea would pay better.

PRUNING.—I have a fairly wide experience. In Cachar, Assam, and Sylhet pruning is done every year, nearly all the year's growth is cut off, only 2 to 4 inches are left. When the bush grows too tall it is cut back to the manager's fancy—from the ground to 24 inches). In those places you can do as you please with the bushes. In Kangra and up-country districts the tea is allowed to grow, cutting back is resorted to as seldom as possible, heavy pruning is done in June, light pruning in the cold weather, the bush is allowed very little growth. In Chota Nagpur the bushes are pruned every second or third year, and not touched with the knife in between.

PLUCKING.—In Assam, &c., the plucking begins by leaving 2 or 3 leaves on the new shoot, 1 leaf on every subsequent shoot to the end of the year (some few gardens pluck all close down for the last few flushes in October and November)—the consequence is a growth of from 18 inches to 3 feet, and this is all out in December.

In Kangra one leaf only is left on the new shoots after the cold weather pruning and after that each shoot is taken clean off; the growth of the year is about 4 to 6 inches. On hard pruned bushes (pruned in June) they allow 3 leaves of the first flush to remain, and pluck close after that.

In Chota Nagpur 3 leaves are left on the new shoots after pruning, and from that time to the next pruning, every shoot is taken (if possible) as soon as it has two leaves and a bud.

I myself in Sylhet once let a plot of tea remain unpruned for one year, and the second year's growth gave me 1,120lb. of tea per acre—but as that plot gave fully 960lb. per acre even when pruned yearly. it was not worth while adopting the new system, because it would be necessary to prune at the end of the second year and the yield would be less. I think that was the reason, but I now think that it would do tea a lot of good to let it remain unpruned for two years (as you do in Ceylon); the branches would have more time to get strong and thick.

The annual pruning in Assam, &c., does not seem to spoil the quality of the tea; the first picking (i.e., shoots out of wood) is generally inferior to the rest; but it seems to me that Ceylon planters lay too much blame on pruning as a destroyer of quality.

There is one point in favour of annual pruning. The first tipping is bad leaf, the second perhaps not very good; but after that you get good strong sappy leaf, and if this can be taken in time or if overgrown, only 2 leaves and the bud are plucked, you will get the best quality tea your soil can produce.

But with deferred pruning say 2 or 3 years interval, the bushes send out enormous numbers of shoots in flushes. Each bud breaks out and matures at about the same time, so that the labour force can only take them all off in from 10 to 15 days.

At the end of 5 or 6 days the shoots have got four leaves or have become "bhangy" (open); you don't like to leave the extra leaf and then your quality is a thing of the past. At the end of the flush nothing much of value is left—some open shoots and a few that have forced their way through the wood from below this rubbish serves to fill up time till the next flush comes on. I am now speaking of what I imagine to be the fault in Ceylon. In Assam the system of pruning and plucking gives a continuous succession of shoots which are well within the capacity of the labour force to take in good time; but with you the flush would require about three times your force to pick when it is ready, and before it gets too long—and

after that you have hardly enough leaf to earn full pay for your pluckers,—you make huge yields of which about $\frac{1}{4}$ is taken in good time and the rest is overgrown flush and odds and ends. But still you manage to pay good dividends and so your methods are justified. Success is always capable of justification, and it is only when one fails that one enquires after other tracks to run on. Suppose that some of you try the Assam method of annual pruning—take only good leaf—and manufacture it carefully. This may lead to a small reduction in quantity and improvement in quality.

NATURE SLOWLY MAKES READY.

You have probably never seen a volcano in eruption. It is a magnificent spectacle. Where do all those torrents of red-hot lava come from? Nobody can tell, except that they come from somewhere down deep in the earth. But one thing we know, namely, that eruptions of any one volcano are far apart. Between whiles Nature is getting ready for them; she is preparing for the tremendous demonstration.

Just so it is with all her processes. In the cold of winter she is arranging the forces which are to make the heat and the harvests of the following summer, and so on.

From May, 1890, to February 1892, is a period of twenty-one months. The two dates will long remain clear in the mind of Mrs. Martha Bowles, of 182, Llangyfelach Road, Morriston, near Swansea. For the first was the beginning and the second the ending of an experience which was bad enough in itself, yet only the introduction to something vastly worse. It was like the time of getting ready for a great trouble to come.

Her first sense of this was indefinite and vague, like the low muttering of thunder below the horizon while the skies are yet clear. She expresses it thus, in the very words most of us use on similar occasions, "I felt that something was wrong with me—something hanging over me."

Ah! dear me. How often we think such feelings are a warning sent to the spirit, when in fact they are caused entirely by the condition of our bodies. She felt heavy, languid and tired, and mentally depressed. This was not only melancholy to her but new, as she had always been strong and healthy. Then came the discomforts which there could be no mistake about. They are common enough to be sure. Oh, yes. But isn't that all the more a reason why we should understand what they mean? "Certainly," you will say.

Well, then, there was that bad, offensive taste in the mouth, that so many of us have had; the failure of the appetite, and the pain in the chest and sides after eating. The worst pain was in the right side, where it was very heavy. That pointed to the liver, which is located on that side; and when anything ails the liver it is as though the big water-wheel of a mill had got fixed so as not to turn round. For the liver does half a dozen kinds of work, and when it strikes work, the rest of the organs take a sort of rainy holiday.

Presently her skin and the white of her eyes turned yellow, as autumn leaves. That meant bile in the blood; the liver was off its duty; that is a sure sign. The kidney secretion was the colour of blood instead of a clear amber, which meant that the trouble had already reached those important organs. Then the stomach was upset and refused to take kindly to food—as though the miller sent your grain back, declining to grind it. She vomited a sour, bitter fluid, which was acid bile, away out of its proper track. On and on along this line, constantly getting further and further from the happy land of health; this was the history of those twenty-one months—all bad enough, yet all preparatory for worse ones.

"One day in February, 1892," she says in her letter of August 18th, 1893, "I began to have dreadful pain and cramp. It began in the right side, and extended across the stomach. For hours together I was in the greatest agony. What I suffered is past description. When the pain eased a little, I was cold as death and shivered until the bed shook under me. I had hot iron plates supplied to my feet, and held hot irons in my hands, but nothing gave me much relief. My stomach was so irritable that I could keep no food on it. I was now confined to my bed, and the doctor attending me said I was passing gall stones. He wanted me to go to Swansea Hospital and be operated upon, but I was afraid I might not live through it."

"I next had two other doctors at Morriston and also three from Swansea, who all gave me medicines, and said nothing more could be done for me. For six months I lay in bed undergoing the greatest agony; never free from pain more than two or three hours

at a time. During the whole of this time I was fed on nothing but and water. I had scarcely any life or strength left in me. As I saw me said I never could by any chance get better in this way."

"I lingered on like this until August, 1892, when my daughter brought me a book telling of Mother Seigel's Curative Syrup. In this book she read of a case like mine having been cured by the medicine. My husband got a bottle from Mr. Bevan, the chemist, and after taking a few doses I felt a little relief. I kept on taking it and soon the pains left me, my appetite returned, and I agreed with me. After taking the Syrup for three months I was a new creature and strong as ever. I can now eat anything and nothing disagrees with me. After I was well our minister of religion said: 'Mrs. Bowles, I never thought to see you alive.' 'Mother Seigel's Syrup saved my life.' You may publish my story, and I will gladly answer inquiries. (Signed) Martha Bowles."

This case—one of acute indigestion and dyspepsia, with liver and kidney complaints—is well known in the district. The husband is a gardener, well known and respected.

Do we need to point out the moral of this wonderful cure? You can see it for yourself.

MARKET SUPPLEMENT.

SATURDAY, SEPTEMBER 4, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (August 13, 1897) says:—The supplies at Public Sales this week have been on a small scale, and a good demand prevailing the market has advanced fully 1/- for nearly every description.

Over 1,200 bags East Indian were offered and attracted keen competition, prices showing a rise of 1/- to 2/- since our last.

The small supplies of Central American brought forward realised full prices and the greyish qualities of Guatemala are fully 1/- dearer.

Futures during the early part of the week advanced 1/3, on rather smaller receipts and firm cost and freight offers, but the receipts increasing again, quotations have dropped back 9d. from the best.

Messrs. Wm. Jas. and Hy. Thompson (into which firm Patry and Pasteur united, have now been absorbed) issue the following Report of the Colonial Markets for the fortnight ending August 11th, 1897:—Bank rate 2 1/2%. Bombay Exchange closes at 1s 3 1/2d. Brazil Exchange 7 3/4d. Rupee per 3 1/2% 63 1/2. Silver 25 1/2d per oz.

A steady demand has prevailed since our last Report. The moderate supply catalogued has been mostly sold at fully previous values to an advance of 1s to 2s per cwt. The sales included:—51 casks and tierces of barrels and bags Plantation Ceylon sold at 84s to 110s 6d. Of 238 bags East India, 547 bags Coorg sold from 70s 6d to 106s, 85 bags Sidoobatum were brought in, 596 bags Neilgherry good part sold at 6s 6d to 96s, and 10 bags Wynaad sold at 80s; 9 barrels, 40 bags Jamaica partly sold at 70s to 82s; 948 bags Costa Rica good part sold at 55s to 65s 6d; 2,687 bags Guatemala chiefly sold at 60s to 90s; 852 bags Salvador sold at 51s 6d to 56s 6d; 1,904 bags Nicaragua sold at 50s to 65s; 735 bags Vera Paz and Coban part sold at 96s to 108s; 29 bags Mexican sold at 65s to 93s 6d; 121 half-bales Mocha bought in; 17 bags Liberian Wynaad bought in, and 420 bags Santos on quay terms were bought in.

According to Messrs. Duuring and Zoon, the European stocks on 1st July, showed a reduction of 9,550 tons, and the visible supply an increase of 27,700 tons, being estimated at 132,200 tons and 266,240 tons, respectively, against 141,750 tons and 238,540 tons on 1st July.

The Dutch Sale which was held on the 3rd inst. comprised 19,162 bags of 2 cases, and went off with some irregularity, good ordinary Java selling at the valuation of 47 cents, against 46 1/2 cents in the June sale.

Daily receipts have averaged 17,214 bags in Rio, and 29,143 bags in Santos.

Futures have been quiet and show but little change, viz.:—Good average Santos in Havre, September delivery, fcs. 44.75, in Hamburg 37, and No. 7 low ordinary Rio in New York \$6.90.

To-day's London official quotations are:—

	Aug.	Sept.	Dec.	March	May
Rio	34/-	34/6	35/-	—	—
SANTOS	36/-	36/3	37/-	37/6	37/9

TEA.

Messrs. Gov. Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated August 13th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	111,509 packages.	281,052 packages.	10,135 packages.
1896-1897...	111,284 „	262,362 „	11,980 „
21,883 pkgs. INDIAN			
42,195 „ CEYLON			
1,539 „ JAVA			
Total 65,617 packages were offered in public auction this week.			

The following table shows that the amount of British Grown Tea taken for Home Consumption and Export has more than kept pace with the increased supplies which have so far come to hand this year:—

SUPPLEMENT TO "PLANTING OPINION."

Movements of Tea in United Kingdom from 1st Jan. to 31st July, as shown by Custom House Returns.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 17th September 1897.

Central

Travancore.

4th September.—*Weather.*—Rainfall for August, 52.88. Heaviest August on record, with exception of August 1883. Rainfall for year to date, 170.87. *Crops.*—Tea not flushing much just now, but will be doing so soon if weather keeps fine. *Labour.*—Fairly plentiful. *General Remarks.*—Roads in a dreadful state. Great difficulty in getting cartmen to come up the ghât in consequence.

S. E. Wynaad.

PUNDALURE, 8th September.—*Weather.*—Since my last report there is no change in the weather; we have had constant rains, and at intervals we have had sunshine. On Sunday, the 5th instant, we had the heaviest showers of rain followed by thunder and lightning. To-day the weather is very clear and hot, and the monsoon seems to have left us. *Crop.*—Coffee ripening here and there; transplanting of paddy is nearly finished. Price of grain still very high. *Plant-disease.*—Leaf-disease showing slightly here and there; if the weather continues, the disease will disappear. *Health.*—Very good, and the aborigines are fully engaged in celebrating Onum feast to-day. *Labour.*—Sufficient.

Coorg.

POLLI BETTA, 8th September.—*Weather.*—Showery with plenty of sunshine. Several rainless days. Yesterday there was surprisingly heavy rain, over one inch. The weather would be ideal weather if it were seasonable, but this it is not. It is continuing too wet for the time of year; and it would not be at all surprising if it brought on a virulent attack of leaf-disease. *Plant Diseases.*—Leaf rot to be noticed in all situations, but not prevalent to an alarming degree. On the whole coffee is looking exceedingly fine; but there are trees to be met with in spots which are very sick with leaf disease. *Labour.*—There has not been any large addition to the labour supply. Coolies are, however, dropping in, and there are enough for present requirements.

Nilgiris.

SHOLUR, 8th September.—Very much as last report; rain incessant, and work almost come to a close; out-door work only carried on by robust coolies, and the best of hoeing being only transplanting. Rainfall for September 2.25, being 44.97 to date. *Health.*—Good. *Grains.*—Rates slightly cheaper. *Labour.*—Plentiful.

COONOR, 8th September.—*Weather*.—Still this everlasting drizzle and rain. North-east winds beginning to blow strongly, and N. E. Monsoon not so very far off. *Crops*.—Much the same as last report. Grain dearer than ever. Horse-gram at horrid rates. *Plant-diseases*.—Comparatively absent, though flashworm in tea is almost as strong as ever. A good ten to fifteen per cent. loss in crop this wretched little worm has caused. *General Health*.—Indifferent. *Labour*.—Ample enough as usual. *Interesting Items*.—Referring to high price of horse food, have any of my brother correspondents tried feeding regularly with oats? Put in pounds of dry grain, what is a fair equivalent?

ROADS AND COMMUNICATIONS.

YEAR after year, this subject has been brought up for the consideration of the U. P. A. S. I. No direct or indirect benefit appears to have resulted, yet the matter is one of extreme importance. The present, certainly, is not a very favourable opportunity for pressing it upon the notice of the Governments concerned. Nevertheless, we are of opinion that planters might gain something by making their wants known through the medium of the Press, as well as that of the U. P. A. S. I. We invite all Honorary Secretaries of District Planting Associations, therefore, to lay before us brief statements of local necessities and requirements in the way of railroads, roads and communications. We undertake to make these wants known. If a concise statement of "objects and reasons," and "arguments in support," is sent in every case, so much the better. Whenever a road is obviously needed, we will not merely refer to it once, but will reiterate the demand for its construction until a definite answer shall have been elicited from the authorities. There may be rivalry between different districts, or several may put forward claims all involving a drain on the same coffers. Consequently it would be well for each Association to put forward its claims soon. In some instances, work might be aided by the still-prevalent distress; in most, we fear, the tightness of money would act as a bar to progress. A trial would do no harm, however; and if planters will enable us to make known what new communications are absolutely indispensable to the development of planting districts, and what others are very desirable, we shall hope to see some little result from the co-operation of our little mouse with the U. P. A. S. I. lion.

With every statement of requirements, a synopsis of previous correspondence (if any) with district authorities or Government should be sent.

GENERAL NOTES AND ARTICLES.

Para rubber, Cocoa and Liberian.

Says a Ceylon correspondent from Kandy:—

"People are talking a lot about this para rubber, and I hear of some being planted. We have a hundred plants or so doing very well. I also hear of Liberian coffee being cut out as a failure. The cocoa ground here looks good enough for anything and carries a fair crop,

but parts are being planted up in tea, which does not look paying concern."

Rhea.

In a recent letter to the Agricultural Society of India, Calcutta, the Secretary of the Rhea Fibre Treatment Co. has made some interesting remarks on the prospects of the trade. A misunderstanding evidently occurred over the market prices, the price of £7 per ton at port of shipment being the reality for the bark ribbons (*i.e.* simply peeled from stem and dried) and not the cleaned fibre. If the scrubbing and cleansing of the ribbons is attempted, the price goes up to £30 ton in order to secure a fair profit. The explanation is, therefore, extremely important. The essential required by the R. F. T. Co. is that the ribbons should be thoroughly dried in order to prevent fermentation on the voyage.

Bat Guano.

A valued scientific correspondent writes from Calcutta:—

"You have recently had occasion to quote Bat Guano as a manure. The following is an analysis made lately by M. Jules, Paris:—

Water	...	...	18.02
* Organic matter	...	...	29.11
† Ash	...	...	52.87
			100.00
* Containing nitrogen	...	...	2.99
† Containing potash	...	...	1.09
lime	...	...	7.11
phosphoric acid	...	...	10.93
silica	...	...	23.61

Except for the phosphoric acid, it is rather a poor fertilising agent.

Is it not possible, however, that, as in bird guano, there are two varieties of bat guano, *i.e.*, the fresh or nitrogenous kind, and the old or phosphatic one?

In their Monthly Circular, dated from London, August, 1897, Messrs. Arbutnot and Co. report:—

Cinchona bark.

On 15th July, Public Sales were held at Amsterdam, when 5,294 Packages Java were offered against 4,343 Packages in June and 5,834 Packages in May. A strong demand prevailed and all went at a slight advance, the value of the unit being 4.30 cents against 4.20 in June. On 20th July, Public Sales were held in London, and only 1,000 Packages of all descriptions were offered, against 2,528 Packages in June. There was good competition and the bulk sold at an average of 1.5d. per lb. being steady. The next auctions in London will be on the 17th instant and in Holland on 26th instant, for which 6,102 Packages are advertised. The Quinine market has been firm and prices a spot are slightly dearer. Some business was reported in German Quinine, but there are no further sellers at the price. The Stock of Quinine in London on 31st July was 86,962 lbs. against 104,725 lbs. last year and 138,595 lbs. in 1895.

Shipments from Ceylon 1st January to 1st July lbs.	1897	1896
	384,000 lbs	610,547 lbs.
Shipments from Java 1st January to 31st July lbs.	1897	1896
	4,308,000	5,050,000
Imports 1st January to 31st July Packages	7,925 Pkgs.	12,638 Pkgs.
Deliveries	9,545	16,046
Stocks 31st July	20,572	24,340

Regulation of moisture.

The importance of so regulating the amount of moisture in the soil that the crops sown therein have their proper quantum, has been insisted upon so many times in this paper. Of course the rainfall itself cannot be regulated, but once it has fallen, the soil can be so treated by cultivation and drainage as to remove excess of moisture if present, or keep it from being wasted, if insufficient.

in some of these remarks we may be travelling over old ground, but let the importance of the subject excuse us.

There is a popular error that land sheltered from the wind by a crop is kept moister than uncropped land. This is, of course, no doubt, arisen from the fact that, owing to the wind and shades, the surface soil is damper. But let us get to the facts.

All root plant food is absorbed in solution, *i.e.*, by pump-action, drawing up water from the soil impregnated with chemicals, and evaporating the water by its leaves and leaving the chemicals in its tissues. Thus in dry weather every need of the crop is robbing the rightful owner of the soil of its moisture, and thus also of its food.

Another interesting point is the effect of manure on plant-growth in times of drought. The more saturated the soil is with chemicals, obviously the less moisture is required to gain a given amount of plant food. As for every pound of additional matter to its weight, a plant has to evaporate from 250 to 300 lbs. of water through its leaves, the matter is well worth attention. An obvious conclusion is the great need of keeping our crops, coffee and other, fully supplied with plant food in the dry season.

Besides leaf evaporation, there is the question of surface evaporation from the soil itself. In a dry season every drop of water that escapes from the surface soil is so much lost to the feeding powers of the plant. Soil evaporation proceeds by capillary action, and subsoil moisture ascends to the surface in the same way that a saucer of water will open the whole contents of a flower-pot of earth placed on blotting paper, or as water or ink runs up blotting paper. That is, water runs up minute canals called capillary tubes.

To know the cause is to know the cure. Take our flower-pot again, or, rather, take two. Fill both with "stirred" soil and place in saucers of water. Stir up the surface of one pot with a stick to the depth of one inch. In the other be. In a short time the untouched one will be moist to the very surface, and evaporation will take place. The surface of the other will keep quite dry, though just below the layer of loose soil the earth will be wet. In both the greater portion of the water will have been absorbed. Give each an equal quantity of added water at regular intervals and note how quickly will the water under the stirred pot be overflowing, while that of the other is comparatively empty. The experiment will be very striking if both pots are placed in a very hot atmosphere, and the surface of the one pot is stirred at each addition of water.

What has been done? The tops of the canals or capillary tubes have been blocked up by the fine particles of the earth. What has been done with the flower pot can be surely done in the field by light forking or digging an inch or so in depth. Better still, as lately recommended, a light two-man rake cultivator could be used with better results at a less cost on all but very steep or stony soil.

SOOTY MOLD ON ORANGE TREES"—LESSONS FOR PLANTERS.

MR. E. E. GREEN writes from Eton, Pundaluoya, on the 10th August, as follows, to the *Ceylon Observer* :—
Thanks for the paper (Bulletin No. 13, U. S., Department of Agri-

culture) on the "Sooty Mold of the Orange and its Treatment." It has a certain amount of interest to us—as it deals with the black fungus that follows an attack of "bug," and its effect upon the plant. The following points may be noticed :—

1. The author confirms other observers in the opinion that the fungus is quite superficial, vegetating solely on the "honeydew" excreted by the insects.

2. Injury is, however, found to occur through interference with the process of photosynthesis (the elaboration of carbon compounds under the influence of light). This fact has been demonstrated by Bütschli:—"He removed the fungous membrane from a small portion of a leaf and exposed the leaf to the sun. In the evening, after a sunny day, the leaf was plucked and the chlorophyll extracted with alcohol. After this the leaf was treated with iodine, and the parts from which the membrane had been removed in every case stained a dense blue, indicating the formation of an abundance of starch, while the surrounding portions of the leaf which were protected from the sun by the fungous membrane remained entirely uncoloured, showing that no starch was formed." This has a direct bearing upon the practice of growing tea under old coffee. When the latter is infected with "scalebug," the "honeydew" and accompanying sooty fungus will be communicated to the tea leaves below, and though not actually penetrating their tissues, will interfere with their proper function.

The author includes "blighted and shrivelled leaves, and small and dry fruit" in his account of injury due to "sooty mold." But the larger part of this account is surely attributable to the attacks of the insects that precede the fungus.

In treating of remedial measures also, the author writes as if the "sooty mold" were the main disease, instead of being one of the consequences of a more serious malady. He evidently understands the facts himself, as his proposed remedies are insecticides and directed against the insects; but the case might have been made more clear to the general reader. Such expressions as,—"the treatment of sooty mold by fumigation with hydrocyanic gas"—"kerosene emulsion, which has been recommended for sooty mold"—"resin wash for sooty mold," &c., &c.—are most misleading.

FRUIT CULTURE.

THE Department of Agriculture of Cape Colony has lately issued an excellent Manual of Practical Orchard Work, of which the following are excerpts :—

I.

THE ARTIFICIAL CHARACTER OF MODERN FRUIT TREES.

1. Cultivation implies, first, a previous knowledge of the nature and constitution of the living being we propose to care for, and secondly, a previous knowledge of the soil and atmosphere in which it holds its dual life. It is only by such pre-knowledge that the cultivator can suit the conditions of growth to the wants of the thing to be grown, and thus place it in the best possible position for fulfilling the history of its life. Nothing short of this work, done of set purpose and as the outcome of exact knowledge, can be called *cultivation*.

2. But it is something more than this. It is not enough to reproduce plants in the precise form in which they exist in nature. Firstly, the cultivator, for his own benefit, aims at guiding and controlling the growth of certain plants so as to make them develop very differently from their normal original condition. Thus in one plant he endeavours to obtain seeds of large size and bland taste, in another the effort is to do away with seeds as far as possible and produce a large succulent fruit, in others, shortening of the axial growth, and great enlargement of the leaves is aimed at. The plant then with certain limits is, like clay in the hands of the potter, capable of being remodelled, by causing this or that organ to take on an excessive and unusual development, without at the same time interfering with the balance of functions necessary for its general health. This complex art is one great part of *cultivation*. To practice it with success obviously demands something more than the loose, popular notions of plant-life, which are picked up without special study or thought, or come by imitating the traditional methods of our neighbours.

3. Secondly.—For many hundreds of years a close watch has been kept upon the seedlings arising in the reproduction of all cultivated plants. Whenever a sport or other chance variation has appeared, presenting characters of a desirable kind, the gardener has quickly to detect it, and to give it permanence by such methods as budding and grafting which are unfortunately almost unknown in Ceylon. And this continual watchfulness, awaiting the chance of betterment by natural variation has produced the kinds of fruits approved and cultivated all over the world, so that in fruit culture as with all knowledge, we are to-day the heirs of countless benefactors who have preceded us and handed down to us their best results. It must, therefore, be always borne in mind that the objects of our culture are distinctly artificial products obtained by centuries of selection and variation, and do not exist as natural forms of vegetation, nor can they put up with the conditions that suffice for the latter. As soon as skilled care ceases they cannot escape deterioration and ultimately dying out. And this indispensable skilled care is orchard work of fruit culture—a special branch of cultivation which requires a special knowledge of principles and practice.

(To be continued.)

PRODUCTS OF THE CITRUS TRIBE IN SICILY.

REPORTING on the trade of Sicily, Mr. E. M. de Garston gives some interesting facts connected with the staple products, such as essence of Lemon and other produce of the Citrus family, the different trades dealing in these being of a very interesting character. The Lemon essence industry is a very important one in Sicily, where the abundance of raw material naturally renders the manufacture of the so-called oils of Lemon and Orange a very profitable undertaking; 37,941 kilos. of these essential oils were shipped during the year 1895, over 32,000 kilos. of which was taken by Great Britain.

Oil or essence of Lemon is obtained by pressing or bursting the oil-glands in the rind of the fruit, and this is done either by hand or by machinery; that obtained by the first process being by far the best in quality. In Palermo the essence is all pressed at night. The workmen are supplied with a certain quantity of rinds, divided into equal portions to each between so many gangs, each under the supervision of a foreman. Each man holds two sponges between the fingers of the left hand, and works the rind about in the best way to fracture the oil-vessels. This is caught in the sponges, which, when sufficiently charged with oil, are squeezed into an earthenware receiver; a considerable proportion of the product thus obtained consists of ordinary Lemon-juice left adhering to the rind, together with more or less of the Lemon-pulp. This, however being heavier than the essence, sinks to the bottom of the receptacle, and the essence remains on the top. As the first of these receivers becomes full, the workman blows the floating oil into the second jar through a species of channel formed in the side of the first, and when no more of the essential oil is transferable by blowing, the remaining essence which may yet be floating in the original receiver is carefully absorbed with a sponge, and thence squeezed into the second receptacle, which only contains pure essence.

The remainder, namely, the essential oil which may still have been left in the rinds, is by some manufacturers extracted by distillation, and forms a second quality of essence. By others, again, it is expressed by subjecting the partially exhausted rinds to mechanical pressure in bags. To ascertain, however, if the obtainable essence has been thoroughly squeezed out by the original hand process, the rinds are tested by a foreman, who presses the supposed exhausted peel into the flame of a candle, when, if any combustion is visible, it shows that the pressers have not done their work properly. The essence obtained by the foregoing process undergoes no further manipulation beyond being collected, and after careful filtration through filter-paper it is ready for shipment in the usual coppers of 100,

50, 25, 12, 5, and 2lb. each. When freshly expressed it has a delicious smell of the fruit, which is greatly injured by distillation.

From the leaves, flowers, and fruits of the several species of the Citrus genus a large variety of products are obtained. The blossoms in their natural state serve to flavor drinks and sweetmeats. When distilled they yield two much esteemed products, namely, orange flower-water and essential oil known as Neroli. Moreover, when candied they form a delicious sweet, much in vogue in some regions of Sicily. The orange flower-water is made of equal portions in weight of blossom and water, which yield on an average about one-fifth of the combined weight of water and flowers. Notwithstanding the abundance and excellent quality of the raw material, to speak, still the best manufactories of orange flower-water are to be found outside Italy. As to candied sweetmeats made out of the blossoms, it is doubtless more wholesome as well as more palatable than many other productions of the confectioner's art. The flowers in the first place are selected with care, weighed, immersed in cold water for twenty-four hours, which they are dipped simply in cold water, rewashed in clean water, and finally spread out on a linen cloth or sheet to dry. When completely dry, they are laid out in low, wide dishes, the flower separate from its fellow, and are then sprinkled with sugar, double their weight in sugar, administered at intervals of a period of eight days or thereabouts. Moreover, during the same period the flowers should be frequently moved about in the shade; at the expiration of this time they are once more placed in the sun, whose rays dry them completely.

The raw juices of all the different varieties of the species of Citrus, except that of the Bergamot, are available for commerce; but the juice of the Lemon is the more highly valued on account of the greater amount of acidity it contains. The raw juice, "Agro-crudo," however rich in acid principle, can never vie in this respect with the same juice in a concentrated form with the "Agro-cotto," in which form it is besides a great superiority over uncondensed juice in durability and in reduction of volume. This concentrated juice is prepared in the following manner. It is first of all clarified by being left to stand, then boiled in large cauldrons of copper, one-third full, and the boiling liquid frequently stirred with an iron rod having its head wrapped in common cloth or in rags which have thus to keep the bottom of the cauldron clear of all sediment; those necessary additions to the liquid which the constant evaporation of the aqueous principle renders expedient are supplied by smaller supplementary vessels in which the liquid is kept sufficiently hot to hinder any interruption in the ebullition of the juice contained in the vessels. When the required density is obtained, a point which is easily ascertained through the medium of the citrometer, is poured into vats to cool, and finally drawn off through ordinary funnels into casks.

The adulteration of the acid or juice is facilitated by the ready absorption of certain well-known and easily-obtainable substances, which increase the weight of the acid-juice concentrated. The most commonly employed substances for this purpose of adulteration are tartaric acid, chloride of lime, and sulphuric acid. The methods employed in Sicily to detect the cheat, if not so scientific and perhaps less accurate than those in use in England, are at least inexpensive, and sufficiently effective. Citrate of lime, which seems to be the safest form in which the acid principle can be concentrated, and is the substance whence the citric acid is directly manufactured, is now prepared to some extent in Italy, although within the last quarter of a century this preliminary process was considered impracticable from a remunerative point of view. A very well-known authority on the subject laments in these terms the remissness and ignorance of his countrymen in

ch alone permits foreigners to reap that harvest which
ians neglect to gather and garner for themselves. The
ctions raised in bygone days, from the supposed impossibility
procuring at home a sufficient quantity of proper chalk, have
n shown to be utterly mistaken with respect to the produc-
of citrate of lime. Objections of a similar nature are now
ted with regard to the production of citric acid, and have
n partially disproved already by the establishment of a
ish firm in Messina, which has undertaken successfully the
nufacture of citric acid in conjunction with tartaric acid.

With regard to the essential oil industry in Sicily, it is said
be both widespread and prosperous. Essence producers and
orters are numerous. The essential oils are derived from
varieties of the Citrus group, though they differ considerably
quality, that expressed from Bergamot being the best, and
n follow the Lemon, Orange, and Citron, the relative value
the essence being in inverse order to that of the juices.

The mode of payment of the workmen engaged in expressing
essential oils is peculiar. Instead of being paid at a fixed
per day or hour, or for the weight or number of rinds expressed,
is remunerated according to the amount of essence he succeeds
extracting out of a given weight of rinds.

It is stated that, though the bulk of the oil produced in, and
ported from, Sicily is quite pure, yet it is sometimes adulterated
with other essential oils, and sometimes with turpentine, or even
with resins. The occurrence of these adulterations seems to
have discredited and unsettled the market value, so that it became
necessary, or least expedient, in some cases to submit it to
analytical test before exportation. Owing to these precautions,
the character for genuineness of the Sicilian essential oils has
been redeemed, or rather maintained.—*John R. Jackson, Kew.*—
Gardeners' Chronicle.

LETTERS TO THE EDITOR.

NOTICE TO CORRESPONDENTS.

["C. DANVERS." Please note that the books required can now only be
procured from Ceylon, as per directions in advertisement. "X." No. Very
sorry, but the names of correspondents to this paper are held sacred.—ED.]

TO PICK AND PRESERVE TEA SEED.

SIR,—Wishing to keep over a few maunds of tea seed from
my present crop till next year, I should be extremely obliged
for any hints as to the proper means to adopt.

I am allowing my seed to fall from the tree, gathering it
every two or three days. I then dry it by spreading thinly on
the floor of the tea-house in a cool corner.

My idea as to subsequent treatment is this: To take some old
tea chests, boring numerous holes in the bottom to ensure
ventilation. Then a layer of straw over the holes. Then thin
layers of seed and straw alternately. Finally to nail on the lid,
perforated, and keep in a dry godown. The temperature here
runs from 58° to 65° during the next few months.

While on the subject of tea-seed, can your readers tell me
which is the best method to pick it from the tree? I have been
told that allowing it to drop results in a very large percentage of
light seed. Personally I have found this to be far from the case.
Hand picking off the tree is costly; there is danger of picking
unripe seed, and great damage is done to the tree unless special
ladders or scaffoldings are erected all round. With over a
hundred trees to pick, the cost of these ladders is not light.

TEA SEED.

HUMUS AND COFFEE.

SIR,—“H. G. R.” in his criticism of Mr. Nelson’s writings,
quotes many scientific authorities to prove that humus is not a

very potent source of manure, and also talks of the dangers of too
much humus. I should like to ask him if he ever knew of a
case in which too much humus damaged coffee, or if he has ever
tried to damage it by these means? I have repeatedly tried this
experiment. I have planted coffee in land covered a foot deep
with leaves and cumbered with all the logs and twigs of an
unburnt forest. It grew the finest coffee in the district, such
in fact as never had been grown on burnt land. I can also
show magnificent bushes growing in poor land, the result of an
enormous amount of cut undergrowth being thrown into this
corner every year. No manure has been applied here, and the trees
crop well. I have often tried covering the ground with a layer
of jungle undergrowth six inches deep and burying it under earth
taken from renovation pits. The effect is as good as that of
any manure I know. I don’t know how many tons an acre a
layer of six inches of humus amounts to, but I can confidently
assert that the more the humus applied in this way the better
the effect. The only difficulty is to get enough, as I admit a
thin layer of humus produces little or no effect, but this is
hardly in favour of the theory that land becomes foul and sour
from an excess of humus. An ounce of practice is worth a pound
of theory. It is a notorious fact that some of the oldest and best
cropping and longest lived estates were opened without burning,
the forest being left to rot on the ground or buried in trenches.
Clearings opened on adjoining land off which the forest was
burnt never became such fine fields or cropped as well as the
unburnt clearings. Where then is the practical proof of the
theory that burning improves the land and that the fertility of
young clearings depend on the mineral constituents freed by fire?

J. W. H.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per
ton:—

61.50	lbs.	Nitrogen.
57.38	„	Potash.
14.92	„	Lime.
13.68	„	Phosphoric Acid.

Orders should be booked early for the coming crop of seed from
the parent trees of above analysis at Rs. 6 per pound containing
about 2,000 seeds. *Germination guaranteed.*

*Only thornless variety extant, and is not procurable anywhere save
from the MANAGER, Arienkew Estate, Shencottah, Tinnevely.*

COFFEE.

Three desiderata.

“Coffee, to be good, must be as
black as night, as bitter as death,
and as hot as sheol.” So says a Brazilian proverb, as
interpreted by a contemporary.

Queensland coffee.

The *Queenslander* states that a
planter on the Russell River has
grown and sent to market this year three tons of dried
coffee berries. The price paid on board ship at Cairns was
9d. per lb. in the parchment. It is understood that 6d.
per lb. at the plantation would leave a sufficient margin to
make the industry a profitable one.

Leguminous shade in
Africa.

Mr. Nelson’s numerous papers on
leguminous shade, some of which
have been republished in the *Central*

African Planter, have aroused considerable interest in Nyassaland. Shade of any sort is so foreign to the local planter that the interest taken in choosing leguminous trees is all the more remarkable. Owing to the fear of leaf-disease, it is not likely that *Erythrina lithosperma* itself will be planted in Africa just now, though it is very possible that sufficiently close relations may be found indigenous to the country itself.

The markets.

The *Produce Markets Review* of the 14th ultimo says that, considering the rapid way in which the present Brazil crop is being brought to market, it is surprising that prices have continued so steadily. Indeed, in the early part of the week, in spite of over a $\frac{1}{4}$ million bags having been received since the commencement of the crop in excess of the very large total of last year, prices in the terminal market improved about 9d. per cwt.; since then, however, the receipts have been larger than ever, and nearly all the advance has been lost. The present prices are no doubt attractive and are producing a larger consumption, but as has been before pointed out, the stocks are too enormous to warrant any material advance. At the auctions, only common and medium grades, mostly Columbian and Guatemala, have been brought forward; the demand has been good and prices are slightly dearer. A further good business has been done privately in Costa Rica, and quotations are again rather higher. Plantation Ceylon and East India continue to sell well at full prices.

Consumption in India.

A correspondent writes: "Regarding your notes on what I said about coffee consumption in India, I did not intend my figures to be looked upon at all as an estimate, but in using the 2,240,000 with a certain quantity of coffee to show how easily a large amount of coffee could be accounted for. I think it is altogether impossible to make an estimate without going to work in some very methodical way, and then there are very great difficulties in the way of arriving at even approximate results. Your idea of 20 to 30,000 tons I'm afraid won't do, for I don't see where the stuff is grown. Certainly not in the coffee districts known to us."

Our correspondent is perfectly correct in saying that there are very great difficulties in the way of correctly estimating the amount of crop consumed in the country. The most obvious method is that of deducting the crop exported from India from the total crop raised, but this is impossible owing to the fact that there are no accurate statistics of crop available. Nor is there much likelihood of such figures being compiled in the near future, when it is remembered that the number of native plantations in Mysore alone was (according to Mr. Elliot) close upon 100,000 in 1890-91, mostly consisting of small patches only averaging perhaps 5 acres or less. In 1895 the Government returns showed 283,432 acres of coffee to be under cultivation. If the yield per acre averaged as much as 3 cwt., the total crop would be 850,296 cwt., or an excess of 524,808 cwt. over the exports for 1894-95 presumably consumed in the country. Or taking the average at only $2\frac{1}{2}$ cwt., the crop would still show an excess of 241,376 cwt. over exports.

There is yet another way of calculation left open. The value of the 310,457 cultivated acres (including tea and cinchona) may be reckoned at Rs.19,65,19,281. In order to

show a profit on the plantation industry of 5 per cent. the capital value (taking the exports at Rs.2,77,00,670 expenses at Rs.3,41,50,242), the amount of produce consumed in the country must be 37 per cent. of the whole.

AMERICAN NOTES: THE COFFEE SUPPLY.

WRITES the New York correspondent of the *Grocer*, issue of the 31st July 1897:—

The record of the year's coffee trade has just been completed, and proves of unusual interest in that it shows an increase in deliveries in the United States of 17·2 per cent., and in Europe and the United States combined of 9·8 per cent. This gain is the more remarkable when we consider that for several years the deliveries of coffee have been practically stationary. Another marked feature is the heavy decline in prices, to which we may credit the increased consumption, due in part in America to the rivalry between the large coffee-roasting establishments. Twenty years ago the southern, south-western, and western states took the raw bean, which consumers roasted in pan in a very imperfect manner. It required the work of years to overcome the prejudice against coffee obtained from the stores roasted. A mother of the Arbuckles of Pittsburg, Pa., had a habit of coating roasted coffee with a preparation of egg, which gave it a gloss and preserved the aroma for a year or more. This recipe her sons acquired and controlled and introduced to the public as glossed package coffee. Under ordinary circumstances coffee loses flavour from the time it leaves the roaster, and it was difficult to make consumers believe that success had been discovered which would keep the roasted bean in perfect condition. In time roasted coffee in packages came into general use, and at the same time the prejudice against roasted bulk coffee disappeared as enterprising dealers bought small cylinders and roasted their daily supply so as to give coffee to consumers in fine condition. Then the introduction of the portable coffee-mill into retail sales dissipated any remaining prejudice, and taught people that roasted and fresh ground coffee perfectly pure could be had without the trouble of roasting it at home. The glossed coffee was protected by patents, and the owners of that patent made many millions. At last opposition started, and when parties identified with the 'S. Trust' acquired a controlling interest in the largest competing roasting plant, prices went down and the sale of package coffee became general in largely-populated centres, where previously it had little or no sale. The retail price went from 1s. down to 6d. and 7d. and consumption increased very quickly.

In July, 1896, the month's deliveries were 319,358 bags, while in June, 1897—a year later—they were 490,719 bags. As prices dropped, sales increased. In August, 1895, No. 7 Rio coffee sold at $16\frac{1}{2}$ c. in July, 1896, at 13c. ($6\frac{1}{2}$ d.); in June, 1897, at $7\frac{1}{2}$ c. ($3\frac{1}{2}$ d.). Not since 1883 has coffee been so low in price as at present. In December, 1882, No. 7 Rio sold at $5\frac{1}{2}$ c. ($2\frac{3}{4}$ d.), and the highest price of the year was $8\frac{1}{2}$ c. (4d.). Low prices ruled, and the consumption increased 10 per cent. annually until 1897, when an era of high cost coffee began, which ended in 1897, but consumption did not grow during the period to any marked extent, and yet population increased steadily from 60,000,000 to 70,000,000. During the year closing June 30, the deliveries in the United States reached 5,088,594 bags; in Europe 7,155,610 bags, making a total for both countries of 12,244,204 against 11,142,813 bags in 1895 and 1896, and 11,153,697 bags a yearly average for the past six years.

The great decline is mainly due to the remarkable increase in crops in Brazil, particularly in the Santos district. For eight years past this great empire exported an average of 6,060,250 bags, but in 1896-97 the exports rose to 8,634,000 bags, or nearly 71 per cent. of the total arrivals in Europe, and the United States and Brazil combined 77 per cent. to the supply of this country. In 1891-92 the country exported 7,267,000 bags, but two years later only 4,000,000 bags. This year's crop is estimated to fall behind last year's 1,000,000 bags. If 1897-98 should be followed by such a decrease in yield as occurred from 1892 to 1894, we should witness in 1898 quite as sudden an upward flight of prices as the downward turn of markets of the world took in 1897.

If low prices continue, consumption ought to increase 8 to 10 per cent., and the world's total requirements go up to 13,000,000 bags. To meet this there was a visible supply, in July, 1897, of about 4,000,000 bags; add the Brazil crop of 1897-98 estimated at a minimum of 7,000,000 bags, and the crops of other

s at 4,800,000 bags, and we have a total estimate supply for the present campaign of 15,890,000 bags, sufficient to leave a carry-over 1898-99 of 2,300,000 bags. On this basis this present year is to be of low prices and big consumption, unless a big European war or other unexpected "if" enters into the question. The National Bureau of Statistics has just published an elaborate program showing the sources of coffee supply during 1896, as follows:—

	Pounds.	Value—\$
Central America ...	38,631,191	6,517,834
Mexico...	23,975,477	4,040,443
Brazil ...	395,106,568	54,019,900
Columbia ...	19,228,311	3,029,947
Venezuela ...	52,019,994	8,128,254
East Indies ...	19,515,324	3,780,325
All other countries ...	32,121,050	5,276,421
Grand Total...	580,597,915	84,793,124

In this connection it may be of interest to note that of imports of 1898,372 pounds of tea, China contributed 50,916,111 pounds, Japan 52,467, and all other countries 4,529,794. From this it appears that the Ceylon and India tea interests have a great field of operations they would displace China and Japan as sources of supply.

TEA.

Jubilee Tea-cup. The Jubilee Tea-cup is Mr. Blechynden's latest. It is described as "brilliant with the English colours."

Lushai seed. The tea seed jungles in the Lushai Hills have now been let by Government to a European contractor, to prevent the wholesale destruction of the trees by the Lushai tribes. The present year's crop is, by the way, already bespoken.

Good roller. Most planters know and like Jackson's Little Giant Roller. The 28 in. Economic has also met with favour, and now an even larger size, a 32 in., has been lately introduced. The pattern is the same in all sizes, and is certainly hard to improve on.

Packing machines and London bulking. Seeing that in but a very small minority of London warehouses are content packers used, the danger of thus packing on the large scale is manifest. For, once the machine-packed tea is opened out, it is quite impossible to repack it by hand (or other feet) without crushing and breaking it to an inordinate degree.

Assam and Darjeeling. The great feature of the opening tea season has been the excellent position achieved by Assam teas, which have realised exceptionally high prices, and the comparatively poor consignments from Darjeeling. Generally speaking, the season in Upper India promises to be rather below the average, which means that the increase in production will not be so marked as usual.

Fish Guano. A Ceylon reader writes us from Kandy that Fish Guano has been used on tea with very poor results. The favourite fertilizer employed is nitrate of soda. A comparison between the two is of course impossible without the fullest data, but we cannot help thinking that the guano has not been given a fair trial. We hear it is a new but great favourite with coffee planters in South India.

South India.

In their Monthly Market Report, dated London, 13th August 1897, Messrs. Arbuthnot & Co. report:—"Rather over 5,300 packages were sold during the month at an average of 6½d. per lb. against 6d. per lb. for 2,000 packages in June, this rise being due to a slight improvement in quality in some cases, helped by a better tone in the market. Travancore as usual sent the largest portion of the month's supplies, the more desirable marks being well competed for, and the best averages were obtained by 'Bon Ami,' 'Kuduva Karnum,' and 'Penshurst.' Consignments from the *Neilgherries* were again small, the highest results being secured by invoices from 'Glendale' and 'Kodanad.'"

Testing tea-seed.

A Planter Correspondent, writing to a contemporary, makes the following very sensible remarks on the subject of tea-seed:—"It would be a grand thing, and would save much misunderstanding and unpleasantness, if there were some recognised methods for testing seed, but how is it to be done? Every man has his own idea of what seed should be, and the standards differ widely. I have sold seed for some years, and have often been amused at the different ways men will test the seed. Some men seem to think you will try and do them, and after testing the seed are afraid to let the seed out of their sight; others again are just the very reverse and trust one too much, which makes it awkward for the seller. Some seed seems to travel much better than others—why, I cannot understand. I often think, too, that after its arrival on the garden things are done to it to either retard its sprouting or to force it, and very often I think this has something to do with it not doing so well as expected. Then, again, when the seed should be plucked is another bone of contention. I myself always shake my seed down, and even then I have been told I have plucked it *kutchu*. So when doctors disagree, etc., 'what can do?'"

Tea growing in Australia!

To those who have been doing their utmost to develop the Australian market, it will come as an unwelcome surprise to learn that, as in Russia, the consumer is now trying to become a producer. Let us hope his efforts will come to a like unsuccessful ending. We insert the following cutting from the *Australasian*:—

"Mr. G. W. Robinson, of Narre Warren, is one of those who go out of the beaten track in his endeavour to find something new in the way of rural industry. About twenty-five years ago he obtained from the late Baron von Mueller a few specimens of the Chinese tea plant. Finding they grew well in his locality, he saved some seed, and grew about 100 plants, and for some years past he has made experiments in the way of curing the leaves for home use. His success was greater than he expected, and he has gone on improving in his system of preparing the tea. In the hill country beyond Dandenong the annual rainfall is heavy, and the tea plant grows well, being perfectly hardy. Last year Mr. Robinson grew about 10,000 tea plants from seed, but his plantation was invaded by an army of grasshoppers, who destroyed the whole of the young plants. This year he is raising about the same number of plants, but has taken the precaution of growing them under cover. The tea, as prepared by Mr. Robinson, has not the finished appearance of the Indian or Chinese article, but it has a pleasant odour, and is said to be strong and of fair flavour."

Hill and plains notes.

The following remarks in a contemporary may find a local application:—"Schemes for amalgamating hill tea gardens with the plains gardens are cropping up every day. Rington, one

of the best and most promising gardens in the hills—a garden which is bound to pay twenty per cent. ere long—has been already amalgamated. Springside is about to be dittoed, and Tukvar, another fine hill garden, is spoken as also to be joined to gardens on the plains. I am surprised that the shareholders in Darjeeling gardens are so blind to their own interests as not to see where they are being led: New gardens are being opened out every day in Assam and the Dooars, and when these and the young gardens already in existence come into full bearing, and millions and billions of pounds of additional tea are put on the market, the price of such tea will be nowhere, and it will hardly pay to grow and make it. It will be entirely different as regards Darjeeling tea, because it is the best in the world. There is not another acre of land available in the hills for its growth, and it will be always eagerly sought everywhere, and command its present, if not a much higher, value. The result will be that when the plains grown teas of the amalgamation are paying nothing, their owners will have the profits of the joined hill gardens to fall back upon for their dividends. Blind! Blind!”

The London Market.

In its issue of 16th ultimo; the *P. M. Review* says:—

Indian Teas.—The market is stronger for most descriptions, and nearly the whole of the 22,000 packages offered at auction changed hands. The sales included a better selection of the medium and fine Assam growths, and higher prices have been obtained, the bidding being brisk at the advance. As usual, at this period of the year, when the market has been comparatively bare of the more useful medium and fine grades, as was the case at the latter end of the past season, the demand generally exceeds the supply, and extreme prices are paid. When, however, the immediate requirements of the trade have been met, and provided there is a fair proportion of these kinds coming forward, a steadier or probably lower market may be expected. The Darjeeling Teas continue to be of moderate quality, but, owing to prices being reasonable, they are going more freely into consumption, and a fairly good business has been transacted in them. Sylhet Dooars and Cachar growths do not show any material improvement, being generally poor in cup, consequently they do not attract much attention, although values remain steady and will no doubt continue so until the arrival of larger shipments. There has been a fair supply of Travancore brought forward, but as the character of the teas continues indifferent, they have been comparatively neglected, excepting when there has been a further decline in values. At the public sales held in Calcutta on the 12th inst., 23,000 packages were offered.

Ceylon Teas.—The largest sale on record of Ceylon Teas took place on Tuesday last, but, notwithstanding the excessive supplies, the upward movement recently noticed has continued, and all descriptions were eagerly taken at a further advance on last week's rates. In many cases the teas certainly showed an improvement in quality, but not sufficiently so to alone account for the extra money paid. The firmness is no doubt due to the fact that prices are very low, and that supplies will shortly be falling off, the official estimate of the export from Colombo for August being only 7½ to 7¾ million lbs., which is about 3 million lbs. less than last month, and, as the present stock is not large, buyers can still operate with confidence, as a further increase in prices is to be expected. At the public sales 41,680 packages were offered, of which about 1,200 were withdrawn.

The last set of questions sent round to its readers by our industrious Ceylon contemporary, the *Observer*, is worded as below. From the answers that have already appeared, opinion is in favour of increased use of wire shoots; generally upholds the present system of clean weeding; is against leguminous plants being cultivated in tea; is in favour of the present system of drainage; and alto-

gether may be summed up in the words of a correspondent "What is, is best." Neat, but only too apt a definition of the trend of agricultural thought the world over:—

QUESTIONS.

(1) Have you had any experience of WIRE SHOOTS, or seen working, and do you think them applicable much more freely to present on estates? Do they damage tea leaf?

(2) Particulars of any other Labour-saving appliances in factory of which you have had experience, or have noted among neighbours?

(3) Could small TRAMWAYS 18 in. or 12 in. gauge be applied profitably on average estates to save transport coolies?

(4) On WEEDING. Has it ever struck you that weeding (both coffee and tea) was overdone in Ceylon?

(5) With reference to saving Labour as well as saving soil, would you advise an experiment in less frequent weeding, or in what might be called, selected weeding—that is the leaving of mosses, selagin, small ferns, and other such small plants?

(6) Have you ever tried an experiment in cultivating any (of lupines, clovers—N.B., not the *Ovalis*, a common and obnoxious weed like a trefoil—) to be dug into the soil,—or would you advise such an experiment?

(7) Is the present system of DRAINAGE satisfactory? Could any practical means be devised for trapping or retaining the vast amount of soil that is annually carried away with the surface water? A favourable account has reached us of the result of planting round cuscus grass (which neither seeds nor spreads) above the drains, these grew close and strong, forming a barrier against soil being washed down, while allowing the rain to pass through.

(8) Kindly mention any means in other directions in connection with the usual plantation work where Labour might be saved?

Next as to keeping Labour, would you

(9) Suggest any special perquisites to coolies—is the giving of ground for gardens to each line generally observed—and where would it not make them more contented?

(10) Would you advise the multiplying of boutiques or bazaris until each two or three estates have their own—in order to prevent coolies wandering a distance and being tempted?

(11) Are you troubled with a liquorshop in your neighbourhood, and do you think labour would be saved if liquorshops were abolished or reduced in number, in the purely planting districts?

TEA AND CHEMISTRY.

Now while strenuous efforts are being made by the U. P. A. S. I. to raise funds for engaging the services of a skilled agricultural chemist, the following interesting article in the *Ceylon Times*, by the pen of its senior editor, will be perused with interest:—

LONDON, August

A few days ago I had the pleasure of a long conversation with men who, in their different ways, have paid a good deal of attention to the chemistry of tea, and I gathered a good many interesting facts from them. I refer to my old friend, Mr. J. Roger, late of Kelani Valley, and Mr. Bamber, the well-known analytical and scientific chemist. The subject of our conversation naturally drifted to tea, and I learnt that the last-named, who had already visited the Indian tea districts—as you are doubtless aware—thought it probable he would go there again at the invitation of, and under agreement with, the Indian Tea Association, for the purpose of reporting and advising with regard to tea manufacture. He has given considerable study to the chemistry of tea for many years past, and is firmly of opinion that the non-keeping qualities of both Indian and Ceylon teas are largely the result of too rapid firing, or such firing that thoroughly dries and scorches the outside of the leaf without completely treating the inside—often consisting of fibrous and woody material, which it is essential should be thoroughly desiccated. Nothing seems to have struck him more forcibly during his visit to the Indian tea districts than the want of system pursued in the firing of tea. If a manager were asked at what temperature he was accustomed to fire his tea, the temperature stated was so found to be that at which the tea was actually being treated in the factory was visited. I do not think, however, he would find so much the case in Ceylon, but I gathered that Mr. Bamber is

need that a great improvement could be effected in the quality of tea if more scientifically treated in the factory. As pointed out, no brewery in Europe is without its own chemist, who mainly directs the delicate operations connected with the manufacture of beer, and no brewery could hope to compete on even terms with others which was without scientific assistance in this respect. Yet once upon a time—and that not so long ago—brewing was more or less a matter of haphazard, and no brews could be relied upon to possess the same character. The uncertainty existed as is now experienced on a Ceylon estate in its tea manufacture. That the time has come when, like the brewers of old, we should, if possible, call in the assistance of science in tea manufacture, does not, I should think, admit of much doubt. The price of our staple has fallen to a point where profit is out of the question, and complaints that its quality is what it once was are far too general to be overlooked any longer. Hence of this is provided for us by the relative prices obtained for teas and by those from the neighbouring continent of India, where once our teas took the lead, they are now far behind-hand here. "Cheap, weak, watery stuff only fit to be used for blending with stronger and better Indians" is how they were described recently by a well-known blender with a long and varied experience. "It has taken the place which China tea occupied some time before you started growing tea in Ceylon", is how another described the situation. Now this is not very pleasant for one so deeply interested in the future of the industry in Ceylon to hear, and, therefore, I came across Mr. Bamber, his opinions naturally in weight with me, and I wondered if the Thirty Committee could induce to make him such an offer—on the occasion of his next visit to India—as would secure his services temporarily for Ceylon planters. He is, I believe, to receive a substantial salary from the Indian Tea Association; but a good retaining fee in our case would suffice, with a scale of fees to be paid by those who availed themselves of Mr. Bamber's services to report on the work in their estates, and to advise as to future working. At all events, I throw out the suggestion, and hope that something may be done in Ceylon to secure the services of this well-known scientist. It is to be observed that Mr. Bamber's conclusions fully bear out Mr. Roger's contentions with regard to the deleterious effects of the fermentation from the woody and fibrous portions of the leaf, especially when not sufficiently fired. Mr. Roger, as is well known, has long contended that the bitter flavor which is obtained from tea too long fermented does not arise from the presence of tannin, which is all removed from the leaf after a few minutes' infusion. It is now very certain that crustatannic acid is the cause of the unpalatable pungent, and that in tea which has been too rapidly fired, or in which the woody portions of the leaf have not had time to be thoroughly desiccated, this acid is most pronounced. To obviate this, as your readers are aware, Mr. Roger removes those portions of the leaf before making up the residue into his tea tabloids, and he, therefore, claims that they are purer, healthier, more invigorating, and less deleterious than tea treated in the ordinary way. His contentions appear, I must say, to have the support of scientific authority, but, until his litigation with Messrs. Burroughs & Wellcome is concluded, and the manufacture of his tabloids is carried out according to his specifications—which he asserts is not the case—it would be unfair to judge the tabloids now being turned out. At all events, there is scope, I feel sure, for great improvement in the manufacture of Ceylon tea, and the sooner we recognise this, and take action to secure the best scientific advice, and follow it, the better.

H. H. C.

DISTRICT ASSOCIATION.

KANAN DEVAN.

GENERAL MEETING held at Munaar Camp Bungalow, 28th August, 1897.—PRESENT: Messrs. G. O. Poulter, E. Harley, D. Martin, F. J. C. Martin, A. F. Martin, C. Burn Murdoch, W. Milne, A. H. Mead, J. Hamilton Hunter, A. H. Sharp (Hon. Secy.), and C. A. Mackenzie (Visitor).

Mr. MILNE was elected to the chair.

Read notice calling the meeting.

Read and confirmed minutes of last meeting.

Insanitary Condition of Bodinaikanur.—Read letters from the District Medical and Sanitary Officer and the President, District Board, Madura, stating that the former had visited Bodinaikanur in January last and fully reported the state of the village, and that the President of the Taluq Board, Dindigul, had been asked to give his special attention to the matter. Recorded.

Dilatoriness of the Police.—The following statement was made by the Honorary Secretary: That three months ago four suits for breaches of contracts were filed against carpenters and sawyers residing in Travancore. At intervals of one and two months two of these men returned to work and the suit against the first was withdrawn, while that against the latter was allowed to proceed and the man convicted. Neither of these men had been arrested by the police. The other two men are still at large, although from time to time reliable information is forthcoming that they are still in their own homes.

Other similar instances were mentioned, and it was resolved that full particulars should be given to the Honorary Secretary, who was asked to write to the Superintendent of Police, Trivandram, fully on the subject.

Bodinaikanur Rest House.—Proposed by the Chairman that it was necessary to build a new and pukka bungalow in the Bodinaikanur compound to the north of the present building. The cost of the same to be about Rs.3,000 and to be spread over a term of six years, the Consolidated Tea and Land Company meanwhile finding the necessary funds free of interest. The roof to be of iron, covered with matting, properly ventilated, and to have a ceiling, and that the building should be commenced without any delay, and that the Honorary Secretary take steps to have the putta of the land registered in the name of the Association. *Carried.*

Telegraph Station.—Resolved that the Honorary Secretary write to the Director-General of Telegraphs, Calcutta, requesting that the wire may be carried on to, and a station built at, Munaar, and to point out that timber may be had free of cost inside the Company's concession or for nine to ten miles of the way, and that the Association will be prepared to give the necessary guarantee.

Netticoodie Dispensary.—Proposed by the Honorary Secretary, and seconded by Mr. F. J. C. Martin, that now the Apothecary does not have to visit the Munaar and Surianalle ends of the district, he should be located at Sathapara as early as the necessary buildings could be completed. *Carried.*

Munaar Bridge and Devikulam to Mettu Road.—The Honorary Secretary stated that on 8th December 1896 he reported the bridge complete to the Dewan and requested inspection and payment of the promised Government subsidy of Rs.600. Inspection was made in March last, and on the 11th June payment was again applied for and a reply received stating that the matter was referred to the Chief Engineer. On the 21st July the Dewan was again reminded that the subsidy was still unpaid, and up to date no reply had been received. Also that on 21st July last a letter was written to the Dewan informing him that the Association had taken in hand the maintenance of the Mettu to Devikulam road and had already spent Rs.27 and over per mile and were continuing the necessary repairs and upkeep, and requested him to send the promised Government grant. This letter still remains unacknowledged.

Resolved that the Honorary Secretary again apply to the Dewan and Chief Engineer.

The meeting then closed with a vote of thanks to the chair.

The next Quarterly General Meeting will be held on Saturday, 27th November.

A. H. SHARP, *Honorary Secretary.*

28th August, 1897.

W. MILNE, *Chairman.*

DR. LAMONT'S STRONG FINGERS.

"I WAS afraid you were going to slip through my fingers," said good old Dr. Lamont.

The writer was a boy of about seventeen, then. While a student at

school, more than 300 miles from home, I was taken down with pneumonia. I had a tough time, and for two or three weeks my life was despaired of. But youth and good care won the fight, and one bright morning I was ready to go home with my dear father who had come for me. I was weak still, but well and happy clear up to the brim. Oh, what a ride! Oh, what sweet air! Oh, what a glorious world I had got back into! and what a reception from mother and sisters at the familiar house. Oh, life! Oh, health! Oh, *dulce, dulce domum!*

Such an illness, if one survives it, only makes the sense of existence and its blessings more keen and delightful. It is good rather than bad. Lucky boy, not to have slipped through the doctor's fingers.

But when a man with most of his days behind him has to write a line like this "*All my life I have suffered more or less from disease*"—why that is another and sadder story. It is the odds between an occasional thunderstorm and a sky always covered with clouds.

We quote what he says, reminding the reader that in this matter Mr. William Hodgkinson voices the experience of millions. He says: "I always had a bad taste in the mouth, no proper relish for food, and after eating had pain and fulness at the chest."

These sensations are symptoms of acute indigestion. In the stomach there is marked loss of power. The food is neither rolled over as it should be so that the whole of it in turn may be presented to the digestive fluid, nor is it duly moved on towards the outlet into the bowels. As a result it ferments and gives off irritating acids and gases; hence the patient complains of pain, weight, distension, acidity, and flatulence in that region. Thence the poisons proceed to every other part of the body, and headache, vertigo, gout, rheumatism, depressed spirits, and a score more of evils follow; among them possibly, nervous prostration, progressive anæmia, locomotor ataxia, and more or less complete paralysis.

"Frequently," continues Mr. Hodgkinson, "I was sick, and as time went on I became very weak and feeble. I consulted one doctor after another, and took various medicines, but obtained no real or lasting relief from any of them. This describes my general condition until the fortunate day when I read about Mother Siegel's Curative Syrup. I was impressed by the statements others had made concerning it, and proceeded to try it. After taking one bottle I found relief, and was soon entirely free from my old complaint. Since that time (now eight years ago) I have enjoyed good health. Knowing personally of its virtues, I have recommended this remedy to hundreds, and have never heard of its having failed to give relief. But for Mother Siegel's Syrup I should have been in my grave years ago. (Signed) William Hodgkinson. Hollington, near Uttoxeter, Staffordshire, August 11th, 1893."

Mr. Hodgkinson is well known and highly respected. He is a local preacher in the Methodist church, and by employment a quarry master. Had he gone into the grave, as he feared he should, he would have been missed and lamented by the community in which he has long been useful, and will live to be useful, we hope, for years to come.

Now let us repeat our leading thought. Short illnesses, even though sharp and dangerous, may result in good rather than harm. But a disease that drags its victim through decades of lingering distress—what shall we say of it? The trouble and suffering it inflicts is beyond estimate, and its name is indigestion and dyspepsia.

And the name of the medicine that cures it Mr. Hodgkinson has done you the favour to mention with clearness and emphasis.

WE SELL PURE DRUGS.

Pharmaceutical Preparations, Soaps, Perfumery and Toilet Requisites, Patent and Proprietary Articles, Surgical and Scientific Instruments.

N.B.—All Drug orders to the value of Rs.100 and above are allowed free bottles, packing and transit up to the Railway Station at Madras.

COLLINGWOOD & CO.,
PHARMACISTS AND MANUFACTURING CHEMISTS,
MOUNT ROAD, MADRAS.

THE "MADRAS STANDARD"

Published Twice Daily—Morning and Evening.

THE OLDEST, THE CHEAPEST & THE MOST POPULAR
IN SOUTHERN INDIA.

Its chief features are:

A LONDON LETTER written weekly by a distinguished Member of Parliament.

Letters from Hyderabad, Mysore (and Bangalore), Travancore, and Pudukota contributed by Correspondents well known in the affairs of those States.

Letters from Far and Near } Political sketches and Caricatures
and } the leading men in Southern India

Telepathic Interviews.

Portrait Gallery—Lives of distinguished men in Southern India with their Portraits. Spicy Jottings on current topics. Anecdotes, Notes, Stories and Sketches. News from various Mofussil Stations. Interesting Extracts.

THE "MADRAS STANDARD"

RATES OF ADVERTISEMENTS.

I. CONTRACT RATES:—

	1 Column.	2 Columns.	3 Columns.	4 Columns.
6 insertions a Week	Rs. 80	Rs. 65	Rs. 45	Rs. 25 per line
3 do do	" 45	" 35	" 25	" 15
2 do do	" 35	" 30	" 20	" 12
1 do do	" 20	" 16	" 12	" 8

2. Special short advertisements for insertion either first or on the eighth page.

	1/2 Inch.	1 Inch.	2 Inches
6 insertions a Week	Rs. 10	Rs. 15	Rs. 25 per line
3 do do	" 6	" 9	" 15
2 do do	" 4	" 6	" 12
1 do do	" 2	" 4	" 7

Contracts cannot be entered into for less than a month, less space than quarter of a column at the above rates, discount of 5, 10 and 15 per cent. will be allowed on advertisements ordered and paid in advance for 3, 6, and 12 months respectively.

II. LINE RATES OF ADVERTISEMENT:—

1. English Advertisements: 4 as. per line, first 4 insertions per line, fifth and following insertions.

2. Vernacular Advertisements: Tamil and Telugu, 8 as. per each insertion; Hindustani, Canarese and Malayalam, 12 as. per each insertion.

III. CIRCULATION OF LEAFLETS:—

- For each circulation locally and by post Rs. 25.
- For each do. locally only " 15.
- For each do. by post only " 15.

(This excludes extra postage where the weight of leaflet necessitates such.)

Advertisement charges are strictly payable in advance, except to approved customers.

MARKET SUPPLEMENT.

SATURDAY, SEPTEMBER 11, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (August 20, 1897) says:—A steady tone prevailed at auction this week and the moderate supplies were all disposed of at full value. The 1,100 bags East India brought upward met a good demand, ordinary and medium qualities realising various rates, whilst fine colory grades sold at extreme prices.

Central American kinds were offered on a moderate scale and disposed of at about valuations for most descriptions.

The Terme market has declined 6d. during the week in consequence of continuation of the very heavy Brazilian receipts.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for Week ending August 18th, 1897, says:—Bank rate 2%. Bombay exchange closes at 1s 3½d. Brazil Exchange 7½d. Rupee paper 3½% 63. per 24½d per oz.

The demand continues good for all the better qualities, whilst ordinary common are rather lower. Extreme prices have been paid for fine Ceylon and Jamaica; ordinary pale Columbian shews a decline of about 2s; Rio markets are dull.

The sales included:—51 casks and tierces 36 barrels and bags Plantation Ceylon sold at 80s to 114s; 78 bags Native Ceylon sold from 70s 6d to 114s 6d. Of 1,024 bags East India, 534 bags Coorg sold from 73s to 114s 6d, 317 bags Neilgherry chiefly sold from 72s 6d to 96s 6d, and 173 bags Travancore sold at 73s to 96s 6d; 264 barrels, 56 bags Jamaica chiefly sold at 49s to 124s 6d; 551 bags Costa Rica good part sold from 50s to 114s 6d; 2,264 bags Guatemala chiefly sold at 55s to 88s; 96 bags Salvador part sold at 54s; 442 bags Mexican part sold at 85s to 86s 6d; 165 bags Vera Cruz and Coban part sold at 106s; 1,181 bags Nicaragua part sold at 56s to 62s; 3,140 bags Columbian good part sold at 45s 6d to 95s 6d; 19 bags Guayaquil bought in; 19 bags Trinidad sold at 43s; 10 bags Lahat bought in; 24 half-bales Mocha bought in; 25 bags African Liberian sold at 39s 6d; 24 bags Travancore Liberian sold at 36s; 749 bags washed Santos good part sold at 52s 6d to 59s 6d, and 250 bags Santos on quay were bought in.

Daily receipts have averaged 22,857 bags in Rio, and 32,286 bags in Santos.

Futures have been further depressed, owing to the continued large receipts, and close quiet at a decline of 1s to 1s 3d, viz.:—Good average Santos in Havre, September delivery, fcs. 43.00, in Hamburg pf. 35½, and No. 7 ordinary Rio in New York \$6.60.

To-day's London official quotations are:—

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated August 20th, 1897, states:—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	139,130 packages.	316,705 packages.	11,381 packages
1896-1897...	146,790 „	284,675 „	11,980 „
27,621 pkgs. INDIAN			
35,653 „ CEYLON			
1,246 „ JAVA			
Total 64,520 packages were offered in public auction this week.			

Indian. Increasing supplies of useful liquoring Tea coming forward on a market comparatively denuded of such kinds are creating an improved demand, and a more general business is being transacted in the country than for some time past. Dealers are thus encouraged to operate with more freedom in the Public Auctions and prices have further improved to a fractional extent. Teas from Assam have again shown satisfactory quality, whilst some of the invoices from Darjeeling are a little better in this respect, though still not up to the standard of previous years. The following averages are worthy of note:—“Tingri T Co. Hoogrijan,” 1/7½; “Jokai T Co. Hattiali,” 1/7; “Darjeeling Co. Ging,” 1/6½; Amal. T Co. Moondakotee,” 1/5; “Jokai T Co. Tippuk,” 1/4.

SUPPLEMENT TO "PLANTING OPINION."

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been moved to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c. Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 24th September 1897.

Coorg. POLLI BETTA, 15th September.—*Weather.*—Monsoon has probably left us. Very fine weather. Only a sprinkle once or twice. There seemed to be a big shower Ammatti way yesterday. *Plant-diseases.*—Coffee still looking very fine on the whole. *Labour.*—Coolies continuing to drop in. *Health.*—Fair. *Interesting Item.*—Marriage of Mr. Seager, of the Forest Department, to Miss D'Vaz, at Mercara, to-day.

Nilgiris. SHOLUR, 14th September.—Since last report the weather has moderated, and though for three or four days a cold W. to S. W. wind was blowing, which continued to check flush, the last three days have, with the exception of cold mornings, been everything a planter could desire. Rainfall for month 2'37, making 45'09 to date. Highest and lowest temperature 76° and 57° respectively. *Health.*—Good. *Labour.*—Plentiful. *Grains.*—Rates very gradually improving. *General.*—The Davidson's "Sirocco" tea roller is a great success, but requires great pace and a real good wither to obtain best results. Unless the next week does wonders, the show of flowers and vegetables at Ooty on the 17th instant will be a poor one.

COONOR, 16th September.—Since the 8th the weather has changed to glorious sunshiny days and cold nights. Last break before the N. E. Monsoon, I fancy. Coffee looking very fit, but crops are poor generally. Black bug generally "done finish" for the time, but N. E. will see it back! Tea flushing again fairly, and a good deal more flavour is apparent. Flush worm bad to the last. Our Club is making steady progress, and, when finished, will be one of the finest, for its size, in South India.

GENERAL NOTES AND ARTICLES.

Wire shoots and roads.

In the correspondence now going on in the *Ceylon Observer* on the question of labour-saving appliances and methods, opinion is unanimous on the great utility of wire shoots in conveying manure and tea leaf to different parts of estates. As an economiser of labour, and consequently of money, they are unsurpassed and obviate in many instances, perhaps, three-fourths of the length of the bandy roads that would otherwise be necessitated. And yet in Ceylon, as in South India, wire shoots are generally conspicuous by their absence. It is hard to understand this, as they are undoubtedly the most obvious and simple labour-saver yet adopted.

To denaturalize salt.

Pressure on our space forbids us to quote in full the translation of the text of Prussian Salt Law as affecting the consumption of salt for industrial purposes that lately appeared in a Colombo contemporary. It suffices that to effectually denaturalize salt for use as manure, all that is required is an admixture of one per cent. of soot, though numerous alternative mixtures are given, such as black oxide of manganese, finely powdered charcoal, lamp-black, cocoanut oil, palm oil, vitriol or alum. In case the U. P. A. are inclined to approach Government on the subject, in view of the great and varied uses to which salt can be applied in agriculture, were the tax removed, we are sending the Secretary the full text of the law alluded to.

Drains.

One of the many puzzles that worries our editorial brains is the extremely scant attention given by some planters to such everyday things as drains. We know of a certain large and steep estate which does not contain a single cross-drain. Yields steadily falling off have induced attention being given to extensive artificial manuring—a most estimable subject to turn one's attention to, but *when* are the drains coming? This of course is an extreme case, but it is still far from unusual for steep estates to treat draining as one of the least, instead of one of the most, important works on the garden. Practically, it is, we venture to opine, perfectly possible to arrest wash altogether by means of efficient drainage. And not only to arrest it, but to actually prevent it occurring. Renovation pits have their uses, but also their dangers. Provided draining is efficiently carried out, it is difficult to find any serious objection against it whatever.

To arrest loss by wash, fairly frequent drains of a gentle gradient, say one in 35 or 40, are sufficient. Periodical attention is of course necessary, inasmuch as the fact of arresting the washed soil causes the drain to be silted up gradually through its entire course. In cleaning out the drains, be careful that the silt is thrown above and not below the drain. To stop wash altogether, similar drains every 20 or 30 feet on very steep land would be necessary. The only apparent objection to the system of gentle gradients is on account of its chief value, *i.e.*, catching the valuable surface soil that would otherwise be carried away. In other words, because of the frequent attention that is needed. Seeing that planters are nowadays almost at their wit's ends how to satisfactorily replace their lost soil by

the expensive means of artificial manures, surely the objection stated does not deserve serious consideration.

A very old idea is to plant some sort of harmless plant above all roads and drains to catch the silt. Guinea-grass has rightly gone out of favour for this purpose, but not has yet taken its place. Box would be an almost perfect plant, save for its extremely slow growth. A writer in the *Ceylon Observer* mentions *Pilea microphylla* as being an excellent weed for the purpose.

RANDOM JOTTINGS.

SOME TIME now, isn't it, since I favoured your readers with my lucubrations. How they must have missed them! I notice that this paper is now the *Official Organ* of the great U. P. A. Doubtless this means great things in the future for the "P.O.", which fluttered so timidly into the world just two years ago.

It struck me as a great pity that the Mysore Planter who lately wrote to the *Mail* about the Dewan's Agricultural loans to coffee planters should give away his industry completely! *Alien cultivation*, forsooth! Out upon your faint heart, is this a time for men to talk about the probable extinction of coffee in Mysore? Gird up your loins, pay your rupee per acre for scientific aid, and it will be enough to chant your funeral requiem when you are dead and buried. Not that times aren't bad enough, in all respects, for science. But everyone knows that: An obstacle is no thing to cry over, its got to be removed.

DESPITE the cloud of disingenuous arguments enveloped round the *Exchange Question* by its official apologist, the main principles are as clear as ditch water. Government declares that a low exchange involves it in bankruptcy. That may be. Yet it is considerably worse for a country to become bankrupt than its Government. In juggling with the Exchange, Government tries to delude the public with the idea that the only alternative would be the imposition of oppressive taxes. What it really does is, in order to save, say, a crore of rupees on its home remittance, to reduce the wealth of the nation by a hundred times the amount. The Indian public is ready enough to contribute its just dues to keeping up its only possible form of Government. But it sees no possible reason to be practically mulcted of one hundred rupees when only one is required. For by this artificially high exchange, not only does the producer suffer great present pecuniary loss, but is prevented from extending its enterprise, resulting in present and prospective serious loss to the Government itself. The question of trade *versus* free trade is now no question of theory alone, it is one of practical politics. A small direct export tax would certainly be felt far less than the huge indirect tax now levied by the artificial rupee. And as certainly would it result in giving Government the amount, and even more, which it obtains at present by its financial legerdemain.

TERMS MODERATE.

SUNDAY CLUBS, OR SOCIAL PLANTING LIFE.

For real enjoyable social life in a planting district, come to me to a locality where there are no European stations or towns. Such a station has a most disagreeable manner of rendering planters independent of each other. A man wants a little relaxation, he straightway hies him to the station, and, mixing with members of a society which is mostly composed of retired Government officials, does his best to cut himself adrift from his own class. For Government officialdom in India, acting or retired, is a corporation that holds outside classes much as Kipling holds foreigners: as lesser breeds without the law. It is easy to see that the town-loving planter acquires by virtue of his surroundings something of the same feeling. The effect of isolation on social planting life is obvious. That strong feeling of *sprit de corps*, so prominent in more remote districts, is beautifully less. Individual planters get out of touch with each other, and save for chance, and none too welcome, meetings in the station, are little more than aware of each other's existence. At planters' meetings the effect is easily seen, the discussions are perfunctory, and want of unanimity, sometimes veiled by the shyness of dissent being garbed in silence, is the leading feature present.

As a planter living in a much be-stationed district, the effect has often struck me very disagreeably. Many have seen the schemes evolved from time to time as palliatives. The uniform have been the failures. An important minority of planters are, in increasing numbers, making their homes in the stations and only visit their plantations once or twice a week on strict business. From these nothing can be expected. It is the others, the old-style planters, who either do not care for station life or cannot afford it, who must come forward and help themselves.

There are lots of ways in which the amenities of planting life could be heightened. Failing permanent clubs, which might be difficult to build owing to lack of funds, surely it would not be impossible for an enterprising planter and his neighbours to rally round them the lonesome scattered units in their neighbourhood. If the district be depleted by wealthy members, the objections to increasing the expenditure of the station could easily be met by a Social Club being formed, the hosts simply offering the use of their house on certain days of the week. The two chief difficulties are of course the finding of the public-spirited hosts and, if evolved, to have them centrally located.

The thing is: how to start the ball rolling? The first move is with the "hosts" by the simple expedient of inviting a few of their nearest neighbours to a weekly or fortnightly social meet. To some it would appear but an ungrateful task, but if the right people are there, and if these make the proper move, the success of their little schemes is assured. If even only four or five neighbours can be induced to join the informal club, let them rest well content. A rather suitable name would be the "Sunday Club," as it is not often planters can get a whole free day during the week. Concession might be made to Sabbatarians, if much evidence, by holding a service of sorts sometime during the day, good stirring hymns being a leading feature. Planters may weary of the elaborate kneelings and postures in a church built with hands. But in their lives, planting in unison with the solemn restful heart of Mother

Earth, are deep chords of Nature's music that vibrate at times strongly in worship to their Creator.

There will be objections, of course. Fancy mixing profane social enjoyment with sacred worship, cry some. What nonsense doing the "pi" on one's only free day, exclaim others. But give and take if necessary everywhere is doubly so in the restricted circle I am alluding to. Some extra unctuous Sabbatarians may think themselves defiled by association with their heathen neighbours. Such can only be prayed for. There are others who only dislike breaking their Sunday rest and meditation for such purposes as tennis, or other athletic frivolities. These may be confidently appealed to as possessing a fair amount of human kindness. For if they feel any real regard for their erring fellow-creatures, they should surely do something more than neglect them. The gay spirits who want to have the day all fun and nothing else may on their part well meet the others half way, and add to the enjoyment of these by joining in their brief but hearty service.

Midway between these two extremes lies perhaps a more numerous section, hearty and wholesome-hearted. These look upon a modicum of hearty prayer as being as invigorating as a keen strong breeze, giving a zest and light heartedness that braces the whole system.

I fear me this modest suggestion of "Sunday Clubs" is drifting into a string of moral platitudes. It's no good, though, ignoring platitudes, as they give an easy dead level for lighter traffic to travel on.

One thing is very certain. That unless the stricter ones relax in some way as suggested, and the more frivolous attempt an occasional seriousness, neither will get much profit or relaxation out of their lives.

Who will be the first to start a Sunday Club?

KADADU.

U. P. A. S. I. SECTION.

[UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.]

THE Secretary retains for the present the work of passing the Annual Book of Proceedings through the Press, and he is responsible for these notes. The remainder of his duties as Secretary have now been taken charge of by Mr. Allan Ronaldson, who will officiate as Secretary to the U. P. A. S. I. during the writer's absence. All communications should, therefore, be addressed to Mr. Allan Ronaldson, at 9 and 10, Second Line Beach, Madras.

It has been noticed that the Book of Proceedings, 1894, contains no Report of the Deputation of Planters that waited upon His Excellency the Governor of Fort St. George on 23rd April 1894. The report has now been reprinted from the *Madras Mail* in the form of an *Addendum* to the 1894 Proceedings, and is available at a cost of 4 as a copy, postage included. Orders should be sent to the Officiating Secretary, to whom remittances may be made in stamps. The 1894 Book is not complete without this addendum.

Government has recorded the resolution of the U. P. A. S. I. with reference to the Government's purchases of Cinchona

bark; and has directed that copies of certain papers bearing on the subject shall be forwarded to the Secretary when they are "placed on the Editors' table."

The investigation of the Malarial Parasite still hangs fire, Government having stated that, though the matter has not been lost sight of, existing demands on the medical department render the postponement of the proposed investigation inevitable.

The accounts for the year 1896-97 have been audited, and found correct. A list of donations to the Reserve Fund is appended. It is audited up to the close of the year 1896-97.

CERTIFICATE OF THE TREASURER, I. F. C. R. FUND.

The following letter certifies that the above sums were duly received by the Hon. Treasurer of the Fund referred to:—
copy.] MADRAS, 16th September 1897.

THE SECRETARY,

UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA,
Madras.

DEAR SIR,

I have received your favour of 14th instant, enclosing a detailed list of subscriptions to the Indian Famine Charitable Relief Fund (Madras Branch) received through the medium of your Association, and beg to inform you that the total amount thereof, viz., Rs. 5,628-2, has been duly received by me and placed to the credit of the Fund.

I am, dear Sir,

Yours faithfully,

(Signed) GEORGE G. ARBUTHNOT,
Hony. Treasurer, I. F. C. R. Fund.

P.S.—The list is returned herein.

LETTERS TO THE EDITOR.

ANSWERS TO CORRESPONDENTS.

["A. L. WHADDON." The whole question of domesticating bees in coffee plantations was discussed in these columns early this year. A complete file of the 1897 volume up to date may be had on applying to the Manager, Madras. If, after consulting the articles and correspondence referred to, you desire further information, kindly write us again. "M." We quite agree with you that a great deal more than a "mere analytical expert" is needed for planting requirements, but it is obviously impossible to engage the services of a complete scientific staff. The class of man the U. P. A. intend getting out is, we understand, an Agricultural Chemist, who should certainly be able to afford the latest scientific information regarding nitrefaction and the mechanical texture of soils.—ED.]

FLIES!

DEAR SIR,—Can any of your readers tell me of any stuff that keeps away flies?

The flies are a perfect nuisance in my bungalow. Is it the flies in monsoon making the rooms hot? Perhaps "Planter's Wife" can assist me to get rid of the flies?

MUDGERI,
6th September 1897. }

"NORMANTON."

THE RAILWAY FOR THE MYSORE AND COORG COFFEE DISTRICTS.

I.

A CORRECTION.

SIR,—Kindly note the following correction in article on this subject which appeared in your issue of the 4th current. The last sentence of the third para. should read as follows: "If the line starting from Hassan followed a trace by Arkulgoode, Ramnadpur, Periapatam and thence to Sidapur, it would skirt the eastern boundary of North Coorg and come fairly within easy reach of the estates in the southern portion of the Mysore planting districts." The part in italics instead of "South Coorg"; an inadvertent slip, which perhaps many readers will have noticed who are acquainted with the localities. And besides, seeing the line was to pass through South Coorg, the mention of that district was superfluous. The papers being late in reaching me, I am only able to make the correction now.

I am glad to see you invite remarks from men in the districts interested, and hope it may elicit the views of many who know the line of country. As you indicate, it would be a very great advantage if the Mysore and Coorg men could combine in advocating a scheme that would serve both. It would add greatly to the importance of any representations they might make to the Government. The Resident of Mysore being also Chief Commissioner of Coorg, their representations would have the advantage, too, of being submitted through the same officer.
"STEAM."

II.

SIR,—I have been greatly interested in the communications made to your paper on the "Coorg Railway" by "Steam," as whoever that gentleman is, he appears to me to have a thorough grasp of the subject, and his views to a considerable extent coincide with those that the Malabar Chamber of Commerce have consistently expressed.

So far as the port of Tellicherry is concerned, it is not necessary again to reiterate the many advantages it possesses over others on the Coast, as these are patent to all who know anything about the ports in question.

The Madras Railway commences the construction of its extension from Calicut to Cannanore on the 1st October, and as the work is to be expedited, it is anticipated that Tellicherry will be in communication with the rest of India by rail in two years time.

It has already been laid down by the Government of India that it is not necessary for a Railway to open a branch line on its own gauge, and there is nothing to prevent the Madras Railway constructing the line advocated by "Steam" from Tellicherry to Kadur on the metre-gauge beyond the fact that the Southern Mahratta would desire to do it.

What we in Tellicherry complain of is, that the cost of the ghaut section of a Railway to Coorg has been condemned as prohibitive without any survey having been made. We are told that the cost of the ghaut section of the line, as surveyed between Munzerabad and Mangalore, is such as to render it entirely unlikely that that line will even come under consideration for another ten years, and yet those who know something about both lines of country assert that a trace could be found down

from Coorg to Tellicherry considerably easier than that from Munzerabad to Mangalore.

The Coorg Planters' Association, in their laudable eagerness to get a Railway into their district from any quarter, have latterly been inclined to throw over their old love Tellicherry, and to court the later proposal of a line from Hassan to Sidapur. The idea of the traffic on such a line paying its own expenses, and in addition contributing in any appreciable extent to the success of the Arsikeri-Mangalore line, was ridiculed by a gentleman who is well competent to speak on the subject.

Personally, I was of an opinion that there was ample room for the Arsikeri-Mangalore line and the Mysore-Coorg-Tellicherry line, but as I now understand there is only the chance of the Government of India sanctioning one, at any rate for many years to come, I would ask those concerned whether it would not be better to unanimously adopt such a scheme as "Steam" has proposed, which is more likely to be taken up by the Madras Railway or Southern Mahratta Railway, now that the former are extending to Tellicherry, rather than wait for a line which we are told is not likely to be considered for another ten years.

TELLICHERRY, }
6th September 1897. }

RALPH TATHAM.

SUNDIALS.

SIR,—In P.O. for June 12, p. 377, an article on sundials is given.

In low latitudes, where the sun rises and sets nearly vertically, a very accurate method of getting east, west, and north points is to work it out by the following formula: Sine declination $\times$ secant latitude = sine amplitude. If you have a good horizon, this will give good results. But the best thing is, take an amplitude at sunset and lay off the west point from it, and 90° from west will be north or south. Next morning take an east amplitude, lay off east point, and north from it, and if there be a slight difference between north laid out from east and west, take the mean of the two. But care must be taken that you have correct declination. The declinations given in Nautical and Whittaker's Almanacks are for Greenwich at noon. For example, the declination on 19th September will be $1^\circ 16' 51''$. At Coonoor it will be noon about 5 hours and 8 minutes before Greenwich noon, and as the sun will set about 6 hours and 2 minutes o'clock, or about 54 minutes after Greenwich noon, the true declination at sunset at Coonoor will be $1^\circ 15' 58''$ or $1^\circ 16'$ nearly. Next morning the sun's declination at Coonoor at sunrise will be $1^\circ 4' 18''$ or $1^\circ 4'$ nearly. Latitude of Coonoor from the map is about $11^\circ 0'$ north. Declination being also north, sun's amplitude at setting on 19th September at Coonoor will be $1^\circ 17' 25''$ north of west point. Drive in two pegs in line with the right and left edges of sun's disc. A point half way between will coincide with sun's centre. From this lay off a point $1^\circ 17\frac{1}{2}'$ to south. This will be true west very nearly, and 90° from it will be north. In the same way at sunrise on 20th September put in a peg coinciding with sun's centre, and from it lay off a point $1^\circ 5' 12''$ (which is sun's amplitude) to south. This will be true east very nearly, and 90° from it will be north. If it differs from north of previous evening, take a mean. In Chambers' Tables, pp. 414 and 415, will be found a table of amplitudes worked out to nearest minute for every degree of lat. and decln., and on next two pages is a table for finding sunrise and sunset according to apparent or solar time to which equation of time must be applied to get local mean time or clock time. These tables are explained at the beginning of the book, and the methods of computing them are explained in works on Navigation and Nautical Astronomy, and in Chambers' Mathematics, equation of time is given in the Almanacks for every day, and varies slightly from year to year, becoming practically the same every fourth year.

For those who can't get an angular instrument, the simplest

plan is to get apparent local time by sunset and sunrise to or better still by going to the nearest telegraph office, get Madras time and applying a correction for difference of latitude equal to 4 minutes for every degree, which, in the case of Coonoor would be about 16 minutes behind Madras. To apply equation of time to get apparent time. Having got suspend a plummet, and at any time A.M., say 11 o'clock mark its shadow. Do so at 12 o'clock apparent noon as a check. Again at an equal time P.M., or 1 o'clock, mark the shadow. A line bisecting the angle of the A.M. and P.M. lines should coincide with the line marked at apparent noon. This will be true north and south line. To this set the gnomon or stile of the dial.

In getting time from a table of sunrise and sunset, a further correction of 2 and sometimes 3 minutes is needed for refraction which makes the sun appear before time at rising and after at setting. At high altitudes above 5 or 600 feet the sun appears still longer before and after. At from 600 to 800 feet elevation the difference is 2 minutes, at 1,600 or 1,700 feet it is 3 minutes, at 3,200 ft. 4 minutes, at 5,000 ft. 5 minutes, at 6,600 to 7,000 ft. 6 minutes, at 9,600 ft. 7 minutes, and at 13,000 ft. 8 minutes.

A. HARRIS.

SCIENTIFIC AID FOR PLANTERS.

DEAR SIR,—So my brother planters have arrived at the conclusion that the investigations of the morphologist lead to no result of any real practical value. Query: Would the observations of the physiologist or biologist prove equally valueless?

Of course, it would take a most experienced and skilful physiologist to investigate that condition of the chlorophyll corpuscles which would appear to constitute a congenial medium for the propagation of leaf-disease. Probably the great deficiency of starch-forming corpuscles in the leaf of disease-haunted bushes would become evident, and the whole process of assimilation would have to be traced out. It might even be found that the history of leaf-disease is really the history of bankruptcy. That is to say, that owing to a sad deficiency of healthy foliage on the bushes, at that period of the year when the principal function of the bush is to lay up on its tissue a store of reserve material to draw upon for its initial requirements the following spring, the poor coffee bush had to struggle for active life again without anything placed to its credit at the commencement of the next growing season.

That period when the bush is most active in laying up a store of reserve material should be in the autumn, or just after coffee time. Planters know only too well the usual state of the foliage on their bushes at that time, and the inability of the bushes to fully ripen the final remnants of crop indicates their exhausted condition and consequent unfit state for carrying on the important function of laying up a reserve of food-material for the requirements of the ensuing growing season or spring. It may probably be found that the history of leaf-disease is *practically* the result of a long history of unobserved deterioration in vitality of the coffee bush. Every planter knows that a long season is inimical to the spread of leaf-disease, whereas a prolonged wet season favours its development. The explanation of this would probably be found in the fact that the absence of leaf-disease in dry weather is the result of the processes of metabolism being then at a stand-still, whilst the impoverished treasure being replenished with sorely needed addition of reserve-material. During the wet season, however, metabolism never ceases and the leaves become poisoned with the products of mal-assimilation which constitutes a favourable feeding-ground for leaf-disease. A thorough investigation of the proteids would probably make this very clear.

The practical question for present consideration would, therefore, seem to be: "What form or strength of nourishment would enable the debilitated coffee bush able to assimilate *normally*?" For must bear in mind that plants do not feed or exercise their

tion in the automatic manner of machines! There is an indispensable equilibrium of inter-defence in all the functions of life which when once destroyed by the undue forcing of function at the expense of the others, it becomes the work of to restore. Seed-bearing is only one of the vital functions of the coffee-bush, and as the planter finds it to his interest to stimulate the function of reproduction, he must at the same time mean to maintain the efficiency of all the other functions of the plant, otherwise mal-assimilation will result, leading to disease. Analogically, when the bacillus of consumption attacks the lungs, the usual forms of nourishment are no longer of avail, and resource is had to such special form of food, &c., as cod-liver oil to check mal-assimilation and destruction of healthy tissue. The task of the coffee-planter at the present time would, therefore, seem to be to adopt such methods as would tend to restore the normal function of healthy assimilation in the coffee bush. What aid of practical value can the physiologist afford in this important matter?

M.

It is very encouraging to be told that all the expensive manuring operations may only go towards feeding leaf-disease owing to retarded assimilation in the coffee-bush!!

COFFEE.

Market.

There has been a good demand, and prices have either maintained their value or are rather dearer, says the *P. M. Review* of the ultimo. The better qualities have been in most demand, and anything at all coloury has sold at full prices or at a slight advance. Some parcels of Guatemala imported early in the season, when there was little demand and now cleaned, sold at very full prices, probably higher than they would have fetched when first imported. Several parcels of East India, which had also been kept back, realised fully 5s. more than they would at the time of importation, the bold sizes showing even a greater advance. Coffee from Grenada and similar qualities have also sold at full prices. Plantation Ceylon and Mountain Jamaica fully maintain the high prices recently current. A consignment of choice Native Ceylon reached extreme rates. In the principal market the heavy receipts have continued to depress values, and quotations are about 6d lower than a week ago.

manuring.

The Mysore planting correspondent of the *Madras Mail* of 9th inst. has decided exception to the Pringlean system of bulk manuring immediately after the S. W. Monsoon. The argument in favour of the practice is of course the danger of the manurial constituent being washed out of manure applied before the monsoon; but this, the *Mail* correspondent affirms, has not been observed with regard to cattle manuring, how-

ever real the danger may be for soluble chemicals. On the contrary, he has often noticed that post monsoon manuring resulted in the manure remaining absolutely inert till the following rains, unless frequent rains fell in the interval. This can be explained by the fact of the comparative insolubility of cattle manure, unless loaded with moisture.

COFFEE CULTIVATION WITHOUT MANURE.

CATTLE MANURE AND LEGUMES.

[This is no reply to "H. G. R.'s" strictures, to which I shall attend later on.—B. N.]

If there are any non-believers in the scientific accuracy of the theories propounded in "Coffee cultivation without manure," the following extracts from Messrs. Sutton's Farmer's Year Book for 1897 will probably convince them that growing coffee under leguminous shade is thorough scientific modern agriculture.

Messrs. Sutton & Sons on Legumes. Messrs. Sutton and Sons write: "According to recent bacteriological experiments, it seems probable that in the near future, by a regular

system of leguminous cropping, we may be able to dispense almost entirely with costly nitrogenous manures." There is, I suppose, no firm who have done so much for agriculture in England in the way of growing and establishing improved and disease-resisting varieties of cereals and vegetables, or who are now competent of expressing an opinion in connection with any agricultural discovery. That such a firm should have thus practically endorsed "Coffee cultivation without manure" will, I am sure, be regarded with satisfaction by all growers of *E. Lithosperma* as proof positive that they are in the very van of progressive agriculture. It is, I think, a great pity that there is no firm interested in tropical agriculture in the same way that Messrs. Sutton's are in European agriculture. In default of private firms, I cannot conceive that Government money could be more usefully employed than in growing and experimenting with cultivated products, in the praiseworthy endeavour to evolve disease and blight-resisting types. Nothing could be of greater importance to an agricultural country like India, and it has in my humble opinion been greatly neglected to the detriment of numerous industries, of which coffee planting is perhaps one of the most striking examples.

Potato cultivation is, on the other hand, an example of what has been done by careful selection in producing disease-resisting varieties; but with coffee we are unfortunately handicapped by the apparent impossibility of obtaining seed from any country that is not liable to leaf-disease. Whether the scientist exists who can give the death-blow to *H. Vastatrix* is problematical, but it is devoutly to be wished that he may soon be discovered; but in the meantime until he is unearthed, the only known way of fighting disease is by manure, and I hope to be able to demonstrate to proof that green manures are the cheapest, and they have the additional

advantage of being in unlimited supply. What is cattle manure but a green manure in another form and a very expensive form? I believe there is a prevalent idea that grass converted into dung is of greater manurial value than grass would be without being passed through the bodies of animals. That this is a fallacy is obvious, for the excretæ weigh less than the food the animal consumes, and there is a loss of the valuable constituents in passing through. All the nitrogen in the blood, flesh, hair and bones is extracted from the food they eat; the valuable ash constituents of the bones are similarly obtained. The cattle manure produced is plainly the balance of the food the animal eats after providing for its growth and nourishment. Hence it follows that where cattle are kept for manure, old cattle make the most valuable manure, as they require less nitrogen and phosphates than young growing animals do for their sustenance and growth. If cattle were leguminous a good deal might be said in their favour, but as they are not, and as they depreciate in manurial value everything they consume, the practice of feeding them on poonac is reprehensible (unless there is a market for the beef so produced), as it is plain that the poonac is of more value as manure applied direct to the coffee than after toll has been levied on it to nourish the animal. If cattle are simply sent out to graze, they only act the part of grass carriers. Each head of cattle brings home about a cooly

methods obtaining in Assam, which might, for many reasons, be called the premier district of India, if not of the world. Hence the directions given are of great value, though in following them every allowance should be made by the planter in the widely differing districts of South India for their particular surroundings.

The style of treatment changes according to jât, elevation and climate. Also must be reckoned liability to hail, blight or drought. The chief if not only reason of pruning tea is to keep the sap in active healthy circulation, and by directing its channels over as wide a planting surface as possible. In India pruning is almost invariably done in winter; in Ceylon, the land of perpetual spring, tea is pruned either in the cold weather or the middle of the year. *No pruning should be done until sap has almost ceased to flow, i.e., when bushes have stopped flushing*: China first, Hybrids next, and lastly Indigenous. This point safe, the sooner the trees are pruned the better, as in the cold season they are storing up reserves of food which should not be wasted by removal through pruning. In Sylhet pruning is done late, as hailstorms are prevalent when the early pruned bushes would have recommenced flushing. In Chittagong, or other hill districts, such as the Nilgiris, very early pruning must be avoided owing to frosts. In the Dooars late pruning is also necessary owing to droughts in spring. In other districts blights induce the same procedure.

So that practically early pruning has many disadvantages, one of the chief being that early pruned bushes give most of their crop in spring, when the flush is invariably poor, and also "shut up" early in the year. In heavy pruning, *i.e.*, almost down to the ground, especial care must be taken that the young shoots may have a good chance of remaining uninjured. For damage done at this stage may be impossible to remove for many years, *i.e.*, till the bushes are heavy pruned again.

The age at which young plants are pruned varies from two to three years, or is regulated according to the growth. In Cachar and Assam tea is pruned when 3 to 4 feet high, in the Dooars when 5 to 6 feet. In Assam a frequent rule is to cut down as soon as possible to 6" or 9" all young plants that have struck well after transplanting. In Chittagong to prune to 13" all fairly thick stems three years from seed; in the Dooars to 14" in the first, second or third year. An explanation of these different systems is almost impossible.

On a good free soil with plants raised from sound seed, pruning would go by girth of stem. On poor soil, and with plants from poor seed, early pruning would be necessary to overcome defects of growth. Young bushes are usually pruned upwards, *i.e.*, above previous years prune for some years; when downwards, *i.e.*, under previous years, cut until the hard wood is reached, when a low prune is a necessity. In this last a sloping cut to prevent lodging of water is a necessity. The sap should also be quite dormant, else great loss by bleeding will ensue. Good deep cultivation and manuring is also necessary. Sometimes heavy-pruned bushes run for two years, to allow formation of good wood for next pruning. To revert to the first prune. Cut the main stem down only, and leave or tip the side branches. The great thing is to encourage diameter of bush. Next year cut down to 18" or 2 feet. All damaged or dead wood of any kind should be cut clearly off.

The lowest straggling branches should be removed annually, as they yield no leaf and encourage seed, and last stops flush seriously.

With the many stemmed China prune harder and at a much lower level. Fairly late pruning is best, ensuring a continuous flushing through the season, early prune induces great rush of leaf in spring and great abundance of their weak wood and consequently cessation of yield.

All knives and saws should be kept very sharp, as tools mean torn bark and split stems. It is a good idea to keep a cooly solely for sharpening the tools for a dozen men or less pruning.

To remove the prunings, the usual method is to burn them. If done deeply and thoroughly, and while fresh, rich nitrogenous leaves give a valuable manure. If blight has been present, it is best to bury in specially trenches or burn.

DISTRICT ASSOCIATION.

LOWER PULNEYS.

PROCEEDINGS of Committee Meeting held at the Peryoor Bungalow, Lower Pulneys, on the 26th July 1897.

Mr. F. R. Gerrard was appointed Extra Committee Member for the Annual General Meeting.

Read letter from Mr. H. E. Somerville resigning his membership of the Association on leaving the District.

(1) COMMISSION OF ENQUIRY.—Read Circular dated 18th June, Circular dated 2nd June, and Honorary Secretary's reply, Circular dated 15th June; (2) Circular dated 23rd June and Circular dated 13th July.

Read report of Commission of Enquiry, and laid on the table copy of Act V of 1866.—Recorded.

(2) THE U. P. A. MEETING.—Read Circulars dated 29th June, 11th June, 26th June, 28th June, 30th June, and Agenda for the U. P. A. General Meeting to be held at Bangalore on August 1st.—Recorded.

Mr. Howard Newport, the Honorary Secretary, is unanimously elected to represent this Association at the U. P. A. Meeting.

(3) THE DINDIGUL-POTHANUR RAILWAY.—Read letter from H. P. Hodgson, dated 12th July, and laid on the table report proposed Dindigul-Pothanur Railway Extension, dated June 1st, kindly forwarded by the Traffic Manager, Madras Railway, covering letter, in reply to Honorary Secretary's queries, were in accordance with the Resolution passed at the Committee Meeting of May 1st.

Mr. W. H. Gerrard said that he feared from what Mr. Howard had said in his letter just read, that the construction of this important Branch Line by Government had been indefinitely postponed. That Lord Wenlock had promised that the Dindigul-Pothanur Branch Railway would be almost one of the first Railways to be taken up. He noted that "Railways" had not been mentioned in the preliminary Agenda of the U. P. A. Meeting though already been circulated, but that he hoped the U. P. A. was going to omit this most important subject of Railways at its next Meeting. He moved that our Delegate bring up this subject if possible, at the Meeting, and urge its undoubted importance that it be commenced without delay.—Carried.

(4) THE U. P. A. FINANCES.—Read Circulars dated 6th June, 13th May, 20th May, 9th June. Resolved that the suggestion by the Chairman, U. P. A. S. I., and the Honorary Secretary, Travancore P. A., with reference to North Wynad, is approved.

Read Circular dated 18th July. Resolved that the Treasurer approves of the expenses *re* Act XIII. of 1859 being debited to the Reserve Fund, if sufficient funds are not forthcoming for the year included in this year's balance sheet.

(5) THE U. P. A. INDIVIDUAL MEMBERSHIP.—Read Circular dated 28th May, 9th June, 10th June, 14th June, Telegram dated 12th June, letter from Chairman, L. P. P. A., dated 16th June; and Proceedings of the Central Travancore P. A. Resolved that

iation approves of Mr. Acworth's last scheme, but Delegate is a free hand to vote as he may think most in the interest of district and Association after hearing the subject discussed.

THE U. P. A. REGISTRATION.—*Read Circulars dated 22nd May and 9th July. Resolved* that this Association is of opinion that registration of the Parent Association would be advisable, even if it be found necessary to register District Associations at the time. Delegate is instructed to vote accordingly.

ADDRESS TO THE QUEEN-EMPRESS.—*Read Circulars dated 1st, and 29th May; 19th June and 6th July.—Recorded.* The Delegate was requested to bring up again, if he thought advisable at meeting, the suggestion of the Association that the cost of the photograph and Address should be met out of the funds of the District Associations. The amount per vote would not amount to much and would relieve the U. P. A. current expenses of a heavy item. *Resolved* that the larger copy of the photo of the casket received and hung up in the place the Association generally meets and that if the photo is copied into, or articles relative to the photograph appear in any of the English Illustrated papers, the Association purchase copies of that paper.

SCIENTIFIC INVESTIGATION OF LEAF DISEASE.—*Read Circulars dated 12th May, and 18th and 27th June. Recorded* that this Association is in accord with what Central Travancore and Wynaad said on the subject, and the Delegate is instructed to vote against the expenditure of U. P. A. Funds in this matter.

MALARIAL PARASITE.—*Read Circulars dated 12th May and 9th July. Resolved* that if possible copies of Surgeon-Major paper be obtained and circulated before an opinion is recorded.

ACT XIII. OF 1859.—*Read Circular dated 16th July. Laid on the table Planting Opinion of date 17th July.—Recorded.*

ACT VIII. OF 1878.—The Honorary Secretary said that he had been informed that a case brought by the police against a Chetty selling coffee on the plains and keeping no books was decided in favour of the Chetty by the Magistrate hearing the case, the Chetty's defence being that he was a "Planter" and therefore need not keep no books. In this case the Chetty was avowedly a merchant and disposed of coffee both by wholesale and retail, but because of 5 or 20 trees that he owned on the hills he claimed, and his case was upheld by the Magistrate, that he need show no accounts and keep any record of his sales of coffee. *Resolved* that the Delegate bring this point up if possible during the discussion on Coffee and Tea.

THE AHTOOR-KODAIKANAL GHAT ROAD.—*Read* letters from Hon'ble Mr. H. P. Hodgson, dated 12th July, and 14th July (enclosure).—*Recorded with satisfaction. Resolved* that the Association request the permission of that Government to allow this matter to stand over till next year, for being the present financial tension due to the famine; we do not think Government are likely to make any allotment for the construction of our Ghat road this year, and we would rather therefore bring the matter up later when our statistics and remarks may be of use before Government at a time when they may more readily see the way to making the grant and putting in hand the construction of the road.

LADY-BIRDS AND COFFEE BUG.—*Read* letter from the Hon'ble Mr. H. P. Hodgson, dated 12th July. Circular dated 5th July and *Planting Opinion* of date 10th July.—*Recorded with satisfaction.* Delegate is instructed to vote in favour of any measure that supports the suggestion of Government for the engagement of an expert, and to allow him to further the suggestion of the experimental importance of some specimens of Lady-birds from Australia.

"PLANTING OPINION."—*Read Circular dated 15th June. Resolved* that this Association approves of this paper being made the medium for the circulation of notices and other U. P. A. matters and that it deserves the support of Planters.

THE VIRUPATCHI POST OFFICE.—*Read* letter from the Superintendent of Post Offices, Trichinopoly, dated 13th July, stating that letters have been issued to place the Post office in question at once in charge of a person who can read and write the English language. *Recorded with satisfaction.*

THE ANNUAL GENERAL MEETING.—*Resolved* that the Annual General Meeting be postponed till after the 1st September. Date to be fixed later on.

ANTWERP AS A MARKET FOR COFFEE.—*Read Circular dated 1st July.—Recorded.*

U. P. A. PROCEEDING BOOKS.—*Read Circular dated 1st July. Resolved* that the Association purchase copies of the U. P. A. Proceeding Books.

(19) STATISTICS.—*Read Circular dated 24th June. Resolved* that as all the statistic forms have not yet been returned by the members, the Honorary Secretary fill in those that he has received and copy the rest from last year's list, and take the statistics with him to the U. P. A. Meeting.

Laid on the table.

Proceedings, Coorg P. A. Annual General Meeting, 31st May 1897.

MARKET SUPPLEMENT.

SATURDAY, SEPTEMBER 18, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (August 27, 1897) says:—Auctions have again been on a limited scale and the small supplies meeting a steady demand; last week's values were in most cases well maintained.

About 700 bags East India were offered, consisting chiefly of native and cherry-dried descriptions, in small lots, which sold slowly at irregular rates.

Central American kinds were offered only in small quantities and colory grades were easily disposed of at full prices, whilst commoner sorts were unchanged but slow of sale.

Futures were easier during the week on very large Brazilian receipts, but the market was firmer yesterday on better advices from Brazil, and prices show a recovery of about 6d.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending August 25th, 1897, says:—Bank rate 2%. Bombay Exchange closes at 1s 3½d. Brazil Exchange 8½d. Rupee paper 3½%. 63½. Silver 23½d per oz.

There is no change to report on the spot, most qualities selling at about previous values. Brazil markets are very steady, considering the enormous Rio and Santos receipts, which have averaged 21,857 bags in Rio, and 37,000 bags in Santos.

The sales included:—53 casks and tierces 18 barrels and bags Plantation Ceylon sold from 78s to 113s. Of 809 bags 20 cases East India 601 bags Coorg native character sold from 64s to 75s, 143 bags Neilgherry at 65s to 103s, 65 bags Wynaad part sold at 86s 6d, and 20 cases Travancore bought in; 50 barrels 10 bags Jamaica part sold at 51s 6d to 107s 6d; 937 bags Guatemala chiefly sold at 52s to 106s 6d; 144 bags Costa Rica 57s 6d to 73s; 1,457 bags Nicaragua part sold at 9s to 62s 6d; 587 bags Salvador chiefly sold 53s 6d to 56s; 177 bags Mexican 68s 6d to 97s 6d; 230 bags Vera Paz and Coban chiefly sold at 74 to 103s; 2,535 bags Columbian good part sold at 48s to 100s 6d; 136 bags Bolivian 65s; 69 bags Venezuelan bought in; 320 bags Guayaquil part sold at 50s 6d; 147 bags Peruvian part sold at 54s to 57s; 200 bags Nyasaland 60s to 100s; 33 half-bales Mocha bought in; and 43 bags Liberian Travancore sold at 36s.

Futures have fluctuated but little during the past week, and close quiet, with quotations unchanged to 3d lower, viz.:—Good average Santos in Havre, September delivery, fcs. 43.25, in Hamburg pf. 35, and No. 7 low ordinary Rio in New York \$6.45.

To-day's London official quotations are:—

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea B dated August 27th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	169,132 packages.	344,662 packages.	12,320 packages.
1896-1897...	183,772 „	311,040 „	11,980 „
30,002 pkgs. INDIAN	Total 58,898 packages were offered in auction this week.		
27,957 „ CEYLON			
939 „ JAVA			

The following table giving the distribution of the exports of Tea Ceylon for six months ending 30th June, 1897, 1896, 1895, is interesting as it shows that, almost without exception, each country that previously been using Ceylon Tea in appreciable quantity during the period in 1895 and 1896, required an increased supply in the first months of 1897.

Exports from Ceylon from 1st January to 30th June, during the years 1897, 1896 and 1895.

	1897.	1896.	1895.
United Kingdom	50,132,235	48,897,533	45,500,000
Austria	1,755	28,714

Sweden	25,140	—	
Total lbs.	58,179,363	56,089,943	51,600,000

Indian. The market generally has been steady, good Teas continue in strong demand; in occasional instances some of the less desirable parcels of whole leaf Tea about 7d. per lb. were rather cheaper. The Darjeeling Tea placed upon the market this week has shown improved quality, and as such kinds are much wanted some very satisfactory were made. The 2,336 packages of Darjeeling Tea sold on account this week realised the high average price of 1/2¼ per lb.

Teas marked thus † are New Season.

COIMBATORE COFFEE WORKS.

Coffee Cured and Shipped to London on Planters' Account

ADVANCES MADE ON CROPS ON MODERATE TERMS.

Tools, Roofing and Planters' Stores kept in stock

SPECIAL MANURE WORKS.

Separate Manure Works have been recently erected, giving greater facilities for the Manufacture of Manures.

White Castor, Black Castor, Neem and Hoongay Poonacs, Bone Meal, Superphosphate, Nitrate of Soda and Saltpetre now in stock.

MIXTURES MADE FREE OF CHARGE. FOR QUOTATIONS AND FURTHER PARTICULARS,

Apply to **T. STANES & CO.,**

Coimbatore and Coonoor

OAKES AND CO., (Limited),

OOTACAMUND.

LEADING HOUSE FOR FRESH STORES.

WINE AND SPIRIT MERCHANTS.

DEALERS IN OATS, GRAM AND BRAN.

MILLINERS AND DRAPERS.

TAILORS AND OUTFITTERS.

Manufacturers of Pure Aerated Waters.

IMPORTERS OF HARDWARE AND PLANTERS' TOOLS

EVERY DESCRIPTION OF PLANTERS' REQUISITES STOCKED OR MANUFACTURED TO ORDER AT OUR

BEEHIVE FOUNDRY, MADRAS.

MANUFACTURERS OF THE FINEST CIGARS AND CHERROOTS.

Maistries and Coolies' Coats in Dark Blue Melton, Rs.3-4 each.

PLANTING OPINION.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for advertisements will be: 4 as. per line for the first, 3 as. for the second, 2 as. for the third and succeeding insertions. Five-line advertisements in Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been moved to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c. Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 1st October 1897.

Nellampathy, British.

22nd September.—*Weather.*—Rain for month to date 6.35, for year 149.56. Very little rain has fallen this month.

Most of the 6 inches fell the last two days, when 3.65 were gauged. There has been a lot of bright sunshine and it must have been fine growing weather for old coffee if somewhat trying for late plantings. N. E. Monsoon has not appeared yet, but it can't be long now if it's coming at all. Rice a shade easier, now 8½ edingallies, instead of 8 as before. Grain 11 measures. *General Health.*—Fair. *Labour.*—Enough for requirements, as works are few on most places this year. *Interesting Items.*—The Resident shot a rather good tusker, I hear.

Nilgiris.

SHOLUR, 21st September.—Five days with rain since last report. Weather cloudy and misty with insufficient sun for good flushes. Rainfall during month 3.01, making 45.73 to date. Highest and lowest temperature, between 6 A.M. and 6 P.M., 78° and 57° respectively. *Health.*—Good. *Labour.*—Plentiful. *Grains.*—Same as last week.

COONOR, 21st September.—Rain has set in with a "vim" since my last. Coffee ripening up fast. Tea flushes are a bit backward. No disease to speak of, thank goodness, save short crops and the Government exchange. May the blessings of all producers light on the heads of those instrumental in inflating the currency. Query: Is this criticism of measures, or of Government as a whole? For I wish it to be distinctly understood that I refer to the measure alone, as I don't appreciate accompanying the worthy editor on a lengthened visit to the Andamans. Labour more plentiful than ever, which is a good thing considering the beastly weather we are having. Just

heard of a rather rough experience for a local estate. Sent 2,500 lbs. tea down to the coast the other day; a fire in the Customs House, where the tea was lying, promptly destroyed the whole lot. That's one way of reducing exports!

TAPIOCA CULTIVATION.

THE present disastrous famine in India has again attracted prominent attention to the cultivation of the tapioca plant as an alternative food to rice or wheat. The plant endures all but the greatest extremes of temperature, and thrives even in arid localities where all other vegetation is parched and withered in times of long drought.

It is cultivated very extensively in South America, and somewhat in Travancore and Ceylon. In a recent number of the *Agricultural Ledger Series** is given an excellent description of the modes of cultivation in Travancore. Introduced by the Portuguese early in the 16th century at Goa, the Bitter Cassava: Manioc, Tapioca (for there are two varieties, the sweet and the bitter) has been cultivated on the West Coast ever since. It is in Travancore, however, that the cultivation has extended most, and the Malayali peasantry now consider it one of their most important crops. It is possible that, undertaken by Europeans, tapioca growing and milling for export might prove a profitable industry. Acting under this impression, we shall give a few notes on the manner of its cultivation. In the middle of the North-East Monsoon, the soil, which should be loose and friable if possible, is deeply hoed or ploughed over. It is then laid out in plots 2—3 yards square, raised a foot from the surface. Manuring is occasionally done with jungle soil, ashes or cattle-manure. For planting, stems of the previous year's crop are taken, cut up into lengths of 6—8 inches, rejecting all but the lower and more mature portions. A break in the monsoon is chosen for the planting, as the cutting might die in a poorly drained and saturated soil (hence hill sides are usually chosen for plantations), and 2—3 cuttings are put down in each plot, at a slant of 60 degrees or so, two-thirds of their length being covered. In ten days to a fortnight the cuttings will have struck and the young shoots will come vigorously in light green tufts of palmate leaves. In another month the side roots will grow, and usually in about to eight to ten months the crop will be ready to dig. They are allowed to remain in another couple of months, however, to provide the cultivator with fresh cuttings for the next planting season. If dug up sooner, and in dry weather, the fresh plantations must be well watered till they have struck freely. There is one variety that gives two crops, a hot weather and a cold weather one, the quality of the first being said to be superior to the latter. The hot weather crop rarely fails, except in extremely sandy or stony soil. The best soil is a well-drained, soft, sandy loam, with an admixture of humus. Clayey soils, like stony ones, are bad. Ashes or ashes and leaves form the best manure and add greatly to the yield and quality. Cattle manure increases yield but spoils quality.

A well-grown healthy root is generally about two feet long, three inches in diameter, and between six to eight

pounds in weight, usually thicker at the attached end tapering off to a fine point. The outer skin is thin, brown in colour, while a stout, tough white inner skin protects the delicate interior. On breaking the root across a compact view of dense fibrous tissue is seen to run through its length. The root contains the greatest quantity of farinaceous material in about ten to fifteen months after planting. Afterwards, if allowed to remain in the ground, it first grows woody and deteriorates into a soft spongy mass, the tough fibrous one being replaced by a narrow canal filled with a pulpy decaying fluid of grey cellular matter. The root seldom bifurcates, and even root fibres are few.

The hill cultivation is far wider, and the tapioca is planted by the hillmen as one of the ingredients of their curious hotch-potch fields of paddy, ragi, maize, chana, dāl and other seeds, in burnt clearings. When ready for use, roots are dug up, washed, peeled and cut up into small pieces, and dried by the sun on mats or rocks into white flinty chips known as *kani marachini* (the hill-man's woody potato). This hill tapioca is bartered for other produce on the plains, and is much prized by the plain inhabitants.

Some of the varieties of tapioca are very poisonous in their raw state, and must be boiled or dried repeatedly before use. Others are perfectly wholesome. Should the first be partaken of when insufficiently boiled, vomiting ensues, attended with severe pain in the throat and stomach, the patient gets drowsy and collapse follows. Sugar in any form accentuates the effects, while coconut oil, curds and tamarind juice act as vigorous antidotes.

Under the local names of *Marachini* (Woody Potato), *Kappa Kelangu* (Ship Potato), about seventeen commonly recognised varieties of the tapioca are cultivated in Travancore. But these are evidently only races descended from a few distinct varieties and differentiated through long and peculiar forms of cultivation, not to speak of the powerful influences of soil and climate. These races, proportionate to the bitter principle they contain, may be conveniently brought under one or other of two heads—*Avians* or *Boilables* and the *Maravans* or dark races. For purposes of study, the following classification has accordingly been found useful:—

I.—*The Avians or easily boilable kinds*, characterised by a little bitter principle:—

(a) *Pacha Avian* (green boilable).—Leaf-stalks pink along upper surfaces, but green beneath and at their origin with the stem; stems 2 inches in diameter, light green; average height 12 feet; flowers rare; roots pale red, large; average weight 15 lbs. each; manure after one year.

(b) *Cheenee Avian* (Potato boilable).—Leaf-stalks and stems yellow; stems delicate; usual height 5 feet; flower after one year; roots white, and, like the *Ipomea Batatas* (Sweet Potato) mature six months after the cuttings are put out; they start in delicate sprouts from the base of the stem, and develop a few inches beyond; average weight 10 lbs. each. This is also called *Vellary* (White boilable).

(c) *Chovalay Avian* (Red boilable).—Leaf-stalks and stems red; flowers common; roots small, light red, firmly attached to stems; mature in one year; average weight 10 lbs. each.

(d) *Curry Avian* (the Curry boilable).—Leaf-stalks and stems pink; delicate plants; usual height 4 feet; flowers common; light red, large; average weight 12 lbs. each; manure after one year; mealy and wholesome.

(e) *Chána Avian* (the Cow-dung boilable).—So called from

**Agricultural Ledger*, 1897—No. 4, *Manihot Utilissima* (Cassava, tapioca, manioc).

are usually used in cultivation. Leaf-stalks pale but red at the joints; stems red, usual height 8 feet; roots few, substance of the pulp arranged in two zones—the outer firm and farinaceous, the inner pulpy, and unfit for food; average weight 8lbs. each.

(c) *Chenkomban* (the Red-stemmed).—A variety resembling the tree Avian, but with the leaf-stalks and stems a bright scarlet.

(d) *Neduvengauden* (the Neduvengaud Tapioca).—So called from the name of that name in Travancore where it was first cultivated. Leaf-stalks pale pink; roots small but numerous; average weight 4lbs. each.

—The *Maravans*, or dark races, like the particular class of thieves of that name in the Tinnevely District. These are all more or less nauseous:—

(e) *Olley Karim Maravan* (the Dark Maravan).—Leaf-stalks deep green with purple streaks below the attachment of the leaf-stalks on the stem; plants delicate; flowers rare; roots mature in the year, few, deep brown, slightly nauseous; they are very lightly attached to the stem; average weight 10lbs. each.

(f) *Neduvalli-Kian Maravan* (a race whose roots take as firm possession of soil as the tenacious claws of the Neduvallior Iguana lizard).—Much-branched race with stem and leaf-stalk like *Olley Karim Maravan*; flowers common; roots few, woody, and have to be boiled before the bitter principle is removed.

(g) *Ana Maravan* (the Giant Maravan).—Leaf-stalks and stems like those of (a) in colour, but the stems are tall, thick, and strong, usually about 20 feet high; flowers rare; roots very large; average weight from 20 to 25 lbs. each, and take 15 months to mature; very nauseous, requiring to be boiled three times.

(h) *Kathelay Marachini* (Kath-elay, i.e., bitter-leaved).—Leaf-stalks like those of (a); stems pale yellow streaked with red; flowers common; roots small but numerous. The race was at one time widely cultivated, but it is now rare; nauseous like (c).

(i) *Koota Maravan* (the Dwarf Maravan).—Dwarfed, much-branched race, usually 2 or 2½ feet high; leaf-stalks and stems like those of *Kathelay Marachini*; roots lightly attached to the stem; very nauseous.

(j) *Ellavum Kappa* (Areca-like Potato).—Tall race like the *Ana Maravan*; stems and leaf-stalks dark red; roots thin and numerous, usually 25 to the stem; flowers rare; very nauseous.

(k) *Avanakkum Kappa* (the Castor-oil plant-like Potato).—Dwarfed, much-branched race, 4 feet high; leaf-stalks red; stems greenish-coloured; roots few, at most four, small; slightly nauseous.

(l) *Vellay Marachini* (the White Tapioca).—Leaf-stalks and stems green, tall, delicate, much-branched; usual height 25 feet; flowers rare; roots brown, lightly attached to the stems; most poisonous, the bitter principle being eliminated only after at least seven successive boilings; race growing extinct, being sometimes cultivated in North Travancore.

(m) *Olaven*.—Delicate, rare; stems small, 3 feet high, branched; flowers common; roots small, few; slightly nauseous.

(n) *Kili Vakay* (the Parrot-green Tapioca).—Stems and leaf-stalks light green; leaves few and far apart; usual height 10 feet; flowers common; roots large, few; average weight 12lbs.; slightly nauseous.

Of these races, the most nauseous, it will be seen, are *Vellay Marachini* and the *Kathelay*, both which, however, are the oldest cultivated, and are now becoming rare; that long cultivation has, in their cases, done comparatively little towards improving the quality of their roots. When left to themselves, and especially under cover, all these races grow into tall and lanky plants, which in time assume the nature of climbers, many of which are often thirty feet high.

With regard to the position the tapioca industry occupies in Travancore, it may be said to compare favourably with many another similar industry in that country. Much tapioca is exported, especially of late, and, judging from the increasingly extensive areas under it, the importance of tapioca cultivation as a profitable industrial pursuit is beginning to be realised every day. The tapioca has long since established itself as an important and excellent article of diet with the Malayali, and the recent steady rise in the

price of rice bids fair to make it one of the first staple food-stuffs for him, if it is not that already.

Apparently there is no export of tapioca flour at present from India, neither are there any mills for reducing the roots to flour.

Besides the bitter kinds of tapioca enumerated above, there are other sweet varieties that require no special preparation at all. These are the favourite sorts in South America, from where a stock of cuttings could be procured through the agency of our British Consuls.

To prepare the flour, the peeled root is grated on a common grater by a handwheel or one driven by machinery into a soft pulp. This, after the water is pressed out, is dried in copper pans and is the farina of commerce.

The yield varies from 5 to 10 lbs. a plant; if planted a yard apart, the crop comes from ten to twenty tons per acre.

GENERAL NOTES AND ARTICLES.

Yerba Mate, or Paraguayan Tea.

We have frequently drawn attention to this "tea" as being one of the lesser known of the "warm drinks" of the world. It will be news, though, to most of our readers to hear of the extent of the trade. Twenty million pounds of export is not bad, but as the price runs out to under 4d. per lb., the margin of profit is not likely to be excessive. Says the *H. & O. Mail*:—

In his last report to the Foreign Office, Her Majesty's Consul at Villa Asuncion has something to say about Paraguayan tea. He says: "There are two classes sold, but it is only in the manner of preparation that they differ. The kind known as 'Mboroviré' is merely dried over a furnace, and then beaten into small pieces with sticks. The 'Molda' goes through the same process, but is afterwards ground in a mill. The export duty on the former was increased in 1895 from 30c paper to 10c gold, and on the latter from 25c paper to 9c gold per 10 kilos. The revenue derived from this source in 1895 amounted to 471,668dols. (£16,845). The Yerba forests, called yerbales, were formerly the property of the State, but most of them have been sold, and are now in the hands of a few capitalists and companies. The Industrial Paraguaya Company, which owns about half of the yerbales known to exist in the country, exports annually about 400,000 arrobas (4,512 tons). The total quantity of yerba exported during the past year is estimated at about 9,024 tons, and the average price per arroba (25lb.) was 11dols 50c paper (7s. 8d.)."

Light Railways.

It would be well worth the while of the U. P. A. to procure authoritative information on the matter of light railways. As will be seen from the extract from the *Ceylon Observer* given below, the cost is about five times less for a 2-foot line than for a 3 feet 6 inches gauge, i.e., £2,000 compared with £10,000 per mile. The steepness of the Tasmanian district, through which the railway line runs should be especially noted. Our friend "Steam" might profitably employ his energy in working out the difference in cost of a 2-ft. line and the one he advocated for Mysore and Coorg. As everything is done nowadays on the "will it pay at once" test, it is easy to see that several cheap light railways might be constructed without demur, whereas a more expensive broad track would be shelved indefinitely:—

LIGHT HILL TRAMWAY IN TASMANIA.—We read of narrow-gauge lines in North-West Tasmania: from the coast to Zeehan (in the silver-mining district) a railway of 3 ft. 6 inches, 28 miles in length, cost £8,000 per mile; but beyond that for 17 miles through very hilly, broken country to N. E. Dundas, a tramway on a 2-foot gauge is being made for £2,000 per mile. The 2-foot line to North-East Dundas will probably be completed for £2,000 a mile, including sur-

veys, engines and rolling stock, while the engineers estimate the probable cost of constructing a 3 feet 6 inches gauge railway through the same country at £10,000 a mile. Excepting the first five miles, which are fairly level, the country traversed by the 2-feet line is very mountainous, rough and broken, and in several places very precipitous. The surveyors had to cut their way through the scrub to make the survey, which cost £103 per mile. At several points the mountains are so steep that it is difficult to keep a footing on the slopes along which the side cuttings have been made. The radius of the curves is from $1\frac{1}{2}$ to 2 chains. There are 300 such curves on the line which is to be $17\frac{1}{2}$ miles in length when completed. About 13 miles were completed at the time of a committee's visit, and the works on the balance were well forward. The cuttings, side cuttings and embankments are almost continuous, and there are several bridges and numerous culverts.

LETTERS TO THE EDITOR.

THE COMMON HOUSE-FLY.

SIR,—In answer to "Normanton," I would quote the following:—"The familiar house-fly (*Musca domestica*) is apt to be considered an unmitigated pest. It is, therefore, time to call attention to some recent investigations of a chemist which go to bear out the pious axiom that everything has its use. This observer, noticing the movement of flies after alighting, rubbing their hind-feet together, their hind-feet and wings, and their fore-feet, was led to explore into the cause, and he found that the fly's wings and legs, during his gyrations in the air, became coated with extremely minute animalculæ, which he subsequently devours. These microscopic creatures are poisonous, and abound in impure air, so that flies perform a useful work in removing the seeds of disease. Leanness in a fly is *prima facie* evidence of pure air in the house, while corpulency indicates foulness and bad ventilation." By these observations it will be readily seen that the housekeeper, instead of killing off the flies with poisonous preparations, should make her premises as sweet and clean as possible, keeping all meat and food covered with wire covers. She may then leave the few busy flies she may have to act as airy scavengers.

"A PLANTER'S WIFE."

OXIDATION OF TEA: A QUERY.

SIR,—I wonder if any of your readers will take the trouble to answer the following query. I have found very great difficulty in obtaining a satisfactory colouring of my rolled leaf for the past month. Weather has been alternately weeks of mist and rain, and weeks fairly bright sunshine. My jât of tea is a low hybrid. Leaf three leaf and a bud, interval of plucking ten days. Pruning last year very light. Elevation high. Wither rather under, with lots of juice.

I at first thought it due to low temperature of fermenting room, only 55 to 60°, with the māl thinly spread and covered with wet cloth. I raised the temperature to 70° and 75°, and spread thinly as before. No improvement perceptible.

In the commencement of the year I had no trouble at all in getting a good bright colour. Is it, perhaps, due to the slow flushes, which are certainly far from free and not over-tender?

The flavour and pungency are satisfactory enough, and the colour of the liquor respectable. My great trouble is the colour of the roll, as the infusion comes out very dull.

I have to take the greatest care to prevent the pungency being lost, as frequently the tea will be almost flat, despite the green colour of infusion.

A solution of the puzzle will be very grateful to

BOTHERED.

GREEN MANURE.

DEAR EDITOR,—Re Mr. Nelson's letter on Coffee Cultivation without Manure in P. O. for 18th September, I should like to

ask a question. For how many coffee trees would a good E. L. shade tree produce loppings for the green manure application? At elevations from 3,500ft. to 5,000ft., between which limits a large number of the estates on the Nilgiris are situated it seems that on N.E. & E. facings coffee does not want shade at all, especially on steep land, since coffee, facing which has no shade, bears decidedly better than where shade is plentiful. On all other facings veering from S.E. to W., and on flats where there is a thin shading, the yield is better than at extremes are found, i.e., either a mass of shade or none at all. Having a lot of shade over coffee is absurd, as a number of planters are now finding out to their cost. A little common sense makes this quite plain. Coffee to bear must have sun, light, and plenty of it. Everybody knows, or at least, if they don't, they ought to know, that if you keep a plant in a close to a window without ever turning it, if it is well treated and watered, it will blossom, but only on the side next to the window while on all sides away from it few or no flowers can be expected. Why? Because sun and light cannot get at those sides. Turn the plant round every day, so that every side gets its fair share of light, and then it will flower all round. Well then, why does coffee blossom but a flower? How can you expect to get a full blossom if you don't let it have sun and light to draw it to? Many planters have packed dense shade over their coffee trees and now wonder why they get short crops! On the other hand, a little shade at good intervals has been found beneficial to coffee as it helps to ward off extremes of heat or cold. Hence it is clear that shade must be dealt out in moderation. Now return to the lopping question, on moderately-shaded land, if shade planted, say, about 60ft. along and 100ft. down a slope or 60 by 60ft. on a flat, one shade tree would have to furnish loppings for the manuring of from 160 to 100 coffee trees planted 6 by 6ft. Would not this be rather more than could be expected from a single shade tree? Presuming that it would, which is, I think, a fairly safe presumption, and also supposing for the present that green manure is superior to cattle or horse manure, which I must confess is a bigger mouthful to swallow, would it pay to plant up some land with nothing but leguminous crops overlooking the coffee land, if possible, so as to allow the coffee its full dose of loppings, without choking it with shade? Or, overlooking, as by means of wire shoots the green manure can be cheaply and easily conveyed to where it is needed.

I hope some one will be kind enough to answer my question on the subject.

NILGIRIS,
22nd September 1897. }

BADGE

"REGULATION OF SOIL-MOISTURE."

SIR,—I am glad to see the system of lightly stirring the soil with a view to conservation of soil-moisture, being so strongly advocated; and having tried it myself, I can vouch for its efficacy. The work should be completed as early as possible before the hot weather regularly sets in, and from the time of completion to the setting in of the spring showers any trampling over the ground by coolies should be avoided. But this should not interfere with recognised systems, for pruning is often carried on late into the hot weather, and pruning coolies would render the surface soil unfitted for keeping in the moisture. A compacted soil is as bad as a too deeply dug one. I suggest a very light pruning immediately after crop, as it not only takes less time, but is less of a shock to the trees and less strained by bearing. The stirring to a depth of four inches immediately follow this, and be the last work done. If manures must be applied before the monsoon, let them be put out after the showers have well set in, but those who have left the beaten track as to apply all manures after the monsoon have found the benefits derived therefrom to far exceed a manuring. Bulky manure can be stored in deep pits till re-

which they may ferment and mellow, but not decay and riorate, if properly protected from air and moisture by a eient covering. Immediately after the rains they can be dcast and dug in, and it will be found that the time they to become effective may be stated as somewhat proportional he depth at which they are placed. These bulky manures old be mainly depended upon to keep the soils up to the isite standard of fertility, while for assisting the trees in nring crop or resisting an attack of leaf disease, chemicals e in as supplementary aids. When these are applied, as their on is immediate, care should be exercised in selecting the e so as to get the utmost benefit from them; and of course ill depend much upon circumstances. But I am merely tioning the question of manuring here as affecting the hot- ther "stirring" of the soil. Where autumn manuring is estab- ed, it is removed from among the obstacles to proper "stir- ing." Trees that have been properly looked after do not give h trouble in the matter of pruning and handling, and I have and seen such good results from careful knife handling—i.e., ing and handling combined—in the monsoon, that I should ost feel inclined to suggest the omission of pruning after crop together, except perhaps when the crop has been heavy, when e might be need for it, just to remove those branches that had ne. If pruning could be put off later, then the soil stirring old be done immediately stripping was completed, and this uld complete the season's work. If two adjacent strips of land e tried—the one stirred, the other not—it would at once be n that all conditions being equal, the resulting crop from the ed land would exceed that from the unstirred, for there uld be less loss of blossom where evaporation from the surface he soil was thus cut off. My first experiment in this proved s conclusively some years ago, but with "Mamool" to contend h, it was some time before I got beyond the experimental stage, even when I generally adopted the system, it was not as com- ely carried out as it should have been, as other works erfered.

HUMUS.

COFFEE.

the Planter' on Coffee.

Our Calcutta contemporary writes that in its recent remarks on the coffee industry in India it had no intention to decry the dustry; yet it is bound to insist that "coffee planting as dustry does not occupy that favourable position in s year of grace which it did forty or fifty years ago." r contemporary is of opinion that "what coffee planters ght to set about is to try and improve the soil which has d all the sustenance it once contained taken out of it by ars of continuous planting. It is better to go on opening e fresh land than to persist in planting and replanting at which has borne fruit a thousandfold more than there s any reasonable right to expect, and then to do it at a s from year to year."

all we return to the wild stock?

A correspondent, in enclosing a cutting re the coffee trade of Abyssinia, urges that the Government of dia might with great advantage import some of the seed r sale and distribution to South Indian planters. He vances, as reason, that Abyssinia is one of the, if not the, ue homes of coffee, and that we should thus be able to vert to the original wild stock. Our readers may perhaps member our addressing the Director of Kew on this very int, and that he strongly advised us *not* to take the rograde step of going back to the wild stock. By careful

selection of the seed from our healthiest and most prolific trees, we should be able to procure stock far superior to either the wild or present average cultivated crop. This is not a matter for Government, save indirectly. Planters must help themselves. As we have very frequently urged, particular trees should be selected on each estate and reserved solely for either seed or grafting. The latter process might be more expensive in the beginning, but is far surer and quicker. As coffee grafting is performed in the same manner as mango grafting, i.e., by inarching, there should be no difficulty in securing the services of a competent native gardener.

It would be as well to select the previous year some fine ripe seed off the hardiest and healthiest bushes available for the purpose of providing strong and hardy stock to graft on. Should interest be taken in the subject, we shall be glad to publish full directions for the proper carrying out of the operation.

Surface manuring with artificials.

In our "General Notes" of last week we had some remarks on draining, demonstrating how loss of soil by surface wash might be entirely prevented. If wash of soil can be prevented, it follows that loss of manurial constituents can also be prevented in a large measure. These results attained, the chief objections against surface manuring are overcome.

We imagine that the great objections to surface manuring are (1) Danger from wash, (2) Supposed inability of feeding roots to assimilate the manure, (3) Its alleged expense. The first of these we have met. The second is difficult to treat seriously, save on the supposition that the feeding roots of coffee are confined to a radius of a few inches round the stem. The last objection, that of expense, we have still to dispose of. It may be held that the extra expense of draining incurred by the method advocated last week should be reckoned in. This we hold to be unreasonable, as its value as a preventative of wash is more than enough to justify the slight extra outlay of five to six rupees per acre. The cost of applying artificials broadcast and digging in lightly is certainly far less than pitting and covering in even the small eyebrow pits in common use. Weeding must certainly be more frequent, but as hand weeding can be perfectly done for 12 rupees per acre at most, *if regularly taken in hand every month*, we do not see any particular fault in this arrangement.

The benefits of the system are not few or slight. Practically the total cessation of wash, the complete and equal absorption of manure, no damage from cut or torn roots, and necessarily an estate free from weeds.

When it is remembered that the total cost will not be more than the usual expenditure on routine work, it must be admitted that we have made out a fair case, on paper at least.

The London Market.

Although the receipts in Rio and Santos have continued on the same heavy scale, says the *P. M. Review* of the 28th ult., and a fresh estimate of the present crop has been put forth by Messrs. Johnston and Co., anticipating from $4\frac{1}{2}$ to $4\frac{3}{4}$ million bags from Santos, prices have not given way. In the terminal market there was a slight fall in the middle of the week, but this has been fully recovered. A rise in the

Brazil exchange has also led to an advance in quotations in Brazil. In other kinds of Coffee, and at auction, there has also been a better demand, and qualities above the value of 75s. are all decidedly dearer, coloury parcels showing the greatest advance. Colombian and similar Central American sorts are from 1s. to 2s. dearer, while the principal home trade kinds, such as Mysore and Costa Rica, have all sold at a further advance.

OFFICIAL STATISTICS OF THE COFFEE TRADE OF THE UNITED KINGDOM.

The Brazil Coffee Market.

The latest accounts of the Rio coffee market are thus reported in the *Rio News*:—"The demand during the week has been steady, and the reported sales reach nearly 90,000 bags, with reserved business done, as to which only guesses can be made. The market felt the very free receipts, but generally dealers and factors were firm, and it is currently reported that no business was realised under 12·500dols. per arroba for No. 7, while this quotation is contested by some, who declare that at no time could coffee be had at under 12·700dols., and brokers' prices have generally been 12·800dols., at which there were buyers when the market closed on the 7th. The purchases by exporters in the interior have considerably exercised the factors, and also some of the banks, whose business is threatened by the 'new departure,' but, so far as we have been able to learn, these latter do not show any inclination to increase facilities, and the planters must have funds. The question has even been ventilated in the Chamber of Deputies, where, it is reported, one of the legislators virtually charged the exporters with forcing a decline in the Rio market to secure better terms from planters, who base their prices on the quotations furnished daily by the local press. And the planters are also charged with bad faith in selling their coffee to the exporters when they have received advances from the factors, whose security is virtually lost. We believe that exporters generally will finally abandon this mode of business, or, if they persist, a serious change in the coffee trade is imminent. In the meantime coffees are being poured into the ports of Rio and Santos, and are

being rapidly shipped; and the fact that the foreign market do not 'bear' prices furiously shows clearly that the Brazilian stocks and receipts are largely already in the hands of consuming markets."

TEA.

ESTATE BULKING AND BINS.

AN impression has of late obtained that London bulk tea was preferred by the trade. This is not so. More tea bulked in London is distinctly injured by the operation, as the bulking rooms, by the Fire Insurance Rules, cannot be artificially heated. The consequent exposure of the tea to the damp atmosphere is unavoidable, and fine parcels suffer in consequence and lose their flavour.

The great drawback to estate bulking is that, in many instances, the tea must remain in bins until enough has been sold for a break is made. It would be of immense service if a really efficient and air-tight bin could be placed on the market.

Until such an invention is registered, we would suggest the following alteration in the usual style of bin. At present a common shape is long and shallow. We would suggest that the bin should be, say, only three feet in diameter, and of any convenient height. Every five feet in height would hold about 1,000 lbs. Instead, or in addition to the ordinary folding lid, there would be a rather heavy block of seasoned wood fitting closely to the sides. This should be covered with a lining of cloth so as to fit more tightly still and practically prevent any intrusion of air to the tea beneath. Metal rings, to which cords could be attached, should be affixed to the upper side of the block to allow of its easy removal. The day's manufacture packed in the bin could be slid down the sliding lid or block could be let down and firmly pressed on to the tea. A loose cloth or two on the top, and an ordinary hinged lid would complete the operation. The idea in the above is to allow the smallest possible surface of tea to be exposed to the air. And as the day's manufacture would only run the risk of exposure for one day, we think that for practical purposes our bin would be found to answer well. To allow of easy unpacking when required, we should advise the doing away with the ordinary trap-door altogether. In its place we should have an opening of about two feet square, to be closed after each emptying of the bin by careful soldering on of a corresponding piece of tin, to prevent leakage of air upwards. We do not think, however, that this opening is necessary at all, as the lid could be removed sufficiently easily from the top. To economise work, and also to utilise old bins, it would be easy to have one large bin of the ordinary length, divided into compartments of the size indicated.

We shall be glad to hear of the results of experiments on this matter, as the subject is of much importance to owners of all but the largest concerns.

A correction.

In our last Market Supplement, we stated that the sale of Brooklands tea was put at 8½d. This, we are informed, is the figure which was paid for it. On the 26th ultimo the same lot netted 10d. a lb., a price on which the Manager is to be congratulated.

Red leaf.

A Sylhet correspondent of the *Planter* writes that no satisfactory conclusion has been arrived at on the subject, whether

should be thrown out or made into tea. He says that a man in Assam argued in favour of throwing it away; another made his into tea; yet another did the same, but priced it separately, and obtained 2 pies per lb. less for it than for his good leaf tea. Can any one say which of these three courses is the best?

Samples of Tea for France. The French Post Office, says the *H. & C. Mail*, announces that, to comply with Customs regulations, it has been found necessary to prohibit the importation of tea into France by sample Post in quantities weighing over twenty grammes. That weight is slightly less than three-quarters of an ounce, sample packets of tea, of which the gross weight exceeds three-quarters of an ounce, should no longer be posted. Samples of tea addressed to other places abroad, the weight of eight ounces named at page 377 of the Post Office Guide remains unchanged.

South America. We are also indebted to the same journal for the suggestion to create a market in South America. Very little tea is consumed in South America, and, so far as we are aware, no important step to increase the consumption has been taken. There is a chance to make an attempt now. An industrial exhibition, under the auspices of the Government, is to be opened in Lima, Peru, on December 9, which it is intended to make a permanent institution. Manufacturers of other countries are specially invited to send, for exhibition, machinery, &c., and classes that will be of use in Peru. All articles sent will be exempt from Customs dues as well as Consular fees.

Legumes in tea. "We note that experiments are being conducted on several tea-gardens with leguminous plants with a view to obtain a nitrefied soil, as these plants owe their property of fixing atmospheric nitrogen to the presence of nodules infested with bacteria to be found on the roots of nearly all Leguminosæ." Thus saith a Calcutta exchange. We wish the meaning were clearer, but are glad to observe the interest taken in the subject. On coffee plantations the use of leguminous plants simplifies matters greatly, but in tea the question assumes a far more delicate aspect. We understand Mr. Nelson has thought out a system of leguminous manuring with regard to tea, which we hope to have the pleasure of publishing in these columns.

Ceylon and Indian Teas in Russia. It appears from the last British Consular report from Odessa that the import of Ceylon and Indian teas into Russia is increasing. Last year about 100,000 lb. of tea were imported at Odessa from Ceylon. In the first six months of this year shipments amounting to 150,144 lb. arrived direct from Ceylon, in addition to a considerable quantity from London. As the amount imported during this period is one and a half times as much as that for the whole of 1896, it will be seen at what a rapid rate the import of this article is increasing. Indian tea has also been imported on an experiment to the extent of 45,000 lb. since January 1 last. These figures in themselves are, the Consul-General remarks, comparatively insignificant; but it is worthy of note that the importation of tea from China decreases in proportion to the increase of that of Ceylon teas. The latter are, however,

invariably retailed blended with China teas, as pure Ceylon tea is not appreciated by Russian consumers.

Dusty teas.

In one of its last issues, the London *Grocer* attempts some mild raillery on the advice we gave to planters re "broken teas," advice echoed and reiterated in every planting journal in India and Ceylon. It is true that Ceylon had the ill-luck to be the first to suffer in the drastic operations of the American sieve-test, but that is one of the risks that always attends brisk enterprise. Not the slightest reflection can be cast on the quality of her teas on that account, though the *Grocer* was of opinion that such was the meaning of our remarks, a pardonable mistake due to only partial knowledge of the trade, i.e., the handling of the manufactured article. Weight for weight, "broken tea" is often as superior in liquor to "whole leaf" tea as gunpowder is to "breakens." A time will surely come when consumers will recognize the great waste always attendant on the use of whole leaf tea, and, granted a satisfactory infuser, will insist on the finest gunpowder. Thus it will come about that tea tablets, made of compressed dust in the factory and stamped with the garden mark, will take the place of the present system of packing. As a matter of course, the whole system of manufacture will be changed, and with it, changes in our machinery will be inevitable. Prophecy is so convincing to the prophet, that it is actually with a jar that we must admit that the days are not yet. And to judge by the past, such days are many long years distant!

China beaten?

In a characteristic article our contemporary, the *Ceylon Observer*, lately drew attention to the fallacy of the popular conviction that China, as a tea-producing country, is on her last legs. Very far indeed is this from being the case. It is true that in Great Britain the imports have fallen to almost nil (29½ millions last year). But this has been more than made up elsewhere. In 1871 the total exports from China were 236 million pounds, last year they were nearly 239 million. The exports of whole leaf to Russia have increased over 10 times, while those of brisk tea have increased 7 times, the total exports to Russia being 27½ and 132½ millions respectively for 1871 and 1896. Not many signs of defeat here!

Japan and Formosa, (which province was of course till quite recently part of China,) too, increased their export during the same period from 18¾ to over 60 millions.

The American trade has also been developing hugely, its total consumption of Far East (excluding of course British grown teas) teas rising from 58½ to 92¼ millions. China, it is true, lost almost 9 millions, the gain being made by Japan and Formosa.

The total export of Far East Teas have risen from almost 255 to nearly 301 millions during the period under review. The British grown teas advanced simultaneously from 15½ to 215½ millions.

There are two ways of drawing a moral from the above. One is the happy one of thanking our stars that we have such ample worlds still to conquer. The other is the more gloomy one of counting the cost of the victories already gained, and reckoning up the probable cost of our future triumphs. For there can be no halting measures. Stagnation means disaster. And, within certain limits, the lower prices fall, the greater must be extensions of acreage to

reduce the cost per pound. For every year sees such great, but so costly, improvements in tea machinery and appliances, that the lot of the small planter is daily getting harder.

The Market.

Indian.—The supply continues to be moderate, according to the *P. M. Review* of the 27th ultimo, and, in consequence of the improvement in the demand, prices generally remain steady to firm. There has again been a good inquiry for the better kinds, especially for Assams and Darjeelings, and where no depreciation in quality is shown, quite previous rates have been obtained. Until supplies are more plentiful, there is not likely to be any material drop in the prices of the more desirable grades, as the demand is sufficiently large to absorb the quantity offering. As the shipments from Calcutta are increasing, and now exceed those of last season, while the outturn in many of the gardens continues to show an excess over that of last year, the imports will soon be more than sufficient to meet requirements, and it is not then improbable that values will decline. There is no improvement in the character of the Sylhet Teas, most of those offered being thin and undesirable in cup, and the same remark applies to Cachars. Doors growths, on the whole, are of a more useful description. Darjeelings, in many cases, show a distinct change for the better, and a few invoices were keenly competed for and fetched extreme rates. Some of the Assams, however, barely maintain the quality of the earlier imports, but they have met with a good inquiry and sold at about late rates. The Travancores brought forward were indifferent, and met with but a moderate demand at declining values. Of the 30,000 packages offered at the public sales, 28,268 were sold.

Ceylon.—Notwithstanding the large quantities again brought to auction, there was no diminution in the eagerness on the part of the trade to buy at prices fully equal to those of last week; in fact, in several instances, a distinct advance was established, several well-known marks realising $\frac{1}{4}$ d. to $\frac{1}{2}$ d. more than was paid for similar teas the previous week. The amount printed for next week shows a considerable falling off, and, as we pointed out last week, the quantity available for this market during the next few months is likely to be considerably smaller than was anticipated. Owing to the comparatively small quantity of low-priced Congou coming to this country during the present season, and the large demand that now exists for tea for price, to meet the requirements of the 1s. canister, there seems every prospect of a still further rise in common Ceylon Pekoes and Peko. Souchongs; in fact, any clean tea of fair quality below 6d. per lb. can hardly fail to be good stock. Out of the 27,756 packages offered at public auction, only 1,128 remained unsold.

ROUND THE BUNGALOW.

NOTES BY "A PLANTER'S WIFE."

Bedroom comforts. I propose to give my readers a few hints which I think will not only add to the comfort of the bedroom, but also to its beauty. First there is the toilet-table, and if this is shabby, I would advise having it well washed, scrubbed and cleaned, and after it is thoroughly dry, have it rubbed well all over with sand-paper to make the surface quite smooth; after which give it three coats of white, cream, or ivory enamel, allowing each coat to get quite dry before putting on the next. Get two brass drop handles, one for each of the drawers, and you will be quite surprised at the smart appearance of the old table.

The toilet cover.

Now we come to the toilet cover, which I think, novel. My toilet cover is of pink silk, with a deep wide hem at the edge, which is lined with cotton wool till it forms a round roll edge to the table. The silk can then be covered with muslin or with an inexpensive lace of good design. The edge of the lace, of the muslin, should fall over the roll, to which it should be tacked with judiciously hidden stitches. The object of a roll edge to a toilet cover is to prevent the lace or frill edging from getting into the drawers beneath, or getting tangled up with the handles in an aggravating manner; and secondly, to prevent ornaments, such as rings, brooches, pins, etc., from falling on the table. It is obvious that to secure these advantages the roll should rest upon and not obtrude beyond the edge of the table.

The pincushion.

We come next to the all-important toilet pincushion. If you possess an old cruet-stand, which is no longer fashionable, I can tell you how to make a really distinguished-looking pincushion. Take out the bottles and wrench out the handles; clean it up and stuff it with a pincushion made of velvet or brocade filled with bran or fine hair, and the result will be most noble.

A handle for button-hook.

The handle can be utilised in various ways. It will make an elegant handle to a brush, or a steel button-hook can be affixed to the end. Another little convenience is a bracket at the head of the bed to hold a small candle-stick and luminous match box.

Pretty chairs.

One or two pretty chairs should be added to the ordinary deck chairs may be made very comfortable with little trouble. Aspinall the entire woodwork, or, if you prefer it, stain it with some varnish stain, light or dark, according to your taste. Get a strip of art serge, the width of the canvas, and a bold design down it in tapestry or double crewel wool. You may iron off a transfer, and then work the pattern merely in outline. On dark green, terra-cotta is effective, and so is orange. On pale blue, red looks well; and on brown some blues are pretty. When completed, sew it on the canvas securely. If you wish to make a chair very nice indeed, line the back with an unworked strip of the same serge or sateen of the same colour.

Small folding-chairs with tapestry carpet seats can be had very cheaply, and when the first freshness is off, they can be made into pretty articles of furniture. Or else, if you like the plan I am about to tell you of, you can buy new ones and make them up before they are worn. Cover the carpet with a piece of Roman satin embroidered in silk crewels. White lilies on a pale blue or green ground would look lovely.

Bedroom slippers.

Procure three ounces of crimson Berlin wool, a small crochet hook, and a piece of cork soles. Make a chain of twelve stitches, and in these work eleven plain double crochet; second row double crochet, taking the horizontal loop at the back of every stitch, and increasing by working three stitches into the centre stitch of the preceding row. Third row the same, without increasing. Repeat these two rows until you have eleven raised ridges from the toe, which will cover the instep. For the side, crochet twelve stitches and work double crochets backwards and forwards until you have a length sufficient to reach back of the sole, then break off and work a similar piece for the other side. Join together at the heel. Work four rows of double crochet round the top—that is double crochet—twisting the thread once round a mesh one inch wide before inserting the hook to make the stitch; then one row of plain double crochet. Line the inside with flannel and sew to the sides, having first bound the edge of the soles with ribbon. Finish off with a ribbon rosette in front.

THEY DON'T WATCH THE POT.

A WATCHED pot never boils, and a watched clock never runs. Nothing is quick enough for impatience. Minutes, hours, and days are mere words after all. We are happy—a day is but an hour. We are miserable—an hour is a day.

From the summer of 1890 to the autumn of 1892 wasn't a contented and busy people; but to Mrs. Annie Dutton it was like one of those tremendous geologic periods that the learned men talk about. For it was measured by weary heart-beats and steps taken in pain. Her trouble began as it begins with

ed multitude of women—the tired and languid feeling, the
st with food, the distress after eating, the coated tongue, the
ng pain at the pit of the stomach, the nausea and vomiting of
uids, &c.—a dreary list.

ting of her experience recently, she says: "After a time I
o much distress that I never wanted anything to eat; the very
of it made me sick. Night after night came, bringing sleep to
t, but not to me. I was low, miserable, and worn out, and
sit for hours all alone, wishing for no company. And, then
vous. Why, the slightest noise startled me.

vo terrible years of this I was dragged through. In that time
four stone in weight, growing continually weaker. I consult-
ctor after doctor, but they were not able to do me any real
I tried change of air, yet was disappointed in my hope of
vantage from it. I only lost ground, and became more and
feeble.

en came unexpected help. In September, 1892, a neighbour
e told me of the good Mother Seigel's Curative Syrup had
er, and urged me to try it. I had heard this medicine well
n of for years; still I had no faith that it would benefit me in
ondition. However, my husband got me the Syrup from
, and after I had taken it a few days I felt better. I could
nce more, and my food agreed with me. After I had used
bottles I was a new woman. *I was well*; and I have been in
health ever since. Now I recommend the Syrup to all our
ners and friends, and so does my husband.—Yours truly,
(ed) Annie Dutton, Nottingham Road, Borrowash, near Derby,
r 6th, 1893."

to the opening symptoms, the narrative of Mrs. Susannah
e is identical with that of Mrs. Dutton, so we need not repeat

October, 1890," says Mrs. Durose, "I read about Mother
's Syrup in a little book. I got a bottle, and after taking it a
time I was well as ever, although *I am 78 years old*. My
ter, who suffered from weakness and neuralgia, took the
y with great benefit. I know many others who have been
by it after all other means had failed.—Yours truly, (Signed)
nah Durose, Hawthorn Cottage, Borrowash, near Derby
r 6th, 1893."

latter lady would be called very old, as she is 78; and, as
average nowadays, she *is* old. Few of us, perhaps none,
ny hope of living as long as she has. Why not? "The days
years are three score years and ten," says David. But most
race fail to reach 70, while many exceed it. There is no law,
ct, on the subject. We are each entitled to live as long as we
nd to be as happy as we can; and both depend (accidents
ed) on health; and health means the continued natural action
digestive process.

d that Mother Seigel's Curative Syrup promotes *that*, a host of
sses in England alone have testified.

(This excludes extra postage where the weight of leaflets
necessitates such.)

Advertisement charges are strictly payable in advance, except by
w. approved customers.

MARKET SUPPLEMENT.

SATURDAY, SEPTEMBER 25, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (September 3, 1897) says:—Moderate supplies were offered in Auction this week consisting chiefly of many descriptions of Central American, the bulk of which sold at steady rates.

About 1,000 bags East India were offered, good Coorg and Neilgherry selling at full to extreme prices, while grey kinds realised valuations.

Central American went off readily at a slight advance for desirable and colory lots, but common kinds were not so easily disposed of, and sold somewhat irregularly. *Futures* continued heavy receipts and increased estimates for the present Santos crop exercised a depressing influence and prices shew a decline of about 2/- on the week.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending August 31st, 1897, says:—Bank rate 2%. Bombay Exchange closes at 1s 3 $\frac{1}{8}$ d. Brazil Exchange 8 $\frac{1}{8}$ d. Rupee paper 3 $\frac{1}{8}$ % 63 $\frac{3}{4}$. Silver 23 $\frac{1}{2}$ d per oz.

Coffee continues steady on the spot, and all good qualities have again been well competed for at fully last week's values. Brazil markets are quiet.

The sales included:—34 casks and tierces 12 barrels and bags Plantation Ceylon sold from 68s to 115s. Of 3 cases 400 bags East India, 3 cases 379 bags Neilgherry sold from 62s 6d to 102s 6d, and 21 bags Travancore were bought in; 441 barrels 5 bags Jamaica chiefly sold at 53s to 121s; 183 bags Costa Rica 63s to 68s; 2,836 bags Guatemala chiefly sold at 45s to 102s; 395 bags Nicaragua 46s 6d to 56s 6d; 226 bags Salvador chiefly sold at 58s 6d to 86s; 459 bags Vera Paz and Coban small part sold at 60s to 101s; 3,899 bags Columbian chiefly sold 50s to 103s 6d; 100 bags Guayaquil bought in; 196 bags Peruvian part sold at 47s 6d to 50s; 115 bags Venezuelan bought in; 52 bags Nyasaland sold at 69s 6d to 48s. On quay terms. 278 bags Rio were bought in; 427 bags Santos part sold without reserve at 32s to 35s, and 499 bags washed Santos chiefly sold at 54s to 64s.

Futures have been further depressed by the continued abnormal receipts in Brazil, which have averaged during the past week 20,143 bags in Rio, and 36,000 bags in Santos. The market closes quiet at a decline of 6d to 1s, viz.:—Good average Santos in Havre, December delivery, fcs. 42.75, in Hamburg pf. 34 $\frac{1}{2}$, and No. 7 low ordinary Rio in New York \$6.35.

To-day's London official quotations are:—

Addison & Co.'s Printing Works

are provided with the latest patterns of Steam Machinery for the production of all descriptions of High Class & General Printing.

PRINTING.—Commercial, Official, Legal, Private, Educational, Social, Fancy Artistic and Illuminated. Every description of bookwork or jobwork, from a visiting card to a three-vol. novel. Colour printing a speciality.

LITHOGRAPHY.—Maps, diagrams, commercial forms, bill-heads, trade cards, facsimile circulars, labels of all sorts, plain or coloured. Menu Cards and Dance Programmes specially designed.

BOOK BINDING.—Any description, from a marble cover to the most elaborate morocco binding.

RUBBER STAMP MAKING.—Addison & Co. are the Contractors to the Government of Madras. Their Rubber Stamp business is the largest in India. Prices have been recently reduced, but the quality remains, as before, the best possible.

ENGRAVING on wood, metal, copper, brass or steel. Illustrations for newspaper advertisements, inscriptions on silver ware, copper-plate visiting cards, steel dies for crests, mottos, addresses and monograms, brass or other metal seals, for stamping or wax sealing.

DIE STAMPING in plain or colours, gold, silver and coloured bronzes. A. & Co. have several die stamping machines and exceptional facilities for doing work well and promptly.

COPPER-PLATE PRINTING.—Ladies' and gentlemen's visiting cards printed in an hour. Mofussil customers leaving their card plates in A. & Co.'s custody can get a fresh supply of cards by return post.

Ruling, Label Punching (large variety of shapes), Perforating, Cutting, Numbering by Machinery.

STATIONERY AND FANCY GOODS.

Ledgers, Cash Books, Day Books, Memo. Books, Swan Fountain Pens, Penholders and Pencils in infinite variety, Flexible Blotters, Writing Cases, Water Colours and Artists' Requisites, Mathematical Instruments, Sketch Blocks, Drawing Papers, Drawing Boards, Photo Frames and Albums, Inkstands, Stationery Cabinets, Despatch Boxes, Copying Presses, Letter Balances, Cash Boxes, Violins, Cricket Outfits, Games, Neo-Cyclostyle Duplicating Apparatus, etc., etc. Send for Catalogue. **Sole Agents for the Yost Typewriter.**

STATIONERY OF EVERY DESCRIPTION.—Samples of letter and note paper on application.

CYCLES.

ADDISON & Co., the Pioneers of the Cycle trade in South India, are Sole Agents for the celebrated Singer, Swift and Premier Machines. Raleighs, Waverleys, Colombias, Bantams and other High-Grade Machines also stocked. The "Addison Special," built by Humber & Co., Limited, cushion tyres, the cheapest machine ever offered in India, Rs. 190. Send for Cycle Catalogue.

**Works: 153; Fancy Goods and General Stores: 188; Cycle Stores: 189,
MOUNT ROAD, MADRAS.**

PLANTING OPINION.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for advertisements will be: 4 as. per line for the first, 3 as. for the second, 2 as. for the third and succeeding insertions. Five-line advertisements for subscribers will be inserted for three issues for one rupee; non-subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

P.M.B.—Remittances should be sent to the Manager, "Planting Opinion," Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 8th October 1897.

Nellampathy. 29th September.—Rain for week 73 cents; cloudy and light showers. *Leaf-disease*—Having come earlier than usual seems to be leaving earlier, as some places are almost free of it. *Health*—Fair. *Labour*—Plentiful.

Nilgiris. SHOLUR, 28th September.—Only one day without rain since last report and a complete absence of sunshine, making tea manufacture, from the small quantity of leaf obtainable under the circumstances, a laborious and unsatisfactory operation. Rainfall for month 5'61, making 48'33 to date. Temperature much lower during the day, highest and lowest being 69° and 59°. *Labour*—Plentiful. *Health*—Good. *Grains* same as last week. *General*.—A little black bug owing to continual wet.

GENERAL NOTES AND ARTICLES.

Drains again. A correspondent gives elsewhere an interesting extract from the "Diary of an Old Planter" on the subject of drains. The conclusion runs as follows: "The result of my experience of catch-draining is that with a drain at a gradient sufficiently easy for the water to deposit the soil held in solution, the drains block and burst, causing immense damage.

If cut at such a gradient as to keep themselves clear, the soil is cleared off infinitely faster than with no drains at all." The alternative systems, we may remark, are monsoon weed-growing and water-pits. The author, now alas! dead, of the Diary alluded to was one of the most capable of the generation of planters now so rapidly passing away. His opinion consequently is of great weight. Yet between the drainage systems tried by him and that advocated by us lies a wide difference, *i.e.*, in the distance between each drain. We suppose that 60 feet apart is probably the maximum distance drains could be cut with any advantage on the *gentlest* of slopes. On really steep land such drains are ridiculously inadequate; in fact, we believe that 20 feet apart in many instances would not be a bit too close. Now it is very patent that the rush of water down sixty feet of hill must be far greater, even in proportion, to that off 20 feet only. Consequently that three drains cut at the lesser interval would carry off with perfect safety a much larger rainfall than could be dealt with by one alone.

Further, that, as the fall or rush of water gains power in direct ratio to its velocity, the soil carried away by swiftly flowing rivulets sixty feet long must be directly and proportionately greater than slower running streams a third of that distance. The further apart the drains are placed, the more concentrated must be the flow of water therein. It's a case of *divide et impera* again. The whole object of careful draining is to arrest the hundreds of small rivulets before they have time to combine their forces. We still hold, therefore, that by systematic and careful draining wash can be practically stopped altogether. Whether water-holes or monsoon weed-growing and sickling are better methods or not are outside our argument. With these we may deal later on.

Rhea in the N.-W. Provinces.

Mr. W. Gollan, Superintendent of the Government Botanical Garden of Saharanpore, writes to the Secretary of the Agri-Horticultural Society of India:—"I suppose, like myself, you are often bothered over Rhea. Mr. Ribbentrop, Inspector-General of Forests, published a note upon it in the *Pioneer* a few weeks ago, and since its appearance I have had no end of letters about it. In his article, he mentions £7 (or Rs.120 at 1s. 2d.) per ton as a paying price for the dried *ribbons* landed at Bombay. I daresay the Rhea Fibre Syndicate would like to purchase them at that figure; considering it takes Rs.75-4-0 (£4-7-9½ at 1s. 2d. per rupee) to carry a ton of Rhea from Saharanpore to Bombay, I do not see where the grower's profit comes in. Rhea is one of those erratic plants that will grow or exist anywhere in India, but to make it produce even one good crop of *wands* in Upper India districts, it requires the richest of soils further enriched with expensive dressings of manure. Our highest outturn is a ton of *wands* per acre, weighed after stripping off the leaves, which yield from three to seven per cent. of *ribbons*, according as they are well cleaned and scraped, or not; so it takes from three and a half to seven acres of land to produce a ton of *ribbons*, which will, according to Mr. Ribbentrop, fetch £2-12-2½ (or say Rs.44-12-0 at 1s. 2d.) to the grower at Bombay, after meeting freight. After the grower has paid land rent, irrigation charges, cultivation, cost of stripping the *ribbons* from the *wands*, drying, packing, delivery at the Railway station, etc., I greatly fear his

£2-12-2½ will be *non est*; in fact, at Mr. Ribbentrop's price he will have to draw upon his banker pretty considerably after spending the above, to even produce his ton for which he is to receive £7 at Bombay."

It will be seen from the above letter that there is no profit to be made in the cultivation of rhea in the North-West, unless prices go up considerably, and it is probable that at the present rates, rhea cultivation in Assam will not pay. So far the Rhea Fibre Syndicate do not appear to have quoted *f.o.b.* rates for Calcutta.

It would be as well for members cultivating rhea to bear in mind that though plantations are made on rich soil, further enrichment is necessary to raise a remunerative crop.

Aloe Fibre.

The *Indian Textile Journal* informs us with a most interesting account of the trade of Bombay in Aloe fibre. It says: "Few of our readers are probably aware of the increasing business that is now being done in the export of Aloe fibre. There has been a continuous demand for the fibre from many parts of the world, and it seems that if India can supply it in large quantities there will be a good field before those who will set to work and begin the export on a large scale. As it is, it unfortunately remains a neglected industry in this country, but if once regular shipments were made and depended upon, a steady demand will be built up. According to a correspondent, a visit to the houses at Colaba would surprise many a capitalist in search of a profitable investment. Wagon loads of the fibre are sent down to Bombay from the growing districts by the merchants or their representatives. It is forwarded either in bulk or in loose bales, and on arrival is carefully sorted by the buyer, who fixes his price, which varies from Rs.100 to Rs.120 per ton according to the different qualities. The price delivered in London is reported to be from £15 to £17, so that a good margin of profit is generally left to the Bombay exporter."

India, like most of the Eastern countries, possesses a great variety of fibres; but very few of them are commercially useful. Aloe fibre grows wild in many parts of India, the Bombay supply depending on the wild tracts of Central India, the whole of the Deccan and the Bombay Presidency where, on the coast of Kathiwar, and particularly in the tracts near Poona, it grows in abundance. No systematic cultivation of the weed is yet attempted. Men, women and children of the lowest caste pick the leaves in swamps and malarious bogs when they have no better occupation to follow. The work is alike unhealthy and injurious, as the juice of the plant causes itching of the skin, and in the case of sores or cuts the limbs have been known to swell. Families set to work in groups, and while some gather together the leaves and stems, the others strike the leaves after they are dipped in water, against a stone, with a operation separates the fibre from the leaves, juice and waste. This is the most primitive of the methods still followed in many districts, but of late several hand machines of somewhat crude design have been made by which the fibre is extracted. Having separated the fibre in this way, the natives attend the bazaar with their supply and part their small bundles for a very nominal consideration, the shape of food-grain or copper coins. The fibre is not used in this country either pure or mixed with hemp or flax.

ng cordage, etc. America exports large quantities of fibre to all parts of Europe, Mauritius being next in her y. The plant in these countries is, moreover, systematic-cultivated, and the fibre being extracted by improved machinery, is commercially far superior to the Indian alooe.

EXCHANGE—THE RISING RUPEE.

R many years loud and seemingly universal have been lamentations over the *falling rupee*; now a still small is beginning to make itself heard whose burden is *rising rupee*, and it is a voice that will probably increase ere long it makes itself heard over the length and breadth of the land, at least the land of India.

was glad to see that Mr. Acworth took up the subject at the recent meeting of the U. P. A., and that you direct attention to it as a matter deserving of discussion amongst members.

Whatever complaints may have been made against the falling rupee, it was not one in which the growers of produce for export, and amongst them the tea and coffee growers had any reason to join. An exchange always favorable to the planter throughout many fluctuations has been the antidote for leaf disease and short crops from whatever cause. Many a brave planter has gone down in the struggle with leaf disease, and but for exchange many would have succumbed; and even those who may be reckoned prosperous might still have been making uphill work of it. It is natural, then, when they perceive that they are being gradually deprived of this advantage, that the planters should take the matter in hand. One at the meeting of the U. P. A. seemed prepared to follow Mr. Acworth in discussing the subject, and probably like Mr. Hodgson they all felt it to be an intricate

It is particularly a subject which requires study, and could be well if the planters made themselves acquainted with it, for unless it is seen that they speak from an intelligent knowledge of the matter, their resolutions and proposals will carry little weight with those to whom they are presented.

is a case that forcibly reminds one of the two sides to a shield. The Government and the services largely interested in making remittances to England see the side which represents the least loss in remitting. Planters and growers of produce for European markets generally see that marked with low rates of exchange which gives them the greatest number of rupees for each pound sterling of their produce sold. The merchant and banker occupy an intermediate position. They may be said to see the old edge on and observe nothing but a constant wobble in which no side is distinctly visible, the fluctuations being their bane.

Whatever the proper remedy for this state of things—I hold it is no temporary action such as closing or opening the mints that will do—the planters have every reason to complain of the way they are being handicapped by growers who have the full benefit of the present price of silver. It affects a very large body of producers. Wheat, jute, indigo, seeds, cotton and a host of other things suffer in the same way. But the question is, what is to be done? As everyone who had studied currency matters foresaw, the closing of the mints, by stopping the

usual fresh supply of rupees and by reducing the demand for silver, must in time impart an artificial value to the rupees in existence, a value out of keeping with the world's market value of silver and the silver currency of other countries. But then the object of Government was to raise the exchange value of the rupee and bring it more into line with sterling money, which, of course, is based on a gold standard; and this is being gradually done. If I remember the Government programme rightly, the next step is, when the rupee has reached certain level, to make it exchangeable for gold and thereby bring about a mixed currency. Whether they will persist in carrying out this programme remains to be seen. It was adopted after thoughtful deliberation. Mr. Acworth, therefore, was wise in pointing out that isolated action would be unavailing, and that they should get the Chambers of Commerce and other influential bodies to join in representing the matter to the Government or House of Commons. But as I have said, what is to be done? What will the planters propose? Are the mints to be opened, exchange allowed to fall, and the Government and the services to be again embarrassed with costly remittances. The covenanted services can, I should say, be easily dealt with, for the Government can arrange to meet them by a fixed rate of exchange, and this would be only fair to men originally employed in England.

The present position of exchange favours the home manufacturer who exports to India, and Manchester would no doubt have a say in any proposed change. Manchester influence will no doubt meet with response from many members of our Chambers of Commerce who have large dealings with that city. Mr. Acworth spoke of India having practically no manufactures. Well she has developed the manufacture of cotton yarn and certain grades of cotton cloth on a considerable scale, and if the rupee were allowed to fall to its natural level, the strong tendency would be to promote the making of fabrics and other goods in this country instead of remitting for them to England. This again would be opposed to home interests. The whole goes to show the conflict of interests, and that the planters when they essay to tackle exchange have no simple matter to deal with.

Things, however, have become so abnormal that I believe there can be no rest till something is done to place them on a better footing. I see by a late *Madras Mail* that the bullion value of the rupee, that is its metal value, is about 9½d.!! Well may we exclaim with Hamlet, "Angels and ministers of grace defend us," for is not this but the very ghost of a rupee, and think of the poor shilling, the Coin we valued so much in our younger days, worth less than 5d.!! What a temptation to illicit coinage? Who will say the game is not worth the candle? I was much struck the other day in being paid Rs.40 in bright shining coins, one would have said just fresh from the mint. What was my surprise to find they bore the date 1840!!! Now was this from an old hoard carefully wrapped up and preserved from any taint of tarnish for 57 long years? or had they come direct from some private mint, the old die having been got hold of? It was a specimen of coinage which set me a-thinking.

My idea is that the only real cure for all these evils of the currency is a return to bimetalism, but to go into this would extend these remarks beyond due limits. A knowledge of

bimetallism, however, is necessary to a right understanding of currency generally, and I may take it up later on. Meantime I would illustrate shortly the abandonment of the system by employing a parable.

"There was a stout ship once named the 'Sound Currency.' During 70 years she had ridden out many a gale with one anchor and *silver* cable at her port bow, another such anchor and *gold* cable at her starboard bow. At times there might appear a greater strain on the one cable than on the other, but together they held well, ensuring the safety of the ship, and she rode steadily through fair weather and through foul. In the year 1873 some long-headed sea lawyers thought she ought to do as well with *one stout gold cable*, so the silver one was cut away; gradually the good ship began to drift, and she drifted till the rocks on a lee shore brought her up, and there she has been going to pieces ever since. We amongst the wreckage are clinging for dear life to any spar or plank we can lay hold of to help ourselves afloat, and now we are getting well into the surf. If we manage through it on to some friendly shore where we can collect our thoughts and reflect quietly on the cause of all this disaster, we shall no doubt see the need for building a new ship having the two old cables that held so well through every vicissitude of weather."

As to the information you think would be useful regarding Planters' Exchange operations, I don't suppose the agent or firm making advances incurs any risk so far as exchange goes. For each advance made, the planter either draws a pukka bill under an arranged credit, or gives the agent or firm a *pro forma* bill which in regard to exchange has the effect of a pukka draft, so that the exchange belongs entirely to the planter. Of course with those planters who are entirely independent of firms and advances, they can make their own arrangements about drawing, timing their drafts to avail of a favourable rate, or to suit their requirements generally. There was a time when some firms lost considerably. Before it was perceived that exchange was on a decidedly downward grade, firms here made advances, drawing simply on their own credits and charging the planter interest till the Bills of Lading for his crop were obtainable when they drew bills on his account against the shipments at the exchange of the day. If between the time they drew on their own credits and the drawing against the shipments a heavy fall had occurred, the agent or firm was the loser. After it was seen that this had become a settled risk, that risk was placed at the door of the planter whose business was the occasion of it.

Your remark that "the higher the exchange the greater the sterling value of savings" applies equally to the planter as to the merchant. Suppose after benefitting by the low exchange that has prevailed the planter now sells his estate, he would decidedly gain by the higher level to which exchange has gone in taking the proceeds to Europe. But the savings form only a small part of his drawings for the working of the estate, so that taking it all round, a low exchange would be more to his advantage than a high one, always presuming of course that the rupee continues to retain its value here in commanding the same amount of labour, etc., as it did formerly.

As I hold that the motto, "United we stand, divided we fall," applies forcibly to the proper employment of the two metals in currency, I will sign myself

"UNITED WE STAND."

THE WRIGHT FUND.

DEAR SIR,—In continuation of the Subscription, List of family of the late Adolphus Wright of S. E. Wynaad:—

Subscription from Mr. T. deRozario	Rs.	50	0
" Mr. J. Burrows	"	50	0
" Mr. Fred. Bell	"	50	0

Total ... Rs. 60 0 0

Promised from S. Wynaad through Mr.

J. W. Hockin	Rs.	55	0
--------------	-----	----	---

Total ... Rs. 115 0 0

Previously acknowledged ... Rs. 413 8 0

Total ... Rs. 528 8 0

Rupees 141-8-0 have been expended in the support of the fund through the kind offices of Mr. E. deRozario, of the Hosur Goodaloor, and Rs. 50 have been sent to the Rev. F. Goudin, Priest at Goodaloor, through whose kind help for the children will be provided for at the Adyar and Madras Orphanages.

OOTACAMUND,
15th Sept. 1897.

J. W. MINCEY

CONSERVATION OF MOISTURE.

DEAR SIR,—"Humus," in your issue of 25th September, advocates a "stirring of the soil" to a depth of four inches this before the hot weather regularly sets in, which also says should be the last work, as any trampling over the ground after the stirring will cause it to harden again and there will be no beneficial result.

Now what month does he begin the stirring operation, and what month is it completed? Suppose one to start about the early part of January, then what about the coffee on the ground would it not be covered over? I don't suppose crop picking perfectly completed anywhere by the end of December.

"Humus" also says a compacted soil is as bad as a too deep dug one. "Science and Coffee," by the late W. Pringle, on the other hand, advocates a good deep dig at about the same time.

"Humus" says to stir the soil. Who are we to be led by?

If "Humus" only goes in for stirring the soil before the hot weather, when does he indulge in a good deep dig?

Last year between the months of September and October I deeply forked the whole of my estate except one patch, and now I can safely say that I have got a far better percentage of crop in the dug patches than in the one which was not dug, the patches being more or less equally wooded. This confirms the case of compacted soil being a cause of failure.

I am inclined to believe in the soil being dug before the hot weather really sets in, but whether it should be a deep dig or only a "stirring" is what I am not thoroughly certain. This season I shall take two patches and fork one deep, the other lightly, and watch the result.

SANTAVERI,
28th September 1897.

A SIMPLE SUNDIAL.

DEAR SIR,—I observe that Mr. A. Hall favours your readers with the P. O. of 18th current with methods for finding true north.

to enable one to set the gnomon or stile of a sundial, object being of course to get correct time. I am afraid to the man in the street, or in this case to the man in the field, the "sine declination $\times$ secant latitude = amplitude," will be so much Greek, and Chambers' Mathematical Tables a sealed book. Many of us, I fear, have left our mathematics behind with our Eton jackets.

For the time, as Mr. Hall remarks, to the nearest Telegraph Office, if there be one close by, has certainly the merit of simplicity, unless there be a bridgeless stream in flood, or a man-eating tiger in the path. Most planters will avail themselves of this method and not trouble about a dial.

For me, our great enemy, swifter we are told than the weaver's shuttle, is measured by the sun though he seems to move but slowly. He is the hour handle and the great arch overhead dial-plate. If we imagine his having a rainbow for his base, then when he reaches the key-stone of the rainbow arch is noon. At that moment and in our latitudes he is either north or due south according to the time of year. For a few days as he passes our degree of latitude to the north or south he may be directly overhead.

What would probably be useful to the planter is an easy method of fixing the north and south line and thereby ascertaining when it is 12 noon, so that he can check or correct his watch.

For this purpose the following simple method is one I think my fellow will understand. It is similar to Mr. Hall's plan with the plumb line:

Level out a piece of ground, say, 8 or 9 feet square. Fix in the centre a straight staff about the thickness of a stout walking-stick—a piece of round bar iron would do well—and adjust it with plumb line to true vertical. When the sun has travelled high up into the heavens, when you suppose it is, say, 10 or 11 o'clock, measure exactly the length of the shadow cast by your staff and make a mark at its extreme end. After noon notice when the shadow (which of course will be on the other side of the staff) reaches exactly the same length as the morning one and mark the extreme end of it. Draw a line from one mark to the other. Bisect this line, that is divide it exactly in two, which can easily be done with a piece of string, measuring the length and doubling the string. From the middle point thus found draw a line to the staff. This line will be north and south. Every day when the shadow of the staff falls exactly on that line it is then 12 o'clock at that particular place. The shadow, it will be observed, too, is then at its greatest length. When the sun is north of the staff, the shadow will be thrown to the south and *vice versa*. When the sun is directly overhead the shadow will be directly under the base of the staff, or rather there will be no shadow at all just at 12 noon. Measuring the length of the shadow is, I think, more accurate than Mr. Hall's plan of taking certain hours before and after, for the watch may not keep time with the sun.

The above plan gives the planter the 12 o'clock a sundial could show. There are other elements to be taken into account in ascertaining 12 o'clock to a nicety, as astronomers, sailors and travellers have to do, but I think he will find the above sufficient. Of course he must remember he only gets local time. Madras is the Greenwich of India, and all time-pieces should conform to Madras time, as it rules the railway, telegraph and time arrangements in India generally. So you must find out how far you are west of Madras—we are all west here but—and as Mr. Hall says allow 4 minutes for each degree, Madras being east, 12 o'clock occurs sooner there than with us. So you must put your watch on according to the distance you are away from that place. At Coonoor Mr. Hall says the difference is about 16 minutes; so when the shadow of your staff

there falls in the north and south line, you must put your watch to 16 minutes past 12 to bring it to Madras time.

Gentlemen, I trust I have made it clear.

STEAM.

ARE DRAINS USELESS?

DEAR SIR,—In reply to your article on "Drains," in your impression dated the 18th September, I daresay that the following lines culled from the diary of an old planter may prove interesting to you and to your readers who seem puzzled as to the scant attention given by some planters to such everyday things as drains. In the following letter you will see that the system of draining as you advocate has been tried and proved wanting. The letter in question begins as follows:—"Your S. E. Wynaad correspondent, in the S. I. O. of the 5th instant, speaking of drains, says he has no practical experience of systematic draining in the Ceylon way. This is most probable, as little work of the kind has been done in this district for many years, owing to the complete failure of catch or surface draining when first introduced in the sixties.

"About 1867 catch draining was much spoken of by theoretical planters as work of the utmost importance, and was especially advocated by Mr. James Gordon, who at that time was considered a great authority on planting matters. I was then serving on an estate for which he was visiting agent, and received instructions from him to lay out drains all over the estate at 25 yards apart, leading them into ravines where such were available, and elsewhere into main drains running down the slopes. The drains were first cut at a gradient of 1 in 20, 1 foot wide and 1 foot deep; these were found to be utterly useless, as the gradient was found to be insufficient to run off the water, and after a heavy shower the drains blocked and burst, causing ten times more damage than was the case before the drains were cut. The drains were filled up, and after some experiments we found that a gradient of 1 in 15 just kept the drains clear, and that 18 in. by 18 in. was the best section of drain. The drains were all re-made the next season of the improved muster, and they worked splendidly! That is to say that the water came dribbling down the hill side, saturated with soil, into the herring bone drains, which conveyed it to the main drain, and thus hurled it into the ravines. The rivers and streams were like pea-soup, and we calculated that if the drains were maintained in working order, it would take about three years to land the whole surface soil of the estate in the Arabian Sea. We then filled up all the drains, adopted the system of growing weeds in the monsoon and keeping them sickled, and were never troubled with wash afterwards. In 1888 I opened a clearing for coffee, and finding there was great wash in one part where the slopes converged to a sort of a basin, I decided to give draining a further trial on a small scale. I cut drains 20 yards apart at a gradient of 1 in 18, 18 in. deep 2 feet wide, to avert wash until weeds would grow and bind the surface soil. The cross drains led into a main drain down the centre of the basin, which fall lower down into a ravine. The soil came down in tons with every shower. I bunded the ravine in two places with loose stones, so as to detain the soil or silt, and let the water run off. By this means a considerable amount of soil was saved, but men had to be sent up every day to clear out the bunds and carry back the soil brought down by the drains. It was loss upon loss! the thief gone with so much, and so much to find the thief. A couple of weeks convinced me of the impracticability of preventing wash by surface drainage. I shut up all the drains and cut water holes 3' $\times$ 1½' $\times$ 1½', one to each tree between the rows of coffee, and these stopped the wash completely.

One of the estates drained on the Ceylon system in 1867 was Seaforth in the Ouchterloney Valley. A most elaborate system of drains was cut at considerable expense by the late Captain

A. C. Griffin, who was always thorough in any work he undertook. One year's experience sufficed to show him the absurdity of the system, and the drains were all filled up the next season. The result of my experience of catch draining is that with drain at a gradient sufficiently easy for the water to deposit the soil held in solution, the drains block and burst, causing immense damage; if cut at such a gradient as to keep themselves clear, the soil is cleared off infinitely faster than with no drains at all.

"N."

"HUMUS AND COFFEE."

DEAR SIR,—“J. W. H.” in your issue of the 11th instant probably flatters himself that he has got me by the hip. Not much. In the first case he mentions in which he grew the finest coffee in the district “in land covered a foot deep with leaves and lumbered with all the logs and twigs of an unburnt forest,” you will note that the vegetable matter is applied as a *mulch*. It is well known how a mulch acts in keeping the water brought up from the subsoil by capillary attraction in reach of the roots so that they are able to derive the fullest advantage from the minerals held in solution in this water. And think you that no sourness arose in this case from the fact that the ammonia resulting from the decay of the vegetable matter, owing to the absence of precautions to prevent its loss, hadn't a shadow of chance of being converted into nitric acid because it was straightway dissipated into the air as fast as it could be formed? In this case I assume that under the circumstances digging was not feasible during the first year at least, before the expiration of which the greater part of the leaves and twigs rotted away.

In the next case, where “magnificent bushes” can be shown in poor land, “the result of an enormous amount of undergrowth being thrown into it every year,” I suppose digging was practised, so that a part at least of the ammonia was made available for the coffee. Or, perhaps, the plan of spreading the vegetable matter on the ground and covering it over with soil from renovation pits was followed here. But we are not particularly informed as to this. However, till we know to the contrary, we will suppose that that the loss of ammonia here was prevented in some way. (You see digging would not be impracticable in this case, as the land was not lumbered with all the logs, twigs, &c., of an unburnt forest.) This being so, it only proves that the land was rich in the necessary minerals and deficient only in nitrogen.

I can perfectly understand why too much humus cannot be applied in the way of spreading vegetable matter on the land and covering with the soil out of renovation pits, and I will tell you why; it is because the subsoil brought up out of the renovation pits probably contains a sufficiency of minerals and base to counteract any sourness that may arise and counterbalance any excess of nitrogen after undergoing the necessary weathering which it is exposed to on being spread on the surface. I could support my contention here by an authoritative quotation, but “J. W. H.” seems to hold the theories of experts in little esteem. I would point out, however, that these are able men who have embodied the experiences of past ages and the observations and study of half a lifetime in their books, which we would do well to avail ourselves of and endeavour to make subservient to our ends.

I do not think that anything “J. W. H.” has said disproves my “theory” that an excess of humus will cause sourness and foulness. What constitutes an excess of humus? It is when the base in the soil proves insufficient to neutralise the acids from the humus. Some soils would take more than others. “J. W. H.” has not yet reached the point beyond which any further applications of humus would prove hurtful, but let him go on. There are some plots in estates that get leaf-disease

regularly every year. I take this as one indication of the soil turning sour, and I have noticed great improvement result in such plots after draining them and treating them with lime.

Ah! that hackneyed phrase, “An ounce of practice, etc.” Have I denied anywhere in my article in *P. O.* of 28th August that estates opened without burning are the best cropping and longest lived? Or have I said anywhere that burning *improves* land, or that the fertility of young clearings *depend* on the mineral constituents set free by fire? All I said was that in clearings that have been cleared and burnt, a lot of mineral food has been set free by the fire. Can this be denied? And it must be acknowledged that results are more rapid in burnt clearings than in unburnt, owing probably to the greater abundance of plant food, but the reason they don't continue to do well is because the available food is soon exhausted. Can a ton-an-acre-crop be pointed to on unburned land under forest shade as it can be on burnt?

In the analyses I give from Dr. Voelcker, it is seen that a plot which had the least humus the coffee did best in. This is a hard nut to crack, so “J. W. H.” leaves it alone. The fact is, if benefit arises from applications of humus, it only proves that the land is well supplied with the necessary minerals.

H. G. R.

CONSUMPTION OF COFFEE IN INDIA.

DEAR SIR.—With reference to what you say in *P. O.* of 11th September in connection with my remarks as to the difficulty of arriving at even approximate results, I am afraid you have fallen into an error in your calculation. Using the Government acreage 283,432, a 3 cwt. crop would, as you correctly state, give

	cwts. 850,296
which you say would be an excess of ...	524,808
over exports for 1894-95, which accordingly would be	325,488

But taking your figures for the same acreage at cwt. $2\frac{1}{2}$,	
the total crop would be ...	708,580
This you say is an excess of ...	241,376

over exports, therefore the exports would be ...	467,204
--	---------

which shows an obvious disagreement in regard to the exports which should be one and the same in both calculations. Mr. Tatham's exports for the same year 1894-95, as given in *P. O.* of 28th August, are cwts. 291,621, which does not correspond with either of the foregoing. Using Mr. Tatham's figures the excess on a 3 cwt. yield of total crop over estimates would be cwts. 558,675; on a cwt. $2\frac{1}{2}$ yield 416,959, both very large quantities. Your last paragraph deals with calculations which include tea and cinchona as well as coffee, but taking the result, 37 per cent., as applying to coffee as well as the other two articles, this would be roughly one-third of the entire crop, the exports representing the other two-thirds; thus using Mr. Tatham's figures for exports ... cwts. 291,621

add one-half for the 37%	145,810
showing total crop ...	437,431

Your first seems the most sensible method of reckoning, but I think the yield all round would rarely if ever come up to cwts. 3 or even $2\frac{1}{2}$ per acre. Besides we should have *particulars* of the Government acreage. I am inclined to think the returns are not altogether reliable. Crop returns in one district that I worked with could not, so far as I remember, be made to fit in with any reasonable calculation as to yield per acre. The whole question of acreage and yield is one well deserving the attention of the U. P. A. In fact, it is not always that an owner or superintendent knows the correct acreage of the estate he works. I have known cases where a survey revealed great discrepancies.

In Mr. Tatham's returns for the past season, of
 the total cwts. 211,760
 native coffee amounted to 94,578
 leaving cwts. 117,182
 as plantation.

It is presumed that very little plantation would find its way into consumption in India. We know that it either goes through agents direct to Europe or is sold for European markets.

This, therefore, leaves cwts. 94,578 native coffee, or in round figures, say, 5,000 tons exported. If, therefore, your estimate of 20,000 to 30,000 tons for consumption in the country be approximately correct, the export portion would bear but a small part of the whole. But we know that there are recognised markets in the several districts and in the coast where native coffee is dealt in, and if such quantities go from these districts to the several parts of India, they would hardly do so without passing through these markets. I feel sure that any merchant or agent intimately acquainted with the trade would be more than astonished to learn that such immense quantities were dealt in or produced in the district without his becoming aware of it.

I am not at all inclined to accept Mr. R. H. Elliot's figures; 100,000 native gardens at 5 acres each would give 500,000 acres, even 2 acres each gives 200,000 acres, while in the last Government return I have beside me, 1891-92, the total Mysore acreage is only 130,440.

I must admit that the more I go into the matter the more puzzling does it seem, for I cannot believe that a quantity like 10,000 tons could pass out of the coffee districts without being observed. Toll-gate returns are annually given in the Coorg district, but as a rule they show a shorter crop than the coast exports do.

It would be interesting if returns could be had from the railways of coffee carried by them for distribution throughout the country if a separate account is kept.

It will be noticed in Mr. Tatham's exports for the past season that cwts. 29,583 went to Bombay and other Indian ports. Was this for transshipment to Europe, or for country use?

HARD NUT.

COFFEE.

Colour in Liberian.

A correspondent asks us to call the attention of our readers to the marked difference in the prices obtained by Indian and African shipments of this coffee. Two lots of the former were recently sold for 35s. per cwt., while in the same sale some African sold for 79s. 6d. The cause of this difference lay in their respective colour. The Indian coffee was *brownish*, while the African was *bright yellow*. This question of colour does not seem to have been properly attended to in India, but, as we pointed out some months ago, is a matter of the greatest practical importance.

Brazil.

The ever-increasing crops from Brazil and neighbouring countries may at times cause tremors to Indian planters despite the apparently total lack of effect in plantation coffee berries. Yet, on the other hand, the extremely low prices current have developed consumption to an enormous extent, widening the taste for coffee throughout the world. A large section of the public will gradually develop a taste for the superior qualities, which will tend to sensibly affect the market for our excellent East Indian growths. The only cloud on the market horizon is the danger of the general adoption of improved curing methods.

Coffee Tablets.

We have often wondered why some enterprising coast firm has not taken up in real earnest the question of creating a trade in "manufactured coffee" with England. There are undoubtedly large profits made in the preparation of the raw coffee for the table. Why should not these profits remain in the country? The difficulties are by no means insuperable. Perhaps the most suitable mode of procedure would be to roast and grind coffee, packing it immediately in airtight canisters or lead packets. The argument that the flavour would be lost is, we think, a false one, for are not coffee extracts and preparations of all sorts well nigh universal favourites? In the United States, a huge trade is conducted in the roasted bean, which is dipped in a patent preparation of glucose, etc. The article is known as "glazed coffee." This, however, would not save freight, while the powder would certainly greatly lessen the cost under this important item. It might be possible to imitate the methods of preparing brick tea, *i.e.*, by lightly sprinkling the powder with liquid arrowroot and forcing it into shape by means of hand-presses.

Coffee in New South Wales and Queensland.

Reuter announces that the New South Wales Government are encouraging coffee-planting. This looks as if the success attendant upon the industry in Queensland had set neighbours a-thinking. It may, however, be some consolation to the nervous (if there be any) among Indian coffee-planters to read the following remarks, sent by a planter to the *Statesman* of Calcutta:—

"I observe a commencement has been made in gathering the coffee crop on the Queensland Government State Plantation, at Kame-runga, in that colony, boys between the ages of 14 and 18 being employed, at the rate of half a crown per bushel; this is of course for 'cherry,' against our average of four annas for the same quantity, or, say, after pulping and garbling about 52lbs. of berry fit for the market. When interest on machinery, upkeep of cultivation, packing and freight are added, it will be seen that the Indian coffee grower will still be able to lay down his crop at about one-fourth the price of his Australian competitor. True, the once large areas under coffee have been greatly curtailed of recent years in this country, but those who still adhere to the cultivation have as little to fear from competition of Queensland coffee as from American home grown tea. Unless the price of labour rises in North Australia, coffee should pay, provided local markets can be found; but cultivation on any large scale for export is not likely to prove remunerative. In these days of keen trade rivalry, we could always undersell the Australians in their own markets, even though the various Colonial Governments might resort to protective measures in favour of their own growers either of tea or coffee. Protection for daily necessities, however, can only be carried out in new and thinly populated countries; for, as the artizan and labouring classes increase and outnumber the agricultural population, the majority will insist, as they did in the United Kingdom fifty years ago, upon all restrictions placed on food-supplies from outside sources being swept aside. However much producers may suffer from free trade at the outset, the nation at large benefits."

The London Market.

The continuance of such abnormal receipts at the Brazilian ports—the total during the first two months of the crop year being 2,642,000 bags—has again checked the upward turn that

CENTRAL HOTEL, INFANTRY ROAD, BANGALORE.

(Under English Management.)

The most comfortable and convenient for visitors.

TERMS MODERATE.

prices had taken, and in the terminal market there has been almost a daily fall so that prices close from 1s 6d to 2s below a week ago. Although this has brought quotations down to the lowest recorded, there is still little desire shown to operate beyond immediate requirements, and it is thought that when the figures of the stocks on the 1st inst. are published, the supply will again show such an increase that any speculation will be checked. Notwithstanding this depression and fall in Brazil kinds, there has been a good demand for other descriptions, and the range of values has still further widened, all coloury kinds having been well competed for at auction, and prices being from 1s to 2s 6d dearer. A few lots of fine New Grenada have sold at prices quite equal to those of a year ago, while many marks of East India and Costa Rica are decidedly dearer than they were then. The Dutch Trading Company have advertised their next sale for Tuesday, when 19,000 bags will be offered, against 21,983 bags and 304 cases at the corresponding sale last year.

Sambur and Shade.

Those interested in the vigorous correspondence carried on some months ago in these columns *anent* the damage done by sambur to shade trees on coffee plantations on the Nilgiris will note with attention the following order of Government, dated 27th July 1897:—

No. 390.—Under the provisions of Madras Act II. of 1879 (an Act to provide for the protection of game and acclimatized fish in the district of the Nilgiris in the Madras Presidency), and in supersession of the notification No. 498, published at page 825, Part I. of the *Fort St. George Gazette*, dated 28th October 1890, His Excellency the Governor in Council hereby fixes the undermentioned periods as the seasons during which it shall not be lawful to shoot at, kill, capture, pursue, or sell, or attempt to kill, capture or sell large and small game, respectively, in the year 1897 and future years, viz.:—

Large game (including all game other than hare and feathered game). } The 1st of June to 31st October inclusive.

Small game (hares and feathered game) ... } The 15th of March to 15th Sept. inclusive.

This notification shall apply to the following local area with the exception of the areas specified in the column of remarks so far as the shooting of sambur therein under free licenses obtained from the Collector is concerned:—

Local area.

The north bank of the Bhavani river from Attipadi in Attipadi valley to the junction of the Moyar river.

The west and south banks of the Moyar river from its junction with the Bhavani to the point in the Mudumallah district nearest to Gudalur.

A line carried thence to the head of the Pandi river (Ouchterlony valley).

Remarks.

(1) In the Halihaldroog and Pakasuraimalai reserved forests a margin of 300 yards round the limits of the coffee estate known as the Upperdroog.

(2) In the Pakasuraimalai reserved forest a limit of 600 yards to the east of the eastern boundary of the estate known as Ibex Lodge.

*The east bank of the Pandi river to where it falls near the Kar-kur pass in Malabar Payen-ghaut.

A line along the south crest of the Ouchterlony valley and across the western slopes of the Nilgiri and Mukurti peaks and Sispara ranges to Wallaghat.

A line thence along the west crest of the Silent valley (Malabar) range.

We congratulate Messrs. Mullaly and Grey on the partial success that has attended their efforts for the protection of their properties.

(8) In the Moyar, Kolmal and northern Hay reserved forests a margin of 300 yards round the limits of the coffee estate known as Leighwood and Northern Hay.

TEA.

Revised Indian Estimate.

The original estimate of the year's crop for 1897 was placed by the Indian Tea Association at 156,669,112 lbs., but owing to the generally unfavourable weather and short manufacture to date, a revised estimate of 148,011,705 lbs. has been issued—a decrease of over 8½ million lbs. The actual shipments to Great Britain up to date were 60,900,000 odd lbs. against 60,800,000 last year.

Brick Tea.

In the campaign for capturing the very important Russian market, we think that considerable attention should be paid to the fact that a very large proportion of the tea consumed is in the form of brick tea. There is no possible reason why hill teas for instance should not be just as readily consumed, if prepared in this form so familiar to the Russian, as the Chinese article itself. The processes of withering and fermentation are the same as usual. But when the roll has been partially fired, and admits of being rolled out in layers, it should be thinly sprinkled with liquid arrowroot to give it the necessary adhesion. It is then pressed into blocks and thoroughly fired. There are other mediums in current use in China, of fearful and wonderful nature, but arrowroot is the best. As our contemporary the *Planter* points out, conjee is apt to turn sour unless fortified, while sugar is likely to set up fermentation.

Open rolling.

In reply to a correspondent's advocacy of removing the top of rollers and increasing the depth of the box, the *Indian Planters' Gazette* writes:—

No advantage is gained by making such alterations, for although a larger quantity of leaf may be rolled, a proportionately longer time is taken in doing it.

Further, a certain amount of pressure is necessary to be applied *on to the mass of leaf*. The leaf inside the machine forms a ball as it were, and the *twist* is obtained by the leaves rubbing or pressing one against the other. By placing a large quantity of leaf in the roller, the leaf on the top certainly exercises a pressure on the leaf lying below, but this pressure is not *equally distributed* on all sides at the same time. The consequence is that some of the leaf gets a twist on to it, whilst another portion does not get rolled at all. To obtain a *perfect roll*, the pressure must be *evenly distributed*, right through, and on the whole mass of leaf, by some independent and external force.

Mr. Jackson's Rollers are so constructed that by keeping on "the top" the pressure exerted on the ball or mass of leaf within, causes each of the leaves of which it is composed to press *equally* one

against the other. The result is that *each single leaf gets the same twist, and each ghán comes out of the machine evenly rolled.* This even and perfect roll is not obtained when "the top" is discarded.

The great secret in rolling is to imitate the old "hand process" as much as possible. Let the *gháns* be of medium size; neither too small nor too large a quantity. Apply a gentle pressure. Find by experiment the most suitable pressure to turn out the leaf with a nice, even twist to it, and then stick to that pressure as a standard. Letting "the top" down on to the roll to its utmost extent plays the very mischief with the leaf. If a constant gentle pressure is applied the roll will keep cool. Handled in the manner suggested, Jackson's Rollers will turn out most perfectly and evenly rolled leaf, and (all other manipulations being equal) yield tea of as good a quality as can possibly be desired. The results obtained from the best of machines may be rendered unsatisfactory through ignorance of the proper method of working them.

Home Market.

INDIAN.—The market has been somewhat irregular, says the *P. M. Review* of 4th September, and in several cases prices are easier, particularly for some of the Assams, owing to a falling off in quality, which is very marked in many of the teas. Darjeeling growths have been in larger supply, most districts being represented, and, on the whole, the quality shows improvement, while from a few gardens some exceptionally fine teas have been received, which met with brisk competition at extreme prices. The active enquiry for these finest growths is due to the scarcity of really good Darjeelings, and it is probable that the demand will continue good until they become more plentiful. The medium and lower grades from the same districts sold irregularly, and prices were mainly in buyers' favour, some of the teas having now fallen to a point at which it would be safe for dealers to hold a fairly representative stock. With few exceptions the character of the later imports of Assam is inferior to the earlier arrivals, and, in consequence, they have sold at reduced rates, but those up to the standard of the earlier imports were well bid for, and brought quite former prices. It is probable that there will be a difficulty in following these teas later on. Most of the other growths, especially the commoner sorts, continue to show undesirable quality, and have sold at generally easier values, and until there is a decided improvement, and they show equal value to Ceylons, the trade in them is not likely to be so large as is usually looked for at this period. In comparison with August last year the following figures show the movements of Indian tea for the past month:—The imports are about on a par, 12,479,000 lbs. and 12,649,000 lbs., respectively, while the deliveries are in excess by 256,000 lbs. and the stock stands at 25,802,000 lbs., against 22,808,000 lbs. There were 32,436 packages brought forward at the public sales, and 28,306 were withdrawn.

CEYLON.—The demand continues good, and as the market has been well supplied, a fairly large business has been transacted. Good medium descriptions have met with an active enquiry, and the firm tone noticed of late still prevails, while prices for all grades have not only been well maintained, but are in some cases rather higher. Common teas, although firm, have shown no distinct change in value. The public sales comprised 26,840 packages, of which about 1,700 were withdrawn. The following are the figures for the past month compared with August last

year:—The imports amounted to 8,854,000 lbs., against 6,900,000 lbs., and the deliveries were 8,350,000 lbs. and 8,015,000 lbs., while the stock stands at 24,716,000 lbs. as compared with 22,400,000 lbs. It will be noticed that the deliveries exceed those of Indian teas, this being only the second time that such has been the case.

DISTRICT ASSOCIATIONS.

WYNAAD.

PROCEEDINGS of a General Meeting held at Meppadi Club on Wednesday, September 1st, 1897. PRESENT: Messrs. Abbott, Day, Mackinlay, J. R. Malcolm, Robinson, Trollope, Waddington, Winterbotham, and Hockin, *Honorary Secretary*.

Mr. Winterbotham in the chair.

The Proceedings of last meeting were taken as read.

The Hon. Secretary read the following report of the delegates to the U. P. A. S. I. Meeting at Bangalore.

Mr. Chairman, in accordance with the usual custom we have drawn up a brief statement of the chief conclusions arrived at at the last Meeting of the U.P.A.S.I. which have not been thoroughly reported in the papers.

The first subject dealt with was the Report of the S.I.P.E.C. and the action taken thereon is sufficiently explained by the letter from the U.P.A.S.I. to the Govt. of Madras which will be read to you but which cannot be reported in the Proceedings.

The next subject was the method of raising funds and you have no doubt seen the resolutions passed thereon. Their effect will be to keep the voting power entirely in the hands of delegates of Associations. The annual income according to estimates furnished by the Hon. Secretaries of Associations should be about Rs.5,000 this year with a tendency to increase to Rs.7,500, the maximum of assessment on the present acreage. The normal expenditure is about Rs.2,000 to Rs.3,000 per annum. The Reserve Fund, of which we lay a Rough Statement on the table, amounts to Rs.10,575-12-0, of which Rs.1,750 has been drawn out, leaving Rs.8,825-12-0 in hand. Of this, in the event of certain Governments and Associations interested, agreeing to contribute, it has been decided to vote Rs.4,000 for the purpose of combating coffee pests, and improving the strain and cultivation of coffee. There should be an annual excess of income over expenditure of Rs.2,000 to Rs.3,000, to replace these drains on the Reserve Fund, and this fund is still open to direct donations.

We put this Association down for a subscription of Rs.675 this year, being Rs.375 from the Association and Rs.300 from members. Our maximum subscription is Rs.693-2-0, and it is to be hoped other proprietors will subscribe to make up this amount, and also leave something over for direct payments to the Reserve Fund. This cannot long stand the heavy drains likely to be made on it if we go in for such expensive schemes as the employment of experts to help our industries.

As a concession to those Associations which wished to bring up more members to speak at the annual meetings each Association was allowed to bring up five delegates irrespective of its voting power which is fixed at one vote for every Rs.10 subscribed up to a maximum of 1 a. per acre.

It was decided that the U.P.A.S.I. should be registered under the Indian Company Act and the Hon. Secretaries of the District Associations agreed to allow their names to be entered as members. The Act requires there shall be at least seven members of a Company, and these members are liable for the expenses of winding up the company should it ever become necessary. It was felt that such liability would be quite nominal, as there would probably always be funds in hand for this purpose, or if not the District Associations would see their Hon. Secretaries did not suffer. The liability can, we believe, be limited to a certain sum.

The rules were amended to suit the new scheme of raising funds and we lay a copy of the amended rules before you. The only one that calls for remark is that which provides that $\frac{2}{3}$ of the minimum sub.

scription, which is $\frac{1}{2}$ of the maximum, must be paid within three months of the close of the meeting. In our case this $\frac{1}{2}$ of the minimum amounts to Rs.130. Unless arrears of subscriptions amounting now to Rs.162 are paid up shortly, we shall be unable to pay this before the 12th November. It should be paid earlier as the U. P. A. S. I. is short of funds until new subscriptions come in.

It would be better perhaps if we made our financial year agree with that of the U.P.A.S.I. and then we should have no difficulty about funds.

The last subject requiring notice is the decision arrived at on the employment of experts. We all felt that Mr. Newport's scheme deserved support. The Government of Madras will pay half the expense and the L. Pulneys will raise Rs.4,000 to Rs.5,000 for this purpose. Green bug does not at present affect us, but as it has spread from Ceylon to the Lower Pulneys, it may easily spread north as far as coffee extends. Personally we hope it requires a dry district to thrive in and our heavy monsoon will kill it, but that is no reason the U.P.A.S.I. should not afford help to districts that need it.

There was considerable disagreement as to the practical benefit likely to accrue from employing an expert for improving cultivation, and the subject was thoroughly thrashed out in special meetings of those most interested. Eventually it was agreed to meet the views of both sides by trying to secure the services of Mr. Cameron to improve the strain of coffee, and also to ascertain if sufficient support could be obtained from Associations and Governments interested to obtain with the help of the U. P. A. the services of an Agricultural Chemist.

In conclusion, we think we may congratulate ourselves on the result of this year's meeting. There were several subjects on which delegates held very strong and diverse views, but every one felt that it would be most unwise to try to force any scheme on an unwilling minority. Ample opportunity for the fullest discussion was provided in Committee and Sub-Committee meetings, and in the end, by the exercise of very considerable tact and patience on both sides, it was generally found possible to arrive at a resolution which met the views of all present. This is a most hopeful sign of the future prosperity and usefulness of the U. P. A. S. I.

(Signed) G. ROMILLY.

(") J. WILLIAMS HOCKIN.

A vote of thanks to the delegates for the able way in which they had represented the Association was passed.

New form of Contract.—There was considerable discussion on this subject, and the Hon. Secretary was requested to obtain further legal advice regarding the payment of wages clause.

Treasury Drafts.—Read Order No. 620 of 6th August 1897 of the Madras Government, Financial Department, stating that drafts on treasuries for private remittances cannot be granted unless local conditions render this course advisable.

Want of Cash in Vayitri Sub-Treasury to Cash Postal Money Orders.—Read several letters stating there was no cash available for the payment of Money Orders at Vayitri and Meppadi Post Offices from the 5th to 14th August.

The Honorary Secretary was requested to ascertain if the Postal Department is not responsible for the prompt payment of Money Orders granted by that Department and to address the Collector of Malabar regarding the inconvenience and hardship caused to coolies in a time of famine prices through the want of proper management at the Vayitri Sub-Treasury.

Medical Fund.—The Honorary Secretary of the Medical Fund reported that Dr. Barboza had accepted the appointment of Medical Officer of this Fund subject to three months notice to his present employers. His services will probably be available about the end of November. He also reported that the Meppadi Apothecary had arrived and that his services can be called for by subscribers. The new system of four Apothecaries and a Medical Officer is now completed.

Roads.—Read telegram stating that Rs.20,000 had been provided for the Calicut-Vayitri Road. Recorded with satisfaction.

Revenue Settlement.—Read letter from Mr. T. J. Boosey re the sale of a portion of his property on which he had paid the taxes for arrears of his jenni. The Hon. Secretary was instructed to address the Collector of Malabar asking that steps may be taken to prevent a recurrence of such irregularities.

Non-Service of Warrants in Coimbatore District.—The Hon. Secretary was desired to address the Superintendent of Police asking him to look into the alleged inefficiency of the Coimbatore Police in getting persons accused of breach of contract arrested.

Papers on Table.—Capt. W. F. Carslake's method of keeping his Check Roll.

MARKET SUPPLEMENT.

SATURDAY, OCTOBER 2, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s *Weekly Coffee Report* (September 10, 1897) says:—A good demand prevailed at Public Sale this week and the moderate supplies were nearly all disposed of at steady prices.

Nearly 2,500 bags East India were brought forward; fine colory grades realised full rates and the commoner sorts sold slowly at about previous value.

Columbian, of which the catalogues chiefly consisted, attracted good competition, prices in most cases ruling in seller's favour.

Futures have been quiet, fluctuations being limited to 3d. and 6d., but at the close quotations show practically no change on the week.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending September 8th, 1897, says:—Bank rate 2%. Bombay Exchange closes at 1s 3 $\frac{2}{3}$ d. Brazil Exchange 8d. Rupee paper 3 $\frac{1}{2}$ % 63 $\frac{3}{4}$. Silver 25d per oz.

This market has been very quiet since our last Report, the lower qualities being difficult of sale at about 1s decline. Good Plantation East India, however, sold steadily at full prices. Brazil markets are flat.

The sales included :—43 casks and tierces 22 barrels and bags Plantation Ceylon sold from 91s 6d to 108s. Of 2,094 bags East India, 238 bags Mysore 68s 6d to 99s 6d, 1,259 bags Coorg 74s to 107s, 532 bags Neilgherry chiefly sold at 67s 6d to 107s 6d, 237 bags Naidoobatum part sold at 102s to 102s 6d, and 428 bags Shevaroy 80s 6d to 106s; 1,214 bags Costa Rica part sold at 66s 6d to 108s; 793 bags Guatemala chiefly sold at 63s to 81s 6d; 166 bags Salvador bought in; 1,071 bags Nicaragua part sold at 44s to 60s 6d; 913 bags Vera Paz and Coban part sold at 51s to 103s 6d; 840 bags Mexican small part sold at 63s; 3,586 bags Columbian chiefly sold 54s 6d to 103s; 660 bags Guayaquil part sold at 41s; 47 bags Manta part sold at 37s to 42s; 131 half-bales Mocha bought in; 5 bags Liberian Dominica sold at 47s 6d; 10 bags Liberian Wynaad sold at 41s 6d; 1,250 bags washed Santos good part sold at 50s to 59s.

Daily receipts in Brazil have averaged 19,000 bags in Rio, and 32,570 bags in Santos.

Futures continue to decline owing to the large receipts, and this week they shew a fall of 9d to 1s, viz. :—Good average Santos in Havre, December delivery, fcs. 41.25, in Hamburg pf. 34½, and No. 7 low ordinary Rio in New York \$6.25.

SUPPLEMENT TO "PLANTING OPINION."

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated September 10th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	241,051 packages.	401,233 packages.	13,960 packages.
1896-1897...	243,660 "	350,411 "	14,923 "
37,834 pkgs. INDIAN	Total 68,448 packages were offered in public auction this week.		
29,668 " CEYLON			
946 " JAVA			

The quantity of Indian and Ceylon Tea taken by all countries outside the United Kingdom during the first six months of this year shows a decidedly encouraging increase, the total amount being 22,823,423 lbs. against 17,098,272 lbs. for the corresponding period of 1896.

Exports of Indian and Ceylon Tea to places outside the United Kingdom from 1st Jan. to 30th June, 1897 and 1896.

INDIAN.		1897.	1896.
Re-exports from U.K.	...	2,730,948	1,680,816
Transshipments from U.K. about	...	2,100,000	1,250,000

CEYLON.		1897.	1896.
Re-exports from U.K.	...	5,427,699	3,855,161
Transshipments from U.K. about...	...	1,100,000	650,000
*Direct Exports from Ceylon	...	7,623,251	6,930,172
Total lbs.	...	14,150,950	11,435,333

* Exports from India and Ceylon direct to North America as shown in Calcutta and Colombo figures have been deducted, as they are doubtless included in transshipments from U.K.

Indian. This week's sale was the heaviest that has so far been held this season and comprised 37,834 packages, against 34,085 last week. For good Teas the market continues fairly firm, but for poor liquoring and undesirable kinds, distinctly lower rates were recorded, the fall being in some instances as much as ½d. per lb. The official wire from Calcutta gives exports to U.K. from 1st April to the end of August as 48,190,000 lbs., against 45,850,000 lbs., for the same period last season. The Indian Tea Association have circulated the following telegram:—"Weather generally in all districts is too cold for the time of the year, and is checking leaf."

Week's av. of Tea sold on Garden Account, 1897, 29,883 pkgs., av. 9d. 1896, 19,521 pkgs., av. 10½d.

Ceylon. The quantity brought forward, although rather heavy, was not too much for the trade and prices tended rather upwards than otherwise, all grades being well competed for. The official telegram from Colombo gives exports to U.K. from 1st Jan. to 31st Aug. as 71,250,000 lbs., against 66,500,000 lbs. for same period last year, and estimates the quantity available for the current month as 7 to 7½ millions. Average for week 7½d. against 8½d. for same time last year.

Ceylon Tea sold on Garden Account 1st January to date 1897, 803,202 pkgs., av. 7½d. 1896, 718,346 pkgs., av. 8½d.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 15th October 1897.

S. E. Wynaad.

PUNDALUR, 6th October.—*Weather.*—From the 1st to 5th instant we have had continuous rains and it is too wet for the time of the year; to-day we are having sunshine. *Plant Diseases.*—Owing to the weather, leaf-rot and leaf-disease are beginning to increase in all situations and the crop dropping. *Health*—Good. *Grains.*—Rice, 1st sort, 6; 2nd sort, 7; gram, 10; salt, 7; and dry chillies, 5 seers per rupee. Surely this is affecting the poorer class very much. *Labour*—Sufficient.

Coorg.

POLLI BETTA, 30th September.—*Weather.*—Wet for the past fortnight. Heavy falls of rain on some days, but amounts registered generally small. Awful weather for time of year. *Plant Diseases.*—"Leaf" bad in parts, but coffee, on the whole, still looking fine. *Crops.*—Ripe berries here and there beginning to show up. Preparations for crops will be soon taken in hand. *Interesting Items.*—Rifle meeting commences to-day, though how any shooting is going to be done in this wet is more than I can tell.

6th October.—*Weather.*—Monday last was the first fairish day for a long time. Rain again last evening, fair this morning. *Plant Diseases.*—Rot has passed off. Although there is "leaf" nearly everywhere in parts of places, coffee, on the whole, is still looking very fine. *Labour*—Sufficient. *Health*—Fair.

Nilgiris.

KOTAGIRI, 7th October.—Abnormally wet September. Very wet every day, except from 9th to 16th, when there was a very welcome break of too short duration for man, beast and all cultivation; the rainfall for the month, spread over 19 days, aggregated as much as 9'16 in., or more than double the average due for this month, which stands at only 4'31 in., and it has only been equalled or exceeded once, that is last year, when, after the failure of the S. W. Monsoon, buckets of rain came down in September, giving a fall for the month of 12'08 in. The rainfall in the station this year to end of September has been 42'42 in. against an average due of only 30'89 in. The fall on the coffee at lower elevation has not been so heavy, say 35 in. down the Kotagiri Ghat and 30 in. more to the Eastward, Kil Kotagiri way. It has been a grand season for new openings; new clearings have very few failures and are looking very well. Crops are below the average in this direction, estates with little or no systematic

shade bearing fairly well; some places have already 4 tons in; weeds very bad this wet season, but labour plentiful and health good.

GENERAL NOTES AND ARTICLES.

An amalgamation.

We learn from the *Produce World* that the two well-known Mincing Lane firms, Messrs. W. J. and H. Thompson and Messrs. Patry and Pasteur, have been amalgamated.

Australian trees.

Writing to a Ceylon paper, Mr. Augusta Rudder, a N. S. Wales Forest Officer, comments on the excellent growth attained in the Island by many Australian trees. The Australian red cedar (*Cedrela Australis*) is recommended as a valuable addition to the existing varieties, as furnishing a light and valuable timber, of great size and rapid growth. In its native habitat this tree is yearly growing scarcer, owing both to the great demand for its timber and the ravages of grubs. Black balt (*Eucalyptus pilularis*) is also mentioned as a very quick-growing straight tree of fair timber.

New treatment of vanilla pods.

M. Dolabartz, Manager in Réunion, of the Crédit Foncier Colonial, at a recent meeting of the Réunion Syndicat Agricole upon a new process of treating the vanilla pod: According to M. Dolabartz the operation consists of drying the vanilla in an hermetically closed vessel by means of chloride of calcium in the proportion of about one kilog. for every kilog. of dried vanilla obtained. The chloride of calcium is not lost, as it can easily be regenerated by heating it in an iron or copper receptacle; one lot of chloride of calcium is thus sufficient for several processes if kept, after regeneration, in an hermetically closed vessel. According to information received, 2,937 kilogs. of raw vanilla will produce about a kilog. of prepared vanilla. It can be easily understood that vanilla dried in an air-tight vessel must lose much less vanilline than when dried by the ordinary process, by which it is exposed in the open air for several weeks.

Cocoa-prices: a curious fact.

Prices are now again on the up-grade, and the cause of the improvement is directly traceable to the low prices ruling hitherto. Encouraged by the cheapness of cocoa, a large number of new factories have been established both at Home and in the Continent for the manufacture not only of chocolate but of cocoa powder. Consumption has been thus greatly stimulated, while on the other hand supplies have been curtailed owing to the low, unprofitable prices. The statistical position is excellent, both in England and on the Continent. A curious fact, however, is the closing of the wide gap that has hitherto ruled between the prices of fine and common cocoa. Luckily there seems no danger of this happening in the coffee market.

Bone manure.

We wonder if it has ever struck our readers that, under certain circumstances, bone manure may be the cheapest *nitrogenous* manure available? For instance if a ton of bone dust, containing 3% of nitrogen, can be delivered on the estate for, say, a third of the price for poonac of 6% N., bone dust is obviously the cheapest manure to use for nitrogen alone. When its phosphates and lime are also reckoned on, all doubt on the point vanishes. But how can bones be thus obtained is the question? The answer is simple. Procure all the raw bones in the neighbourhood

and crush them yourself. Bone crushers are by no means expensive, and a water-wheel or engine, or even hand-power, will do the work cheaply and efficiently. Naturally steaming should be avoided, as very nearly all the nitrogen is thereby lost.

Dominica.

This island has large possibilities of planting development, though small enough in extent, being but 29 miles long by 16 miles broad. Disadvantages of course are not few, chief among these being lack of proper communications. Part of the island is also wind-blown, though not to any great extent. The highest point runs up to 4,740 feet, while the loftiest plateau is between 2,500 and 3,000 feet. The lower temperature, however, atones in great measure for the comparatively low elevation of the country. The rainfall varies from 67 to 196 inches. The soil is excellent, being of volcanic origin, and grows tropical produce of all sorts: coffee, limes, sugarcane and what not. The labour question is more satisfactory than might be expected, being chiefly negro, and doubtless imported labour would succeed here as well as elsewhere. The last census (1891) gave a total population of 26,800 odd persons, of whom 325 were whites, 6,806 coloured, and 19,700 black. The lack of a sufficient number of plantations, and consequently of employment, is causing a gradual decrease in the population. For the present there is sufficient labour for any extensions in cultivation in the near future. Estate wages vary from 9d. to 1s. per day for men and 6d. to 8d. for women.

Planting figures.

In the excellently got-up book of Proceedings of the Fourth Annual General Meeting of the U. P. A. S. I. are some interesting tables of statistics relating to the planting industry of South India. Names of estates and their owners and superintendents, with details of acreage, elevation, &c., are carefully given, and should certainly be found of great value as the latest reference book on the subject. The chief interest just now attaches to the proportion of young coffee to the old, *i.e.*, the expansion of the industry. Of course here the younger districts easily take the lead, as in the older and more settled localities extremely little land is now available to be planted. The percentage of increase is thus greatest on the Kanan Devans, reaching very nearly to 100%. The Shevaroyes, Nellampatties and North Wynaad follow with 51%, 40% and 39% respectively. South Mysore, North Mysore, Lower Palneys, Coorg and the Nilgiris show about 16, 13, 11, 7 and 4%. Central and South Travancore have under one and over 2%, respectively, to their credit. Taken as a whole, the coffee under three years shows a percentage of a little over 10% on the older coffee. This is of course only as regards the European plantations.

As regards tea, the three districts of Travancore lead with a total acreage of 13,041 acres, the immature plants coming to 3,400 odd. Next come the Nilgiris (total 7,177 acres: 155 young tea), Wynaad (1,032) and the Nellampatties (55 only).

Photos of a coffee plantation.

We have received a set of interesting photographs of scenes of coffee planting on the Nellampatties from Messrs. Nicholas & Co. The definition is clear, and the scenes happily chosen. We congratulate the firm on the success of their work.

Silt as a manure.

It is often said by planters that it is generally useless to attempt to replace in its original position the "wash" from steep land, more generally known as silt. They argue that all the goodness in the mineral and organic constituents have been washed out, and that the residue is little superior to pure sand. A very simple analysis would speedily convince them of their error. There is another way, however, of proving our point, and that is the great esteem in which silt is held as a manurial agent by the low-country cultivators. The canals that distribute the water over their fields leave a residue of silt on the surface, and in the majority of instances this silt is the only manure used for their crops. Where does this silt come from, unless it be from the streams that feed the river, bringing down as silt many thousands of tons of valuable surface soil robbed from the uplands. It is true that there is more than one kind of silt, and it is undoubtedly a fact that the slimy silt deposited by gently-flowing muddy water is a great deal more valuable than that deposited by rushing streams or torrents. The reason is a simple one. By virtue of their weight the heavier stones and gravel are deposited first; further down, when the rush of water is less violent, sand banks are formed. Further down still, mud and silt settles slowly to the bottom. This last contains an appreciable proportion of nitrogen, phosphates and potash. Hence the silt deposited in the beds of drains aligned at a gentle slope is greater both in quantity and value than that found in the quickly-flowing 1 in 15 drains. All roads lead to Rome, and there are branches of planting discussion that cannot be made to deviate into the ramifications of drainage.

Cherimoya culture.

Some attention is now being paid to the culture of this excellent fruit in Jamaica for the London market. The cherimoya (*Annona cherimolia*) fruit is very similar to the ordinary custard apple, but the "scales" are smoother and less defined, the seed fewer and the flesh much firmer. While as to the taste, the cherimoya is some miles ahead. Trees are growing in different parts of the Nilgiris and Shevaroyes, but have only fruited, we believe, in the latter district. The prices realized in London are excellent, and should tempt planters to undertake their culture. Average-sized fruits fetch *six shillings each*, while the largest sell for as much as 10 shillings. It is now extensively cultivated in the warm, southern slopes of Madeira, replacing the vine in the sheltered valleys formerly devoted to its culture. The trees attain a height of 30 to 40 feet and bear abundantly. Propagation is by seed only. In an interesting article on the subject, in the *Produce World*, we learn that the young trees are grafted when about two years' old, and begin to bear about three years afterwards. When the leaves have fallen in May the trees are pruned, only those branches which are likely to bear fruit being left. The crop is gathered in December and January. The fruits vary in weight between three to eight pounds, exceptionally large ones even exceeding 16lbs. The maturity of the fruit is indicated by the loosening of the seeds inside, which may be felt when the fruit is shaken. They are still quite hard to the touch but fit to pick, and if laid in straw will rapidly ripen. The fruit is always cut off with a sharp knife, leaving a short stalk attached; if pulled off, the core is injured and the pulp spoiled. Special boxes

are used for packing; the first is fruit wrapped in paper and then embedded in straw, two dozen fruit going to a box. The journey from Maderia only takes four days. From India the fruit would of course have to be packed in cold storage chambers.

A TIP TO PLANTING CLUBS: THE GRAPHOPHONE.

A CORRESPONDENT, a new arrival to one of our planting districts, gives us the following excellent description of the "Graphophone." He points out the great amusement and entertainment that could be derived from the possession of such instruments by planting clubs to the community.

"Before the cover is taken off, it looks like a small sewing machine; on removing the cover, the first thing to catch the eye is a solid steel cylinder, six inches long and about the same circumference. On this is slipped a 'record,' which is a hollow cylinder, the outer surface of which is covered with hardened brown wax, on which can be seen delicate tracery in parallel lines. A trigger which is armed with a fine agate pointed needle is then fixed on to the machine. The trigger is depressed till the agate point touches the 'record,' after which the machine is wound. To set the machine off, a small button is pressed. First a slight burring sound is heard for about ten seconds, and then one is startled by hearing a loud rancous voice announcing the name of the piece of music about to be played. Thus: 'The Russian National Hymn, played by Gilmore's famous band, for the Phonographic Society, New York City,' and immediately the music begins. The man's voice is so clear that one would think he was in the same room. The music, however, is not loud. To hear it more distinctly there are two or three contrivances. First, on a little hollow projection of the machine you fix one end of a rubber tube, six inches long, the other end bifurcates into two smaller tubes, the ends of which you place in your ears. You then hear, but much too loud to be pleasant. The second way is to remove the rubber tube, and on the projection already mentioned, fix a black japanned tin horn, eighteen inches long, the broad end or mouth of which is about eight inches in diameter. Then you hear very distinctly, and quite loud enough for a small drawing room.

"The third way, if you wish to get the full power of the instrument so as to be able to go some distance away and yet hear well, is to detach the tin horn, and in its place fix a large brass horn, three feet long, with a mouth eighteen inches wide, and then you *do* hear.

"We placed the instrument with the last mentioned horn on at one end of our sitting room, and sat in easy chairs at the other end, and heard beautifully. The harmonies were lovely, and the correct solos with piano accompaniment quite grand. We heard about thirty pieces, some of which were 'dancing on the house tops,' 'dancing in the kitchen,' 'wing dance' and many other dances, which are supposed to be danced by Negroes and Negresses. For instance, after the rancous voice finishes announcing the 'wing dance,' you hear another one apparently addressing the orchestra, thus:—'Now you niggers, do you know the wing dance?' Chorus replies—'Of course we do, you nigger.' Then the first voice again, "Well, I have a tender one under my wing, and she wants to dance, have

haw, so strike up." Immediately the bones (taking the place of drums) begin, ruk-a-tuk-tuk, ruk-a-tuk-tuk, and the music begins. Amidst it all you hear shouts, loud laughter, screams of mirth, sounds as though some couples had fallen, and were rolling about on the floor. A most lively, mirth provoking piece.

"Then comes another class of music, 'The anvil chorus,' 'Jubilee singers,' 'The forge in the forest,' &c. This last I must describe. Immediately the announcement finishes, you hear five bell-like strokes on an anvil. Then a cock crows loudly, and the music begins, in which the anvil takes the place of a drum. Another class of music is the correct solos, some of which were 'Scenes that are fairest,' 'Yankee Doodle,' 'Suanee River,' 'Old Folks at home,' &c., all with variations, and with the most lovely piano accompaniment.

The funniest of the many funny pieces is the 'Virginia Skidaddle,'—you hear a great row, as though hundreds of people were 'hooking it,' screams, laughter, and shouts, the music and the bones go prestissimo, and the whole thing made us laugh heartily. By an accident we discovered a small button, which if pressed, causes a word or phrase to be repeated until you release the pressure. So when the rancous voice was announcing 'The Virginia Skidaddle,' we stopped him at 'daddle,' and he went on shouting 'daddle, daddle, daddle' with a strong emphasis on the 'dad,' as though he were in a great rage at being compelled to repeat himself so often. It was excruciatingly funny, and we nearly expired with laughing.

"These instruments cost about Rs.300 each, and Re.1-8 for each 'record,' and could doubtless be obtained from New York, where they are made, through any large musical firm in this country."

THE TRADE IN KAPOK.

AN INCREASING DEMAND.

WHAT is Kapok? How many persons in the commercial world in general, or even in the close corporation of Mincing Lane in particular, could answer. Kapok is the Dutch name for the seed hairs of the white silk cotton tree, scientifically known as *Eriodendron anfractuosum*, which grows throughout the East Indies, the Java variety being regarded as the best. It is, however, too short in staple, too smooth, and too soft to be spun into yarn. Its chief use is for stuffing pillows, mattresses, and sofas, where its lightness, immunity from moth, softness and elasticity, render it superior to all but the best qualities of feathers, wool, and hair. *Eriodendron anfractuosum* is a lofty forest tree, with a large straight trunk, covered, when young, with prickles. The branches are horizontal, and arranged in whorls. In Java, the growing trees are commonly used for telegraph posts, as the branches grow so conveniently at right angles to the trunk that they do not interfere with the wires. The flowers are large and white, and are followed by dry, cucumber-shaped capsules, filled with black seeds embedded in silky hairs. The seeds are sometimes eaten. They yield a bland, fatty oil, the residual cake being used as a cattle food. In India the tree yields an almost opaque dark red gum, which is said to be astringent, and has been used in tanning. From the bark there is sometimes prepared an inferior reddish fibre which is used locally for making ropes and paper. It possesses, however, no commercial value, and the barking of the trees would not compensate for the injury done to them as a source of floss.

The kapok, or floss, is, according to present demand, a fibre of considerable importance. It is said that its elasticity and harshness prevent it from becoming matted like the generality of flosses. It is important, as pointed out by Dr. Watt, to guard against an error into which many writers fall, of viewing kapok as a generic trade

name for all silk cottons—including that of the simal—the floss of *Bombax malabaricum*. When the demand for kapok first started, Indian exporters placed on the market a quantity of very dirty simal, having a large percentage of dust as well as seed. This was at once condemned, and was sold at a price that would not cover the transport charges. India thus fell into an inferior position, which might have been avoided if carefully cleaned fibre had been sent to Europe.

Serious complaint is made in Australia and elsewhere of the quality of the kapok shipped from India. "Even at the low price of the Indian article, it is found better to pay 8½d. or more per lb. for that grown in Java. The former is frequently received in such a filthy condition as to be almost unsaleable." The hydraulic or steam-press packing of kapok tends to destroy that peculiar elasticity to which it owes its value. In addition the packing tends to press a dark coloured oil from the seeds left attached to the fibre, and hence a noticeable difference in colour between the Indian and the beautifully white Java products. At the latter islands the trade has adopted a uniform practice. No unclean kapok is shipped, but the different grades of cleaning denote standards of quality; the first "extra cleaned" is the first picking of the crop, and is cleansed by machinery; the second, denoted as "best cleaned picked," is all hand-picked and free from seeds, except an odd one here and there; the third is simply designed "cleaned." It contains a few seeds, together with the "slubs," or little knotty curly lumps, which are cast aside from the higher grades. Packing is all done in straw mats and the floss is never tightly pressed. The first quality, "extra cleaned," weighing about 65 lbs.; the second and third from 75 lbs. to 90 lbs. Bales over 90 lbs. to 95 lbs., on account of having to be dumped by machinery, destroying the elasticity of the fibre, are reckoned not to be worth within ½d. to 1d. per lb. in value of bales of lesser weight. In fact, it is a peculiar feature of the Java trade that weight of bales form an essential condition of price—the lightest the highest, and vice versa.

In Ceylon kapok is collected throughout the villages of the interior. The season commences in May, and one crop is obtained each year; the tree reaches maturity about the fifth year. Australia receives large shipments of kapok both from India and Java, but it is difficult to obtain reliable statistics concerning the trade. It is entered at the local Customs under all manner of names such as "vegetable fibre," "vegetable wool," "silk cotton," "raw cotton," and "simal cotton." So much attention is kapok receiving in the East Indies that the cultivation of the trees is even said to be ousting coffee. Kapok has not been received in England on a very large scale; 200 bales a month are sent from India and Ceylon (one bale equal to 200 lb. Ceylon, 400 lb. Indian), and the price in London varies from 3½d. to 5d. for raw, and 6d. to 9d. when cleaned.

The Editor of the PRODUCE WORLD invites suggestions from Planters on this subject, and will be pleased to put Growers in communication with London and Continental buyers.—*Produce World*.

LETTERS TO THE EDITOR.

TEA: LIME FOR COFFEE.

DEAR SIR,—Will you or any of your readers very kindly advise me on the following:

1. The best jât of tea to plant and where to obtain the seed.
2. The best way to apply lime to a field of coffee, whether in the hot weather or after rain.
3. Should the lime be used slaked or unslaked.

"COFFEE."

[District Mysore, the land for tea, averages 250 inches of rain.—ED.]

STORAGE OF POONAC AND BONES.

DEAR SIR,—I am writing to enquire whether bone or poonac meal can be kept in store for any length of time—say two seasons—without deteriorating in its fertilising elements. Owing to short crops chiefly, and difficulty of securing labour in time, large quantities of manures have been held back this season. What I wish to know is whether they will be as valuable as newly crushed bones or poonac after being stored for a year or more. If manures deteriorate even when kept under shelter, it would be a benefit to know what the planter

is to do under the circumstances. Refuse to take the stuff, or ask for a reduction in the price? I trust that some of your readers will kindly enlighten.

ALIQUIS.

HUMUS IN COFFEE.

DEAR SIR,—Allow me to reply briefly to “H. G. R.” I have every respect for the authorities he quotes, and should not attempt to disprove the theory that under certain circumstances a great excess of humus (once such an excess of humus is established) will cause sourness and foulness. My remarks were made with reference to his criticism of Mr. Nelson on page 528 of the *Planting Opinion* for August 28th, 1897. “H. G. R.” there says: “To my objection that the well-known dangers of an excess of humus would be likely to arise from constantly applying *E. Lithosperma* cuttings, he replies in effect that this is impossible and says that on the contrary, as it is difficult to preserve what humus there is on coffee land, there is very little risk of increasing it to an undesirable extent. Why I find it impossible to agree with Mr. Nelson will appear presently.” From this it is evident that the question is not whether a certain excess of humus is harmful or not, but whether it is possible to establish such an excess by applying *E. Lithosperma* cuttings for a series of years. My experience is that the whole humus contained in the surface soil of a primeval forest plus that contained in all the stems, boughs and leaves (unburnt) of the heaviest known forest on the Ghats did not cause such an excess. Nor have I been able to establish such an excess by repeated applications of humus on the same land beginning some ten years after it was opened unburnt.

Further, “H. G. R.” says in his letter under reply: “I can perfectly understand why too much humus *cannot* be applied in the way of spreading vegetable matter on the land and covering with the soil out of renovation pits.” I understand Mr. Nelson does not propose burying his cuttings at a great depth; anyhow he could apply them as a surface mulch. Assuming he does so, it seems from my experience and “H. G. R.’s” own showing Mr. Nelson is right in saying there is very little risk of increasing humus to an undesirable extent by constantly applying *E. Lithosperma* cuttings.

J. W. H.

KUTCHA BUNGALOWS: SOME QUERIES.

DEAR SIR,—Can some of your readers help me in any of the following difficulties. Firstly, as to preventing iron roof from sweating. The roof in question is a very low one, and, owing perhaps to the dampness of the room generally, sweats in a terrible way at night, making a horrid mess of everything. I tried whitewashing, but this has only made things worse than ever. I may add that I have already put a thick layer of tiles over the iron. As a last resource I am putting up a ceiling-cloth. The house being only a kutchha one, none but the cheapest of remedies are solicited.

Being in urgent need of buildings on my estate, &c., for stores, godowns, &c., I made a number of them in wattle and daub, as brick-making was impossible owing to the continuous rains. I am not at all satisfied with the result and shall have to replace them with better buildings in the dry weather.

In other districts, notably in Coorg and the Wynaad, I believe a very favourite substitute for brick is rammed earth, and the one or two bungalows I saw made in this way looked extremely well. As I can’t burn good bricks on the estate, I have to get them from a distance at a cost of about 10 rupees per thousand. Building them up in mud and chunam plastering inside and out will cost me, everything included, about 25 rupees per 100 square feet of wall, $1\frac{1}{2}$ brick in thickness. How does the cost of rammed earth compare with this? Is it possible to make double stories with this material?

If the cost is appreciably less, say Rs.10 or Rs.15 per 100 sq. feet, I should be extremely obliged for full particulars of the process, special attention being paid to the following points: Exact description of mould or boarding required; best kind of earth; thickness of wall for given height; whether beams or wooden supports should be built in the walls to support the roof; or whether the roof would rest simply on the wall-plates; if foundation of stone or brick is required; what kind of plaster is used for the walls.

The roof I should intend using in any case would be iron sheeting and tiles. By the way, what is the cheapest galvanized iron roofing in the market per square foot?

I see a great many queries in your paper, but very few answers! I hope this will be different in this instance.

KUTCHA.

COFFEE.

Grevelleas.

They are so taken with the great value of grevelleas in tea, that Ceylon planters are now asking themselves whether, if planted out in their now abandoned coffee, their old favourite might have been saved. For an answer, they need only turn to South India, where the silver oak enjoys enormous popularity.

Dangers of irrigation.

All river or well water contains in solution appreciable quantities of sodium-salts, more especially in the dry weather. If persistent use is made of irrigation water, and sufficient care is not taken to ensure the most thorough drainage, these salts accumulate in the soil, being rejected by the plants growing thereon. In course of time the proportion of sodium-salts is absolutely inimical to plant-life, and then results those barren wastes of land known in Northern India as the Reh or Usar Plains. Numerous attempts have been, and are still being made, to reclaim these deserts but with very indifferent success.

It would be well for the thriving young coffee industry in the neighbourhood of Bangalore and Mysore to take the greatest precautions to ensure the most thorough subsoil drainage practicable.

East Java.

Very hazy ideas exist on the resources and conditions of Java. It is, to quote a contemporary, the gem of the Dutch Indies. It covers 50,554 square miles, and has a population of over 25 millions. Of Europeans, too, Java has a very considerable number. At the end of 1894, it had over 1,000 miles of railway open. The authorities are very desirous of attracting foreign capital, and, by their generous treatment of settlers, aided by the magnificent soil, have accomplished a great measure of success. A canny Dutch regard for their own feelings, has led to their offering their greatest inducements for foreigners to be located as much as possible in the one extensive and hitherto *unoccupied* district.

But the strongest note is struck by Mr. Mackay, an old Ceylon planter, in a letter describing some Ceylon-planted coffee gardens in East Java. Of one in particular, a large one of 1,300 acres, the crop for three and four year old Arabica coffee is something like ten cwt per acre!

Labour is said to be good and ample, but rather more expensive than in Ceylon, the standard being a gold one.

Brazil Crops.

The following statement shows the total Coffee crop in Rio and Santos during the last fifteen years, commencing July, and ending June 30 :

	Rio. Bags.	Santos. Bags.	Total. Bags.
1896-97 ...	3,552,000	5,103,000	8,655,000
1895-96 ...	2,399,000	3,081,000	5,480,000
1894-95 ...	2,712,000	3,987,000	6,699,000
1893-94 ...	2,588,000	1,702,000	4,290,000
1892-93 ...	2,980,000	3,213,000	6,193,000
1891-92 ...	3,722,000	3,664,000	7,386,000
1890-91 ...	2,395,000	2,913,000	5,308,000
1889-90 ...	2,351,000	1,869,000	4,220,000
1888-89 ...	4,124,000	2,611,000	6,735,000
1887-88 ...	1,921,784	1,120,043	3,041,827
1886-87 ...	3,500,234	2,587,912	6,088,146
1885-86 ...	3,887,618	1,668,965	5,556,583
1884-85 ...	4,117,116	2,095,435	6,212,551
1883-84 ...	3,186,696	1,871,384	5,058,280
1882-83 ...	4,742,969	1,967,880	6,710,849

Stocks in Europe.

The following statement of the total stocks of Coffee at the principal ports in Europe on the first of each of the past twelve months, compared with corresponding dates in previous years, is taken from Messrs. Dauring and Zoon's report:—

	1896. Tons.	1895. Tons.	1894. Tons.	1893. Tons.
September ...	83,650	91,750	61,650	110,050
October ...	82,950	88,650	55,750	95,700
November ...	82,100	90,500	60,200	86,150
December ...	86,700	92,050	64,920	77,900

	1897.	1896.	1895.	1894.
January ...	98,750	100,600	69,150	78,200
February ...	106,700	101,150	70,450	73,000
March ...	117,050	102,900	75,300	72,150
April ...	134,200	101,300	88,850	72,550
May ...	140,600	102,800	97,000	75,350
June ...	143,000	99,450	94,750	79,150
July ...	141,750	96,200	101,500	78,600
August ...	132,200	91,400	94,600	71,550

TEA.**The American sieve-test.**

The latest news shows that the attempt to alter the present sieve-test at the American customs has been unsuccessful. This means that for the present at all events a decided check has been put on the importation of "fine" British-grown teas, though the coarser grades will enter without hindrance. It is shrewdly suspected that the whole episode is a move on the part of the traders in China and Japan teas to prevent the development in Indians and Ceylons.

Final firing.

Writing to a Ceylon paper, an Indian planter wrote for instructions on the final firing of teas. The reply thereto by "5,000 feet" states that the great mistake in final firing is allowing the process to proceed too long, even though the temperature be a low one. The best results are got by the writer in a Dessicator, firing at 220°, using one chamber only and spreading the tea half an inch thick on the trays. When the tea is slightly heated, the odour is rather unpleasant than otherwise, but when hot, all flavouring tea gives off a fragrant aroma. As soon as this begins, it is time to stop.

Banjhi leaves.

A writer in a Calcutta exchange asks the question: what is a banjhi leaf, and proceeds to answer it in a very interesting way. Space allows us to quote only the practical part of the letter. The word "banjhi"—note the spelling—is derived from the adjective "bānjh," which means barren. As applied to tea, it indicates that the terminal leaf on any shoot (long or short) has a more or less dormant eye at its footstalk or axil, and that the growth of the shoot in length is arrested. All varieties of tea throw banjhi leaves, most at the sides and edges. Growth being arrested at times of flowering and seeding, banjhy leaves are then frequent. Being the last leaf on a shoot where the eye is dormant there is no tip, and, having less sap, are stiffer, more leathery and of poorer quality. Anything that arrests growth results in banjhy leaves forming; among these causes are want of cultivation and cold dry air. Lightly pruned bushes are specially liable to banjhy.

The Calcutta Sales.

The last sale before the Pujas was held at Calcutta on 29th ult. when 16,700 packages were offered and about 16,350 sold.

Messrs. W. S. Cresswell & Co. report:—

The selection was not very good, there being a lot of liquoring teas catalogued. The few Assams offering in some cases showed rather better quality than previous invoices of same marks. Cachars and Sylhets were still rather wanting in cap, and the Duars were not quite so good as they have been. The few Darjeelings were fair, and in some cases good, for the time of year. At the commencement of the sale prices were inclined to be a little irregular, but soon settled down, bidding being brisk and prices generally firm for all descriptions. Low-priced teas here and there shewed a slight inclination to advance. Exchange closes at $1/3\frac{2}{5}$. The first sale after the Pujas will be held on the 15th October, prompt Monday, 25th October. Since the opening of the season on the 15th May, 17 sales have been held, totalling 279,578 packages in all; and in spite of the fact that quality was poor for the first few sales, and the estimated crop considerably larger than the previous season, with heavy stocks held in London, the average sterling equivalent comes out exactly the same as the corresponding period of last year, although the rupee price is fully an anna less, owing to the higher exchange.

To economize labour on tea-gardens.

The interesting correspondence still running in the *Ceylon Observer* repeats, with a few variations, the summary already given by us of the first few letters. A strong consensus of opinion is in favour of the multiplication of wire-shoots for conveyance of leaf, fuel or manure. If stretched at an easy gradient, the damage done to the leaf is only nominal. Tramways are mostly dismissed as impracticable on the majority of estates. Handcarts are generally advocated as relieving coolies of the work they most desert, i.e., transport of goods, etc., on their heads, while light single carts have also strong advocates for the same reason. Stress is laid on the waste of water-power that is now allowed, as though engines may be necessary for a part of the year; water-power could take their place with great economy the rest of the time. Clean-weeding is almost unanimously supported as the *ne plus ultra* of hill cultivation. The growing and digging in of even leguminous weeds is condemned all round on account of the loss of soil resulting from loosening the earth. Attention is drawn to the value of tea or cus-cus hedges, especially the former, above roads and drains in preventing loss of soil by wash. Terracing of course is a counsel of perfection, unattainable only on

account of its expense. The Editor's query as to "selected weeding," i.e., leaving moss, ferns, etc., to grow, is rejected, mainly on account of the bad effect of moss on the tea. This we should have thought was fairly obvious. As to drainage, all are agreed that drains should not be too far apart, nor should their gradient be too steep. A world of virtue lies in the application of the word "too." Silt-pits at frequent intervals are also recommended.

Manuring: side roots. The following advice given by a Ceylon planter to a contemporary is worthy of notice, though we think there is something to be said on the other side. Granting for the moment that the cutting of side roots of tea is distinctly harmful, our readers will find it well worth their while perusing our remarks on surface manuring in our "Coffee Notes." Without ceaseless supervision, side roots are bound to be cut or injured if the manure is applied in pits.

This is the extract referred to:—

"There is one thing in Ceylon not half attended to, and that is, when applying manure either artificial or bulk, to be careful not to let the coolies cut the roots of the tea, the main side roots, I mean. I have seen a lot of careless work done in this respect. The tree will expend its energy in making fresh roots, using up the manure in the attempt, instead of its going to strengthen the whole tree, and make it flush more freely. For this work mamoties should be forbidden, and forks or a blunted short scraper used. I think it folly manuring tea, too, when old coffee stumps with feeding rootlets are allowed to remain in the land. These should all be removed if manuring is to be done."

On the other hand, where digging and forking is the rule, it is quite impossible to pursue cultivation in a thorough manner *unless* the side roots are cut. The usual alternative is to allow roots being torn and turned up out of the soil; certainly far more harmful than careful cutting back within a short distance of the stem. In this case, we would feel inclined to recommend making trenches of about a foot deep all round each stem, and cutting off all side roots above that depth with a knife. The shock that would inevitably ensue must be counteracted by a liberal supply of manure, say a pound of poonac and bones per tree. The effect would be that the lower side roots would develop themselves, and throw up fresh feeding roots from below. Digging and forking would injure the large roots no more, and cultivation could be as thorough as it is now "shoddy."

In Northern India, especially on the plains, exactly the same results are attained, we believe, by the garden being deep-hoed in its early youth, before the side roots are developed. Subsequent deep-hoeings check all tendency for side roots to form above a certain depth of soil.

Wind-belts.

The great difference in temperature between different fields, of even the smallest gardens, is largely explained by the amount of shelter provided either by nature, or artificially. Considering what an easy matter it is to grow suitable wind-belts, it is extraordinary to note the general inattention paid to the matter. For there is no doubt that, besides lowering the actual temperature, winds usually have a marked effect in retarding growth. On the other hand, patchy and incomplete works in this direction is to be strongly deprecated. Single rows of trees planted both far apart in the line and at a great distance between the rows will render the minimum of assistance. According to the variety of tree chosen, the wind breaks should be belts, not

rows, six to ten lines deep. Naturally a great deal depends on the tree, and Bluegums are far too generally employed. It is a most undesirable tree to employ, as it impoverishes the soil all round to an extent incredible to any but careful observers, while nothing will grow under its shade. Far better than the gum is the favourite grevillia, which is such an enormous favourite in Ceylon. Its abundant litter mitigates wash and adds largely to the stock of humus in the soil. The timber is excellent, and its value as fuel is considerable.

A better tree even than the grevillia would be the famous *E. lithosperma*, which, besides its well-known manurial properties, gives a very good fuel. A good deal of discretion must be exercised on the choice of sites for the wind-belts, and the line they should take. Until the trees are thoroughly established, and of respectable size, it is obvious that the number and width of the belts should be at least double those finally requisite. Anyway the old whist rule holds good: when in doubt, play trumps, i.e., allow a good big margin of trees over and above your estimate.

The evil effects of shade on the quality of the tea should of course be continually borne in mind, but it is a choice of two evils; for wind-blown tea is at least as bad as shaded tea, and is a great deal less in quantity.

To revert to the site to be chosen for the wind-belts. In enclosed valleys, the wind will always blow up or down, never across. At the head of the valley, this rule is not a safe one, and only personal observation can decide the point. Again, elementary as the caution may seem, it is quite useless planting wind-breaks in a hollow, following the line of depression. Ridges should be the site *par excellence* for wind-breaks, and the size of the pits in stony and barren soil should be of generous proportions.

FERMENTATION.

THE following article from the *Indian Planters' Gazette* will be sure to be read with interest by all tea-planters, though the inference drawn by our contemporary, that the fermentation of tea is real fermentation, is by no means justified. The initial changes are far more likely to be due to oxidisation, as demonstrated by Bamber, than to real fermentation:—

(i) What is real fermentation?

(ii) Is it either possible or probable that real fermentation can take place in the manufacture of tea?

The researches of Pasteur led to the following conclusions regarding fermentation:—

Fermentation is produced by the action of living germs or cells on the substance to be fermented. These cells or germs may be of three kinds:—

1st.—The living cells which exist inside fruits.

2nd.—The germs or seeds of plants.

3rd.—The germs of animalcula.

In the first instance what takes place is this: The cells take oxygen from the saccharine juices of the fruit, throwing off carbonic acid and producing alcohol. If these cells are broken or injured by gushing or other means, they are powerless to effect this: everybody knows the unpleasant hot flavour of a pine-apple that has been kept too long. It has lost its sweetness and has acquired instead a peculiar burning taste. What has taken place is neither more nor less than fermentation. The living cells which exist in the pulp of the fruit have absorbed oxygen from the sweet saccharine juices, and have by doing so, produced alcohol, which is the cause of the burning taste.

The second instance arises from a very different cause. We now have the germs or seeds (as they really are) of a plant acting exactly in the manner we have described, in a foreign substance. This is

the sort of fermentation that comes into play in the manufacture of beer and wine. The brewer first steeps his barley for a certain time in water, then drains and subjects it to a gentle temperature sufficient to cause it to germinate; he then dries it on a kiln, and calls it *malt*; he now grinds and mashes it up with warm water, boils it with hops until all the soluble parts have been extracted, and obtains an infusion which is called *wort*. He has now got to ferment this, and for the purpose uses the seed of a minute plant called *Torula cerevisia*. Yeast is a fluid containing these seeds in suspension, and the admixture of the yeast with the wort is simply the sowing of the seeds of the *Torula* in a congenial soil. These seeds sprout and grow, but in order to do so they require oxygen. They accordingly take it from the sugar contained in the wort, turning it (the sugar) at the same time into alcohol, and acting just in the same way as the life-cells did in the case of the pine-apple. In the manufacture of wine, yeast is not required, simply because the seeds of the *Torula* are found on the outer surface of the ripe grape ready to hand. Break the skin, and the seed is sown, and forty-eight hours afterwards we find it sprouting into growth with all the usual phenomena of real fermentation. The result of fermenting *wort* with *Torula* is the beverage called *beer*. The result of fermenting the *must* of the grape with the seed of the same plant is *wine*. Were germs of other ferments sown in the wort or *must*, fermentation would ensue, but the results would not be palatable. The maladies of beer are owing to its being contaminated by germs floating in the air which are not those of the *Torula*. The plants which spring from these objectionable seeds are not nourished in the same way as the *Torula*, and consequently the result is not *beer*.

The *third* instance is that in which the germs or eggs of animalcula are sown; in short, when animal and not vegetable life is the fermenting power. When milk turns sour or putrefies, the cause is to be sought in the presence in it of curious eel-shaped organisms; the sourness being due to an animalcula called *Vibrio*, and the putridity to a different one called *Bacterium*. These animalcula float in the air, and are the direct cause of milk going bad. Keep your milk in air free from them and it will never go sour or putrefy. Take an ordinary tin of soup, open it and leave it exposed to the air in a room; it will putrefy in a certain period, which will be longer or shorter according to the temperature of the atmosphere. Open a similar tin in air which has been freed from such germs, and it will remain perfectly pure. The bacterial eggs which float in the air of a room fall into and are hatched in the soup. They then breed and multiply at a marvellous rate, totally altering the composition of the soup; and the result is *putrefaction*, as it is commonly called, which is really due to fermentation.

We have thus *three* phases of fermentation. In all three the causal force is to be found in the life existing in cells, or seeds, or eggs, and the question is, does any such process take place in the manufacture of tea? The process of *rolling* expresses the *juices* of a leaf, and among them appears *tannic acid*. Fire the leaf immediately after it is rolled, *i.e.*, without fermenting, and after infusion note flavour of liquor and colour of outturn. The liquor tastes harsh, pungent and raspy, and is quite unpalatable. It wants *body*. Compare with leaf that has been fired after having been *just sufficiently fermented*, and then with leaf that has been allowed to *over-ferment*. Planters know full well the results, so we need not enter into particulars, as they can draw their own conclusions.

• SHORT STORY.

MORE KASHMIR TALES.

I LEFT Srinagar after I had only been there two days or so and went back to Rampore, which much reminded me of Scotland and Switzerland. I felt very lonely without my friend X, as even after his departure I had not been quite so much alone as I now was. I stopped a day or two at Shadipore, which was getting very lovely, for the leaves were mostly out by this, and the trees in their young spring coats were of the most vivid colours. I found the cold at nights very pleasant, but my old servant went about grumbling and trying to keep warm in the thickest clothes he could lay hands on. From Shadipore I dropped down to the lake, and had some duck and snipe shooting, and there met Col. Longshanks and his wife and daughter. He was a great shikari, rather reserved and cold at first, but a real good fellow when you got to know him. Monsieur LeCocq, a very old Kashmir resident and friend of the Colonel, was also there. He's a widower, and, strange for a Frenchman, not

only a good business man, but a great tracker and shikari. I can pay him no higher compliment than to say he ought to have been English. The Colonel's wife was a great invalid and hated the cold, and the temperature of her houseboat was a great contrast to that of the outside air. Their daughter was a long colourless slip of a girl who used to accompany her father out shooting. She detested the jungles, and longed for Srinagar, where there was, at any rate some society, but we did not hit it off well, as though she was glad to see a young man, she was a trifle trying. She would be most cordial one day, and then without rhyme or reason as cold as ice the next; perhaps she found M. LeCocq rather hard nut to crack. I cleared out rather quicker than I might otherwise have done, as I heard a man enquiring my name one day; and on hearing it said he was not sure but he had a message for a young sahib from a native lady; it was for me and from Chota Begum, but I told him it was not, and that the sahib for whom his message was was somewhere else. Then I went to Bandipore and on to Attawat Nullah about 17 miles off. I stopped at Kraalpara for three days and tried for the big bear there. Kraalpara is at the foot of the Traajbad Hill. The Gilgit road here leaves the main valley to cross the first pass on the way north. I did not get the bear. I only saw it once 300 yards away. At Attawat I found it very cold; rain in the valley meant snow at night. I only had one bit of luck. I saw two bears about a mile away from me, and about half a mile apart, one black, one red. I left my chota shikari to watch the black and went after the red one with my head shikari and tiffin cooly; though only a mile away across the nullah, it was three miles to him, for I had to go up half mile and then half a mile down. He had a real good coat and was feeding on the young grass that was growing up in patches among the snow. My shikari and I were some 20 yards ahead when we heard a yell behind, and saw a most comical sight. The tiffin cooly in following up had slipped, and he and a good big patch of snow were sliding down on us. We got out of the way as best we could, and then turned to look at the bear, for the man and the snow were sliding straight down on him. He turned and bolted, but the snow went faster, and in half a minute snow, man and bear were all rolling down the hill together,—the man yelling, the bear roaring. We ran after them shouting with laughter; luckily there was a small hollow about 100 yards below, where they all brought up, and both picked themselves up, both more frightened than hurt. The man bolted one way and the bear the other, but not fast enough, for I got a right and left at him. The right hit him hard; but the second seemingly missed, and away he went in the direction of his black cousin. We followed as hard as we could and managed to keep him pretty close, but yet not near enough to make good shooting; suddenly he disappeared over a knoll, from the back of which began a devil of a row—grunting, growling and groaning. When we got to the top, we found him and the black one about 20 yards off and going it hammer and tongs. We were quite close, but they did not notice us, for we had the wind; claw and smack, grunt and growl; there seemed no love lost; we watched them for two or three minutes, and then as I was afraid their coats might get spoiled, I waited my chance, and seeing the red one was badly hit and getting rapidly weaker, I shot the black one in the side of the head and he pitched over dead and began to roll down the hill. The red one looked about him stupidly for a bit, and before he'd a chance to do more, I shot him behind the shoulder: he sank down with a grunt, not quite dead, and rolled down after the black one. When we got down to them he was still groaning but dying fast; in fact, in five minutes it was all over, and we set to work to skin them.

BALLOON.

AT THE FALL OF THE LEAF.

WHY do the leaves fall? "Bless me, I don't know," you answer: "I suppose because it is one of nature's arrangements."

Precisely; but why did nature so arrange? Why not have summer time always, with perpetual foliage? What is the meaning of denuded branches, withered flowers, daylight fading in mid-afternoon, and winter's cold and desolation? When you find out why the leaves fall, you will have discovered one of nature's deepest secrets—*why men die*.

Suppose we try an easier problem. Why should Mr. William Steel have written such a sentence as this?—"At the fall of the leaf every year I got into such a state that I took no pleasure in anything."

No doubt there are minds so highly strung as to feel keenly the influence of outward conditions, changes of the weather and of the seasons, and so on. But they are rare, and for practical purposes they ought to be rare. Our friend Mr. Steel, happily for him, was not one of them. All the same he was a miserable man every time the leaves began to rattle to the ground.

Here's the way he puts it: "At the fall of the leaf every year I felt languid, tired and weary, and took no pleasure in anything. My appetite was poor, and after everything I ate I had pain and fulness at the chest and sides. Then there was a horrible pain at the pit of the stomach, which nothing relieved."

Now this sort of thing would spoil a man's pleasure any time of year, but the oddity in Mr. Steel's case is that it always coincided with what you may call nature's bedtime.

"After a few months," he says, "the pain and distress would be easier for a while, but as autumn approached I became as bad as ever. In September 1890, I had an unusually bad time of it. I couldn't touch a morsel of food, and presently got so weak I was unable to stand on my legs. Every few hours I had to be poulticed, the pain was so bad. I went to bed and stayed there for a week, with a doctor attending me. He relieved me a little, but somehow he didn't succeed in getting to the bottom of my ailment."

That may be, but it doesn't quite follow that the doctor was in the dark as to Mr. Steel's ailment. He might have understood it right enough, yet failed to cure it because he had no remedy for it among his drugs. That happens all the while. Still, the reader may ask, What's the good of knowing the nature of a complaint if we possess no medicine to cure it? There you have us; no use at all, to be sure.

Well, Mr. Steel goes on to say: "For some time I continued very feeble, and was hardly able to walk across the floor. If I took a short walk I felt so tired and done up I didn't know where to put myself. This was year after year for six years.

"Finally I read about the popular medicine called Mother Seigel's Curative Syrup, and made up my mind to try it. So I began and kept on with it for some time. The result was that the pain left me, and my appetite waked up, and my food tasted good and digested well; and presently I was strong and hearty as ever. That was three years ago, and the trouble has never returned. (Signed) William Steel, Hambleton, near Oakham, Rutlandshire, Dec. 5th, 1893."

Mr. Steel is grocer and postmaster at Hambleton, and his case is well known there. His complaint isn't hard to see through; it was indigestion and dyspepsia. But why did it come on only in the autumn? What had the fall of the leaf to do with it? Let the reader study on that point.

Meanwhile it is a comfort to know that Mother's Seigel's Syrup will cure it, no matter when it comes on.

IF SURGEONS DISAGREE AND PHYSICIANS COINCIDE NOT,
THEN WHY NOT TRY
STEEL'S AMERICAN BALM.

HUNDREDS HAVE TESTIFIED TO IT
THOUSANDS HAVE COMMENDED IT

AS BEING

A sure and certain remedy for Rheumatism, Neuralgia, Lumbago, Sciatica, Muscular Stiffness and other Articular and Nervous Complaints.

Sold in pots, 12 Annas.

MARKET SUPPLEMENT.

SATURDAY, OCTOBER 9, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (September 17, 1897) says:—Public Sales have been on a small scale this week, and the supplies brought forward were readily disposed of at fully previous rates.

About 2,200 bags East India sold steadily for ordinary and medium qualities, whilst fine colory grades realised extreme rates.

Good prices were obtained for the moderate supplies of Central American catalogued, fine colory Guatemala showing 1/- advance.

Futures mark a rise of 1/3 since our last in consequence of reduced estimates of present Santos crop, but prices close 3d. off the best.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending September 15th, 1897, says:—Bank rate 2%. Bombay Exchange closes at 1s 3½d. Brazil Exchange 7½d. Rupee paper 3½%. 63½. Silver 25½d per oz.

This market continues quiet, good qualities still realizing firm prices, whilst common sorts shew no improvement. Brazil markets are steady.

The sales included:—158 casks and tierces 63 barrels and bags Plantation Ceylon at 85s to 116s. Of 2,918 bags East India, 223 bags Mysore sold at 73s to 98s, 644 bags Coorg 71s to 107s, 1,974 bags Neilgherry chiefly sold at 64s to 108s, 77 bags Wynaad bought in; 223 barrels 44 bags Jamaica chiefly sold at 55s to 122s 6d; 22 bags Costa Rica bought in; 1,138 bags Guatemala chiefly sold at 53s to 94s; 115 bags Vera Paz and Coban 50s 6d to 96s; 937 bags Salvador 47s to 83s; 530 bags Nicaragua chiefly sold at 49s to 58s; 164 bags Mexican 57s to 67s; 2,551 bags Columbian chiefly sold at 52s 6d to 100s; 82 bags Peruvian part sold at 49s; 30 bags Bolivian 73s 6d to 74s; 4 bags Liberian Wynaad bought in; 120 half-bales Mocha bought in; 106 bags Caravellas bought in; 241 bags washed Santos bought in; and 250 bags Santos on quay terms bought in.

Daily receipts in Brazil have averaged 12,625 bags in Rio, and 31,625 bags in Santos.

Owing to reports of heavy rains in Rio, and the Brazil receipts shewing a slight diminution, the market for "Futures" has been steady, with quotations unchanged to 6d dearer, viz.:—Good average Santos in Havre, December delivery, fcs. 41.75, in Hamburg pf. 34½, and No. 7 low ordinary Rio in New York \$6.45.

To-day's London official quotations are:—

		Sept.	Dec.	March	May	July.
Rio	...	33/-	32/6	—	—	—
SANTOS	...	33/9	33/9	34/9	35/-	35/3

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated September 17th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	290,862 packages.	427,417 packages.	13,960 packages.
1896-1897...	292,344 "	365,954 "	15,809 "
49,811 pkgs. INDIAN			
26,184 " CEYLON			
" JAVA			
Total	75,995 packages were offered in public auction this week.		

Home Consumption and exports since the beginning of the year show considerable expansion over either of the past two years given in the table; the increase in the re-exports of Indian and Ceylon Tea is decidedly encouraging, especially to the Continent of Europe.

Movements of Tea in United Kingdom from 1st Jan. to 31st Aug., as shown by Custom House Returns.

✧ TO PLANTERS AND GROWERS OF PRODUCE. ✧

What others do!!

It is well known that there are Merchant Houses that, although they accept Produce for sale on **Planter's Account** they, on the other hand, are also **Purchasers on their own Account**.

What we do!!

It is evident that the services of such houses are not wholly and unreservedly at the disposal of their correspondents. We on no account enter into competition as **Buyers against Planters**, but deal with each separate shipment on its own independent value; correspondents may, therefore, rest assured that **Produce** sent to us will be sold upon its merit, and not used to bolster up inferior qualities.

Business Area :—

We do not confine our business to any particular part of the world, but receive **Produce** from all over the globe, and are in touch with every market for **Produce**.

Samples and Reports :—

On receipt of samples, particulars of the class of **Produce**, and the quantity that can be shipped, a report shall be forwarded, giving full particulars as to market value, demand, &c.

How we Pay :—

We can secure more money for the Planter and Grower of **Produce** than he can obtain by local sale, and, although in the latter case he may at once secure cash, we are quite ready to meet this, possible, advantage to the **Planter**, and by our system of negotiation of drafts drawn upon us against **Produce**, and willingness to pay freight on approved shipments at this end, the **Planter** will obtain a very substantial portion of cash, and further will be quite certain to receive the full **Market Value** of the **Produce** shipped to us.

Promptness :—

All enquiries will be answered by return mail, and upon arrival of shipment every expedition will be used to turn into money the **Produce** sent us.

Markets :—

We can find a market for any **Produce** from any country on the face of the earth. Put your business in our hands and be certain of getting full value and prompt action.

Bouverie House, Salisbury Square, London, England.

N.B.—Remittances should be sent to the Manager, “Planting Opinion,” Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 22nd October 1897.

SEASON REPORTS.

S. E. Wynaad. PUNDALUR, 13th October.—*Weather.*—From the 6th to 8th we had sunshine and at intervals cloudy; 9th and 10th we had the rains; in the evenings 11th and 13th very cloudy and at intervals a little sunshine, and heavy showers began at 2 p.m.; do not know how long it will last. *Crops.*—Below the average. *Plant-disease.*—No change, same as last reported. *Health.*—Good. *Grains.*—The same as last week. *Labour.*—Sufficient.

Coorg. POLLI BETTA, 12th October.—*Weather.*—The N.E. Monsoon set here apparently on Saturday during the night with a short sharp shower. On the three succeeding days there has been heavy rain in the afternoons, accompanied on Sunday and Monday by severe thunder and lightning. There was an absence of thunder to-day. This indicates that the atmosphere was surcharged with moisture. *Planting-diseases.*—The coffee is, like at this time last year, looking very fine. What is to be feared is that the severity of the leaf-disease may also, like last year, be deferred to late in the year. *Crops* are ripening up. *Interesting Item.*—The Rifle Meeting came off on 30th September and 1st and 2nd October, but the weather was not conducive to good shooting.

Nellampatty, British. 13th October.—*Weather.*—Rain for fortnight 6.92, to date 157.21; 27 cents fell last night, the first rain for a week, during which we have had a lot of bright sunshine and in the afternoons clouds and distant thunder. It has been splendid growing weather and one can almost see the plants growing. *Crops.*—Coffee is likely to be ripe early this year again. In fact on low elevation places (2,500 and below it) they have started ‘fly picking.’ The new rice crop has not made rice as cheap as it ought to have done, and it is still 8½ measures per rupee. *Plant-diseases.*—Leaf-disease in most cases has considerably abated and the trees are recovering wonderfully and looking well. It would seem we are to have the Ceylon fashion here

and get our leaf disease in June-August instead of September-November, unless indeed we are to get both. *Health*.—Good, for here *Labour*.—In most cases sufficient. Moplas have left in great numbers, and it is likely there may be difficulty in getting more, as they will in all probability flock to the making of the new Railway. *Interesting Items*.—Resident comes up: much-needed work is at once begun on bridle path up the Ghaut. Resident goes down: work stops at once!!

Nilgiris.

COONNOOR, 13th September.—Last week the persistent rain cleared off till quite the end, when after a day or two interval fine weather has again returned. It was badly needed everywhere. A grand season though for planting it has proved. Coffee is ripening up well, and fly-picking has been on for some time. Leaf rot, caused by the excess of moisture, has been unusually prevalent. Tea flushing very well again, and our particular enemy, flush worm, has turned it up almost. Jolly good time too. Extensions proceeding on several estates, but only in our mild Nilgiri way. We have three "swell" (as regards prices only!) gardens in this district, whose prices have been this year about the lowest on record. The third hasn't yet put in an appearance in the market. Our lethargic railway is apparently progressing as fast as ever, which isn't saying much! The chief energies of the establishment seem concentrated just now in supervising a few dozen coolies trying to establish a new principle in embankments, *i.e.*, to make a gradient of 1 in 1 serve the same purpose as 1 in 5, and in loose soil too. It may be that the "natural angle" will be found in time. *Health* fairish all round. *Labour* plentiful. Horseflesh of all kinds cheap on account of the exodus from Wellington.

SHOLUR, 8th October.—Rainfall for month 0.47, making 49.48 to date for year. Temperature 58° and 68°. *Labour* in full swing, but *grains* still dear. No sun to speak of, and tea won't flush owing to continued mist and cold mornings. The tea seed from "Peria Sholah" has come up well, over a lac of plants from 4½ mds. seed and very true to jat, resembling "Singlo" once or twice removed. Quality supplied excellent. The "Sirocco" Tea Roller improves every day, and is undoubtedly the finest in the market, taking very little power and doing its work well and is comparatively a cheap machine, as one boy is all the attendance necessary. The tea oxidises during rolling and is very soon ready for firing, and all foreign matter, such as bits of stick, bamboo, or hessian, can be picked out during the process of rolling, as the "mal" is open to inspection, not being covered at all, and there is a good table on which the attendant can stand.

GENERAL NOTES AND ARTICLES.

Spices.

There is quite a boom in spices. Pepper has doubled in prices, cinnamon has gone up a third, and others similarly.

Scientific research.

We understand that Mr. D. Hooper, formerly so well-known as a clever Chemical Analyst at Ootacamund, has established a research laboratory in the Indian Museum in connection with economic products. He will be allowed by the Trustees to undertake on a small scale private analyses of cinchona bark and other organic produce. It is a pity that the Madras Government could not see its way to retain his services in this Presidency, but though further off,

Madras planters will, we fancy, be only too glad to re-avail themselves of his invaluable services.

Hope for cocoa planters.

If advertising can create a demand, cocoa manufacturers—and indirectly cocoa planters—should reap a golden harvest. Cocoa firms at home are among the most persistent advertisers known to the advertising world. The proprietors of Vi-Cocoa have just achieved a record in securing whole pages of the *Daily Telegraph* at a cost of £200 an issue per page. Another firm announce that any purchaser of a certain paper in which their advertisement appears can go to the nearest grocer whose name is printed in that day's issue, when he will receive one penny (the cost of the paper) and a free packet of the firm's cocoa.

"Amelia Testatrix Esq."

We were favoured the other day with a communication addressed as above, with a request to forward it to the addressee. Making a bold guess we sent the cover to the writer of a recent article on Leaf Disease, signing himself *Hemeleia Vastatrix*, thinking the letter to be from a scientific enquirer eager on obtaining truth first-hand. It was returned for our perusal last week, and it turned out to be an application for the post of a tea-maker on "small estate on Nilgiri with salary Rs. 25 to Rs. 30"! It is difficult to guess at the modes of thought employed by the applicant, who, after perusing a letter on leaf disease, was "given to understand" that the writer thereof had a vacancy for a tea-maker "on Nilgiri."

Sisal hemp a failure.

Statements have been made to the effect that Mr. Chamberlain had abandoned his sisal plantation in the Bahamas as a losing speculation, according to the *H. and C. Mail*. The annual report of the Governor, Sir W. F. Haynes Smith, which has just been issued, tends to confirm the general impression that this West Indian industry is not a great success. The Governor observes:—"The cultivation of sisal plantations is abandoned in some places, whilst in others it is reported to be on the increase. The prospects for this new industry are now becoming more defined, and although it has absolutely failed to fulfil the anticipations once formed of it, there seems to be less reason to fear that it will die out altogether, and some reason to hope that it may in time become a small but well-established industry returning fair profits to those engaged in it." Pineapple cultivation in the islands is more promising. The Governor reports this industry to be increasing, and that large growers are making substantial profits.

Rubber prospects.

The question of rubber production is to the fore at the present time, says the *H. and C. Mail*. Even if a "slump" comes in the cycle "craze," it is very probable that quite as much rubber will be required for the tyres of motors, and other vehicles, as is now used for bicycles; to say nothing of the growing use for the article for varied industries. It is pointed out that there are big rubber forests in Tibet and mid-China which are as yet comparatively unexploited, and that while private individuals cannot, as a rule, accomplish much in their development beyond the "prospecting"

stage, there is yet ample room for work on the part of the State or public companies. Some attention is also being given to the Far Eastern sources of supply; for the rubber forests of Burma will be entirely exhausted within the next ten years, if the present methods of reckless and immature tapping of the trees are continued, and that year by year the output will decrease, until nothing be left. Of course, this is an old complaint with respect, also, to the West African and other forests; and the remedy would seem to be that the virgin rubber should be collected under the supervision of Europeans who have received the requisite training. It must be admitted, too, that, as time goes on, some of the plantation companies which have been formed in recent years should add considerably to the visible supply; but there appears still to be room for more (if properly managed) companies of the kind.

Light railways in India. Seeing that railways are so earnestly required in all our planting districts, we cannot understand the general indifference to the only form likely to be generally adopted, *i.e.*, light narrow-gauge lines. There is as much difference in the cost of broad-gauge and light railways as there is in the cost of a twelve-foot earth road, and the cost of a metalled ghaut highway. This is what the *Home and Colonial Mail* has to say on Light Railways in India, as a preventative of famine:—

Mr. E. R. Calthrop, C.E., of Liverpool, the eminent authority on narrow-gauge railways, anticipates an enormous expansion of railway enterprise in India in the form of an extension of light lines. These, he points out, if connected with the standard trunk lines, would establish trade with the millions of India who are as yet but small consumers of British products. In the event of famine the ordinary cattle transport of India breaks down at once from the impossibility of feeding the animals. That the narrow-gauge railways of India have been of great value in assisting in the swift carriage of grain to famine-stricken districts is undoubted, and it is admitted that they have also been the means of developing large tracts of the country. These light railways, constructed at half the cost, and carrying half the traffic per mile of the standard lines, are paying a larger percentage on capital than are the standard railways. It is asserted that for £15,000,000—the cost of the Manchester Ship Canal—8,000 miles of additional 2ft. 6in. gauge railways might have been built in India and provided with rolling stock.

The closing of the Mints. This is what Mr. Forbes Mitchell, the author of "Reminiscences of the Indian Mutiny," who has lived in India for the last forty years, and has peculiar facilities for knowing the real opinion of the natives, says on the subject:—
"I see that Lord George Hamilton said on August 6: 'It is the policy of the Government to multiply the industries of India, and thus render the people less dependent on the rainfall.' How is this to be done? Does Lord George propose to gather figs from thistles, or to twist ropes from sand? Be it remembered that the commerce of India and almost every industry in the country are already ruined by the policy of closed mints and a rupee artificially appreciated about 25 per cent. above its metallic value. The opium trade is killed, and those engaged in it are on the verge of bankruptcy. The wheat and the oil-seed trade has gone, and if the present policy goes on a little longer, the tea industry must follow the opium, wheat, and oilseeds. Keep the mints closed and force the rupee a little higher and you will have China tea competing with Indian tea, not only in Europe and the colonies, but in Calcutta itself. What are our large merchants who are responsible for the tea industry of India doing? Are they to sit with closed eyes and shut mouths till we have steamers loaded with China tea in the Hooghly to compete with an artificially-appreciated rupee, created solely for the benefit of the Simla Junta? With silver down to 20d. an ounce, with tea

garden shares at nil, then the tea industry will no longer be dependent on the rainfall. The competition of Argentina has already wiped out the wheat and the oilseed trades, and they no longer require any rainfall, because the millions of India can be more cheaply fed by wheat imported from Argentina than by the Indian-grown article."

Stones as a manure.

It is a fact well-known to all planters that land with numerous boulders and stones present often affords the best soil for either coffee or tea. Why should this be? There are a number of plausible answers that arise at once, but it is extremely difficult to choose the right one. How did this food soil get there? Is the humus so abundantly found in this soil a cause or a consequence? That is to say, is it the plant-food afforded by the detritus of the stones or rocks that induce vigorous growth of the plants that furnished, by their leaves, the humus? Or, on the other hand, is it the mechanical, pocket-like conditions that enable the whole of the humus to accumulate, no loss being suffered by the wash that prevails on stoneless soil. We put this query in no idle spirit. If it be the mineral plant food afforded by the decaying rock, as might be somewhat easily proved by chemical analysis, then we have at hand an easy and very cheap means of enriching our land. For it must be borne in mind that to powder even the solid rock is an easy matter with the help of suitable appliances. Stones are piled in heaps and covered with dry brushwood or any other convenient fuel. When fired sufficiently, they are put through a stone-breaker (the smaller sizes of which can easily be worked by hand power) or simply pounded up by hand. Perhaps the best way of applying the powder to the land would be by using it as a dilutant of such concentrated manures as poonacs or nitrates, especially the last. In most instances of course the percentage of available plant-food in the powder will be very small, and compare unfavourably with phosphates and other prepared manures. But the real question of course is the relative cost per unit, and in not a few cases it will be found that stone manure will compare favourably.

Quinine.

"Shilling quinine" has at last been reached again, says the *Chemist & Druggist* of 25th ultimo. The manufacturer's quotations this week are more or less nominal, but in second-hand about 70,000 oz. have changed hands at prices ranging from 10d. per oz. on Friday last up to 12d. per oz. on Wednesday. The last-named figure was paid by a broker for a parcel of about 8,000 oz., and since then it has been repeatedly refused. Messrs. Howard & Sons have issued the following statement:—

We beg to advise you that an advance in the price of quinine is inevitable, price will be definitely fixed after the Amsterdam bark sale of September 30. In the meantime we can offer a limited quantity at (2) two pence per oz. advance on our September list, making quinine sulph. in 1-oz. vials, 1s. 2d. per oz.

Next week's cinchona auctions at Amsterdam may be a turning-point in the commercial position of quinine. In all probability the German manufacturers, who have so far done their best to discourage a rapid advance in quinine, will be compelled to pay considerably higher prices for their bark, and in that case a fairly large advance will have to be made in the quinine prices. The general position of the article looks very sound, especially as the manufacturers, who now have a fair control of the drug, seem disposed to sell very cautiously, and not to renew the unrestricted dealings with speculators which a few years ago caused so great a depreciation in quinine.

Messrs. Powers and Weightman, of Philadelphia, also, on September 4, issued a circular on quinine, in which they say:—

Our sales of sulphate of quinine this year, up to date, have been

unusually large, but we have met every engagement promptly and executed all current orders, for ordinary quantities, from regular customers, in full. We have considered it prudent to suspend making contracts for a time, as our supply of the article has become very much reduced. When prepared to resume entering for future delivery, due notice will be given.

The agents for the B & S brand tell us that they were no longer selling at 9d. per oz. to wholesale druggists on Thursday last. They stopped offering at that figure several days previously.

To-day the market is, if anything, a trifle easier, with second-hand sellers at 1s. per oz. The B & S agents inform us that they are not selling at present. There is an impression that, should a moderate advance be established at the Amsterdam auctions next week, the German makers will fix their price at 1s. 2d. or 1s. 3d. per oz.

Black panther shooting. "SNIDER CARBINE" writes us:—"A fortnight ago a black panther fell to the rifle of Mr. Lawson Morgan, of the Goodalore Mullay Estate, in the Ouchterlony Valley. A dog of his having been taken by the brute, he went in search of it, and found the remains in dense jungle, where it would have been impossible to have sat over the kill. Hastily building a fence round the kill, Mr. Morgan laid a trap for the pard, which declined to visit the bait. For two nights the trap was set, but without avail. On the third morning Mr. Morgan with an attendant, after visiting the trap, ventured further into the jungle to look about for a suitable site for the tying out of a live bait. Having found a desirable spot where it was possible to get a chance of a shot, Mr. Morgan with his attendant was on the point of leaving, when the howlings of a troop of monkeys attracted their attention. Silently advancing in the direction of the commotion, which had become furious, the intrepid sportsman knelt down to await events. He had scarcely taken up this position, when he was rewarded by seeing the dark, lithe form of the pard advancing in his direction. Taking a rapid aim and covering the brute he fired, and when the smoke cleared, was in doubt whether he had not missed, as a slight inequality of the ground, the sombre colour of the animal, and the gloominess of the jungle all contributed and made it very difficult to distinguish the body as it was all in a heap. The aim, however, had been very true, the bullet just striking under the right eye, and shattering the head and jaws, death must have been almost instantaneous. The animal, though evidently full grown, only weighed 46 lbs. and was 5 feet and 7 inches in length. The cunning nature of the brute prevailed against its hunger, for she certainly had not had food for a week or ten days, yet would not look at the tempting bait. This, I may mention, is the third black panther shot within the year in the district, and the fifth accounted for within the last three years. The spotted variety seems to be quite as common, as seven have been accounted for within the same period. Mr. H. R. Norman made some pretty shooting with a Martini Henri carbine, dropping a black and a common panther within thirty seconds of each other with two consecutive shots; the second animal was stopped with a well placed shot in the centre of the neck, a descriptive account of which appeared in the *Nilgiri News* a little while ago. Though panthers are common enough now, rarely, paradoxical as it may appear, are they to be met with; it requires a thorough knowledge of the habits of the animal, and one has to be a past master in woodcraft, and possess a great modicum of those indispensable virtues—perseverance and patience—to be successful in the mysteries of woodcraft."

RHEA.

RAMIE CULTIVATION IN JAMAICA.

THE following extract will be found of particular interest and value, as it contains a great deal of information not previously available:—

The constantly increasing amount of attention which is being given to the cultivation of ramie is resulting in large additions to our present knowledge of the habits and *habitats* of the plant, and the conditions to which it can adapt itself to such an extent as to become a profitable product. A correspondent of the "Jamaica Agricultural Society," dealing with the suitability of Jamaica for the culture of ramie, points out that any advantage which India has over Jamaica, so long as the preparation of the fibre remains essentially a hand process, lies in the cheaper labour of the former, and this advantage will be swept away with the advent of a successful decorticating machine. The objection that the plant is not likely to prove commercially successful in Jamaica because of the enormous quantity which could be produced in India would soon swamp the market is dismissed with the observation that at the low price at which it can be produced, it will probably undersell cotton, jute and flax, makes it improbable that the world's supply will exceed the demand, at least in this generation. The correspondent evidently writes upon a subject with which he is well acquainted, if he appears to have experimented on the growth of ramie under varying conditions, both of land and season, and his conclusions seem to be at once thoroughly established in suitable soil the plant will "not only withstand a severe drought, but may also grow during dry weather, although less quickly than usual," therefore the idea that "without irrigation it would be a risky cultivation in Jamaica" is erroneous. In a nursery two years' old he succeeded, after a period of severe drought, in obtaining stalks averaging over three feet nine inches, and again, three weeks after cutting, he got ramie over four feet. At the same time he admits that cuttings planted out only a few months died from drought. In support of these views, the remarks of Mr. Allison, a well-known American authority, in reference to a Texan plantation, are quoted as follows:—"But early in July, 1889, a drought began, which lasted nine weeks. During this period, so great was the intensity of the heat, the soil was dried to a depth of more than two feet. Hundreds of thousands of coffee plants perished, but ramie survived the drought and quickened by the fall rains, grew to such luxuriance that often 150 stems were found in clusters not more than two feet in diameter." The plants referred to were of the *Nivea*, or white underleaf variety, but having after a long drought obtained growing roots from a neighbour who had planted *Tenacissima* variety, the writer concludes this species is also suitable to countries where constant irrigation is not in vogue.

The chief obstacle, therefore, to the profitable growth of ramie in Jamaica, appears to be the lack of a successful decorticating machine. Our Jamaica planter readers, therefore, will learn with pleasure that according to *Capital*, the difficulty connected with this process is one easily overcome.

Says our contemporary:—"The gum, which has always been held up as a bugbear, has assumed such a size in some people's imagination, that it is difficult to conceive how any remedy could be found to cope with it. As a matter of fact the stripping of the bark, or decortication, is one of the simplest and easiest things possible, and instead of the woody fibre being carried away, to be plunged into a hot soda water bath to allow of decortication, all that is required to be done is to snap off the stem as close to the ground as is required the result being that the woody fibre breaks through the bark; then by simply pulling it, it decorticates itself, and instead of robbing the ground, the woody fibre substance can be left to rot and form manure. The ribbons are cut off with a knife, for the fibre is so strong that if an attempt was made to break it, it would uproot the plant bodily. . . . Rhea or ramie will grow almost anywhere but growing and flourishing are two different terms, and it will only do the latter in the very richest of soils that are not likely to be inundated, for it is very chary of damp. . . . To cure the ribbons, almost no machinery is required, and, in fact, this can always be done in the sun; the only absolute necessity is a baling press for hitherto the rough bundles sent down from Assam have run away with all the profit in the high rates demanded for freight, so that baling by hydraulic or other power would be necessary. There need be no apprehension on the part of jute growers that their trade will be interfered with, for we feel certain that the rhea fibre will

always command a much higher place in manufacture than the finest of jute. There can be no doubt that fabrics can be manufactured from this fibre, which only an expert can distinguish from silk, and, so long as ramie can be mixed with silk, there is a great future for it. To many it may not be known that a great deal of what is called Assam silk is made from the fibre, and it is only after repeated washings that this can be detected. To those then who have a large area of first class waste land we would recommend the cultivation. The dried ribbons when sent home in the rough command a ready market, and have done for some years, at prices ranging from £14 to £16 per ton which, if one were possessed of a baling press, would leave a handsome profit behind it."—*The Produce World*.

LETTERS TO THE EDITOR.

TO PREVENT IRON ROOFS FROM SWEATING.

SIR,—It may interest some of your readers to learn that my experiment with the ceiling-cloth to prevent the discomforts resulting from the profuse sweating of my iron roof has proved entirely successful. The reason of this success, I take it, is that the upward passage of the moisture in the room, which would otherwise condense on the cold iron at night, is stopped by the practically air-proof cloth.

KUTCHA.

ARBUTHNOT & CO.'S TEA CIRCULAR.

SIR,—With reference to the following extract from your paper of 21st August last:—

"Messrs. Arbuthnot & Co.'s monthly circular, which unluckily generally reach 10 days later than other home circulars, dated London, 16th July 1897, says:—(and here follows an extract about tea from our circular)" our London House write as follows:—

"We note the remarks in *Planting Opinion*, but as we always have to wait for correct returns of figures from the Docks which we cannot get till the 8th of the month, it is impossible to issue our circular earlier if the useful statistics we give are to be included."

MADRAS, 7th October, 1897.

ARBUTHNOT & Co.

SEALING WAX: A QUERY.

SIR,—The black dammer tree, *canarium strictum*, is to be found in these (Travancore) jungles. The resin which issues therefrom is of a deep brownish yellow or amber colour when held between the eye and light, and when adhering to the tree it has a bright shining black appearance. I have been told this resin could be used for hermetically sealing up preserve bottles, jars, etc., i.e., over the cork of course. Could you or any of your readers kindly tell me what is to be added to the boiling in order to make thoroughly reliable sealing wax for the above purpose? I have tried with linseed and cocoanut oils, but it either does not adhere sufficiently to the stopper or paper, or with the latter oil it will not dry up but remain in a sticky condition.

Apologising for the space I've taken,

AGRICOLA.

SHORT CROPS.

SIR,—Have any of your readers thought that they could trace any connection with this and the time they manured? As a *chick doree* I held very strong opinions on this point. Further experience confirms me in the view that manuring just about and before the flowering season converts the whole coming crop of berry into leaf, the cause being a thorough check to the plant, which needs the "winter" not only of Nature but that of human agency. And yet how often has one met the planter who "gasses" about the magnificent effect that a digging just about that time has later on on his coffee. Of course it has. Lots of leaf—but precious little berry. And the visiting agent gives him a pat on the back and advises his neighbour to do likewise!

Those planters who keep a careful record of when and how

each field was cultivated and the crops can very easily verify this.

Mind, I do not pretend that this is the sole reason. It explains in a measure the magnificent show of wood which comes out only to be thrown away. The pity of it!

C. DE V. D.

CONSERVATION OF SOIL MOISTURE.

SIR,—After 20 years experience of the difficulties planters have to contend with in introducing any special methods of cultivation, I could not commit myself to fixing any time for "soil stirring." I can only say to those who try it "complete it as soon as possible before the hot weather regularly sets in."

I fancy, in the majority of cases, crops are now all off the estate by mid February, and that stripping rarely extends into that month. No doubt there are special cases where crops are heavy and labour short when crop operations extend to a much later period, and I have myself been stripping up to the first week in March. But I am not dealing with special cases, though I should like to see planters struggling to harvest their crops on account of their being bumpers!

If picking is properly looked after, at the completion of stripping there should be so little coffee on the ground as to render its recovery worth neither the trouble nor expense. On each occasion of picking over the trees, if fallen coffee is also picked up, it will be difficult at the end of crop to find on the ground what has previously escaped observation. This, at any rate, is my experience.

In advocating "Soil Stirring"—as indeed many other works—we have to take for granted that labour is sufficient. This is often a serious matter, though personally I have more often been troubled the other way. I wrote hurriedly in my last merely wishing to support what I considered of importance, and purposely avoided side-issues. If, however, difficulties arise from lateness of crop or insufficiency of labour, and only portions of the estate can be "stirred," it would be advisable to treat heavy soils first, those which bake and crack, and do as much as can be done for the lighter soils later. After all, all soils cannot be treated alike if we wish to get the utmost out of them, and every planter should know something of the characteristics of the various soils on his estate.

Your correspondent "W. I." misunderstands me, as he evidently misunderstands the late Mr. Pringle. "Deep digging" should certainly be done, but not in the hot months. His time of deep digging is correct, i.e., September or October, when the soil should be well turned over. If this is done, cleaning up for crop is easily managed by a light forking and hand weeding. But I do not want to raise controversies on matters of weeding! It is *after* crop and before coolies are paid off that "stirring" should be done, and this is quite another operation.

"PLANTING OPINION" OFFICE,
3, ESPLANADE ROW, MADRAS.

Conclusions drawn from experiments in stirring show, according to Fream, "that (1) keeping the soil stirred if only to the depth of half inch increases the water content of the first 12 inches to a very appreciable degree; (2) that the deeper the tillage, at least up to 4 inches (*italics mine*), the greater is the increase in water content; (3) that the rate of increase diminishes as the depth increases" (*italics mine*), etc.

G. Drysdale Dempsey, C.E., on Drainage says, "Too much cannot be said in favour of pulverising the soil; even thorough draining itself will not supersede the necessity of performing this most necessary operation," and further "supposing the soil not properly drained, the sufficient pulverising of an additional inch in depth would increase the escape of water from the surface by upwards of 100 gallons a day," *i.e.*, per acre. These considerations must have been taken into account by Dr. Voelcker when he commended the system of shallow ploughing adopted by the Indian cultivator.

Since stirring is a very light work, all classes of coolies can be employed at it, and with a gang representing a cooly an acre, it would not take long to run over an estate. A compacted soil, especially a heavy one, bakes and cracks; and this, besides conducing to loss of moisture by evaporation, causes injury to the fibrous roots of the trees growing in it.

I trust I have made matters clearer to "W. I." in what I have written. Deep September-October digging is more for aeration, and is in fact a manurial operation. The hot weather stirring is merely recommended to check evaporation at a time when soil moisture is so much needed to keep fresh the "Spike" then upon the trees.

HUMUS.

FIRE AND LEAF DISEASE.

SIR,—The P. O. of the 26th June, with your introductory remarks on this subject, has just reached me. May I be permitted to join in?

I may premise that coffee planting in this colony is now practically moribund. It has been brought to this stage by leaf disease. In my endeavour to resuscitate the industry, I am invariably confronted with the past experience of this Colony with this disease. Although as you know, Sir, I have had some planting experience in India, I must confess that my knowledge of *Hemeleia Vastatrix* was of the usual order. With the incentive to combat the prejudice existing against coffee, I was led naturally to make as complete a study of the question as I was able to. A study, I regret to say, greatly confined to a long list of failures to cope with *Hemeleia Vastatrix*, with successes only here and there. Unfortunately there have been but few occasions when I could test in the field the opinions arrived at in my study. I have below briefly summarized a report of Dr. Burck, sometime Assistant Director of the Botanic Gardens, Buitenzorg, Java, to whose researches the present writer is much indebted.

The necessary conditions for the germination of the *H. V.* spores are water, air and all but complete darkness. The most cursory glance will show that the *under* sides only of leaves form the points of attack; the *upper* side has no stomata by which alone the spores can penetrate to the interior of the leaf. *No other spot, under ordinary out-of-door conditions, but the under-side of a coffee leaf permits of the germination of the spores.* These spores are carried here and there by the wind, and in a lesser degree, by mechanical means. But those spores which fall on the upper sides of leaves or on branches or stems of coffee, on the ground or on any other place and allowed to rest there, die absolutely. Here is explained the futility of stem washes. And as the defeat of an enemy is most surely gained by finding the point of his true attack, so here by having found where to look for the first approach of the disease, we have gained a most important point.

To proceed. The spores must have water; dampness or moisture is not sufficient; absolute fluid must be present. Air and darkness, the two other conditions necessary for germination, are easily found, but it may puzzle some to find the fluid on the underside of the leaves. But let one of your readers to-morrow morning examine the first coffee branch he comes across. He will notice that although the old leaves are dry, the young leaves at the end, just out of or still in bud and sticky with bud resin, will have retained, owing to the presence of this resin some dew or rain drops well on into the morning. If this branch is an affected one, so much the better. Your readers will observe that none of the old leaves, counting the first half dozen pairs as young ones, show the disease in its incipient or earliest primary stage. The young ones only have these spots. The first or bud leaves show no signs. The second pair none also, although the disease may be there. But on the third pair the yellow spots of the primary stage are present, and as he goes up the branch towards the stem the traces grow larger and larger, with indications of the secondary stage having arrived.

It is this secondary stage which is the actual cause of the fall of the leaf, the disease taking about two months to run its course.

If he can eradicate from any leaf the disease while in its first stage, that leaf will be saved. It is evident, therefore, that if he can successfully defend this one and only breach of the enemy it can make no inroads.

This is perhaps all old ground to some experienced planters, but it is a necessary explanation of the plan I am going to adopt in commencing coffee cultivation here, and which I submit for the advice and criticism of your readers.

Recognising that it is practically only the outside of the plant that has to be protected, I have arrived at the conclusion that nothing can be better than some re-agent in liquid form, which will kill the spores and at the same time adhere more than a few days to the leaves without any way injuring them. Here is a list given by Dr. Burck, referred to *supra*, with his remarks on two of them:—Copper Sulphate, Chloride of Iron, Nicotine, Boric Acid, Sulphate of Quinine, Extract of Cinchona Bark, Cupric Hydroxide, Mixture of Lime and Sulphur, and Cupric Sulpho Steatite.

Of all these, Nicotine and Copper Sulphate proved the best for practical use. The proportions are, for the latter 1 to 1,000 parts of water, and as this re-agent will kill the spores when mixed in the proportion of 1 to 150,000 parts of water, your readers will understand that a good margin has been allowed for the dilution of the mixture by rain or dew. If this is used constantly, a crystal which burns the leaf is deposited thereon. A little sugar, however, added to the mixture prevents crystallization to any large extent. The Copper Sulphate is easily obtained, is cheap, and is in powder form readily dissolved in water. Tobacco water, however, is recommended. It is applied as with all the other re-agents given by a spray diffuser to the *under* surface of the leaves. It is immediately effective, killing all the spores then on the leaf. By condensation a thin film of mixture remains on the leaf, only to be dissolved by the next rains or dews. This process goes on until it is gradually washed away. Renewed applications are, therefore, necessary at intervals contingent on the rainfall or amount of dew. The proportions recommended are *one lempeng*, *i.e.*, to two kerosine tins-full, sufficient for 1,000 small plants. Put the tobacco into warm water the night before use. As tobacco is easily obtainable here, it is the re-agent I intend to use.

I shall begin applying this spray in the nurseries once or twice a week. But of course circumstances must guide one, and fewer applications may be found sufficient.

In planting the estate (6 ft. x 6 ft.) every fiftieth row each way will be trebled, thus dividing the whole estate into squares with strong hedges of coffee forming the four sides. These

hedges will be kept trimmed on both sides and allowed to run up to 6 or 7 feet, and, across the prevailing winds, even to 9 or 10 feet. Only these hedges will need the constant attention of the spraying gang, who will be kept at this work every day of the year. The gang will, however, at once be transferred to wherever indications of *Hemeleia* appear.

In addition to this I shall use the eradicating method as practised by Mr. F. W. Morren, President of the Blithan Company of Coffee Planters, and Mr. J. A. A. Tannay, Administrator of Kawi-Sari, both of Java, and which they used with success on 220,000 plants or about 200 acres, and 170,000 trees or about 140 acres, respectively.

Here is a description of the two methods put in practise. The cooly is supplied with a small bottle, only one-third or one quarter full of concentrated Sulphuric Acid, through the cork of which a glass tube passes half way down the bottle. A thin needle of bamboo is passed through the tube into the acid, and then applied to the leaf, the diseased spot being punctuated. This is a very primitive style. An ordinary oil squirt with a little ingenuity might be converted into a far more effective implement.

Scissors, no description is given, have been found to permit of quicker work than with the acid. A little tube in the scissors receives the cut-out bits, so that I presume the "scissors" are more in the nature of a punching tool, such as is used by shoemakers. I might here mention that throwing the spore into water, one way mentioned of disposing of the cut-out bits, effectually kills them, although this sounds rather a paradox read in conjunction with my earlier remarks.

The latter method of eradication is what I would use. I should in conclusion point out again that it is the third pair of leaves which first shows the attack. That this pair is the only one which should be treated with "scissors" or acid. But as the tree continues growing, the third pair is constantly changing into the fourth pair. An average growth will effect the change in about a month. It is child's work, and in that way costs little. Trusting that what I have written may prove of some value, I am, etc.,

COFFEE.

Coffee in Queensland.

Despite many unfavourable conditions, such as dearness and comparative scarcity of labour, coffee planting in Queensland has "come to stay." From all the sources open to us, private and public, the life of a Queensland coffee planter is many degrees more attractive than that of his fellow planter in India. For in many districts where coffee flourishes in the Colony, it has been proved beyond all doubt that besides the abundance of crop, the planter can settle a *pucca* home, unobtainable alas! in the coffee climes of Ind.

Maragogipe.

We are pleased to find that interest is gaining ground daily in the necessity for fresh strains of seed, a necessity on which we have many times and oft insisted. Maragogipe may not fulfil the extravagant pretensions some of its advocates have set forward, yet on the Nilgiris it is gaining increased favour yearly. It is in the nature of things that experiments conducted on out-of-the way gardens must necessarily take many years before, if successful, they are generally adopted in the district. By means of an experimental garden carefully conducted on economically sound principles, the progress of a district could be accelerated several hundred times faster than is now possible.

Mr. T. L. Villiers, the Ceylon planter who recently proceeded to Brazil as the Manager of the Dumont Coffee Company's estates there, has returned to Ceylon. His description of planting life in Brazil is not attractive:—

"Mr. Villiers went with Mrs. Villiers to the estate, but found the life there rougher than he anticipated and very different to a planter's life in Ceylon. The heat, he says, was very trying, almost as bad as Colombo, and yellow fever was very prevalent in the neighbourhood, so that he managed to get his agreement with the Company cancelled, and left Brazil after a very brief stay. His description of planting life in Brazil is interesting. There are very few English in the country, and they are not popular with the indigenous population. There was a European family on the Dumont Company's property—the Secretary and his wife—but the nearest European doctor was a 16 hours' railway journey away, and the labourer is Italian, with little in common either with the cooly or with the planter. The little narrow-gauge railway that traverses the San Paulo district is the principal means of communication, but there is an accident on it nearly every day, so that, while it is useful for freight, passengers prefer to go round to Rio by sea, as being slower but safer. Brazil coffee growing may be profitable, but is evidently not an occupation for a married Ceylon planter, or for anybody who is not prepared to rough it a good deal."

The Market.

There has been a good deal of fluctuation in the quotation on the terminal market says the *P. M. Review* of 18th ult., due, as is generally the case at the time of year, to the receipt of cables respecting the prospects of the next Brazil crop. The two principal ones received have been entirely of an opposite character, the first stating: "Crop prospects favourable," and the second that it was affected by drought and that the flowers had not set. The heavy receipt and the evident desire on the part of Brazilians to sell has quite counteracted the latter telegram, and the highest prices have not been maintained. At auction there has been a moderately large supply, and prices for all grades, excepting the lowest, have been well maintained, although in some instances there has been a little irregularity. Plantation

Blossom fertilisation. Recent enquiries as to the value of bees on coffee plantations naturally recalls the animated discussion on the subject some months ago. The strange conclusion of the argument was that no one knew for certain whether the major part of the fertilisation of the blossom took place more during the day-time than at night. Theory, and of an interesting quality, was given in ample measure. But the record of actual experiment was entirely lacking. Yet it would be by no means difficult to conduct a series of conclusive experiments. Opening simultaneously, the time required for such trial need be but a few weeks at most. The questions for solution are three: (1) Whether the major work of fertilisation is conducted at night or in the day-time; (2) Whether, if in the day, bees can appreciably supplement the work of other insects; (3) Whether wind alone would be sufficient. To determine these, a tree should be chosen, conveniently near the bungalow if possible. Its spike-laden branches should be carefully examined, and a selection should be made of a number of equal development. Either the whole branch or a portion thereof should be enveloped carefully in a bag of very fine muslin, fastened with a lightly fitting rubber band, so as to prevent the intrusion of insects, and while permitting of its easy removal. Two branches, say, should be selected for day experiment and two for the night. In choosing these it would be well to have one day branch and one night branch on the same primary on one side of the tree, and the other two on another primary on the other side of the tree. Before tying them up, they should be carefully ticketed with the number of buds ready for blossom, the immature spike being rubbed off. The day branches should be kept open, *i.e.*, have the bag removed altogether, during the day, but should be carefully closed early in the evening, certainly before dusk. The night branches should be treated of course in exactly the opposite manner and be closed at dawn. A second and double set of day branches could be chosen for settling the bee question, which would be rather more difficult and would entail having a convenient time at hand. One set should be kept open all day, but the other should be always closed, except for the purpose of introducing bees into the bag. It might be sufficient to introduce a couple of bees and leave them. The third series is rather more difficult, *i.e.*, to determine whether wind alone would be sufficient. For this purpose the bags would have to be kept entirely closed throughout the whole period, and

gently shaken at intervals during the day. To balance these branches another and similar number of branches should be selected; these should not be protected in any way whatever. When the blossom has once set, careful counting would give the results in each case, results which could not fail to be of great value. For if the wind alone is sufficient, it is obviously useless to trouble ourselves about anything except ensuring that the prevalent breezes shall not be rendered entirely nugatory by excessive shade or shelter belts. If, however, insects of some sort are indispensable, it is a matter of great moment to know if the attentions of moths and other night insects suffice. Should they not so suffice, the final question is, are bees of practical use or not? If this be answered in the affirmative, the only sensible conclusion is to encourage their presence on the estate in all possible ways. That this can be more or less easily done we have before now amply demonstrated in these columns.

The above experiments, which may seem to the casual reader complicated and tedious to a degree, are in reality very simple. Briefly all that is required is to fasten on and remove a few muslin bags twice a day, and to compare the number of buds with that of the "set" blossoms of each branch.

COFFEE FORCING.

(BY A LOOKER-ON.)

THE fact, announced above, that these remarks are by a mere looker-on may be sufficient to ensure their non-perusal. To guard against any mistake, I would beg of my practical readers to bear in mind that the ideas set forth below are rank theory, if not absolutely heretical. So that if they read further, they will have only themselves to blame if their conservative feelings are jarred by the crude newness of my views. This introduction should serve my purpose.

I shall start by challenging the whole system of present-day coffee cultivation. What is the reason and object of either starting or buying a plantation? To gain a return on the capital. As large a return, some add warningly, as is compatible with safety. Amplified, this means that a property yielding a moderate but regular income is preferable to one giving very large returns for a few years and then collapsing. In general, the principle is sound as a bell. But applied to coffee-planting, there are serious faults to be detected in its application. In all except one favoured district, coffee districts in South India do not boast of such climate and local surroundings that would make one look forward to making one's permanent home therein. Again, it is seldom that the small and regular income derived from a "safe plantation" enables the possessor of the property to live on it with comfort in the old country. The obvious conclusion is, therefore, that the sooner one can capitalise, I do not mean by selling, the whole income the better. How is this to be done is the question I have set myself to answer. That it will be scouted as absolutely impracticable by my readers nowise affects my self-satisfaction as a theorist.

In my peregrinations round the coffee districts I have noted that in many cases of bumper crops, the chief cause has been alleged—by neighbours only, of course—to the system of forcing the crop from suckers. The owner c

manager naturally attributed it to his unusually excellent cultivation. The after-exhaustion of the plant is gloated over by the first as inevitable, and glossed over by the second as accidental, bad season, &c. &c. Now here we have the fact that by means of allowing the growth of one or two suckers from the stem, considerably above the average may be obtained. The succeeding crops, it is true, are very small. But cannot this be averted? Experience says no. Theory, from the pen of the writer, agrees, with a reservation. What is this reservation? High cultivation, be it ever so Eifellian, cannot do it. No, as things stand, this is true. But *why* should things stand as they are? For I hold that by altering the general conditions, results otherwise unattainable could be easily gained.

The usual system followed in suckering is to allow the growth on every tree in the plantation or field to be treated. My suggestion is to treat thus only one-half or one-third, *i.e.*, allowing suckers to grow on every second or third tree only. Alternate rows would be the easiest way of doing this. It would depend of course on the climate of each plantation whether the sucker rows should be closer or further apart. The sooner the maximum crop was attained, the closer the rows and *vice versa*.

If the time required was, say, two years, my theory is this. Let one row sucker the first year, but keep alternate rows in the usual order. The second year, when the suckers are bearing heavily, allow suckers to start on the first row. Thus one half of the field would be bearing profusely while the other half was recovering. Each year the suckers would, I imagine, have to start lower and lower down the stem. In fact, it would be a modification of "native coffee." It might, indeed, be advisable to start boldly with root or collar suckers from the start. Undoubtedly the trees would perhaps become exhausted sooner than if treated in the ordinary manner, but in compensation the crop would be a great deal larger. At a rough computation you would have secured in, say, ten years the same total crop which could otherwise be yielded in fifteen, and save the loss of interest in addition. The reason why I suggest that alternate rows should be treated, instead of in whole blocks or fields, is that the cropping rows would have practically all the light to themselves and would moreover shelter the young growth coming on. Replacing exhausted stock would seem to be at first sight a very big and difficult business, but I cannot see why this should be. Native-grown coffee is not exhausted sooner than topped coffee, is it? The annual root suckers are an indication how the methods of nature may be improved upon. For as it is imperative that each sucker should be forced to bear the biggest crop possible as soon as possible, topping the suckers is indispensable. Moreover, few plantations are so sheltered that they could allow the trees to grow up to their full height with any chance of big crops.

TEA.

Java plantations.

A recent visitor to the tea-plantations of Java, Mr. John W. B. Davidson, of the well-known Sirocco Company, was greatly struck with the splendid growth of the tea. The soil he stated to

be very excellent. The factories are large and well-equipped, but their process of manufacture is different from the modern Indian and Ceylon modes. Withering is not attended to, the leaf being sun-dried, which accounts in great measure for the very poor averages of most of the estates. There are only two Englishmen in the tea-districts, and they are keen on inducing more of their countrymen to join them, the prospects of success being so very good.

A correspondent writes:—"Your article on wind-breaks was interesting. But I think a plan almost as good and certainly cheaper would be to use rows of tea-bushes themselves as wind-breaks. A single row would be more than sufficient, as their habit of growth is very dense. On the other hand, their small height, scarcely thirty feet at best, would necessitate the belts being more numerous than if such trees as grevillias were used. Again, the food taken from the soil would be tea-food, and there would be no return to the soil to speak of, until their full height had been attained. Though, if the jât were good enough to enable one to dispose of the seed, a considerable profit could be gained, counterbalancing all other disadvantages. It is by no means uncertain that tea-seed oil could be manufactured at a profit, if the quantity were at all appreciable, as it would be if a whole estate was lined with tea-hedges as wind-breaks."

A steam dryer.

A novel and cheap type of tea dryer has been brought to our notice in Sutton's Patent "Safety" Steam Dryer. Among the special advantages claimed for the machine is that each tray is subjected to exactly the same temperature by means of steam coils placed between each tray. A constant temperature of 225° to 275° can be maintained with ease as long as the boiler pressure is kept up from 45 to 70 lbs. It is of course impossible to burn or smoke the tea in any way, an extremely important point in finishing off or re-firing the fine grades. The space occupied is only 7 feet by 6 feet and 6 feet high to the base of the chimney. The vapour from the drying tea is allowed to pass off in three sides, thus avoiding stewing. The steam required is very small, a 4 H.P. or 6 H.P. boiler being sufficient for six of these dryers, each of which will turn out 40 lbs. of made tea per hour. The price, with ten trays, is only £55, and can be procured from G. W. Sutton, Great Baddow, Chelmsford, or from Hieron Rolfe and Company, 28, Martin's Lane, Cannon Street, E. C.

"Fruit-roots and wood-roots."

One of the toughest horticultural fallacies is the one indicated by our heading. Its vitality is explained in a large measure by a certain amount of truth it undoubtedly contains. Some go so far as to assert that the surface-feeding roots, which they call fruit-roots, are absolutely useless to tea and should be destroyed whenever possible. Further, that the only roots that help to produce flush are the deep tap-roots, or wood-roots as they call them. The simplest refutation of this extraordinary argument is to invite such as hold with it to plant their tea in future on bare subsoil. For the tap-roots are alone found in the subsoil, the rich surface soil being monopolised by the feeding roots, *alias* "fruit-roots." Or, if further instances are required, let them turn to Ceylon, which yields abundantly on soil never disturbed by fork or mamoty. Again, how is it that shallow manure pits have the slightest effect on the flushes? If it is the deep-feeding sub-soil roots that produce the flushes, why do not these worthies drill holes with crowbars right below the surface soil out of the reach of those greedy fruit-roots. The real respective uses of surface and subsoil roots are that the former are principally feeders and the latter principally drinkers. The latter have to go a great depth mainly in search of water, while the latter exist on the surface simply because it is there that they find their most abundant supply of food, both organic and mineral. The growth of roots can only take place by absorbing the food present. Consequently, wherever food is found in greatest abundance there will be noticed the most luxuriant development of the roots.

The Market.

INDIAN TEAS.—Prices for the medium and lower grades have fallen, says the *P. M. Review* of 18th ult., to a level which has induced the trade to purchase more freely, and a distinctly larger business has been transacted than for some time past. The buying, however, is of a somewhat cautious character, the opinion generally being that with heavy supplies of the common sorts, values have not reached the lowest point, although as they compare favourably with Ceylons a

continued improvement in trade may be looked for. The Sylhets and Dooars gardens are supplying the market with a more useful assortment, and, as prices are moderate, they have been taken more freely at the decline. Some of the Pekoes, although thin in cup, are of attractive appearance, and are readily taken both for the home and export trade. Assams, on the whole, do not show any further depreciation in quality, and being now obtainable at useful prices, they have met with a fairly active demand, and it is probable there will not be any material change in values for the present. A good selection of Darjeelings has been offered, the quality being quite up to the improvement shown in previous sales, and transactions have been on a fairly liberal scale, the finer descriptions still meeting with a good inquiry at late rates, while the lower sorts have sold irregularly without material change. Those from the Cachar districts continue to improve, and have met with greater attention, but Travancores generally being poor and undesirable are comparatively neglected. The latest reports of the out-turn of the crop are somewhat conflicting; some of the gardens are said to be deficient in weight, while others are quite up to, and in some cases, in excess of last year. However, as the recent accounts of the weather are favourable for flushing, it is quite probable that any deficiency will soon be made up, but it certainly appears likely that the earlier estimate will not be reached. Of the 49,911 packages catalogued for public sale 44,219 were sold, the demand being active for all the finer descriptions at late rates, and steady for other grades at the decline.

CEYLON TEAS.—Increased firmness has prevailed in this market, and a good business has been transacted at generally hardening rates, with the exception of the lowest sorts, which show no change. The most active demand has been for the medium and better grades, between 9d. and 1s. per lb., in both Whole and Broken Leaf descriptions, which have further risen in value. Some of the marks, which a short time since were selling at about 8½d and 9d, are now fetching over 2d per lb. more money, and although the quality now offered is certainly better, it is not sufficiently so to warrant the extra prices paid. At the public auctions 26,180 packages were brought forward, of which about 2,000 were withdrawn. The quantity advertised for sale next week shows a considerable reduction, and therefore it is not unlikely that the rise in values will be maintained, if, indeed, there be not a further increase in prices.

MARKET SUPPLEMENT.

SATURDAY, OCTOBER 16, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (September 24, 1897) says:—The catalogues this week were on a very limited scale and the small supplies meeting a steady demand were readily disposed of at firmer prices.

About 400 bags East India were offered but all bought in.

Guatemala formed the bulk of the Central American brought forward; colory grades attracted keen competition, values showing an advance of 1/- to 2/-, whilst for ordinary and medium qualities previous rates were fully maintained.

A sharp rise occurred in futures this week of 1/6 to 1/9 on smaller Brazilian receipts, but quotations have dropped back 9d on favourable reports of the growing crops.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending September 22nd, 1897, says:—Bank rate 2%. Bombay Exchange closes at 1s 3½d. Brazil Exchange 7½d. Rupee paper 3½% 62½. Silver 27d per oz.

We have no change to report in this article. Fine qualities still continue to realize extreme rates, whilst common sorts remain inactive. Brazil markets are steady.

The sales included:—5 barrels Plantation Ceylon sold at 85s 6d; 27 bags Ceylon bought in. Of 444 bags East India, 82 bags Mysore, 282 bags Neilgherry, and 80 bags Pulneys were all bought in; 12 bags Jamaica sold at 96s; 1,254 bags Guatemala chiefly sold at 56s to 104s; 325 bags Salvador part sold at 60s to 66s 6d; 1,302 bags Nicaragua chiefly sold at 51s 6d to 58s; 689 bags Vera Paz and Coban part sold at 68s to 79s; 1,073 bags Columbian chiefly sold at 51s to 102s; 22 bags Peruvian bought in; 47 bags Guayaquil bought in; 42 bags Cape de Verde sold at 54s 6d to 56s; 59 half-bales Mocha small part sold at 78s 6d; 24 bags Liberian Ceylon 34s to 54s 6d; 39 bags Liberian Borneo 27s 6d to 30s 6d; 82 bags East India Liberian chiefly sold up to 56s 6d; 168 bags Liberian Johore bought in; 1,375 bags washed Santos small part sold at 54s 6d to 76s 6d, and 1,373 bags Santos on quay terms bought in.

Daily receipts in Brazil have averaged 15,286 bags in Rio, and 32,714 bags in Santos.

Futures have fluctuated considerably during the past week, owing to the contradictory reports which have been received about the growing crop, and the close is weak, though quotations shew an advance of 1s 3d to 1s 6d viz.:—Good average Santos in Havre, December delivery, fcs. 43.25, in Hamburg pf. 36, and No. 7 low ordinary Rio in New York \$6.65.

To-day's London official quotations are:—

	Sept.	Dec.	March	May	July.
RIO	33/-	33/6	—	—	—
SANTOS	35/-	35/3	36/-	36/3	36/9

The demand which usually sets in towards the termination of the summer holidays appears to have commenced, and buyers generally are therefore beginning to operate with more confidence.

Indian. The larger supply met with a steady demand for all descriptions, the better qualities being in strong demand at somewhat improving rates while commoner descriptions continued fairly steady. The official telegram from Calcutta showing only slight increase in shipments to U.K. to the middle of September rather tends to give buyers confidence, while the revised estimate reducing the expected supply by eight million pounds and giving the probable shipments to U.K. as lbs. 130 millions, against lbs. 132 millions last season, should have a beneficial effect upon prices.

The following official wires have been received from the Indian Tea Association:—“Shipments to U.K. from the 1st April to the middle of September were 58,150,000 lbs., against 57,690,000 lbs. for the same period last season.” “The revised estimate of the present season's crop of Indian Tea is 148 million lbs., of which 130 million lbs. will be available for export to Great Britain.”

The following averages are worthy of note:—“Jonktollee,” 1/6½; “Budla Beta,” 1/6½; “Margaret's Hope,” 1/5; “Jokai T Co. Hukanpukri,” 1/4½; “Runglee Rungliot,” 1/4½; “Selimbong,” 1/2½; “Assam Fron. T Co S.,” “Singlo T Co Napuk” and “Tingri T Co Hoog,” 1/2½.

Ceylon. Offerings were comparatively light and comprised 20,194 packages against 26,184 last week. The market was strong for all descriptions at a slight advance in rates, good liquoring Teas being in special demand. The general quality shows an improvement. Export orders continue to be a help in supporting prices and there is no doubt the foreign demand for Ceylon Teas is becoming of great value in relieving the London market. The following averages may be mentioned: "Newera Eliya Est. Co. Park," 1/3½; "Associated T Co Silver Kandy" and "Ingestre," 1/3½; "Diyanilakelle," 1/2½; "Mahagastotte," 1/1½;

"ST Co. St. Leonards" and "Holmwood," 1/1; "Talawakelle," 1/0½; "Alnwick," "Campion" and "CTP Co. West Holyrood," 1/0½.

Average for week nearly 8½d., against rather over 8½d. for same time last year.

Ceylon Tea sold on Garden Account 1st January to date 1897. 844,502 pkgs., av. 8½d. 1896, 751,168 pkgs., av. 8½d.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c. Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 29th October 1897.

SEASON REPORTS.

Nilgiris. SHOLUR, 13th October.—Rain continues with heavy mists and thunder. Rainfall to date 50.14. Temperature 61° to 68°. *Labour.*—Plentiful. *Grains.*—Still dear.

Coorg. POLLI BETTA, 21st October.—Weather has cleared up since Saturday. Coffee looking fine though "leaf" is not absent. Crops beginning to ripen up. Some "fly-picking" will be begun next week. *Labour.*—Sufficient in most cases. *Health.*—Fair. Prices of grains still high.

S. E. Wynaad. PUNDALORE, 20th October.—*Weather.*—The heavy showers that began at 2 P.M. on the 13th inst. lasted till Monday, the 18th idem, on every afternoon; 19th and 20th no rain, and the monsoon seems to have left us and we are having bright sunshine during the day and cold at nights. *Crops* are ripening and fly picking is carried on. *Plant-disease.*—No change, same as last reported. *Health.*—Good. *Grains.*—The same as last. I believe the merchants bring cholum at Rs.2½ per Pulla and sell at Rs.5-4 per Pulla, and no one to question. *Labour.*—Sufficient.

Nellampathy(British). 20th October.—*Weather.*—Rain for week 1.15, to date 158.36. This last week has been rainless except for last Friday night, when we had a thunderstorm and 1.15 fell. Since then it has been bright during the day and cloudy at night with heavy dew. It would seem the S. W. has left us, and no one is sorry. *Coffee* ripening all over very fast and folks are getting their pulpers ready to deal with whatever little fruit there may be. Gram 11½ meas. per rupee. Rice as last reported. *Leaf-disease.*—Old coffee very nearly free of it, but a lot of it showing in last year's clearings and this year's plantings. *General Health.*—Good.

GENERAL NOTES AND ARTICLES.

Thornless E. litho-
spermas.

It is a wonder to us, that after all has been published on this subject, most grotesque misconceptions are still held, and firmly held, by many planters. We shall touch as briefly as possible on one or two of these errors. Firstly, we may confidently assure our readers that, as far as we know, the thornless variety cannot be obtained anywhere save from the Manager of the Arienkow estate, Shencottah. It is certainly not obtainable in Java, its original home, nor in Ceylon, in both of which places no one has troubled himself about the question at all. Next, as to its supposed expense. Planted out at 12' x 12', only 300 odd plants are required per acre. This, allowing for failures in germination, comes to about one rupee eight annas per acre—a truly terrible sum to waste! If planted in tea as wind breaks and allowing two double rows per acre, the cost of the seed amounts to, say, twelve annas per acre.

Gardens.

Among the various helps to render the life of a lonely planter more endurable, none are of greater use than gardens. It is to be greatly regretted that proprietors are often greedy of their land being used for any but what they call "estate purposes" that they insist on the coffee or tea running right up to the very doors almost of the bungalow. Nor if there is one thing a planter loathes after the day's work is over, it is to be confronted with the sight of the monotonous bushes among which his daily work lies. To achieve complete rest and recuperation, it is essential that he should be able, for the nonce, to cut himself adrift from his work as much as possible. Without this slight change of scene, an almost unendurable disgust sets in, ruinous to anything like good work and consequently entailing loss to the proprietor. Large gardens or extensive shrubberies should be considered a *sine quâ non* to all estate bungalows, and every inducement should be given to managers and superintendents to make their estate homes as comfortable as possible.

Weather lore.

Weather lore of a certain accuracy may be attained, in the planting districts, without excessive difficulty. This holds good at least in the duration of the monsoon currents. For instance in a S. W. Monsoon district, during the N. E. Monsoon, a cessation of the N. E. winds generally preludes rainy weather. *Vice versâ* in a N. E. locality, there is little chance of rain as long as the S. W. current is strong. A change in the currents may be observed some days previous to the actual change in the weather, by noting the direction of the upper strata of the clouds. For it is always in the upper strata that the first indications are found. The lower strata of clouds merely indicate the course of the local winds, the original direction of which are apt to be modified exceedingly by the local conditions of hills and valleys, forests and plains. Aided by hygrometers, such as wet and dry bulb thermometers, or more homely appliances, very accurate and useful forecasts can be made.

Planters' Provident
Fund.

The most difficult of all tasks is to persuade the public, or a section of it, to take precautions against

any but the most obvious of dangers. Sometimes even their very obviousness acts as a deterrent. We may mention for instance, the discomfort and dangers of a planter being suddenly cut adrift on losing his billet. The possibilities of such an occurrence are recognised in the most matter-of-fact, not to say, slothful manner. To guard against it taking place is of course impossible. It is surely practicable to devise a means whereby its attendant losses and dangers are reduced to a minimum. It would not prove a matter of much difficulty to devise a scheme whereby subscribers to a fund would, after a certain term, be entitled to receive an "out of work" subsistence allowance for a few months. The funds required need not necessarily be great, and if interest were taken in the matter by those really concerned, the capital would be forthcoming easily enough. It is just this difficulty, however, that makes things so hopeless.

Manuring old trees.

The unwisdom of expecting manure to give its best results on old trees without the use of the knife is not as generally recognised as it should be. In particular instances the old trees may be still in the best of health of course, and pruning might easily cause more damage than good. We are treating here of those cases in which the original stems are so knotted and gnarled that the sap channels, through which alone the manure juices must pass, are blocked and encumbered with obstructions of all sorts. Sometimes, indeed, these obstructions do far more than simply hinder the passage of the sap: they actually divert it from its proper destination. Woody malformations of the bark, excrescences both in and outside the cambium, are by no means infrequent. These act like cancers, absorbing the nourishment of the crop for their own well-being. In these cases, it is impossible to clear out the old sap channels: a fresh arterial system must be constructed. And the only way to do this is to cut down the useless stem, and with the help of manure, produce another one in its stead.

THE RAILWAY FOR THE MYSORE AND COORG
COFFEE DISTRICT.

I was glad to see that Mr. Pilkington, representing the North Mysore Planters Association at the Mysore Representative Assembly, held during the Dassarah, broached the subject of the line which I lately sketched out, namely from Kadur *viâ* Chikmagalur, Hassan and Sidapur to Tellicherry. I have only seen the very brief report, given in the *Madras Mail* of 11th, but it is interesting to know that the scheme finds favour with that section of the planting community and that it has thus been brought prominently to the notice of the Mysore Government. Let us hope that the other districts concerned may join in supporting the scheme. The Dewan's reply was to the effect that the Tarikere-Birur line would first be completed (it is now in course of construction) and the extension considered afterwards.

In his address at the opening of the assembly the Dewan said in referring to the subject of Railway projects: "The projected Railway from Arsikere *viâ* Hassan and Manzarabad to the West Coast is still under consideration. The difficult problem of the best and most economical route

and method for the ghaut descent is being carefully investigated by the Durbar."

Now, therefore, is the time for the planters to represent the marked advantages of the proposed line to Tellicherry over that to Mangalore, namely that it will bring the line within reach of *all* the coffee districts of the province and serve Coorg as well, while affording accommodation for the extensive tract of country through which it would more immediately pass. And while thus accommodating a large stretch of country, the actual length of the line would not greatly exceed that to Mangalore, whereas the latter would only serve a comparatively small portion of the coffee districts, and but a small tract in the Mysore Province altogether. Coorg, too, would be entirely excluded. I have been told that a flying survey of the ghaut on the Tellicherry line showed it was not an easy portion to negotiate, but I cannot imagine its being worse than the long Mauzarabad ghaut, where I believe some tunnelling would have to be done. Seeing the very great advantages the Tellicherry line offers, nothing short of its being proved that the ghaut forms an insurmountable barrier should cause it to be abandoned; but such a state of things I cannot imagine possible.

Mr. Tatham's suggestion is that the Madras Railway Company, which is now extending from Calcutt to Tellicherry, might take up the construction of this line. It would certainly be a good opportunity for annexing additional country to work upon, for they have sadly lost ground. The Southern Mahratta and South Indian Companies, with their metre gauge lines which are found much more suitable for Indian districts than the old expensive broad gauge, are gradually shutting out the Madras Company, and it behoves the latter to wake up, or it will be left out in the cold. If free to construct on the metre gauge, this new line would afford a capital start. It would also form an important line for future extensions, seeing it would connect the interior directly with the coast. It would probably place within their reach the connecting branch to the town of Mysore and secure to them the country requiring railway accommodation in that neighbourhood. More than this, the present line between Bangalore and Mysore is the property of the Mysore Government and in time they might either acquire it or arrange for working it as the Southern Mahratta now do. Such an arrangement along with their extension to Tellicherry would link them with their present Bangalore line and give them the whole stretch across from Madras.

That we shall see a railway from the town of Mysore to the West Coast before long, I think there is no reasonable doubt. With therefore the proposed line from Kadur to Tellicherry and one from Mysore joining it at Periapattam, they would have a very fair extension of their system and probably further ground to work upon.

The extension from the town of Mysore to join the Tellicherry line adds another to the arguments in favour of that project.

Regarding a 2-foot railway remarked upon in the *P.O.* of 25th September (No. 26), I do not think the Government of India would consent to a break of gauge, especially in a line running to the coast in connection with the metre system established in the interior. The average cost of the metre gauge is not, I believe, much over Rs.70,000 per mile. The 2-foot line may do for feeders, however, and

I think the time will come when we shall see this description of railway extensively used for this purpose and where traffic is light.

STEAM.

LETTERS TO THE EDITOR.

ANSWERS TO CORRESPONDENTS.

["Will, Mysore," and "Indian Planter," unauthenticated.—Ed.]

KUTCHA BUNGALOWS.

SIR,—Referring to "Kutch's" letter in *P.O.* of 9th current, regarding his enquiries about building with rammed earth, he might get the information he wants from the President of the Coorg Planters' Association, Mr. Logan, the walls of whose bungalow I believe are built of this material. I have heard that if well done, it is quite as strong, if not stronger than, brick and if suitable earth is obtainable near the building site, much cheaper. However, I have no practical experience myself, but in case "Kutch's" letter does not elicit directly through your columns the information he wants, so far at least as rammed earth is concerned, this may put him in the way of obtaining it. I have no doubt Mr. Logan, an old and experienced planter, would be glad to help a brother planter in such a matter. His bungalow, too, I think is roofed with iron, so he may be able to help "Kutch" in that as well.

PLANTER'S FRIEND.

SUGAR GROWING—INFORMATION WANTED.

SIR,—Will some of your readers kindly enlighten me about sugar growing in India?

1. Cost of production.
2. Time for young cane to come into bearing.
3. Crop per acre.
4. Value in this country per cwt. of sugar.
5. Length of time cane will last, and if they can be cut more than once; if so, how often?
6. Is it necessary to irrigate cane?
7. Are there any cheap books on sugar planting?

SUGAR.

TEA SEED FOR MYSORE.

SIR,—In answer to "Coffee's" enquiry in your issue of 9th instant, I fancy he will find a *jât* once removed from Indigenous the best tea to plant, provided he is well below frost range. The heavy rainfall, 250 inches, is of course a disadvantage, for during the heavier bursts tea stops flushing. Wind, both S. W. and N. E., if excessive, produces the same effect.

Most excellent seed of the *jât* I recommend can be obtained of Messrs. Barry & Co., 5, Lyon's Range, Calcutta. I have planted it myself and can testify to the quality. If "Coffee" will mention my name and say that he requires similar seed to that supplied me, I am sure he will be well served. The seed should be shipped by direct steamer to Madras, and cut across country by mail train to the nearest Railway Station.

I may add that I am not interested in any way in recommending Messrs. Barry & Co. Seed can be procured from Ceylon, but my experience is that that from Assam is more to be depended upon in point of *jât*.

GRANVILLE L. ACWORTH.

CENTRAL TRAVANCORE PLANTERS' ASSOCIATION, }
PEER MAAD, *via* PERIACOLAM, 14th October 1897. }

COFFEE.

An up-to-date book on coffee.

During the last ten or fifteen years, the advance made in the scientific cultivation coffee has been

so great that most of the literature extant, which was published previous to that time, has become altogether antiquated and out of date. We doubt in fact whether it be in the power of any one planter to compile an authoritative work embracing the latest modes of coffee-cultivation in all their branches. We are at present still in a state of transition, most of the systems in vogue being either antiquated or experimental. Again each district almost must be considered on its own merits. What succeeds beyond all doubt under certain local conditions is very apt to lead to failure when carried out in other districts with differing local conditions. The chief of these differences are temperature, rainfall, and soil. The work of the "complete planter" is to discover the precise effects of each of these controlling features, singly and in combination. At present our knowledge is vague, empirical and unordered. It needs to be defined, scientific and ordered.

Planting at stake.

We are not aware whether the system of planting at stake in the field, in lieu of nurseries, has been tried on coffee plantations. Yet to judge of the increasing popularity of this method on tea gardens, it would seem worthy of careful trial. The advantages of sowing the seed, either before or after germination, direct in the field are many. First of all its cheapness is undoubted, saving altogether the cost of expensive nurseries, baskets, and transplanting. Besides this, it is undoubtedly a fact that unless the most scrupulous attention is paid to transplanting—either into the basket or in the field direct—a very large proportion of the young plants have their tap roots shamefully mishandled. Vacancies again are usually considerable. Whereas planting at stake is one of the simplest and safest methods conceivable. If the weather is favourable, there is no need even to germinate the seed before sowing. If, however, germination is essential, care must be taken to sow out the seed in the field as soon as the tap-root shows itself. To ensure safety, from such causes as insects, etc., it is best to plant 3 seeds in each pit, some 3—4 inches apart, so as to allow of subsequent transplanting for neighbouring vacancies. The chief points to be observed are that the tap-root, if germinated seed be used, should be of course placed downwards, and that only a very light layer of earth should cover the seed. Too deep planting is perhaps the most common of all faults in sowing seed of any kind. Half an inch is ample. The next operation is ferning, which should be exceedingly thick, especially *above* the stake, so as to prevent a wash of soil from above covering the seed too deeply. If the ferning be carefully done, all that is needed in the shape of subsequent weeding is to remove all weeds growing round the fern. The shade cast by the fern will check the growth of weeds under it to a very large extent. One point we have omitted so far, and that is, the dangers of drought. If the ferning has been properly attended to, drought, unless exceptionally prolonged, is not to be feared. The writer has himself witnessed an instance of stake-sown seed, though this was tea, not coffee, successfully withstanding a five months' continuous drought in a high elevation district. On the other hand, in excessive rain the fern might be slightly opened from the top, *not* removed, to allow of ventilation and to prevent mildew. To conclude, the writer contends that planting at stake is cheaper, safer,

simpler and altogether better than transplanting from nurseries.

VINDICATION OF COFFEE CULTIVATION WITHOUT MANURE.

In P.O. of August 28th, H.G.R. criticises "Coffee Cultivation without Manure," "as a physical impossibility to be relegated to dreamland," and in support of his contention quotes certain authorities to prove his argument that the minerals in humus are insoluble and unavailable for the cultivated crop, and that nitrogen is of small importance, and quotes certain authorities, to wit an analysis of Dr. Voelcker's, and quotations from Prof. Munro and Fream, and winds up with the assertion that coffee cultivation without manure is bound to lead to too much humus, and foulness and sourness. Now, whatever may be said for or against "Coffee Cultivation without Manure" scientifically, or what everyone is more interested in, practically, it is to be hoped that it rests on a firmer basis than H. G. R.'s criticism. I will deal *seriatim* further on with his authorities, but in the meantime, just for the sake of argument, am prepared to grant all his points, and will presume that his estate is so fortunately circumstanced that humus is a superfluity and nitrogen a luxury, then all that has to be done to supply coffee with mineral ingredients is to *burn* all the loppings of his E. L. trees and his coffee will be amply supplied with the very minerals he requires. He wants potash? He will have some difficulty in getting a more concentrated form of potash manure than E. L. ashes, containing as they do 35.14% of potash. E. L. ashes are thus twice as rich in potash as kainit, a purely potash manure. The other ash constituents of coffee are very liberally provided for in E. L. ashes as will be seen from the following analysis of the ash constituents:—

Erythrina Lithosperma ashes contain				
% Potash	...	...	...	35.14
Lime	...	...	...	9.14
Phosphoric acid	...	...	...	8.41

By burning instead of burying, the obnoxious humus is destroyed, and the useless nitrogen is dissipated, and E. L. supplies all the minerals that coffee wants, in a soluble form after H. G. R.'s own heart. He wants minerals; he has got them from E. L., so that coffee cultivation without manure stands exactly where it did and his criticism falls to the ground, or more strictly speaking is reduced to ashes, and we are exactly where we started from in the original proposition of coffee cultivation without manure, *i.e.*, that as long as the shade tree lasted, coffee would be amply supplied with all it wanted. It is strange that your correspondent should have overlooked so simple an expedient of adapting coffee cultivation without manure to his own system of cultivation, the whole process of conversion being brought about by the application of the familiar fire stick, which destroy all he objects to and leaves him with all he wants.

Having proved that his criticism won't stand fire, and indicated how he can adapt coffee cultivation without manure to his own system of cultivation, I will now deal with his authorities that he quotes in support of his contention. To begin with the

COFFEE SHADE TREE.

Sun-dried *Erythrina lithosperma* loppings, &c., contain per ton:—

61.50 lbs. of Nitrogen, 57.38 lbs. of Potash, 14.92 lbs. of Lime, and 13.68 lbs. of Phosphoric Acid.

Orders should be booked early for the coming crop of seed from the parent trees of the above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only *thornless* variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE, SHENCOTTAH.

analyses by Dr. Voelcker, on which he lays such stress, I am not disposed to attach much weight to them. They appear to be analyses of soils sent to Dr. Voelcker for analysis. Had Dr. Voelcker been specially employed to report on coffee soils, and the outcome of his investigations was his conviction that a soil containing .032 nitrogen was the best for coffee, I should have a great deal more respect for the analyses than I have now. Perhaps H. G. R. will give us more analyses of good coffee soils by reliable men showing as low percentage as .032 nitrogen, as at present we have only the one he has quoted, low percentage of nitrogen in which might be explained by other causes. We are asked to infer that the summer has arrived with the arrival of the solitary swallow. In reference to coffee soil analyses I prefer Mr. Hughes as an authority as he was employed by the Ceylon Planters' Association for the specific purpose of analysing coffee soils, and in his book in giving the analyses of two coffee soils selected as having given good crops *without manure* for 35 and 40 years, respectively, we find the high percentages of nitrogen of .224 and .213 respectively and also unusually high percentages of phosphoric acid .166 and .185. These percentages are interesting as showing that a permanently fertile soil should be well supplied with both nitrogen and phosphoric acid, and afford an explanation of the great benefit fish manure usually is. There is another instance of a soil containing .40 of nitrogen bearing good crops, and I am personally acquainted with a soil containing a very much higher percentage still that regularly and steadily gives heavy crops. This soil was specially taken from a few trees that had given regular heavy crops and was specially selected with a view of ascertaining if there was any peculiarity about it conducive to large crops. In fact, it was selected as an ideal coffee soil, as a soil capable of giving heavy annual crops and withstanding the excessively virulent form of leaf disease that this district suffers from. Now this soil shows the enormously high percentage of 1.26 nitrogen or *two and half times as rich as cow dung*. Thus we see that an unusually high percentage of nitrogen is not inconsistent with cropping ability, and I believe as a matter of fact that the measure of fertility of a soil for coffee might be approximately gauged by the nitrogen shown on analysis, i.e., as long as the humus containing the nitrogen is in the form of *vegetable mould* and not humus in the form of *peat*. There is also no doubt that an ample supply of nitrogen is of the greatest benefit to enable trees to withstand and recuperate from leaf disease. Your correspondent maintains that under coffee cultivation without manure an injurious excess of humus is bound to arise. I said before that excess of humus is a theoretical danger that is not likely to arise in practical coffee cultivation, and nothing he has advanced alters my conviction that I am right.

The sight of coffee trees flourishing among the mouldering remains of some monarch of the forest is an every-day one. Here we see coffee revelling in an amount of humus it would be impossible to obtain from the loppings and thinnings of shade trees. In forest clearing there is frequently some portion remains unburnt, and yet coffee grows freely in the unburnt portion among the accumulated humus of centuries. These instances afford, I think, ample evidence that no danger is to be anticipated that any quantity of humus is derived from shade trees. H. G. R. makes a great point of insolubility of minerals in humus, and quotes Fream, Munro, and a quotation from the Royal Agricultural Society's journal quoted by me in *P. O.* of March 6th. Were the minerals insoluble and unavailable for plant food, I quite admit coffee cultivation without manure would be demolished; but on this point I directly join issue and say that they are soluble from the showing of his own authorities which I will deal with *seriatim*. H. G. R. says: "Cattle manure contains all the constituents that crops require, and is thereby entitled to rank as a perfect and general manure." (Fream.) Again, "all vegetable matter retains a stock of all the minerals necessary

to plants." (Munro.) If cattle manure is a perfect general manure, it is hard to see logically why vegetable matter should not be equally so classed. Cattle manure is vegetable matter, and compared with vegetable matter in the form of E. L. is in a very insoluble form. To quote again, Fream says: "It was formerly thought that humus was capable of serving directly as plant food, but this has been proved not to be the case." I have never made any claim that humus was capable of serving *directly* as plant food, nor am I concerned with erroneous opinions held formerly, but what I do maintain is that it serves *indirectly* and that on complete decomposition the minerals are available for the growing crop. To quote from H. G. R. again: "The following quotation from Prof. Munro would appear to partially account for this:—'The production of carbonic acid water and ammonia become slower and slower as the carbon, hydrogen and nitrogen in the decayed matter are left behind in combinations more and more difficult to break up, and the particles of humus, however long they have existed in the soil, never become entirely robbed of either of these three elements.' This being so and the minerals being bound up in the particles of humus, they cannot be set free until this combination is broken up." Quite true, I agree entirely with H. G. R. in his inference that the minerals cannot be set free till the combinations are broken up. The only question is, how long it takes to do it. The complete disappearance of the humus must surely mean the complete liberation of the minerals. It rather goes to show the great value of humus as a manure than anything else; up to the last it retains its value, never losing its virtue. Now for the quotation from the Royal Agricultural Society's journal quoted by your correspondent, viz., Deblingar sold all his cattle and adopted green-manuring *supplemented by artificial manures* in place of stable manure. H. G. R. quotes this to prove that green manures are incapable of supplying mineral food; but I don't see that it bears that construction: it only proves that the minerals in Deblingar's green manures were insufficient, not that they were unavailable.

H. G. R. says: "Experts are agreed that humus is not a source from which the mineral needs of plants are derivable." Again I differ, and will quote from Prof. Scott as to the availability of minerals in humus. He writes: "By ploughing in a green crop, the surface soil is enriched not only by the elements which the crop derived from the air, but also by *mineral* and vegetable matters which were brought up by it from the sub-soil. The green crop thus acts the part of a gatherer of plant-food, and makes it easier for any crop sown after this green-manuring to get its supplies from the decomposing vegetation present in the soil. The crop ploughed in has thus been made to act the part of collector of nourishment for future crops in a way that no mechanical sub-soiling or trenching could effect. Many of these crops, when ploughed in green, are, weight for weight, almost as good as farmyard manure, containing large quantities of nitrogen, phosphoric acid and potash."

This seems to me to exactly support the theory of C. C. without manure, that by employing deep-rooted leguminous shade trees assimilating the same mineral constituents as coffee, the coffee will be amply supplied with all the mineral ingredients it wants. It is certainly dead against the non-availability of minerals in humus, and certainly seems to be common sense. I see nothing in H. G. R.'s authorities to support his theory as to minerals in humus being unavailable and as to humus being injurious so that I was right in characterising it a theoretical danger only. J. W. H. shows in his accounts of trying humus *ad lib.* in coffee, how the more he gave it the better it liked it; so that I have no hesitation in asserting that C. C. without manure is absolutely untouched by his criticism, and that so far from being relegated to dreamland, dreamland is not an inappropriate name for the country whence H. G. R.'s criticism emanates.

I have ever held that practice and science are synonymous terms, and whether I have given the correct scientific explanation of the success of coffee with E.L. or not, its revival must be attributed to other causes than the injurious effects of E.L. humus and the insolubility of the minerals therein. If H. G. R.'s theory was sound, as the coffee was very far gone when E.L. was planted, surely the shade trees should rather have hastened its decease, by converting large quantities of potash, lime and phosphoric into insoluble humus, and enriching the land with needless nitrogen, than facilitate its resurrection. To maintain that the minerals in humus are insoluble is, in my humble opinion, contrary to nature, contrary to reason, and contrary to practice. Now as to the question of crops. To begin with, crops are not invariably the result of a system of cultivation or the application of any kind of manure. Crops on one estate might fairly be compared with crops on other estates in the neighbourhood subject to the same local influences; but to compare crops from a district where coffee has a far more severe struggle for existence than it has in other districts more favourably situated would be misleading. A large crop in this district would be nothing out the way in others. As regards crops in this neighbourhood and for miles round, I can safely say that the E. L. shade coffee has regularly and persistently given better crops than any other coffee. This year I am sorry to say that the crop is little better than nominal, in common with the whole district, but E. L. can hardly be held responsible for this. The extraordinary, and to all intents and purposes, monsoon burst in February when it rained for ten days consecutively and heavily is surely sufficient excuse for any ruin of crop. What crop it will give next year it is impossible to say, but as it has got through leaf disease with practically no loss of wood, and as there is an ample supply of that necessary article, with an ordinary season there is no reason why it should not give 8—10 cwt. per acre comfortably.

This may be considered a triumph for E. L. as it has been brought about on old half-abandoned coffee. The growth and vigour of coffee is a thing there is no deception about; seeing is believing, and H. G. R. is welcome to come and see it, and once he had seen it, I have every confidence that he would be converted into a believer in *coffee cultivation without manure* and the virtues of E. Lithosperma in contending successfully with leaf disease; the unparalleled ferocity of leaf disease here is, I believe, unknown in other districts. I can show young coffee struggling for its existence (in new clearings) till the shade is well up, bare of leaves and primaries, killed back into old thick wood, crop or no crop, and the old coffee with the shade well established now a fine cover with its branches grown again from stumps of the original primaries. All this I can show your correspondent or any coffee planter who is sufficiently interested to come to this somewhat out-of-the-way district. There is another interesting fact in connection with E.L. and coffee, and that is the reduction in bushels of parchment per cwt. Before planting E. L. the first year I had it, it took 6.25 bus parchment; last year with the shade well up and utilised it took 4.67. These figures are eloquent alike of its worn-out condition and its improvement.

B. NELSON.

ARIENKOW, SHENCOTTAH.

TEA.

Tea in Mysore.

Coffee crops have been so bad in Mysore the last few seasons that rather more than spasmodic interest is being shown in tea. It would be well for experimenters to bear in mind the very great importance of the *jât* of tea chosen. *Jât* is everything nowadays; better, far better, to pay Rs. 150 per maund and

secure a first-rate *jât* than to pay Rs. 40 for even a good hybrid. South India is decidedly *not* the best place to buy good seed in, as planters here have only recently recognized the importance of the subject. Consequently most of the seed available is hybridised to a greater or less extent. The wisest plan would be to purchase direct from some reputable firm in Calcutta. Price in itself is of course no guarantee of quality, but it is equally certain that good seed cannot be obtained cheap.

In selecting land for experiment, it must be remembered that dry districts are particularly unfavourable. A large and fairly even distribution of rainfall is essential to the success of a tea-garden. While as to soil, why, the richer and opener it is, the better. Water-power available for driving the machinery in the factory is a great advantage.

Chinese competition.

The following extracts from a letter dated the 7th ultimo, from a tea merchant at Foochow, to a Ceylon resident have been placed at the disposal of the *Times of Ceylon*. The first one gives some interesting particulars about an estimated shortage of one-third in the China output; and the second contains very candid criticism on the present machine-made teas, though a hopeful tone is expressed regarding the more or less distant future:—

"The present season has not been a good one so far. Bad weather making short crops; small exports leading to better results than usual in Australia and London, and those better results reacting on the market here and raising prices unduly. Canada and U. S. A. having gorged themselves with old tea in anticipation of a duty (not imposed), are unable to buy, and so we are struggling along—idle half the time. Our crop will be one-third short, which means a deficit of 6 to 8 millions from Foochow.

"As for our machine-made teas; so far as they have gone they have been a failure, partly because they have tried the worst district, partly because of want of experience. The teas *look* handsome and golden tippy, but the liquor of the first two grades is hard and no richness, and the 3rd, 4th, and 5th grades tail away to nothing. *They say* that just recently they have made very much better leaf from pruned and manured trees under their own care; but I have not seen these. These teas are going to Australia, which seems to think better of them than London. A few hand-made teas from the good districts show very nice flavour, but they *don't keep*. There can be no doubt that China *will* compete again with Ceylon as soon as machines become *general* and good supervision is exercised, but I look for several years (5 to 10) before a hundred machines are spread over the country, and I look for 10 to 20 years before *foreign superintendence* will make the new style of making of any practical use for opposition. They are trying to get up a company here to take up the pioneer company's work—capital proposed 250,000 dols., half paid up; and the company has bought 50 or 60 acres in the name of *Chinese*, as no foreigner can at present hold land in the interior. Unless this company is taken up strongly—which I much doubt—delay is sure to occur in going beyond the present small concern, which can only operate about 200,000 lbs. made tea a year with *everything favourable*."

Best time for manuring.

It is true that it is not so nearly as important a question to tea-planters as to their *confrères* in coffee. Yet if one is desirous of getting the greatest benefit possible from the manure used, the question is certainly worth thinking out. Before trying to give a satisfactory answer, we must first see what the question really is. In other words, before deciding what is the best time for the manure to be applied, we must first decide what results would be most satisfactory. The answer is obvious: to get the greatest possible yield at the most

favourable time of the year for the manufacture of good tea. In the early part of the year flushes are usually abundant enough without any extraneous help. Moreover, the teas made at this time are by no means perfect. The autumnal teas are generally the best in all districts, and as a rule it is precisely this season that crops are scarcer. It may be safely said, therefore, that it were best for the action of the manure to be delayed till June or later. How is this to be accomplished? By careful timing of the manuring operations. Especially is this timing necessary with quickly-acting artificials, such as bones and poonac. Granted light showers and careful application, the effect of these manures is plainly shown inside of two months, that is to say if the trees are in good heart. If applied in dry weather, three or even four months may elapse before they begin to work. So that in N.E. districts, manuring could be safely begun in January to be completed, if possible, by the end of April. In districts liable to frosts it would be unwise to manure after this date, as frost-bitten flushes are absolutely wasted.

Another important point is to ensure that the manure when applied is not liable to be washed away—by surface or subsoil drainage—by heavy rains. Thus in S.W. districts, post-monsoon manuring with artificials is essential. Cattle manuring may be perhaps undertaken before the rains set in, as the deep roots of tea would probably recover most of the valuable solutions washed down into the subsoil, while a large proportion of the manure would still be insoluble.

MR. SHARPE'S PATENT OXIDISER.

THE following extract, which ill bears "boiling-down," will be read with great interest by our readers. Small proprietors will be probably debarred from purchasing Mr. Sharpe's machine by reason of its expense. A little thought will show, however, how simply and easily the principle enunciated may be adopted, and without the least infringement of his patent:—

The *Home and Colonial Mail*, in an article entitled "Mr. Nathan Sharpe on the Oxidation of Tea," writes thus:—He contends that the time of oxidation entirely depends upon the amount of oxygen the *mal* (or rolled leaf) can get from moving air, at a speed, however, which does not force more oxygen on to the *mal* than is consistent with proper colouring. Acting on this idea, the rate at which the moist cool air should pass over the *mal*, he mentions, was very carefully calculated before the oxidiser left for India, and it proved correct at Lungla Tea Estate, Sylhet, with a temperature of 80° F. A beautiful colour was brought steadily on in 2 hours 45 minutes, and *ghanny* after *ghanny* was finished in this time. Against this, *mal* was placed on trestles, and covered with cloths in the ordinary way, and although the air coming into contact with this *mal* was several degrees higher than that passing through the oxidiser, it took 15 minutes longer to obtain a colour not to be compared with the oxidiser *mal*, whilst according to recent views the *mal* in the oxidiser should not, owing to lower temperature, have been ready until 15 minutes after the ordinary method *mal*. In the cup these two samples of manufacture were, says Mr. Sharpe, reported on by well-known Calcutta brokers, the oxidised teas being very highly commended. According to Mr. Sharpe the method now in vogue of laying leaf on cloths in trestles and then covering the *mal* with cloths is like wrapping up the *mal* to keep it warm, which it really does. Probably he says the heat thus generated sets up a fermentation, and therefore under these conditions it cannot be oxidised. Mr. Sharpe's theory is that the oxygenating of rolled leaf under the present system cannot be carried on correctly in large rooms, however admirably planned, because of the absence of unity of air current coolness, moisture and darkness. The three first must be under control; moisture especially must go with the weather, counteract-

ing climatic influences, and at times accomplishing what was a day before counteracted. In the absence of a certain air current coolness, darkness, and means for regulating moisture, irregular times of oxidation, irregular colours, irregular liquors, and a fluctuating quality must be the result.

"The time 2 hours 45 minutes occupied by the 'Simplex' oxidiser in oxygenating the *mal* might be by many thought short," remarked Mr. Sharpe. "There are many who perhaps think yet that the prolongation of this process is the desideratum, and that the attainment of this is to keep the leaf as cold as possible, even to the introduction of refrigerators."

"By an arrangement I have," says Mr. Sharpe, "I can nearly freeze the water in the oxidiser tanks, but this is an auxiliary which would not be included in my machine, unless ordered." The prolongation of the process of oxidation by a lower temperature than 75° F. is, in Mr. Sharpe's opinion, to be avoided, just as much as anything beyond 80° F., and in this view he claims that he is supported by not a few planters and one of the leading firms of brokers in Calcutta.

"There is no doubt that the process called fermentation is one of oxidation," says Mr. Sharpe, "for if the temperature of the non-moving air in one of the present fermenting rooms, filled with *mal* at the same time as a Simplex oxidiser with the air moving at the same temperature, were tried, the *mal* inside the oxidiser would be finished fully one hour before that in the fermenting room simply because colouring of the *mal* in the oxidiser has been gently encouraged, or, in other words, the *mal* is oxygenated by a free and constant supply of cool moist air whilst the *mal* in the fermenting room has been left to oxygenate itself. In the cup the oxidised teas would have all that could be desired in colour and liquor, whilst the fermenting room teas, through prolonged oxidation, would probably have a good colour, but the liquor would be soft."

The Simplex cool oxidiser, the inventor claims, oxygenates and prepares the *mal* for second rolling and firing better and quicker than ordinary fermenting-room methods, whether the fermenting rooms be cool or warm.

"Not only does the Simplex cool oxidizer," said Mr. Sharpe, "facilitate the oxygenation of rolled leaf through moving air, but it has the additional advantage of being able to control the moisture of the air that enters the leaf chamber according to the prevailing weather, the deficiency or excess of moisture being met with in the following manner:—

"The gunny cloth curtains at the sides of the machine present a cooling surface of over 200 square feet of absorbent material, through which the air that enters the machine must pass, and as is often the case there is a high percentage of humidity during the rains; all that is required is to regulate the supply of water to the curtains, so that they may be but slightly moistened. On other occasions they may require a greater percentage of moisture, or may be thoroughly wetted according to the readings of the hygrometer attached to the machine."

The oxidised teas have, when fully manufactured, Mr. Sharpe

3, ESPLANADE ROW, MADRAS.

states, a much blacker appearance than those fermented in the ordinary way, and this fact had been noted by the brokers in Calcutta, to whom samples were submitted. The inventor maintains that by carefully working the oxidiser, the crop of the season will maintain a high standard of quality, and improved and steady average prices, provided conditions in other departments are equal. With reference to the construction of the machine, Mr. Sharpe says that it may be inferred by some that the air propellers at the ends of the oxidiser have a clear thoroughfare, but this is not so. Gunny cloth baffles are placed behind the fans so as to prevent a blast of air moving over the leaf instead of the slight current obtained. The propellers have a splendid distributing power, overcoming the auxiliary baffles of side curtains through which the air must pass, and producing an equitable draught all over the apparatus.

Mr. Sharpe has placed a few additional items to the machine, including a hygrometer, so that planters can readily fix on a certain humidity that to their leaf might be essential, and thus the air can be kept at a marked point and regulated by the water valves to the curtains as the weather may demand. Mr. Sharpe states that the mechanical simplicity of the cool oxidiser met with the warmest approval of all who saw it on Lungla Tea Estate. He points out that there is no gearing or complicated mechanism to get out of order, and adds that those acquainted with life on Indian and Ceylon estates will readily appreciate the great advantage. The two air propellers, being the only moving parts, merely require $1\frac{1}{2}$ H. P. The machine is also very economical in water consumption, this only being about two gallons per hour, when most is required, while the economy in space is tremendous, the saving being 300 per cent of factory room.

DISTRICT ASSOCIATION.

NELLIAMPATHY.

PROCEEDINGS of a Meeting held at the Victoria Bungalow on Wednesday, September 29th, 1897. Present: Messrs. Barnes, Denny, Everington, Fenton, H. M. Hall, E. Jones, F. Jones, Lamb, Milne, Watts, and J. C. Abbott, *Honorary Secretary*. Mr. H. M. Hall in the Chair.

1. Proceedings of last meeting were taken as read.
2. The Honorary Secretary gave an account of the last meeting of the U.P.A.S.I. and of the action of the delegates of this Association, which was approved and confirmed. A vote of thanks for their services was passed unanimously.
3. Some discussion took place about Scientific Investigation, and it was resolved that a circular be sent round to ascertain what members would subscribe towards procuring the services of an Agricultural Chemist. The suggestion that the U.P.A.S.I. should endeavour to obtain the services of Mr. Cameron to improve the strain of coffee was approved.
4. *Wallenghy Bungalow*.—Six more estates were added to the subscription list, making a total of 19 now subscribing.
5. *Bazaar*.—Read letter from the Honorary Secretary to the Chief Engineer calling his attention to the insanitary condition of the bazaar and requesting him to have the boundaries properly demarcated, as stipulated by the owners of Poothapara estate when they gave the land for the extension.
6. *Roads*.—The Honorary Secretary was requested to write to the Dewan and ask him whether it was the intention of the Cochin Government to open up the Ghaut Road for wheeled traffic, and if so, when the necessary work would be begun.

A vote of thanks to the Chair terminated the proceedings.

(Signed) H. M. HALL, *Chairman*.

(„) J. C. ABBOTT, *Hony. Secy.*

ROUND THE BUNGALOW.

NOTES BY "A PLANTER'S WIFE."

The Garden.

Since the weather to a certain extent has begun to be brighter, one's attention is

naturally drawn towards one's garden. I have already begun to sow my annuals in boxes and baskets under shelter, and hope in a week or two to have them all out in the bed prepared for them which by Christmas will be a perfect blaze of colour; however, I am this week giving an idea of how a very pretty fernery may be made with very little trouble.

With a certain amount of care and attention, and a due regard to watering, fern will grow well even during the hot weather, and the amateur gardener who has not already a fernery should start one. This is by no means a difficult task, and the first step is to decide where would be the best place to have it; if you have some large trees, of a kind that do not lose their foliage in the hot weather, your fernery will look very well under these.

I have just had a very pretty one made in my garden in this way—first have a large circle marked out, say 10' or 15' diameter and dig out the soil to a depth of 2', and with large stones have a wall built inside the circle to keep the soil from falling in; in the centre of this circle have another circle marked out about 6' or 8' and another wall built round, and the bottom of the outside ring or circle paved with stones. The smaller centre circle must now be filled first with broken bricks or some such rubbish to a depth of 1 foot; then a good mixture of garden loam, leaf mould and a little sand, which should be piled up high to form a pyramid shape. In the centre plant a good sized tree fern, and cover the whole of the soil surface with quartz and pretty pieces of moss covered rocks filling in between the crevices with all sorts of pretty ferns. The outside circle is now filled with water and the fernery forms a small island. There must also be an inlet and an outlet for the water, a standing water would be very unhealthy. The ferns should be watered every day with a garden syringe. Ferns could also be planted round the top of the outside wall and form a fringe which would look very pretty.

Another pretty fernery, and perhaps more easy to make, is to build a high trellis-work house, in any shape to suit your fancy; the roof must also be of trellis-work, and the whole of the roof must be covered by creepers to protect the ferns from the fierce heat of the mid-day sun; if there are no creepers, some thin matting should be thrown over during the day.

The next step is to plant creepers all round the fern-house, for it will not look pretty until it is entirely covered; some quick growing creepers, such as *Humulus Japonicus*, *Ipomea Grandiflora* (the Moon Flower), *Convolvulus Major*, all of which grow very quickly, slower growing creepers may also be set at the same time and will come on later.

Inside the fernery the pots containing the plants should be arranged that there is plenty of room for walking about, and here arrange there an ornamental stand filled with masses of pretty ferns and hanging baskets with delicate trails of ferns or small creepers hanging from them will add much to the appearance of the interior.

I have had several hanging baskets made thus (which have the advantage of being very cheap). You know the basket kind of muzzle used by natives for putting on their bullocks' noses. I had 50 of these made rather larger than the usual size, lined inside with leaf moss, then some pieces of charcoal and filled up with leaf mould and placed my ferns in, covering the top with moss; then fasten three pieces of wire to the basket about 2 feet in length or longer as desired, twist the three pieces of wire together into a loop at the top and hang it on to a nail, and you will be surprised to see how quickly the ferns grow and cover the basket, when they look like green balls of ferns.

GOLD AND BLOOD.

MANY years ago I knew a man who expended a great part of a large fortune in buying gold, in coin and in bars. This he melted and with human blood and other unique ingredients, laboured secretly to prepare a mixture that should arrest all disease, renew vitality and prolong life indefinitely. I need hardly say that he failed. Not only did he fail, but one day an explosion took place in his laboratory which destroyed the fruits of his toil and left him senseless and badly wounded amid the wreck. The rest of his days were passed in an asylum.

Yet he was not the first man who tried that same experiment, and by thousands. To find the elixir of life was one of the main purposes of the science of alchemy, the barbaric ancestor of the modern

science of chemistry. But all that is now discredited. No doctor or student of healing even pretends to possess or to seek an essence of life.

What is undertaken, however, and successfully, is to ascertain the truth about nature's functions, and to help her perform them when they are impeded by disease.

Illustrations of what can be done on this line are plentiful. Here is one: "Twelve years ago," says Mrs. Eliza Matcham, of Armitage House, Sutton-on-Hull, "I had an attack of rheumatic fever. At the same time I had a bad taste in the mouth, poor appetite, and pain and weight at the chest after eating. I frequently spat up a quantity of greasy, fatty matter. Later I was afflicted with rheumatism in my hands and feet. Then I fell into a state of debility which continued year after year. I spent a great deal of money in doctoring, all to no purpose. Finally I was induced to try your medicine. In a short time my food agreed with me, the sickness ceased, I grew stronger, and the rheumatism by degrees abated. Now by taking your remedy occasionally I keep in good health. (Signed) Mrs. Eliza Matcham, June 2nd, 1893."

"For some time previous to 1887," writes another, "I was troubled with a digestive disorder. In the autumn of that year (1887) I got a severe cold, which brought on rheumatism and lumbago. I had great pain in the back and also in the joints. I consulted a doctor, who gave me medicines, and advised me to go to Buxton. I did so, but I am bound to say obtained little benefit from it.

"In January, 1888, I had another attack of rheumatic fever, which brought me down into a very low and feeble condition. For days and days together I was unable to eat or sleep. It was only by hardship and pain that I got about at all. Whilst on a visit to Little Downham, Cambridgeshire, some friends told me of the medicine furnished by you. I used it, and soon found relief, and gained strength. Cheered up and encouraged by this, I continued taking it, and now, by an occasional dose, I keep wholly free from rheumatism and other troubles. (Signed) Philip Hopkin, 20, Maude Street, Grimsby, November 14th, 1893."

The eccentric man alluded to in the first part of this article failed to cure any disease with his odd brew. It was costly, too, as I said. Blood is cheap enough, but bars of gold come high. He was a fanatic and a fool.

But here we have two instances in which rheumatism, a common and dangerous ailment, was cured by Mother Seigel's Curative Syrup, a remedy made not from blood and gold, but from the healing herbs of the fields and forests. And why was it cured thus so speedily and with such seeming ease? Because rheumatism is not a disease of itself, but a symptom of indigestion and dyspepsia. It is *this* universal plague that the Syrup scatters and drives away, its children following after. Thus we keep our blood in our veins and our gold—if we have any—in our pockets.

THOMSON'S ANTI-MALARIAL PILLS, THE PLANTER'S FRIEND.

The only known Antidote against Malarial Poison.

A sure and efficacious Remedy for Malarial Fever, Enlargements of the Spleen, Malarial Cachexia (Anæmia after Malarial Fever) and other Malarial Symptoms.

A Planter from Assam writes:—

"I have tried Thomson's Anti-Malarial Pills and find them to be most efficacious among my coolies. I can strongly recommend them."

Contracts cannot be entered into for less than a month, nor for less space than quarter of a column at the above rates. A discount of 5, 10 and 15 per cent. will be allowed on advertisements ordered and paid in advance for 3, 6, and 12 months respectively.

II. LINE RATES OF ADVERTISEMENT:—

1. English Advertisements: 4 as. per line, first 4 insertions, 2 as. per line, fifth and following insertions.
2. Vernacular Advertisements: Tamil and Telugu, 8 as. per line each insertion; Hindustani, Canarese and Malayalam, 12 as. per line each insertion.

III. CIRCULATION OF LEAFLETS:—

1. For each circulation locally and by post Rs. 25.
2. For each do. locally only " 15.
3. For each do. by post only " 15.

(This excludes extra postage where the weight of leaflets necessitates such.)

Advertisement charges are strictly payable in advance, except by w. approved customers.

MARKET SUPPLEMENT.

SATURDAY, OCTOBER 23, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (October 1, 1897) says:—Previous prices were fully maintained in Auction for the limited supplies brought forward, and in some cases value show an advance on last week.

Over 600 bags East India were offered and met good competition, fine colory grades realising very full prices.

Columbian, which has formed by far the greater part of the catalogues, was readily disposed of at previous rates for medium qualities, whilst fine bold descriptions were firmer.

The Terme market gave way a further 9d during the week owing to continued heavy receipts, but at the close quotations show a recovery of 3d from the lowest.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending September 29th, 1897, says:—Bank rate $2\frac{1}{4}\%$. Bombay Exchange closes at $1s\ 3\frac{1}{2}d$. Brazil Exchange $7\frac{1}{2}d$. Rupee paper $3\frac{1}{2}\%$. $62\frac{1}{2}$. Silver 25d per oz.

The moderate supply brought forward in auction met with a good demand, and prices for all descriptions, except the commonest, shew a slight improvement, fine qualities especially realizing full rates. Brazil markets remain steady.

The sales included:—13 casks and tierces 26 barrels and bags Plantation Ceylon sold at 94s to 111s; of 372 bags East India. 357 bags Neilgherry sold from 65s to 104s 6d, and 15 bags cherry Wynaad from 57s to 63s; 89 barrels 38 bags Jamaica chiefly sold at 53s to 90s; 125 bags Costa Rica small part sold at 50s; 1,676 bags Guatemala sold from 55s to 93s; 426 bags Salvador sold at 60s to 62s 6d; 647 bags Nicaragua chiefly sold at 51s 6d to 54s 6d; 910 bags Mexican chiefly sold from 44s 6d to 70s; 55 bags Vera Paz part sold at 70s 6d to 71s; 3,185 bags Columbian obiefly sold from 46s to 101s; 150 bags Guayaquil bought in; 38 bags Bolivian bought in; 93 bags Venezuelan bought in; 113 bags Peruvian bought in; 766 bags Nyasaland sold from 60s to 107s 6d; 14 bags East India Liberian bought in, and 829 bags Santos on quay terms, part without reserve, sold from 34s to 35s.

Daily receipts in Brazil have averaged 17,143 bags in Rio, and 31,571 bags in Santos.

Futures have been quiet during the past week, and in the absence of further unfavourable news regarding the new crop, quotations have slowly declined, and close quiet at a decline of 1s to 1s 3d, viz.:—Good average Santos in Havre, December delivery, fcs. 42.50, in Hamburg pf. 35 $\frac{1}{2}$, and No. 7 low ordinary Rio in New York \$6.50.

To-day's London official quotations are:—

	Oct.	Dec.	March	May	July.
RIO	...	32/6	...	...	...
SANTOS	...	33/9	34/3	34/9	35/3

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report dated October 1st, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	386,971 packages.	463,039 packages.	15,795 packages.
1896-1897...	392,096 „	402,910 „	17,428 „
48,749 pkgs. INDIAN	Total 65,305 packages were offered in public auction this week.		
15,428 „ CEYLON			
1,128 „ JAVA			

Under the influence of a steady business in the country, anticipate shorter supplies from India, and smaller quantities expected to arrive from Ceylon during the next few weeks, buyers generally have taken decidedly more cheerful view of the situation and appear inclined to operate with more confidence. The very cheap prices lately ruling for nearly all descriptions of Tea appear to warrant them in purchasing somewhat more freely so long as such good value can be obtained as possible at the present time.

Indian. Sales were rather in excess of last week and comprised 48,749 packages against 47,360; prices for all grades were very steady, good and useful liquoring descriptions being specially in demand. The following avgs. are worthy of note:—“Assam C Cherideo,” $1/5\frac{1}{2}$; “Poobong,” $1/4$; “Budla Beta T Co Budla Beta,” $1/4d$; “Mim T Co,” $1/3d$; “Amal T Co Dooteriah,” $1/2\frac{1}{2}$.

Week's av. of Tea sold on Garden Account, 1897, 39,033 pkgs. av. $9\frac{1}{2}d$. 1896, 37,368 pkgs., av. $9\frac{1}{2}d$.

	1897.	1896.	1st June to date 1897.	1st June to date 1896.

Total sold on Garden Account 1st June to date 1897, 274,093 pkgs., av. $9\frac{1}{2}d$. 1896, 262,034 pkgs., av. $9\frac{1}{2}d$.

SUPPLEMENT TO "PLANTING OPINION."

Comparative prices of Indian Tea in London :—

		1897.	1896.	1895.	1894.
DUST.	(Fair ordinary, dark liquor)	... 3½d	4½d	5d	3½d
FANNINGS.	(Red to brown, strong rough liquor)	... 4d	5½d	5½d	4½d
BROKEN TEA.	(Brownish to blackish, strong liquor)	... 6d	7½d	6½d	6½d
PEK. SOUG.	(Blackish greyish, useful liquor).	6½d	7½d	7½d	7d
PEKOE.	(Greyish to blackish, some tip, useful liquor).	... 8½d	9d	8½d	8½d
PEK. SOUG.	(Blackish greyish, inferior liquor).	4½d	5½d	6½d	5d
PEKOE.	(Blackish greyish, some tip, inferior liquor)	... 5½d	6d	7d	6½d

Ceylon. The week's offerings were very small and comprised only 15,428 packages against 20,194 packages. Quantity continues, as generally happens at this time of the year, to show an improvement and many of the Teas now arriving have very attractive liquors. Competition for all grades was keen and a rise of ¼d. to ½d. was noticeable in all medium kinds, while a rather more perceptible advance must be quoted in Teas of the higher grade. Teas for price were also here and there ¼d. dearer. The following averages may be mentioned:—"Brookside," 1/2½; "Newera Eliya TCo. Excelsior" and "Concordia," 1/2½ and 1/2¼ respectively, and "ST Co. St. Leonards," 1/2¼; "Holmwood," "Campion" and "Portmore TCo. Portmore," 1/0¾.

Average for week slightly over 8½d., against 9d. for same time last year.

Ceylon Tea sold on Garden Account 1st January to date 1897, 858,028 pkgs., av. 7½d. 1896, 760,669 pkgs., av. 8½d.

Comparative prices of Ceylon Tea in London :—

		1897.	1896.	1895.	1894
PEKOE SOUG.	(Ordinary leaf; fair liquor)	... 6½d	6½d	7½d	6½d
PEKOE	(Ordinary leaf, little twist; fair liquor)	... 7½d	8½d	8½d	8½d
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	... 5½d	5½d	6½d	5½d
PEKOE	(Somewhat bold leaf; indifferent liquor)	... 6d	6½d	7½d	6½d

Java. The offerings this week were, generally speaking, of an attractive character. Good invoices from "Perhawatee" and "Goalapara" were brought forward while "Panoembangan" was also represented by some very fair Teas grown from Assam seed. A small parcel of Flowery Pekoe in boxes from the "Nangoeng Estate" realised 2/6½d. per lb. The market for all descriptions was very strong and prices showed an advance of ¼d. to ½d. per lb. on rates ruling a short time back. A few Teas of indirect import were included in the auctions. Catalogues for 629 packages are advertised for sale next week.

Bank rate 2½ per cent. Exchange on London three months sight.—Calcutta 1/3½½, Colombo 1/3½½.

PUBLIC SALE OF SOUTH INDIAN TEA.

JOHN TANN'S
"ANCHOR RELIANCE"
 FIRE-RESISTING

SAFES!
SAFES!!

The bodies of these SAFES are made of best STEEL PLATES, bent solid at corners, the chambers are 3 inches thick, and are charged with J. TANN'S Patent Steam-generating Fire-resisting Non-corrosive composition.

The DOORS are Solid Steel Plates, $\frac{1}{2}$ inch thick, and the Bolts are secured by J. TANN'S improved

SIX-LEVER LOCK

Which is protected by drill-proof UNBREAKABLE Plate.

QUALITY taken into CONSIDERATION, these are the CHEAPEST SAFES ever offered, as it is only by lessening the cost of Production by the use of Special Machinery and the Manufacture of Large Quantities at one time that they can be sold at the following

LOW PRICES:

- No. 99.—Outside measurement:—20 inches high, 16 inches wide, 16 inches deep, 8 inches clear depth inside, approximate weight, 2cwt., 1qr., 14lbs., Rs. 130.
- No. 100.—Same size as No. 99, but with LOCK DRAWER inside, Rs. 146.
- No. 101.—Outside measurement:—25 inches high, 19 inches wide, 19 inches deep, 11 inches clear depth inside, approximate weight, $3\frac{1}{2}$ cwt., Rs. 146.
- No. 102.—Same size as No. 101, with LOCK DRAWER inside, Rs. 156.
- No. 103.—Same size as No. 101, with LOCK DRAWER and PARTITION, Rs. 165.
- No. 36.—FIRE and FALL-RESISTING Commercial Safe. Outside measurement:—24 inches high, 18 inches wide, 18 inches deep, $9\frac{1}{2}$ inches clear depth inside, approximate weight, 3 cwt., fitted with SHELF, Rs. 186.
- No. 37.—Same size as No. 36, with LOCK DRAWER, Rs. 196.
- No. 41.—FIRE and FALL-RESISTING Commercial Safe. Outside measurement:—27 inches high, 21 inches wide, 21 inches deep, clear depth inside, $12\frac{1}{2}$ inches, with LOCK DRAWER and PARTITION, Rs. 235.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 5th November 1897.

SEASON REPORTS.

S. E. Wynaad. PUNDALUR, 27th October.—*Weather.*—Since my last report we have had bright sunshine and cloudy evenings. On Monday and Tuesday it was cloudy and rain, at intervals a little sunshine. To-day the sun shines again brightly. *Crops.*—The ryots are harvesting ragi and the coffee ripening. *Health.*—Good. *Grains.*—Rice 7, salt 7, ragi 19, and cholam 19 measures per rupee. *Labour.*—Sufficient.

Nilgiris. COONOR, 27th October.—The long break in the N.-E. seemed to break up on 26th, when we had some heavy rain. Sunny weather again now, with cold snap in air. Expect heavy November rains. Coffee ripening up fairly well, but a lot dying back of primaries is noticed all over the district. Consequently a deal of crop will turn to black. This dying back of primaries is present on young coffee as well as bearing trees. Tea doing very well indeed. "Cumbly poochie" visitation almost *non est* compared with go last year. A little sickness among coolies. Labour ample as usual. Coffee turning out very heavy this year. Leaf-disease almost disappeared.

GENERAL NOTES AND ARTICLES.

Profits of Banana meal. In Surinam the profits on this industry are reckoned at fifteen per cent. Very little that we can show in South Indian plantations can beat this.

Coca leaves. We have of late seen little of Ceylon coca leaves in London, says the *Produce World* :—

An experimental parcel sent here in 1885 was valued at 13s. per pound, but the present price is nearer 6d. At one time it looked as though the cultivation was on the increase in the island; the export in 1890, which was 956 pounds, had risen in 1896 to 3,397 pounds.

Camphor. Another new industry, if planters took but the trouble of planting the trees about their estates, would be camphor growing. We learn that the United States Government are trying it in Florida, with encouraging results. The tree appears to thrive at any elevation almost, begins to yield camphor from the leaves in about four years, and can be inter-planted in coffee or tea until its success as a separate culture is assured.

But to stimulate interest in new products amongst South Indian planters is a gigantic task.

Dominica: the Planters' Paradise. Mr. Naftel, Administrator of Dominica and an old Ceylon planter, has recently issued a glowing report on the Island and its capabilities. Its rich soil, good climate, command of labour, and proximity to the English and American markets, Dominica is said to be an ideal planting district for all tropical products. Liberian coffee will flourish exceedingly, and as to tea, Mr. Naftel gets tremendously enthusiastic. Putting the profit per lb. at the liberal figure of 3d., he asserts that the profit per acre should be easily £6-5 to over £12. Happy Administrator, and happier planters!

Recent science. In the last number to hand of the *Journal of the Royal Agricultural Society of England* are two very interesting and suggestive articles on Denitrification and Plant Roots as Soil Tillers, the last named being by Mr. Robert Elliot, the Mysore coffee-planter. The former article, with which we shall deal at length in our next issue, deals with the hitherto little suspected denitrifying organisms contained in farm-yard manure. The results set forth are so startling that, if verified in the field, the use of cattle manure on plantations will probably be much modified. Briefly stated, the harmful denitrifying bacteria in cattle-dung, especially if fresh, not only consume the nitrogen in the dung, but also that of nitrates and other chemical manures if applied in conjunction.

Silt pits in drains. As an addendum to our last notes on draining, we would point out the advisability of silt pits being made at convenient distances in the drains to catch the matter held in suspension in the running water. The size of the pits and their number must vary in proportion to the distance of the drains apart and their gradient. Experiments alone can determine this point. It would be preferable to have the system so carried out that a yearly or bi-yearly cleaning out of the pits

would suffice to keep their utility unimpaired. The pits, by the way, should be dug, of course, in the side and not in the down drains. It would also lighten the work, and consequently the expense of replacing the silt as near as may be *in situ*, to have numerous and shallow pits, rather than infrequent and large ones.

Chemical grocers. There is little chance that food-products will ever be bought and sold on their chemical analysis, desirable as this may be in many instances. The consumer uses no test tube in his tea-cup, the palate is still good enough for him. The London *Grocer*, however, has an idea that the commercial value of coffee and tea depend on the percentages they contain of caffeine, and theine and gives its readers directions for simple analysis thereof. This is a false assumption. The commercial value chiefly depends on taste and appearance, with neither of which the above alkaloids have any relation. Caffeine and their percentages are very constant, and chemical analysis is consequently of little, if any, use. The flavour in both cases is due to the presence of volatile essential oils, tempered by the gummy bodies that thicken the liquor and by the tannin that gives it its piquant pungency.

Famine Fund Misappropriation.

Thus speaks *Truth* in a recent article on "Indian" affairs :—
Nobody is likely to question the general accuracy of Lord George Hamilton's statement in his letter to the Lord Mayor that the Indian Famine Fund has done immense good in the relief of suffering and distress. At the same time it is to be feared that the administration of the fund has not been wholly free from abuses, and a peculiarly gross instance of the misapplication of the money has been given in *Planting Opinion*, a Madras journal. Being in want of labour, a planter from a Native State endeavoured to recruit it in the famine district in the Madras Presidency. Some eighty coolies offered to enter his employ, and were conveyed by train at his expense from Adoni to Koilpati. There, however, all but about a dozen flatly refused to proceed to the estate for which they had been engaged, and as the planter came from a Native State, the law gave him no redress against the deserters. The latter were offered other work, but they declined to do anything whatever, and finally their expenses back to Adoni, amounting to nearly ten rupees a head, were paid by the Government out of the Famine Fund. It does not appear that there was anything objectionable or irregular in the recruiting of coolies, or that they had any reason, except an indisposition to work, for refusing to carry out their contract. But whatever the merits of the dispute between the coolies and the planter, it was certainly not a case for relief from the Famine Fund. If it was the duty of Government to send men back to their own district, it was the duty of Government to pay the expenses. Most assuredly it was not for any such purpose that the Famine Fund was raised.

The opening of the mints.

Now that the Home Government, on the representations of the Indian Government, has declined to urge the re-opening of the mints, it is time that the great producing classes of the Indian Empire should take steps to present their view of the question to Parliament. As the most educated and influential section of producers, the planting communities should take the lead in the movement, and, if possible, join hands with their *confrères* in Ceylon and the Straits, to obtain a universally-signed memorial stating their position. There is no need for financial genius to grasp the fact that Indian and other rupee producers are being subjected to a most inequitable indirect tax. It is a plain and matter-of-fact question that a planter or ryot must get less rupees for his tea, coffee or grain, if the exchange is

forced up to 1s. 4d. than he would if it was allowed to sink to, say, 10d. It is even more serious than this. Grain and tea compete largely with silver-countries, and the dishonest rupee results in a huge bonus to their rivals. We stated some time ago how the consequent loss on home charges could be easily recouped by the Indian Government by a small direct export tax, and we are glad to see this view taken up in Ceylon. The *Observer* suggests that Ceylon should lead the way in the matter of the memorial. If it does, we sincerely trust that the movement will be enthusiastically supported in India.

Guaranteed artificial manures.

A leading Nilgiri planter writes us from home on this important subject. We have frequently expressed identical views:—

"I enclose a cutting from the *Times* which I think may interest readers of *Planting Opinion* as showing the severity with which vendors of adulterated artificial manures are treated in England. Though not doubting for a moment the integrity of our Agents and Merchants, would it not be to their advantage to sell all artificials on the unit value by analysis. With the imported artificials, Superphosphates, Kainits and Sulphate of Ammonia, this is I believe done, but not with the more popular Poonac and Bone different forms of Potash, and in consequence we cannot supply the requirements of our soil as economically as we could if we knew exactly what we were putting out."

INFERIOR MANURE.—At Lichfield, yesterday, Margaret Catherine Ginster, Frank Ginster and Rudolph Ginster, trading as M. C. Ginster and Sons, patent manure manufacturers, Erdington, Birmingham, were charged at the instance of the Staffordshire County Council with breaches of the Fertilizers and Feeding Stuffs Act, 1893, by having failed to supply invoices and details of analysis with two loads of turnip manure purchased by Mr. Nigel C. A. Neville, stipendiary magistrate of Wolverhampton, for use on his farm at Shenstone in June and July last. Mr. Fisher prosecuted on behalf of the county council, and Mr. Vachell appeared for the defence. The manure purchased was advertised to contain fish blood, horn hoofs, flesh, bones, and other animal matter, with a trace of flour, of which some were dissolved and some undissolved, some partly soluble and some unsoluble, because if manufactured all soluble it would be too rich for the first crop, the aim being to grow two crops without the assistance of stable manure. The manure was sold at from £6 10s. to £7 10s., and Mr. Neville purchased two and-a-half tons in June and half a ton in July. Not having been supplied with proper invoices and analysis, and failing to secure satisfactory results from the manure, Mr. Neville sent samples of the last load to Mr. E. W. T. Jones, the county analyst of Staffordshire. That gentleman said the manure consisted of blood and animal matter largely mixed with shoddy, and he pronounced the samples to be rubbish not worth more than £2 to £3 per ton. Mr. Ginster, senior, in reply to a question, admitted that he was bankrupt twelve years ago, and that the business had since been carried on by his wife and sons, with himself actively engaged in the management. He declared that the manure was what it was represented to be in the advertisements. The Bench imposed a penalty of £2 and costs on each of the three members of the firm for each of the two offences, and allowed the county council £15 15s. for special costs. The full penalties and costs amounted to £33 18s.—*London Times*, 23rd October 1897.

CULTIVATION AND MANUFACTURE OF ARROW-ROOT.

[The following notes are contributed by a native gentleman, and will be found of interest as supplementing the information we have already published on the subject.—Ed.]

ARROWROOT is now cultivated in most parts of India, and the starch is greatly appreciated as a nutritive medicinal

food. It is known in Tamil as *Kuva mavoo*, in Hindustani as *Tikhor*, and in Malayalam as *Kuva Nuroo*.

The different species have the same vernacular names, and are grown in Travancore, in Malabar and other districts in Southern India. It belongs to the natural order *Marantaceæ* or *connaceæ*, the arrowroot order, and is a herbaceous plant, closely allied to *Zingiberaceæ* or the ginger order, from which it differs in the absence of aroma. It is a herb with a rhizome, simple sheathing, leaves parallel veins diverging from the midrib, and flowers composed of membranous spathes.

The farina is manufactured in a rough and rude way; attention is not given to the cultivation of the plant to increase the quantity and quality of the starch.

The mode of culture followed by the native producer is to roughly plough up the land and level, then to plant out the rhizomes or root stalks, at about one foot apart either way, before the commencement of the rains, and little or no attention is given them. As a rule manure is seldom used nor are the plants irrigated, except perhaps in exceptional instances; whilst crop after crop is taken off the same soil.

For the proper and scientific culture of arrowroot, care should be taken in the selection of the soil. The soil in which it best luxuriates is a soft, loose sandy soil, or a somewhat porous, loamy one, so as to admit of the rhizomes forming readily and to enlarge to their fullest extent. The land should be well ploughed and freely manured with rotten farm-yard manure, and after being well mixed with the soil, levelled and formed into beds of a convenient size, so as to admit of the plants being irrigated when necessary. The plants should be planted out in lines, two feet apart either way, and when they have attained a height of six inches, they should be ridged or earthed up. The plants should have plenty of room to enable them to form large clusters. For seed we generally prefer the root stalks with their fibrous roots broken up, and the stalks cut short to about four inches in length. The first inch or two of the rhizomes will also answer the purpose of seed, in fact any portion of the rhizome of the size of an inch, containing a joint, will answer the purpose equally as well.

The rhizomes are fit to be taken up in about nine or ten months. They are planted out in the month of March and are taken up from January to March following as best suits the convenience of the cultivator.

The ridges are hoed on either side, and the plants pulled up by the stalks, then having the rhizomes attached, and are handed over to women and children, who remove them from the fibrous roots and stalks and free them of as much of the soil as is possible, and carry them in baskets to the store-room, where they are washed, cleaned, and have the scales peeled off. The white glistening rhizomes are then placed in other baskets to be grated or pounded. Graters are made of perforated tin after the plan of a nutmeg grater, but of much larger dimensions, so as to admit the hand and fore-arm passing through to hold on to the handle at the upper end. The rhizomes are rasped until the whole disappear in the form of pulp; or they are cut into pieces of one or two inches in length, placed in stone or wooden mortars and pounded into pulp. The pulp is then transferred to vessels of clean water in which it is

freely mixed by the hand, any lumps that may exist being broken up. This is allowed to stand to allow the farina settling to the bottom, when the floating fibres are collected and pressed firmly by both hands to squeeze out the fluid which is then thrown into another vessel containing clean water, to undergo a similar process. This operation is repeated three or four times to remove every particle of the farina from the fibres and the resulting white turbid fluid is allowed to stand, after it has been filtered through a clean piece of cloth, to exclude all the fibrous particles. The supernatant fluid is removed either by a syphon or by means of a tin or other pot, fresh water being added to wash the starchy matter that now lies like a paste at the bottom of the vessel; this is well stirred up, strained again and allowed to settle. This process may be had recourse to several times, to render the farina quite clean and pure when the water is drawn off for the last time. The farina or starch is now collected and placed on clean white pieces of cloth, tied up into bundles, easy to handle, and hung up to drain off the moisture. When this is effected, the wet starch is placed on other clean sheets, and placed out in the sun to dry, and when thoroughly dried, the lumps are broken up by hand and the farina is preserved for use.

The average crop of rhizomes produced on an acre of land is 2,500 pounds of corms, yielding 600 pounds of farina (the average is one-fourth the quantity of the corms, but for safety, I have fixed it as 600 pounds), which at four annas the pound will realize Rs.150. The retail price of arrowroot is from 12 annas to one rupee the pound, and, according to an estimate, deducting Rs.50 for cost of cultivation, there is a balance of Rs.100 as the net profit. With care and attention in the cultivation and preparation of arrowroot, the profit will be found to exceed the estimate. The farina if carefully dried can be preserved for use for a long time without spoiling in any way, which is a great advantage.

As famines are likely to occur with greater frequency and severity in the future, I hope our capitalists will try to cultivate the plant to a great extent.

"It is agricultural labour directed by the mind that clothes and feeds a people."

LETTERS TO THE EDITOR.

TO PREVENT IRON ROOFS FROM SWEATING.

SIR,—I note honest "Kutchu" has solved his query. But let the next roof he constructs be allowed ventilation to be on either side of the ridging.

If corrugated iron, put a purlin between the sheet under and next to ridge at its *bottom* end between it, and see that it overlaps beside that on ridging. This is to be preferred as the overlap can be made deep and so prevent driving rain from getting through.

BENGAL, }
20th October, 1897. }

"SENEX."

"VISITING AGENT."

SIR,—Some time ago I asked for the definition of the above two words in *P. O.*, but no one has answered. But I think I have found out! viz., "a man with a *good nose*"!! My reason for saying so is:—

A "V. A" was going round an estate the other day (on the roads of course!) and gave it as *his* opinion that there was not much crop on the place; "That HE could '*smell*' a *good crop* without going into the fields and looking into the trees"!!!

Now, as a matter of fact, the said estate is bearing about 7 cwt. an acre all through! I wonder what "a *good crop* smells like"!! if this is *not* one?!!

"KOLA."

Ooty, 21st October 1897.

SAGO PALMS ON PLANTATIONS.

DEAR SIR,—Enclosed is a copy of the latest ruling sprung on us by our benign Government. What do you think of it?

I was under the impression when I bought my land, under the permanent tenure rules, that everything on it, except sandal wood, became mine absolutely, and so those rules certainly seem to make out.

I have a few coffee trees growing on my property, and I suppose in course of time the Government will discover it has some sort of lien on them, and will order me to give its servants free access to them also!!

KADUR DISTRICT, }
North Mysore. }

TWENTY-FIVE-YEAR OLD PLANTER.

The copy of rules only received by me on 20th instant.

Bagni (sago palms) trees.

MEMORANDUM.

No. 215-19.

The following instructions are issued to the amildars and supervisors for making preliminary arrangements for the settlement of the Bagni toddy farms. The dates on which the Excise Deputy Commissioner will visit several taluqs have already been notified in *Gazette* for public information

As the Bagni trees are mostly situated on the property of coffee planters, they will be at liberty to dispose of them to the lessees, under such private arrangements as may be arrived at between themselves, but the lessee will be bound to pay Government tree tax at the prescribed rate and get the trees duly marked by the excise officers before drawing toddy therefrom.

Proprietors of coffee gardens will in virtue of the grant be allowed to tap free of tax five trees per annum for the making of bread, or any other *bona fide* domestic purpose. Such trees should be duly marked by the excise officers and a license obtained therefor from the Deputy Commissioner or such other officer as may be appointed for the purpose.

They will be further required to allow free access to their estates without reservation to the excise officers for marking and inspecting

the trees, and to see that the license rules are not infringed. Any abuse of the privilege will not only entail prosecution but cancellation of license granted to them.

Signed) W. WINCOMBE DAVEY.

18th May, 1897.

EXCHANGE: CHINA SENDING TEA TO INDIA.

SIR,—In an extract you give in *P. O.* of 16th October of remarks by Mr. Forbes Mitchell, that gentleman in connection with the present anomalous position of the rupee anticipates that China will ere long be importing tea to Calcutta. It has been already done, but whether the result of the inflated rupee is not stated. Here is an extract from Sir Claude Macdonald's report on China trade to Lord Salisbury, taken from the *London Times* :—

"India, while destroying Indian black tea trade with England, is herself taking more and more Chinese tea. In 1887 China sent a little over two millions of fine teas (mostly green) to India. Last year, in spite of plague and famine, the amount reached 6½ millions."

Mr. Mitchell's remarks are very pertinent as bearing on the Exchange question, but he deals with the matter from the producer's point of view, and it is this that is now coming into prominence. Before it was the remitter's, now it is the drawer's turn to complain. But the fact is that the whole thing is out of joint, and not until Gold and Silver currencies are bonded together by a fixed ratio will there be any satisfactory settlement of the question. This is the doctrine Bimetallists have been preaching for many years to what seems a stiff-necked and blindfolded generation. Will it have to be burnt into them with the red hot irons of fruitless toil, ruined industries and general disaster?

UNITED WE STAND.

COFFEE.

Loquat shade.

Shade in Nyassaland is beginning to be recognized as a necessity, but the choice of suitable trees is proving a great puzzle. One man recommends loquat as being very dense (a scarcely desirable quality) and affording lots of fruit to the labourer.

Shipping parchment.

A planter on tour on the Continent writes us that he was informed by a Hamburg coffee merchant that the amount of coffee shipped in the parchment was increasing every year, as it was found to retain its colour so much better. The same informant added that although Brazil crops would be as large as ever, it would not—as we have frequently assured our readers—affect prices for East Indian marks.

A new use for pulp.

We learn from a contemporary that orders are occasionally received at Colombo from the Persian Gulf ports and Aden for coffee husk, the refuse thrown away after pulping the coffee. It appears that the natives there boil the husk, and use it as a kind of tea or make a preparation and mix it with real coffee. The husk of Liberian coffee is preferred to that of either plantation or native cherry.

Ceylon on Nilgiri Coffee.

One of the recent visitors to the Nilgiris is Mr. Parr, a well-known Ceylon planter and sportsman. In

an interview published in an Island paper, Mr. Parr, after enthusiastic praise of Nilgiri sport, thus expresses his opinion on Nilgiri Coffee :—

I went round some tea estates and coffee estates and was very much struck with the coffee. It is very fine Arabian Coffee, and they cultivate very highly. I should say they understand coffee better than we did; at any rate they realise it is worth taking care of, which I am afraid we did not. The estates are very isolated. You go through a lot of jungle before you find another, but all you see of coffee you are rather astonished at and pleased with; you feel it is good, strong and healthy, and signs of leaf-disease are not particularly apparent; you can see a few leaves on the ground, but not very much.

Brazil plantations.

There are indeed huge estates in the "ten million bag country." The largest coffee estate in that country comprises 110,000 acres, of which 13,000 are planted with coffee, and 20,000 more are suitable for coffee trees. It was sold for \$5,838,000. The trees in bearing rose from 1,300,000 in 1892 to 2,096,500 in 1895. The profit in 1895 was \$637,000; the estimate profit for 1896 is set at \$711,000. The total number of trees in this plantation was, in June 1896, 4,426,604, of various ages, and it is estimated that two-thirds of the trees being new, from 1897 onwards, an average harvest of 100,000 bags (13,200,000 pounds) may be expected, and that, in three or four years, the yield may increase to 250,000 bags or about 32,500,000 pounds per annum. The next largest estate is of 9,785 acres, with 1,800,000 trees, populated by nine colonies with 260 families, furnishing some 1,500 labourers. There are several other plantations on which grow more than 1,000,000 coffee trees.

The Market.

There has been a very considerable falling off in the supplies brought to auction, and even the small quantity offered has consisted mostly of undesirable parcels, says the *P. M. Review* of 2nd October. With the exception of a few parcels of Guatemala, little has been offered by the importers beyond Colombian, and these have been, like the greater part of this growth, so mixed with bad berries that, so far as the home trade is concerned, very little attention is paid to them. It is a pity that more care is not bestowed upon the preparation for market of this growth, as much of the coffee is of fine quality and would often fetch 10s. to 15s. more money if only it had been more carefully picked. In the terminal market, no fresh news having been received as to the next crop, the continued heavy receipts have

COFFEE SHADE TREE.

Sun-dried *Erythrina lithosperma* loppings, &c., contain per ton :—

61.50 lbs. of Nitrogen, 57.38 lbs. of Potash, 14.92 lbs. of Lime, and 13.68 lbs. of Phosphoric Acid.

Orders should be booked early for the coming crop of seed from the parent trees of the above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE, SHENCOTTAH.

again had a depressing effect upon prices, and quotations are about 9d. per cwt. lower. The total receipts in Rio and Santos for the first three months of this crop, that is to the end of September, amount to rather over 4,000,000 bags, so that it is hard to believe that the crop will not turn out even heavier than last year's, which was the largest on record.

TEA.

West Indies. It is reported that Dominica offers excellent prospects to tea-planters. We sincerely trust that the West Indian planters will be able to hit upon some product other than tea to replace their ruined sugar-industry. •

Tea in the Caucasus. Reports from Odessa, says the *H. and C. Mail*, state that the new tea plantations at Chakia, in the Osurgentski Government, on the Caucasus, have given most excellent results, and encouraged their proprietors to engage a number of Chinese experts to instruct the natives in all the intricacies of tea-growing. The last tea crop is stated to have yielded $\frac{1}{4}$ lb. of tea for every bush planted, or 1,500 lb. from an acre having 6,000 tea plants on it, which sounds quite incredible. The whole available area for tea-growing is 20,000 acres, therefore the total yield could, on these figures, with ease be brought up to nearly 30,000,000 lb., which represents more than half of the annual consumption of the tea imported into Russia. This news is not gratifying to those who expect an expansion of the Ceylon tea trade with Russia, but it is no doubt unduly sanguine in its estimate of future results.

A New Mixture.

Adulterated tea is played out in these markets, writes a Home paper. The rise of the Indian and Ceylon tea industries practically put an end to the art of doctoring tea leaves. On the Continent the game still flourishes, and a preparation of adulterated tea-leaves is described in a German medical paper. This preparation has long been known in Russia, where it is sold under the name of "rogogeski." It is made in the following way:—"The manufacturers of this adulterate buy in the tea houses the residue of the teapots—leaves which have already been used—and mix these leaves while still moist with other leaves and very little genuine tea. The mixture is heated with an addition of extract of caramel and campeche wood, in order to improve the colour and the taste. The weight is also increased by the addition of sand or soil, and just before being dried the leaves are rolled between the hands. The adulteration is so difficult to recognise that a chemical test is necessary to prove it. If tea prepared in this way is dipped into a cold saturated solution of copper, the blue colour of the solution will not be changed, not even if the adulterated tea is allowed to remain in it for three or four months."

The Market.

INDIANS.—The revised statistics of the crop and reports of unfavourable weather in most of the tea districts have imparted a firm tone to the market, says the *P. M. Review* of 2nd October. It now appears probable that the exports from Calcutta will fall considerably short of the early estimate, as the

production of most of the gardens is behind that of last season, and it is generally expected that the quantities available for this market will not be in excess of last year. It is, however, too early to forecast with any degree of accuracy what the actual outturn will be, and the difficulty of doing so was shown last season when the first estimate was reduced materially at about this period, though eventually the quantity produced was considerably larger than the earlier anticipations. In any case there is no reason why an important advance in prices should be established, as it must be remembered there was a surplus of 5,000,000 lbs. in the stock at the end of last season, which, of course, has been materially reduced in the later months, but at the end of August the quantities were still about 3,000,000 lbs. heavier than in the same month in 1896. This, coupled with a larger stock of Ceylon by upwards of 2,000,000 lbs. should, and no doubt will, check any tendency towards an advance in values, as, with the heavy imports now coming forward, supplies will be ample to meet any reasonable increase in the consumption. At the public sales 48,749 packages were brought forward, 5,052 of which were withdrawn. There was good competition at firm and in some cases advanced rates, the common grades with clean good infusion were readily taken at slightly higher prices, while quite former values were obtained for the better sorts.

TEA MANUFACTURE BY ELECTRICITY.

THOUGH perhaps inapplicable to the great majority of South Indian gardens, yet there is little doubt that far too little advantage has been taken up to the present of the extraordinarily economical power of transmission of energy by electricity. So we trust that the following extract from the *Indian and Eastern Engineer* will secure the attention it merits:—

Mr. Davidson Rickie, Electrical Engineer to the British Darjeeling Tea Co., Ltd., has successfully introduced electricity as a motive power for the manufacture of tea, which has been successfully at work since the beginning of 1896.

Mr. Rickie is also the patentee of a process for the complete manufacture of tea without the aid of fuel, where water power is available within reasonable distance from a tea factory. The value of this cannot hardly be over-estimated when one considers the thousands of acres under tea cultivation and the numerous gardens with water power available.

The Thurbo Tea Estate, which covers over 3,000 acres, belongs to the British Darjeeling Tea Co., Ltd., and extends from the Mesh River (one of the Nepal boundaries) to the Rungbong River, which flows through the Nagri Valley. The tea factory is situated one mile from the Rungbong River at an elevation of 4,000 feet: all the machinery is worked by electricity. The water taken from the Rungbong River is led by a substantial waterway of masonry to a point where a fall of 56 feet is obtained; from this point 16-inch steel pipes convey the water, down the 56 feet fall, to a 40 H.P. Jonval Turbine (this being one of the best low-water fall horizontal turbines by Mr. William Gunter).

To this turbine is connected, by belt and pulley, a Messrs. Mather and Platt's Patent Manchester Dynamo capable of generating 30 H.P. indicating 320 volts and 70 amperes. The current of electricity is transmitted by overhead copper wires to the factory; the terminals being connected to a Manchester motor, patented by Messrs. Mather and Platt, and capable of developing 24 B. H.P. The motor is under complete control, and the speed is regulated by a graduated 10-stop switch; it is also supplied with drop sight of cups and Messrs. Mather and Platt's patent carbon brushes, so that practically speaking, it requires no attention.

The machinery driven by the above electric plant comprises—

Large Davidson Down Draft Sirocco tea driers, 2 Jackson's Patent tea-leaf rollers; 1 Davidson-MacGuire tea packer; 2 Tea sifters; 1 Tea cutter. It also provides for the lighting of the factory throughout by electricity with numerous 16 C.P. incandescent lamps which are hung from the ceilings and give a brilliant light. The electric lighting of the factory is effected by joining the positive and negative wires for the electric light to the positive and negative wires between dynamo and motor, the current being regulated by a small resistance box.

The entire confidence which the British Darjeeling Tea Co. place in Mr. Rickie's abilities, and the reliance they place in electricity as a motive power of tea manufacture, is proved by the fact that there is no reserve power at hand in the event of a breakdown; and no doubt can be entertained of the success of the above plant, seeing that such satisfactory results have been obtained, and it is now well through the second season, with no sign of any trouble or stoppage.

We will proceed to enumerate the many advantages to be derived from electricity, as a motive power, for tea manufacture. Firstly, we must consider that most serious question of fuel.

It certainly seems almost incredible that those who are striving daily to reduce expenditure, and study economy, on a tea garden, cannot see that they are throwing away a large percentage of the profits in smoke; whereas, by utilizing this water power and adopting electricity, a great economy could usually be obtained.

What are the advantages derived from steam power? Coal or wood is absolutely necessary. There is the constant fear to the manager of a tea garden that the native driver may allow the water to run low in the boiler. The fires must be lit at a certain hour to be ready for withered leaf, and after steam is raised and the leaf is not quite ready, the fires have to be kept back. The boiler has to be cleaned out occasionally and scaled, which incurs the cost of packing, jointing, etc. The yearly overhaul to machinery, viz., steam engine and boiler. The dirt and dust resulting from the use of fuel. These are all disadvantages, and the only advantage steam can claim over electricity is that it does not require so large a supply of water. In all other respects, electricity proves to be superior. It is the acme of cleanliness as a motive power. It can be started and stopped at any moment, night or day, at a moment's notice. It will run for years without requiring any repairs. It is more economical than any other power excepting the water-wheel.

There is the great advantage of lighting the factory by electricity, and most of the disadvantages, arising from the use of steam power, are obviated.

The Superintendent can command the electricity at any moment, as he has only to ring an electric bell, and the man in charge, at the turbine house, turns on the water by opening a sluice door, and in 2 to 3 minutes all the machinery in the factory is in motion. There is no necessity to order more or less power, as the ammeter indicates what machine is at work by the resistance indicated thereon, and the voltmeter indicates the speed by the number of volts. No danger can arise from too great a pressure, as a safety fuse would immediately melt and cut off the current, or, in other words, break the circuit; but this seldom, if ever, occurs, and in the event of it occurring, a fresh fuse is always at hand, which can be replaced in half a minute.

We learn that Mr. Rickie is now making arrangements for testing his patent on a large scale; and should he prove successful it will create a revolution in tea manufacture, and it can only be a question of time for the general adoption of electricity.

Another decided advantage of electrical plants is the ease with which they can be carried. A dynamo or motor can be taken in parts and the heaviest of these can be carried by eight hill coolies to the most inaccessible tea gardens in the hills; whereas it would take days of labour and anxiety, with hundreds of coolies, to drag a steam boiler and engine. As a matter of fact, it has been found to be quite impracticable in some of the hill gardens. We would impress on all interested in tea, who decide to adopt electricity as a motive power, the necessity of having the plant erected, and fitted up, at the outset by a thorough, practical engineer, as the secret of success is that electrical plants must be thoroughly put together, and if this is done they will run for years without giving any trouble.

Many who are not conversant with electricity have an idea that it is a dangerous power; that is a great mistake, as the only danger lies in touching the exposed parts which are charged with electricity, and there is no reason or necessity for doing so; but even should this occur, the only result would be a severe shock, as the power required

for a tea garden would not be sufficiently strong to cause any serious accident. It has been very amusing to read in the local papers articles headed "The Dangers of Electricity;" the writers of these articles appear to forget that accidents due to electricity are few and far between, whereas accidents from steam are of frequent occurrence, we may say almost daily.

DISTRICT ASSOCIATIONS.

COORG.

PROCEEDINGS of a General Meeting of the Coorg Planters' Association held at the Bamboo Club, Pollibetta, on Tuesday, 14th September 1897. Present: Messrs. W. Davies, J. W. Finlayson, F. W. Gerrard, H. G. Grant, A. H. Jackson, R. Kaundinya, John Logan, H. T. Shaw, and H. G. Parsons, *Honorary Secretary*. Mr. John Logan in the Chair.

U.P.A.S.I.—The Honorary Secretary read letter from the Chairman, U.P.A., to the Government of Madras with reference to the Report of the Committee of Enquiry, and gave a short history of the business conducted at the meeting of the U.P.A. held in August at Bangalore and the action taken by the delegates of the Coorg Planters' Association on the different questions. Mr. W. Davies, in a few well-chosen words, proposed a vote of thanks to the delegates for their services, and was gratified to see that the Vice-Chairman of the U.P.A. was a Coorg member.

Agricultural Chemist.—After some discussion and hearing what had taken place at the U.P.A. Meeting, Bangalore, it was resolved that it would be futile to circulate a subscription list in Coorg; however, the Honorary Secretary said he would be pleased to open an account and receive subscriptions from those disposed to support the object of engaging an Agricultural Chemist by the U.P.A.

Railway.—Resolved that this Association views with satisfaction the investigation into the question of Railway Extension from Mysore to Hunsur.

District Magistrate.—Resolved that the Honorary Secretary write to the District Magistrate asking him to kindly send round notices when coming on circuit to Veerajapett and Pollibetta.

Mr. Shaw pointed out the inconvenience occasioned owing to there being no one at the time in the Gedenalkaad Taluq with powers to grant warrants under Act XIII. of 1859. *Recorded.*

A printed Agreement form for advance under Act XIII., adopted by the Wynaad P.A., was examined, and it was resolved that a printed copy be sent to each member of the U. P. A.

Proposed by the Honorary Secretary, seconded by the Chairman, that Mr. G. C. Garrett be elected a member. *Carried nem. con.*

The following papers were laid on the table:—

General Meeting, Shevaroy Planters' Association, July 1897.

Wynaad Planters' Association, June and July 1897.

Lower Pulneys' Association, March 1897.

Central Travancore Association, July 1897.

Nilgiri Planters' Association, July 1897.

Water Lifts, Bulletin No. 35.

Photos of Casket to the Queen-Empress from U.P.A.S.I.

With a vote of thanks to the chair, the meeting ended.

JOHN LOGAN, *Chairman*.

H. G. PARSONS, *Hony. Secretary*.

N.B.—Next meeting, Mercara, November.

U.P.A. Book of Proceedings for 1897. Now ready. Orders invited. Also a few copies of "Graphic," 12 annas each, with picture of U.P.A.S.I. casket to Queen-Empress.

Honorary Secretary regrets delay in issuing report owing to absence from the district.

CENTRAL TRAVANCORE.

A General Meeting of this Association was held in the Penshurst Bungalow on Saturday, the 16th October, when there were present:

Messrs. F. M. Parker (Chairman), H. W. Baker, R. W. Cole, H. Bissett, H. J. Blandford, R. H. Goldie, H. S. Holder, L. G. Knight, C. Lance, W. H. Leahy, A. E. Veale, Hon'ble

V. B. Wilbraham, C. H. Williams, and G. L. Acworth (Honorary Secretary).

The Minutes of the last Meeting having been taken as read, the Chairman called on the Honorary Secretary for his Report, when Mr. Acworth read as follows:—

MR. CHAIRMAN AND GENTLEMEN,—The proceedings of the U. P. A. S. I. General Meeting at Bangalore were so fully reported in the Press, that I will as usual only glance at one or two of the topics discussed.

The Report of the S. I. P. E. C. was of course the matter of most importance before the meeting and was very fully gone into in Committee. The result of our deliberations was embodied in a letter to the Government of Fort St. George, which letter has since been laid before your Committee.

Finances.—It was decided that the method of raising funds should be that which had already received your approval and which you instructed us to support. To become a member of the Head Association no District Association may subscribe less than one anna per acre on a fourth of its cultivated area, whilst the most it can subscribe is one anna per acre on its total area under cultivation. Any Association now has the power to send five delegates to any General Meeting, and the value of the votes has been fixed at one for every Rs.10 subscribed. I conclude this Association will take the full number of votes possible, in which event our annual subscription will amount to about Rs.375. I may mention that subscriptions to the U. P. A. are now due, and the sooner the money is paid in the better.

Planting Opinion.—It was resolved that a section of this paper be reserved as our official medium for the publication of circulars and so on. This will save the U. P. A. a considerable expenditure annually, and as one of your chief means of obtaining information as to what the U. P. A. is doing will be through *Planting Opinion*, I would ask you all to give the paper your cordial support.

Closing of the Mints.—This, Mr. Chairman, I consider was one of the most important subjects broached at the meeting, and I most sincerely hope that it will not be allowed to drop. I am heartily glad to see that *Capital*, the leading financial paper in the East, has taken up the question, and in a series of very able articles is giving us and all producers hearty support. You will doubtless have observed that the silver question is again simmering in Europe, and now is the time for us to act. Should we be fortunate enough to secure the co-operation of the other leading producing Associations in the East, we shall be too powerful a body to be ignored. Our claims, in spite of the embarrassments of Government, must be considered. Moreover we are quite prepared to share the burden with others and to assist Government by paying an equitable export duty, or something of that sort. What we do object to is being fined exactly half our income, which was the case some few months since. We are even now paying a tremendous income tax, between 40 and 45% according to the fluctuations of exchange, probably the largest tax extracted from any one body of men in modern times, and it says much for our patience that we have so long submitted to it without a murmur.

Chemical Expert.—The last subject to bring to your notice is the decision arrived at in regard to the employment of experts. I personally cannot claim to be as modest as Mr. Harris, the mover of the resolution, and I think we are none of us quite as ignorant as he dubbed us: at any rate if we are, it is our own fault. However the Mysore delegates made a great point of this question; they know the position of their own affairs best; they have, I am sure, the sympathy of all during their present period of depression, and if they can show they can help themselves, I for one consider them fully entitled to support from a Fund, which they themselves have helped to build up. There was a good deal of difference of opinion as to the benefit likely to accrue from the employment of a chemical expert, but it was most gratifying to note in this instance, and indeed in all questions on which divergent views were held, that delegates were prepared to give way and meet each other. As the Honorary Secretary of the Wynaad Association recently said, "This is a most hopeful sign of future usefulness and the prosperity of the U. P. A. S. I."

To turn to our internal affairs. I should like before laying down my office to notify what has been done during the past nine months, as also to indicate one or two matters that need our attention.

Land Sales.—The Dewan has consented to publish in future the

lowest sum he is prepared to accept for any block of land applied for and to be auctioned.

Title Deeds for lands sold two years since are not yet all issued to the very great inconvenience of the purchasers. I have been assured again and again that they "will shortly be issued," but am now beginning to fully understand what is the "hope deferred which maketh the heart sick."

Telegraph Subsidy.—I hope you will find the call on you in the coming year a far smaller one than has hitherto been the case. To my certain knowledge the wire is much more used than was the case a year since, and in some months I should imagine our guarantee has been very much more than covered.

Government Buildings.—An Engineer was deputed in concert with some of the members of your Committee to view suitable sites to which these buildings might be removed, and a position close to the Pambanar was fixed upon. I have however heard nothing more of the matter, but would urge you not to allow it to drop, the present position of the buildings being not only inconvenient but unhealthy.

Medical Fund.—After a long cross-correspondence, the lines on which were dictated by your Committee, H. H. Government has offered a grant to two out of the four dispensaries already established. It is of course impossible to abolish any one of the dispensaries, four being the very least that are necessary, and it is much to be regretted that so heavy a burden should fall on the Association. The attitude of the Durbar Physician, whom of course the Government consulted, has been far from sympathetic, and he has moreover displayed a singular want of knowledge of the geography of the District.

Revenue Survey.—I had many complaints brought to my notice regarding the action of these officers when engaged early in the year in demarcating our estates. I duly forwarded these on to the Dewan, but was briefly told that the proper person to refer them to was the head of the Department. I therefore allowed the subject to drop, being unwilling to initiate a fruitless correspondence.

Roads and Communications are a subject I am almost afraid to touch upon, so frequent and so reasonable have been our complaints and so small the result. For some months most carters have absolutely declined to proceed to the hills owing to the condition of the roads, and factories in some instances have been blocked with produce which could not be moved. Regarding such chests of tea as were carried during the monsoon, a formal complaint was made to me by Messrs. Aspinwall and Co., and I had the satisfaction of viewing these chests in their godowns. The greater part of them were covered with mud and smeared with cow-dung, the estate marks obliterated, plainly showing that the cartmen had occasionally to unload their carts, draw them empty through such obstructions as there were, carry the chests across by hand, and then reload the cart. I myself have seen this done, and I need hardly say that it spells loss for the planter.

Coomlie Timber Depot, Chotah Para Barrier and Periyar Ferry.—I have been credibly informed that at all these stations blackmail is extorted from cartmen by the local officers. I have begun to investigate the matter, and trust my successor will not lose sight of it. It is we who indirectly pay the blackmail, for of course the rice merchants have to take it into consideration when fixing their prices.

Moondikaim-Kanjerapullay Road Overseer.—I have had many complaints of the high-handed action of this person in forcibly detaining coolies proceeding to estates in these hills brought to my notice. These I have duly forwarded to the Chief Engineer. My last letter was addressed to him on 24th July, and enclosed were formal complaints from the aggrieved parties. I have however received no reply from that officer, and matters reached such a crisis of frequent repetitions of the offence that one gentleman wrote me early in September that he was tired of ineffectual complaining and should another case of crimping occur, he would take the law.

CENTRAL HOTEL,
INFANTRY ROAD, BANGALORE.

(Under English Management.)

The most comfortable and convenient for visitors.

TERMS MODERATE.

into his own hands. It is probably only some such action as this that will rouse those responsible to the gravity of the situation. It is absurd to suppose we shall tamely submit to the crimping of our coolies by subordinates of the D. P. W. and to the consequent loss of advances.

European First Class Magistrate.—We have now been many months without any such officer, and to this I greatly attribute the trouble we have had with the D. P. W. You will recollect that in April last the acting President, Mr. Nicholson, informed us that the Dewan had assured him that, so soon as opportunity arose, he would appoint a resident first-class European Magistrate. For thirty years this official has been considered necessary here, and one hardly sees the sense of removing him, when the District is almost double the size it used to be, when it is still growing, and when the number of European residents is increasing. It is impossible for the Magistrate at Devikulam to give his attention both to that and this District, and I think a strong representation should be made to H. H. Government that Mr. Vernède, who, it is rumoured, is to be transferred to the Forest Department, be appointed Resident Magistrate in these hills.

Crime in the Periakulam Valley.—This is the last subject I shall bring to your notice, but it is a most serious one. You will all remember that about this time last year, one of our members was dacoited and robbed in this valley. How many dacoities there may have been in the interval I cannot tell, but the valley is notorious for this class of crime, which ought to be stamped out. The last instance I know of I will briefly relate. A Cangany of mine was proceeding to his village to procure coolies with an advance of Rs.200. Another Cangany and two or three coolies accompanied him. At a river crossing in a desolate part of the country the party was set upon, robbed and beaten. The whole of their money was taken, their blankets and all such valuables as they had. Some days later one of the men died of his wounds. The matter directly it was reported to me was put into the hands of the Police and thirteen men were arrested. Eleven of these, all of whom I believe were guilty, were shortly released. Two were retained in custody, and the Inspector of Police at Uttamapaliam himself informed me (I still hold his letter) that these men had confessed their guilt. Personally I do not think much of confessions to the Police, but in this instance my Cangany identified the men, and he tells me he is still prepared to swear to them. Notwithstanding this the Inspector of Police has seen fit to release the culprits without even placing them before a Magistrate. Mr. Chairman, this is a matter that must not be allowed to drop. You must recollect that both we and the Kannan Devan Planters are constantly sending Canganies with large sums through this valley, and the fact that notorious dacoits have got off scot free will be an enormous incentive to an increase of this class of crime. The thing can be checked at once. Every village headman knows, some are said to actually protect the habitual criminals and to share in their gains. Were an extra Police force placed in the valley, and the respective villages made to pay the cost thereof in proportion to their size, dacoity would cease at once. In any event the present condition of the valley reflects but little credit on the responsible authorities. It is intolerable that in the peaceful Madras Presidency one should be unable to proceed unarmed a distance of 50 miles from these hills towards Periakulam, and yet you know well that no one of us sitting here would venture to do so.

Gentlemen, I thank you for your patient hearing, and I now beg to place my resignation in your hands. I very much regret, I regret more than I can tell you, that this is the last meeting of this Association that I shall attend as one of its officers. But, Mr. Chairman, I shall always take the keenest interest in this Association, its welfare and its proceedings, wherever I may chance to be. And I am quite sure that, with such an able body of men as I see before me, and with such gentlemen as yourself and the elder men here present to guide them, this Association will remain what it is, and what it has long been, one of the leading District Associations of S. India.

GRANVILLE L. ACWORTH.

The Chairman, Mr. F. M. Parker, then rose and said that before the

Report was finally adopted he should like to say a few words. It was true that during the monsoon we had had very much trouble with the roads, but he attributed this chiefly to the Chief Engineer's want of experience of the West Coast, and to his idea that the wet weather was the best time for repairing roads. Doubtless he would now alter his views, and that being so, we ought to give the Government a fair show and see what they could do. He had just passed along the whole line himself, and he could vouch for the fact that between Kottayam and the 39th mile the road was better than it had ever before been. Abrupt gradients were being altered, and the repairs to the roads themselves were not mere patchwork; it was practically re-making them altogether. This was most satisfactory, and all we had now to do was to see that things did not slip back into the old groove, but that the present improvements were kept up.

But the most important item in the Honorary Secretary's report and a matter that concerned all producers was the question of exchange. He was much, and had always been much surprised, that when the mints were first closed, no agitation had been started. If we were only the Government of India, how nice and easy it would be for us to legislate, for of course we want a law that is a natural exchange, and means could be found to compensate the remitters. Bankers said that the value of produce would rise with that of exchange, but he thought this absurd, and that it was really the law of supply and demand that caused fluctuations in produce. In any event he was strongly of opinion that all producers should combine for an agitation to restore exchange to its true market value, and Government could easily meet the loss to itself by placing duties on all produce. (Applause.)

The Report was then formally adopted.

Vote of thanks to retiring Honorary Secretary.—Mr. Veale said Mr. Chairman and Gentlemen, it is with great pleasure that I rise to move a most cordial and hearty vote of thanks to Mr. Acworth for his services to this Association. During the past four years this Association has done an immense amount of work, and we are now

one of the most prominent Associations in S. India. That we owe our present position largely to the able and energetic manner in which Mr. Acworth has conducted the onerous duties of Honorary Secretary there can, I think, be no doubt. As to the general interest displayed in Association matters by members themselves, Gentlemen, I am sure you have all appreciated the enthusiasm Mr. Acworth has displayed in our own local affairs as well as in those of the U. P. A., and we can have no better proof than in Mr. Acworth we have had a most able and indefatigable Secretary than in his election to the Chairmanship of the U. P. A. last year. Further encomiums on Mr. Acworth's services are unnecessary. I am sure you will all join with me in wishing both Mr. and Mrs. Acworth a most enjoyable visit to England.

Mr. Parker, in seconding the resolution, said that Mr. Veale had left him really nothing to say, but that he cordially endorsed every word that had fallen from his lips. He himself when Honorary Secretary had always looked on the work as a duty, but with Mr. Acworth it had always appeared a real pleasure, so much so that he wondered he could drag himself away from it to go home. He had much pleasure in seconding the resolution. The vote was then carried with acclamation.

Mr. Acworth, in replying, said that he thanked the Chairman and Mr. Veale most heartily for the more than kind terms in which they proposed the vote, and also all the members present for carrying it so cordially. He must, however, ask members to remember that he was not the real artificer of the Association. It was founded many years ago by Mr. Parker, more years perhaps than Mr. Parker would thank him for mentioning. He had merely carried on Mr. Parker's work. It was easy enough to carry on such work; construction was another and a very different matter. He once more cordially thanked the Association in his own and Mrs. Acworth's name for their good wishes.

Periakulam Valley Dacoity Case.—The Honorary Secretary said that he thought it only just to read the last letter from the Superintendent of Police, Madura Division, on this case. Having done so, he continued that his comments on this letter were

(1) That most dacoity cases when related were extraordinary stories. What story could be more extraordinary than the dacoiting of Mr. Garstin, a Member of Council, on this road.

(2) The moment the dacoity was reported to him he passed it on to the Police. It was perfectly natural his Cangany should keep out of the way till sent for. They all knew how much the Police were dreaded and what a poor chance a low caste man had.

(3) Why men should run themselves into danger by confessing dacoity, in order to put the Police off the scent, he was at a loss to conceive. He could not imagine anything more idiotic.

(4) He did not believe for a moment that his "Cangany and the understrappers appropriated the money and invented a cock and bull story." The Cangany had been with him for years, and he had always found him an honest and trustworthy fellow. Moreover at the time of the robbery he owed the Cangany a good deal more than the men, of which the latter was robbed, and the Cangany had no reason to suppose the Rs.200 would not be debited to his account. The estate responsibility in regard to it ceased so soon as he had received the money. Finally the Cangany extremely assured him that he knew the men and was still prepared to identify them, and he believed his word to be as good, if not better, than that of the Police.

Resolved,—That the Planting Member of Council be requested to draw the attention of H. E. the Governor in Council to the chronic state of highway robbery and dacoity in the Cumbum-Periakulam Valley, and respectfully to request that measures be taken to stamp it out.

The Chairman further moved, and it was resolved,

That a copy of this resolution be sent to the Kanan Devan Association with a request that they be good enough to support it.

European Resident First Class Magistrate.—Mr. Veale said: there is a rumour current in the District, and which so far as I have able to learn is generally believed, that on Mr. Maltby's return to Travancore, Mr. Sealy is to be appointed Resident Magistrate at Devikolam. This District is then to be left without a First Class Magistrate. Against this action on the part of Government, I think we should protest. If a European Magistrate has been necessary in these hills for so many years, how much more then is he a necessity now that the District is yearly becoming larger and more populated and is likely to increase still more within the next two or three

years. Why should we, who have for so long been the premier tea-producing district of the State, now be left with only a Second Class Magistrate. A Resident European Magistrate is as necessary here as he is at Devikolam. Both districts are amenable to the same laws and both labour under the same difficulties in respect to run-away and absconding coolies. Mr. Veale then proposed and it was resolved:

That in view of the rumour that this District is to be left without a First-class Magistrate, H. H. Government be respectfully requested to appoint Mr. Vernède to fill that office in these hills in lieu of transferring him to the Forest Department.

Resolved that H. H. Government be requested to abolish the ferry at the Periyar crossing and to reconstruct the bridge at that point.

Closing of the Mints.—Read circular letter from Chairman, U. P. A. S. I., and cordially approved.

At the close of the Meeting, Mr. A. E. Veale was by ballot elected Honorary Secretary.

The following papers were laid on the table:—

Proceedings of the Lower Pulneys Planters' Association.

Do.	do.	Nilgiri	do.	do.
Do.	do.	Shevaroy	do.	do.
Do.	do.	Wynaad	do.	do.

A vote of thanks to the Chairman and late Honorary Secretary, who conducted the business, concluded the meeting.

MARKET SUPPLEMENT.

SATURDAY, OCTOBER 30, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (October 8, 1897) says:—The small supplies brought forward in Public Sale met a good demand and values ruled generally in seller's favour.

200 bags East India were offered and mostly sold at unchanged prices.

Central American kinds attracted good competitions, five colory grades of Columbian realising very full rates whilst the commoner qualities sold steadily at about previous values.

The Terminal market after giving way 6d to 9d the earlier part of the week has recovered the decline and closes 3d dearer than last week, the recovery being occasioned by a falling off in Brazil receipts.

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated October 8th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	429,435 packages.	483,406 packages.	10,424 packages.
1896-1897...	446,810 "	425,145 "	17,428 "
42,464 pkgs. INDIAN	Total 63,460 packages were offered in public auction this week.		
20,367 " CEYLON			
629 " JAVA			

Deliveries of Indian and Ceylon Tea from 1st June show sufficient increase to warrant the belief that supply for the season will not be excessive, and that some advance in price may occur.

Indian. All grades sold very freely, slight advances being noticeable here and there; Teas with quality continue in most demand although considerable attention is now being given to those for price. The Official Wire gives exports to U. K. for second half of Sept as 10,900,000 lbs., against 10,340,000 lbs. last year, and the total from 1st April to 30th Sept. as 69,050,000 lbs. against 68,030,000 lbs.

Week's av. of Tea sold on Garden Account, 1897, 32,750 pkgs., av. 8½d. 1896, 36,102 pkgs., av. 9d.

Ceylon. With comparatively light auctions, bidding was animated for all descriptions, slightly improved prices being occasionally obtained. The Official Wire gives shipments to U. K. during Sept. as 6,250,000 lbs., against 6,500,000 lbs. last year, making the total from 1st January 77,500,000 lbs., against 73,000,000 lbs. last year, and estimates the quantity for Oct. at 6½ to 7¼ million lbs., against 6½ million lbs. last year. Average for week 8½d., against rather under 8½d. for same time last year.

Ceylon Tea sold on Garden Account 1st January to date 1897, 877,223 pkgs., av. 7½d. 1896, 777,517 pkgs., av. 8½d.

Comparative prices of Ceylon Tea in London:—

	1897.	1896.	1895.	1894.

CINCHONA.

The Chemist and Druggist of 9th October 1897 reports:—

CINCHONA.—The average quinine content of the manufacturing barks at last Thursday's auctions at Amsterdam was the highest on record. Not so very long ago a 5 per cent. average was considered a high one; last week it was 6·10 per cent. The richest parcel offered was one of 27 bales *Ledgeriana* crushed bark, analysing 9·24 per cent. This realised 58c. per ½ kilo. The highest unit paid was 7c. (at which 2,126 kilos. of bark changed hands), the lowest 5½c., at which 921 kilos. sold. The tone was very animated throughout the auctions, and improved steadily towards the end. The general opinion is that a further advance is imminent. Druggists' barks realised irregular but generally higher prices. There was an especially good competition for crushed *Succirubra*, which was readily bought by cinchonidine manufacturers. The following figures show the result of the first eight Amsterdam auctions (Jan.—Oct.) of the past five years:—

Year.	Total weight of bark offered.	Representing sulphate of quinine.	Average content of manufacturing bark.	Total weight of quinine sold.	Total weight of quinine bought in.
	Kilos.	Kilos.	Per cent.	Kilos.	Kilos.
1897	4,005,504	221,058	5·26-6·10	186,444	34,614
1896	4,528,277	240,309	5·05-5·83	202,126	38,183
1895	4,636,859	225,367	4·63-5·17	141,314	81,053
1894	3,443,031	161,659	4·61-5·12	125,727	35,932
1893	3,930,594	172,982	4·23-5·02	97,679	75,303

The exports of cinchona-bark from Maracaibo, S. America, in 1896 amounted to 161 cwt.

CINCHONIDINE has again advanced considerably. The *Auerbach* factory, who are the principal makers at present, have made heavy sales at 7½d. to 7¾d. per oz. and are now asking 8d. per oz. A good deal appears to have been bought for shipment to the States. It is said that the British Government recently gave orders for several thousand ounces, but only succeeded in obtaining a 1,000-oz. parcel. The B. & S. factory are rather out of the market in this article at present. About a year ago cinchonidine sold at ¾d. per oz.

QUININE.—The beginning of the week witnessed considerable excitement in this article. Between Saturday and Tuesday fully 100,000 oz. were sold, mostly from second hands, at from 1s. 1½d. up to 1s. 3¼d. per oz. It is even said that 1s. 3¼d. per oz. was paid, but this seems doubtful. Since then a complete quietness has come over the market, and to-day it is difficult to quote a price. The nearest figures seem to be: sellers at 1s. 3d., possibly 1s. 2½d., but no buyers over 1s. 2d. per oz. This applies to the standard German brands. With regard to special makes, we may say that *Howard's* quinine is still quoted by the makers for "small

wholesale lots" at 1s. 3d. per oz. for bulk, and 1s. 5d. per oz. for vials. *Whiffen's* sold yesterday in bulk at 1s. 3d. per oz. *Taillandier's* agents have no price at present. The B. & S. agents also have no quotation; but a few 1,000 oz. of *Amsterdam* quinine are offering at 1s. 4d. per oz. *Brunswick* also quotes 1s. 4d., and *Auerbach* offers small lots at 1s. 3d. per oz. In second-hand 1s. 2½d. per oz. was paid on Monday for *Howard's* quinine, and 1s. 3d. for B. & S. and *Brunswick*. *Auerbach* sold on the same day at 1s. 2d. per oz. from the factory (October—December delivery), and at 1s. 3d. per oz. in second-hand. To-day there were second-hand sellers in Mincing Lane at 1s. 2d. per oz. We have compiled the following table, showing the unit price of bark (in cents) at the Amsterdam auctions of the past six years, and the average price of German second-hand bulk quinine in London (in pence) during the weeks in which the Amsterdam auctions were held:—

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 12th November 1897.

SEASON REPORTS.

Coorg. POLLI BETTA, 4th November.—*Weather.*—The very heavy shower of the 26th ultimo, amounting to over 3 inches, which came down in the space of an hour, was not all-embracing. Out East it was light. Siddapur way I hear over 4 inches fell. From the 28th ultimo to 2nd inclusive the weather has been fair, with clouds hanging about. On the night of the 2nd there was a small shower, and yesterday it was wet. *Crops.*—Picking is general now, from $\frac{1}{2}$ to $\frac{3}{4}$ bushels being picked per cooly. *Interesting Item.*—Rifle meeting at Mercara.

Nellampatty (British). 3rd November.—*Weather.*—Rain for fortnight, 1.10; to date, 159.46. N. E. Monsoon is with us in a very mild form here; its total rainfall has been 1.10, but other places have had more; yesterday and to-day seem more like monsoon in reality. *Crops.*—Rice $8\frac{1}{2}$ to 10 measures per rupee, depending on how much water has been put to swell it! Gram $12\frac{1}{2}$ per rupee. *Plant-diseases.*—Very little leaf-disease showing except in young clearings, where it is very evident. *General Health.*—Fair: colds are prevalent. *Labour.*—Sufficient. *Interesting Items.*—Nil.

Kadur. MUDIGERE, 2nd November.—*Weather.*—Heavy rain on the 27th and 28th October; 2.25 in two days. Fine bright weather ever since and promises to continue so. *Crops.*—Picking has begun on a few estates, but the majority of estates have no signs of ripening yet. It is feared that there will be a large percentage of light coffee. *Plant-diseases.*—Leaf disease is still amongst us, but by no means so severe as last year. First-class crops might be picked next year if the “enemy” keeps away. *General Health.*—Cholera that was prevalent in Gonibede and on one or two estates has quite disappeared, but *dysentery* is a common complaint amongst the coolies. *Labour.*—Plentiful. *Interesting Items.*—The weekly bazaar at Chikkanhully is not quite the success it might be; the *Relur sante* is still kept up. There was not enough rice last Sunday to supply the wants of the many estates around Chikkanhully. Sir Graham Anderson arrives in Bombay on the 4th by P. and O. *Egypt.* Col. Robertson, the Resident, is expected about the end of the month. Assistant Engineer Mr. Rice at

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, “Planting Opinion,” Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

Mudigere has been doing excellent work on the roads. The main road to Mangalore through *Kotigehar* is in perfect order and does him much credit. Complaints are easily and frequently made, so it is only fair that when good work is done it should be praised.

Nilgiris.

COONOR, 3rd November.—Not much doubt about the N.-E. being again with us, unless it be explained away by the usual theory of cyclones on the East Coast. As much as $4\frac{1}{4}$ inches fell on the 1st near Coonor. Coffee ripening up fast, and looking well except on heavily-bearing gardens, where an inordinate amount of dying back of primaries is observable. Tea still flushing well, and no signs of bug so far. Good deal of sickness among coolies, though nothing serious. Gravest form is "mallay seeeku", not unusual at this time of year.

KOTAGIRI, 4th November.—October has been marked by absence of the heavy rain usual in this month on this side of the district and notable for spells of fine, cold, enjoyable weather after all the recent heavy rain, one break extending for 12 days, from the 17th to the 28th, just when, from all past records, one would have looked for heavy monsoon weather from the N. E. During that spell of fine weather a fresh breeze was blowing from over Dodabettarangeto the westward, and old hands here opined that the N. E. Monsoon did not make any established show till the very end of October, and these first few days in November, which have been marked by thunderstorms and heavy rain from the right quarter. In October the rainfall in the station has been only 4.40 in., the smallest fall yet recorded, against an average due of 14.19 in. November has opened out very stormy and wet; within the last five days over 6.50 in. have fallen on the Coffee Estates half way down the Ghaut, 3.30 in. of which came down last Monday night and which caused a good deal of wash and knocked off some crop and messed the ghaut road a good deal. Fortunately there has been a general lull in the picking this side. Places that had got in one-fourth or one-third their crop have been quite slack, with only fly picking going on since middle of October and will not get on again to full pick till middle or end of this month.

GENERAL NOTES AND ARTICLES.

The "Central African Planter." Our planting contemporary was to have converted itself on the 1st ultimo into a general paper, like the *Central African Times*. We congratulate the "C. A. P." on its development and wish it all success.

To prepare Papaw juice. The Papaw Juice, which is now quoted at 5s. per lb., is easily prepared. The unripe fruit has to be scarred or lined some $\frac{1}{4}$ in. deep, with a sharp knife daily, and the juice caught and dried upon sheets of glass, when it becomes at once a marketable commodity. The active principle, papaw is in much esteem as a medicinal agent. The *Chemist and Druggist* gives the following method of preparing it:—"The juice is pressed out of the fruit, clarified by filtration through a twill bag, and the ferment precipitated by alcohol. It is then dried, but is sometimes purified by treatment with water."

Where camphor grows.

Whoever wishes to undertake the cultivation of camphor had better begin soon, for the number of places where the tree thrives is legion. Egypt, the Canaries, South East France, Buenos Ayres, California and Madagascar are all countries where camphor thrives. In Tokio, Japan, they withstand

the frosty nights of winter and a minimum temperature of 12° F. In Australia, too, camphor grows very freely. The increased demand for camphor for use in explosives and in the manufacture of celluloid gives greater importance than ever to this commodity. The Japanese have commenced to prepare it by distilling the leaves and branches of the trees instead of destroying only full-grown trees for the purpose. It is decidedly worth while to ascertain if the shrub growing in the warmer climates will bear cutting sufficiently well to yield an adequate return of camphor when distilled. We wonder if this new departure of the go-ahead Japs dated from the publication of Mr. D. Hooper's researches at Ootacamund, published a year or two ago?

Gold and silver production.

The following extract from the *Statist* of 25th September 1897 will prove of great interest to that small band of our readers who try to follow the "inwardness" of the exchange question:—

ESTIMATED WORLD'S PRODUCTION OF GOLD (VALUE) AND SILVER (OUNCES).

	Gold. Value of Production. £	Silver. Millions of oz.		Gold. Value of Production. £	Silver. Millions of oz.
1850	11,600,000	—	1874	22,950,000	64½

1873	23,600,000	*62½			

The letter A designates averages.

On this the Editor of the *Produce Markets Review* has the following sensible remarks:—

The above figures from *The Statist* are of the greatest value to the business world, which cannot very closely follow the theories of bi- or mono-metallists. Here we have the plain fact that the supply of gold has doubled in the last ten years, while we all know, to our cost, that the prices of produce, other than the precious metals, have fallen continuously during the same period. This apparently endless depreciation in values cannot therefore be due, as was alleged, to the increasing scarcity of gold, for that metal is infinitely more abundant than it was. In the same period the supply of silver has increased some 60 per cent., thus showing that its relative price, as compared with other commodities, has still been so high as to stimulate production. The silver party believe that if civilised mankind would only "pretend very much" that a shilling is worth a florin, we should all be set right, and unheard of prosperity would follow. Unfortunately, the action of the Bank of England lends a colour of respectability to such visionary dreams, although nothing of the sort was probably meant to be conveyed. The great rise in wheat, coincident

with a great and renewed depression in silver, shows that the course of prices is dependent on far wider causes than the demonetization of silver by Germany and Japan. We were told that agriculturists were ruined because silver had fallen. It has fallen still further, and farmers are much more prosperous than they were.

THE U.P.A.S.I. SECTION.

THE CLOSING OF THE MINTS.

THE following is a draft of a letter that it is proposed to send on behalf of the U.P.A.S.I. to various Chambers of Commerce, the different Planting Associations and large Industrial Institutions of India, Ceylon, &c., and the leading Banks and Firms :—

DEAR SIR,—At the last Annual Meeting of the United Planters' Association of Southern India, I was instructed to address all the large Produce Associations and Chambers of Commerce and Mill Owners in India and Ceylon with a view of ascertaining whether they would join us in forming a combination for the purpose of representing to the Secretary of State for India and the Houses of Parliament the critical condition of the producing industries of this country; and to forcibly point out that if the present financial policy is long continued, the export trade of India must seriously suffer, with the result that the final position of the Government of India will be worse than if it had never made the fatal blunder of tampering with the currency.

2. In accordance with this resolution, I beg to request that you will favour me with the views of your { Firm Chamber Association

(a) On the closing of the Mints and the general policy of the Government of India in endeavouring to create an artificial rate of Exchange;

(b) On the effect that this artificial rate has had on your industries.

3. With regard to ourselves, the effect of the present financial policy of the Government of India has been as follows :—

Our chief industries are the growing of coffee and tea. Our coffee has to compete with Brazil, and our tea with China and Japan. Taking the present intrinsic value of the rupee at between 9d. and 10d., the Government has forced it up to nearly 1s. 4d., or 60% over its real value. Brazil has nominally a gold standard, but owing to bad financing, the value of its standard coin, the Milreis, has fallen during the past ten years from 27d. to between 8d. and 9d., so that for all practical purposes Brazil is a country with a currency on a level with that of all silver standard countries.

As a result, Brazil has flooded the markets with coffee which she can sell profitably, owing to her low rate of exchange, at 40s. per cwt. In India, on the other hand, under existing circumstances coffee cannot be produced at a profit under 80s. per cwt. Luckily, owing to its superior quality, it can still command this price, but it has to compete with the better quality coffees of Costa Rica and other silver standard countries of Central America. We would point out to you that this action of the Government of India in maintaining an artificial rate of Exchange acts as a bounty in favour of those countries of 60%.

4. In like manner our teas have to compete with China and Japan. The former has a silver standard, and Japan, though she has recently adopted a gold standard, has fixed her Exchange (doubtless having this and other competition in view) at the present low rate ruling in silver standard countries, and is for practical purposes one of them. Here again, owing to the action of the Government of India, China and Japan enjoy a bounty of 60%. Although Indian and Ceylon teas have been able to wrest the British and Colonial markets from China and Japan, they have only succeeded in doing so owing to their low rate of Exchange in the past, and even then at a cost to themselves of more than 50% reduction in the price of their teas.

5. It must further be borne in mind that Chinese and Japanese teas, although inferior in quality, are still selling for a higher price in silver than ours, and that the Japanese exports have increased during the last twenty-six years from 18½ to 60 million lbs. and the Chinese from 236 to 239 million lbs. This increased export has so far found an outlet in the markets of Russia and the United States that our competition has been less keen. The struggle that is to come must be to conquer these markets, involving in all probability

a further fall in the gold price of tea. In view of these facts, we maintain that it will be impossible for Indian and Ceylon Planters to continue giving this bounty of 60% to their rivals and yet compete with them successfully in the world's markets.

It seems to us that the future prosperity of India and the safeguard for its increasing population, shielded by Government from war and famine, depend mainly on the cultivation of the enormous tracts of waste land that it contains, and as pointed out in the *London Times*, this has hitherto been effected by the cultivation of articles of export such as tea, coffee, jute, cotton, wheat, and seeds. Owing to the constant opening up of new countries and increasing facilities of cheap communication with the world's markets, the gold price of India's produce is more likely to fall than rise. It seems, therefore, the height of folly for the Government of India deliberately to throw away the advantage which a low Exchange gives the export trade of India in their severe competition both with gold and silver standard countries.

6. We shall be told that the loss to the export trade is largely balanced by the gain of the import trade, but the latter is a smaller trade than the former, is not so necessary, and depends for its volume largely on the power of the exporters to purchase imports. If the export trade suffers, the import will also suffer proportionately, and the better off exporters are, the more imports they can purchase.

7. We are well aware that the Government of India is not in a position to forgo the saving now effected in Sterling charges without increasing its taxation to a considerable extent. But we believe that if Government were to re-open the Mints and refrain from tampering in any way with Exchange, the export trade of India under a low Exchange would very rapidly increase (as has been exemplified by the coffee and wheat trades of South America), and that with increased land and other sources of revenue, the imposition of a direct 5% export duty would be found sufficient to cover the loss on the home charges. We as producers would infinitely prefer to submit to a direct tax than suffer this indirect loss of 60%.

8. Our proposition, therefore, would be that the Government of India be requested to re-open the Mints and refrain from tampering in any way with the rate of Exchange, and that it should refund itself for the losses caused by this policy by the imposition of a 5% export duty.

“THE PROSPECTS OF RAMIE CULTIVATION IN PERAK.”

MR. L. WRAY'S ESTIMATE SHOWS A LOSS ON THE CULTIVATION; MR. E. MATHIEU—A NETT PROFIT UP TO 136½ DOLLARS PER ACRE. MR. J. M. MACDONALD'S ESTIMATED PROFIT, £25 TO NEARLY £50 PER ACRE! WOULD THE SOUTHERN PROVINCE OF CEYLON RETURN £5 PER ACRE PROFIT?

Our readers may be inclined to pass over the following article with scant attention, if not disgust as of articles on Ramie there is a surfeit. But we are of opinion that—with the exception of Mr. Macdonald's estimates perhaps—these notes form the most valuable contribution to Ramie literature yet published. They are abridged from our contemporary, the *Ceylon Observer*.

The following estimates of yield have been prepared by Mr. L. Wray, Jr., for the Perak Government :—

	Fibre.	Ribbon.
	lb.	lb.
Forbes Royle	960	1,280
J. Montgomery (mean)	986	1,314
Hardy	1,260	2,100
E. M.	610	1,080
E. Mathieu	1,881	2,508
Mean yield per acre	1,173	1,656

The mean yield of fibre is therefore a few pounds over half a ton, and 739 of a ton of ribbon per acre, that is about 14½ cwt. or 12½ pikuls.

Then as to cost :—
Very little is to be found, in any of the accounts of ramie, of the cost of the cultivation. It is variously stated that one cooly can keep in order 2 to 3 acres of land; while no information is available

as to the cost of gathering, boiling, stripping, drying and baling the ribbon. Taking the mean, that is one cooly to $2\frac{1}{4}$ acres of land, or 2 coolies to 5 acres, and the wages at \$9 per month, the cost per annum is \$43.20 per acre, and per ton of ungathered ribbon \$58.45. As I have already said, there is nothing on which to base an estimate of the cost of harvesting and preparing the crop. The process is as follows:—The stalks are cut near the ground, then stripped of leaves and topped. They are then carried to the boiling tanks and boiled for about a quarter of an hour. The bark is then stripped off by hand, carried to the works to dry; when quite dry it is sorted into lengths, and baled ready for shipment. Considering that some 15 tons of stalks have to be treated per acre, I do not think that less than \$20 could be allowed per ton of ribbon. This would bring up the cost of the ribbon to \$78.45 per ton or \$57.98 per acre.

There is then supervision, manure, rent, duty and buildings. The least that can be allowed for this is \$10 per acre per year. Taking a 500-acre estate this would be made up as follows:—

Rent at 50 cents per acre	...	...	\$ 250
Supervision, \$300 per month	...	...	3,600
Manure	...	...	500
Upkeep of buildings	...	...	250
Duty on 369.5 tons at $2\frac{1}{4}\%$	...	...	623
			5,223

The final cost of the ribbon would be \$91.97 per ton or \$67.98 per acre.

Summing up as to result, Mr. Wray is not encouraging:—

Dr. D. Morris, the Assistant Director of the Royal Garden, Kew, in a lecture delivered on the 30th November, 1896, gives the price of ribbon as £8 per ton in London. It does not appear that more than £7 (\$67.20) per ton could be reckoned on for the ribbon, and as by the above estimate it would cost to grow and prepare \$91.97 per ton, it would appear that there is a loss of \$4.77 per ton or \$18.30 for each acre of cultivation. There is another side to this question, and that is for the planter to also be the manufacturer of the finished product, in the same way as sugar planters are.

A reply to Mr. Wray's Report came from Mr. E. Mathieu of Singapore, who quotes actual experiments made for two years at Buitenzorg, Java, under the control of the Director of Botanic Gardens:—

"One bouw gives four cuttings in one year, weighing in the aggregate 34,000 kilos of green stems, without leaves and topped."

In English figures this works out:—

One bouw ($1\frac{1}{4}$ acres) = 74,000 lb. of green stems, stripped and topped.
One acre = 42,800

He next quotes a series of American experiments; but we do not attach much importance to these, though the tabular results of all the experiments quoted may be given:—

I shall now bring together the figures presented you so far, and put them under tabular form:—

YIELDS OF RAMIE.

Countries.	Number of years' growth.	Number of cuttings per year.	Weight of stems, without leaves and topped, per cutting per acre.	Weight of stems, without leaves and topped, per acre per year.
Java	2	4	10,700 lb.	42,800 lb.
Louisiana	3 to 4	2	12,880 "	25,760 "
Texas	"	2	12,600 "	50,400 "
California, Kern Valley	"	4	11,013 "	33,040 "
Algeria	"	3		

It will be seen at a glance that while the above figures present very large differences in gross totals of the yearly crops, yet when they are apportioned into separate cuttings they agree very closely; the relative weakness of the weight of the Java cutting, as compared with those obtained in the States or even in Algeria, being explained by the fact that the latter experiments have been carried on for a longer period than in Java.

Mr. Mathieu is therefore inclined to think that after three to four years a ramie plantation in Malaya should give in four cuttings 20 tons of stems per acre per annum. Such an estimate we consider most unreliable to work on as a permanency, even on the richest soil and with the best possible cultivation. It may be done on a small

plot for a few years; but we scarcely think any practical planter—in Ceylon at any rate—would embark capital with the hope of harvesting 20 or 10 tons of a crop per acre, continuously. However let us see what Mr. Mathieu has further to say in respect of the "yield in fibre." We agree with him as to the great confusion over the different terms used:—

Yield in Fibre.—Turning now to the yield in fibre, here again we have to brush away the ambiguity attaching to the term fibre. It is dubbed ribbon, raw fibre, clean fibre, dry fibre filasse—without these words conveying any true idea of the standard of purity of the fibre nor of its value in money; and sellers of patents or machines have too often availed themselves of the vagueness of the terms used to impose on the public as to the output of their inventions." Mr. Mathieu adopts "clean dry fibre" and takes as the average of several experiments (chiefly with the Faure machine at Buitenzorg) an average of 3.75 per cent. He then recapitulates after the following attractive—not to say triumphant—fashion:—

My estimate of yield of ramie stems, stripped of leaves and topped, stands as shown above 20 tons per acre per annum. Greens stripped stems yield 3.75 per cent. of their weight in clean dry fibre, as sample No. 2, worth £32 in London. Therefore 20 tons of green stripped stems, the aggregate yearly crop of one acre, will give 1,680 lb. of fibre, worth £24 in London. Conclusion: The gross yearly product of one acre planted in ramie in Malaya is £24 in London.

Let us now establish the cost of production of these 1,680 lb. of fibre, and laying them down in London.

ACREAGE, 500 ACRES.	\$
Rent per acre	050
Cost of cultivation of 1 acre trimming and cutting superfluous roots; light hoeings	30.00
Manure (using the leaves and refuse from decortication)	4.00
Cutting, stripping of leaves, gathering and carting 20 tons of stems to factory	25.00
Management and Superintendence, per acre	20.00
Decortication { Cooly labour, 1 cent per lb. of fibre	16.80
{ Engine room wages, 1,680 lb. = $\frac{1}{3}$ day's output	6.20
Depreciation of machinery and upkeep	10.00
Cost of production of 1,680 lb. at the estate	112.50
Duty $2\frac{1}{4}\%$ on \$112.50	2.70
Pressing, baling, transport to port of shipment, freight to London, etc, \$30 per ton on 1,680 lb.	22.50
Total cost of 1,680 lb. of clean dry fibre laid in London	137.70

This figure of \$137.70 should be under ordinary conditions considered a maximum; under favourable conditions, and labour at \$6 per month, the expenditure should be much reduced. As it stands, however, it shows that one acre, at a cost of \$137.70, brings in a gross return of £24 or \$240, leaving a nett profit of \$102.30. But it is possible for the planter very materially to increase his profit by partially degumming his fibre himself.

How to gain the last-mentioned advantage with an additional profit of 34.20 dollars per acre, is thus described:—

Degumming, when the gum is yet fresh and fluid, offers very much less difficulty than when it is hardened, as is the case when the fibre is sent simply dried to Europe. Anyone can satisfy himself on this point by boiling freshly stripped ramie in water for, say, one hour; it will be seen that the fibre loses a notable quantity of its gum. If the boiling is kept up for several hours and a small quantity of washing soda added; or soft green soap, the reduction of the gum will be yet more complete: if the boiling is made under pressure in autoclave kiers an almost complete degumming can be obtained; but, beyond the fact that pressure implies more or less complication, it is not necessary nor desirable to carry the degumming so far, because in the presence of a perfectly finished fibre the spinner is apt to suspect the use of injurious chemicals; he prefers, as in the case of hemp and flax, to finish off the process himself with his own partial degumming, limiting himself to extracting, say, two-thirds or three-fourths of the gum.

Advertisers are notified to send all advertisement matter and answers to advertisements direct to Manager, this paper, 3, Esplanade Row, Madras.

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

And then the final conclusion becomes:—

1 acre { =20 tons of stems, stripped and topped.
=1,680 lb. of clean, dry fibre.
=1,344 lb. of degummed filasse.

Cost of production ... \$163.50
Value in London ... 300.00

Nett profit ... \$136.50 per acre and per year.

Mr. Mathieu further thinks that the best market for the fibre is not Europe but China itself, since while he puts the whole production of Ramie (China grass) in China at 11,000 tons, the export is only 2,000 tons, the rest being used for local manufacture.

Finally among the papers sent us is an estimate from Mr. J. M. MacDonald (of MacDonald, Boyle & Co., London)—“of the machinery necessary to decorticate and degum the produce of 1,200 acres of land, and of the profits to be made from the cultivation of Ramie and its subsequent decortication and treatment on the ground, so as to render it fit for the manufacturer in which condition it will readily command £42 per ton in Great Britain for large contracts, and much larger prices for small quantities. In France as much as 2 francs per kilo, equal to about £90 per ton, have been offered; indeed at our mill at Long Eaton we are selling the noils or waste at from 4½d to 5d per pound.”

It may be judged from this passage alone that Mr. MacDonald is a sanguine man and that he writes after a magnificent fashion dealing in large figures. He is writing to Mr. T. Gipson, Hon. Secy. of the local Planters' Association:—

“In calculating the return from an Estate, I have taken six months as the time required for the plant to mature, but as you are aware, from your experience of Ramie on your Estate at Klange, it matures in three months. I have also taken the product at one ton only for the first six months, but properly planted this may be calculated at 1½ tons; also the product of the second year at 1½ tons, when two tons per acre can be relied upon if the land is suitable. The estimate for machinery does not include buildings. What I should suggest for the consideration of the Planters is that a central factory to degum the fibre should be erected on some suitable spot, and a battery of decorticators placed on each Estate where the Ramie is grown so that the decorticated fibre only need be sent to the central factory to be treated. Thus an enormous saving in carriage would be effected, the decorticators would be worked by the central factory, and credit would be given to the Planter for the weight of stems decorticated daily, and according to the weight of stems decorticated the amount of his proportion of the profits of the central factory could be determined. The cost of the machinery for the central factory, including working capital for six months, would not exceed £10,000, which will be returned in full with 9 months of the first crop, leaving a considerable profit, and after that the Planters will be receiving at least £25 net profit per acre for every acre under cultivation. By doubling the item of decorticators the output of the central factory could be doubled, the other machinery being equal to the output of 2,400 acres.”

We may as well put Mr. MacDonald's sanguine figures on record, though we fancy few practical Planters will put faith in those referring to returns on working of estate:—

RAMIE IN THE MALAY PENINSULA.

Estimate of cost of necessary machinery and erection thereof for treating the product of 1,200 acres; 900 being under cultivation, the rest being roads and paths

Decorticators, 4 installations of 40 drums, one installation of 20 drums, with 4-12 HP Engines	£ 1,898
Fixing and fitting same with brickwork including sheds	425
Degumming machinery, including fittings, &c.	1,000
Steam boilers and engine	1,000
Soaking tanks	250
Chemical tanks	250
Water tank	100
Steam pumps and appliances	100
Wharf with loading crane, weighing machinery, &c.	500
Soap tanks and fittings	125
Fittings for treating sheds	250
Steam barrels, steam valves and fittings	150
Belting, say	100
Baling machinery	500
Sundries, say	127
	6,775

ESTIMATE OF THE FIRST 12 MONTHS' EXPENSE OF THE CULTIVATION OF THE ESTATE AFTER PLANTING.

Allowing one coolie for each two acres of land for the cultivation and cutting purposes it will be necessary to employ 450 coolies who will keep down the weeds for the first five weeks, and cut the stems as they ripen, but in case of illness allow for 480 at 6d per day, this will amount per annum to ... 3,208 5 0

COST 6 MONTHS TREATING THE FIBRE, SAY 156 WORKING DAYS.

The first cutting will take place from four to six months after planting, so that there will only be 6 months' produce the first year.

Coolies collecting the stems and delivering to decorticators, 2 to each 100 acres, 18 at 6d per day	70 4 0
330 coolies working decorticators at 6d per day	1,287 0 0
16 coolies assisting in Mill and Baling and wrapping at 6d per day	62 8 0
Chemicals to treat 450 tons at £2 per ton of Filasse	900 0 0
Engineer, 6 months	200 0 0
Cultivation Manager	500 0 0
Works Manager, 6 months	250 0 0
	6,477 17 0

RETURN FROM ESTATE FIRST YEAR.

At the end of the first year from Planting it is estimated that the product will be at least 450 tons of cleaned fibre, ready for manufacturer. Taking the sale price of this at four-pence half-penny per lb. only, it amounts to ... 18,900 0

Cost of producing the above as on other side	£ 6,477 17
Freight £2 per ton	900 0
Brokerage and Incidentals, 2%	260 0
	7,637 17

Working Profit ... 11,262 3

The second year the Estate should be in full bearing, and producing 2 tons of cleaned fibre per acre, but for safe calculation we will only take it at 1 and-a-half tons per acre.

Product of Estate, 1,350 tons at four-pence half-penny per lb. (£42 per ton) ... 6,700 0

Cost	£ 3,208 5
450 coolies cuttings	...
18 do. collecting stems and delivery to decorticators	140 17
230 coolies on decorticators	1,799 15
60 do. assisting in Mill and drying and baling sheds	469 10
Chemicals £2 per ton	2,700 0
Engineers	400 0
Managers	1,000 0
Freight, £2 per ton	2,700 0
Brokerage and Landing charges, say 2 per cent.	1,134 0
	13,552 7

Working Profit ... 43,147 13

From these profits the Patentee's Royalty of 25% will have to be deducted.

For the present we would only note one little point of discrepancy. Mr. Mathieu writing on actual experience bases his estimate for Malaya on a 3½ years to 4 years old ramie plantation: Mr. MacDonald begins operations in six months after planting! It is a pity that planting opinion should, we feel, be prejudiced at the very outset by estimates and figures, which seem to us far too glowing. Far better pleased would practical men be to see a well-considered moderate statement work out a possible profit of £5 per acre than to be met with over £12 per acre profit the first year and well-nigh £50 of working profit in the second year from a cultivation which, so far as we know, no

Advertisers are notified to send all advertisement matter and answers to advertisements direct to Manager, this paper, 3, Esplanade Row, Madras.

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

one has yet tried on a scale sufficient to justify reliable estimates for a plantation—at any rate in the Eastern world. Garden experiments are useful as guides; but they do not count for serious estimates on a big scale with experienced tropical planters.

The Southern province of Ceylon has been described by practical men as “a paradise for fibre-yielding plants” and labour in some parts is abundant and cheap. But we should be sorry to see anyone go in for “Ramie” there on an expectation of more than £5 per acre return—and even then the investment would be a venture as all pioneering attempts in the tropics invariably are.

Since writing the above we have seen it stated that Mr. MacDonald has arranged with a native Sultan (Datu Mahommed) to put 1,000 acres under Ramie and that a central factory is to be erected to treat the product after the MacDonald-Boyle process. This undertaking and experiment will certainly be watched with the greatest possible interest. Mr. MacDonald has a wide margin to work on, and we wish him all success.

INDIA RUBBER.

South America.

Of the two planting products which are just now exciting such wide interest, it is difficult to say whether Rubber or Ramie takes the cake for chaotic ignorance on the part of their supporters. Rubber-producing trees there are in great abundance, but of varieties to profitably cultivate, there are but few. Fewer still are the countries or districts where plantations can be made by the private capitalist. The most valuable rubbers are Bolivian and Para, which have touched 3s. 10d. per lb. and are steadily rising. They are obtained from various species of *Hevea* and of an allied genus, *Micrandra*. Plantations of *Hevea* in Brazil do not exist, as they thrive best in their natural habitat, i.e., malarious swamps under water for half the year. Plantations of *Heveas* in other countries have all failed commercially, even in Ceylon, where they apparently thrive exceedingly: the yield was only $\frac{1}{4}$ of the Brazil output. The Brazil trees are in myriads, and, were it not for lack of enterprise and capital, the imminent rubber famine would be many decades off.

The best rubber tree for cultivation, as distinct from the collection of rubber from trees in their natural state, is undoubtedly the *Castilloa elastica* of Mexico, British and Spanish Honduras, Guatemala, Nicaragua, Costa Rica, the Isthmus, and part of the United States of Colombia. The *Castilloa* is a totally different tree from the *Heveas*, and belongs to the same botanical order as the breadfruit, whereas the *Heveas* belong to the Spurgeae. The two trees have no characteristics in common, except that both yield india-rubber. The chief advantage offered by the *Castilloa* from the planter's point of view is that it will thrive on comparatively dry lands, or even on hills of moderate elevation, and, consequently, under far more favourable conditions for the planter than the *Heveas*. Its yield of milk is nearly, if not quite, as abundant, but its rubber is of about 40 per cent. less value. Properly prepared *Castilloa* rubber is worth from 2s. 3d. to 2s. 6d. per lb., according to condition, while the rubber prepared after native methods realises from 1s. 8d. to 2s. Improved systems of coagulation will in all probability raise the value to 3s. per lb., as compared with the present price of Para, but it is unlikely that it will ever be as valuable as Para, owing to the great difference in the chemical constituents of the milks. In its wild state the *Castilloa* is fast becoming extinct. In Costa Rica it is difficult to find a tree that the rubber collector can “put a knife into,” so close is the network of channels in the bark made by previous collectors. Saplings of two years old are tapped regardless of legal restrictions, and except on the few plantations, it is certain that there will soon be no *Castilloas* to tap. On the Mexican plantations and in Guatemala the trees are commonly tapped in their fifth year, when they yield from $1\frac{1}{2}$ lb. to

$2\frac{1}{2}$ lb. of rubber. In British Honduras the planters wisely leave the trees alone until their eighth or tenth year, when from 3 lb. to 5 lb. may be expected. The annual yield increases until a certain age is reached, and trees fifty years old have been known to give 20 lb. of rubber. The net profit on cultivated *Castilloa* rubber, so prepared as to be worth 2s. 4d. per pound, is from 1s. 4d. to 1s. 8d., according to the cost of labour in the country where it is grown. The margin is amply wide enough for profitable employment of capital. The proper place to commence plantation of *Castilloa elastica* is where the wild trees are not abundant. Like the *Heveas*, it does not seem to yield well where it is not indigenous. Jamaica and Trinidad have introduced it, and the growth of the trees has been all that could be desired, but the yield of milk is small. The same may be said of the *Castilloa* in the East Indies and elsewhere. It must not be forgotten that even in its home—Mexico and Central America—the yield of the *Castilloa* depends greatly on the situation. A loss must follow any attempt to cultivate it on very poor soils. The richest alluvial lands give the best results.

The principal rubber tree of India, Burma, and various other parts of the East is the *Ficus elastica* previously alluded to. It has been cultivated on a very extensive scale by the Indian Government in Assam, where promising results have been obtained, the average yield of 50 trees in one year amounting to 26 lb. per tree. The yield fluctuates, but the tree is well worth the planter's attention.

The rubber from Borneo, Sumatra, and the Malay Archipelago, which chiefly reaches us via Singapore, is mostly derived from species of *Willughbeia*, climbing plants so closely allied to the *Landolphias* of West Africa as to be, for all practical purposes, the same things. It is believed that in fairly healthy countries like Borneo, Sumatra, and Java, where land can be obtained for next to nothing, and labour is very cheap, the cultivation of the best of the *Willughbeias*, *W. firma*, would pay well, notwithstanding that the yield is small— $1\frac{1}{4}$ lb. in the sixth year, and the value of the rubber only 1s. 10d. per pound. The average price of Bornean rubber is considerably under 1s. 10d.; but that is a consequence of the native methods. They mix together milks of widely different values and adulterate the mixture with saps that contain no caoutchouc at all. The value of rubber from *Willughbeia firma*, carefully prepared under European supervision, may be safely taken at 2s. 6d. per pound. In their sixth year the *Willughbeia* stems are only about 2 in. diameter; but they grow to the thickness of a man's body, and the yield increases in proportion.

In the United States of Colombia there are a number of rubber yielders which in all probability it would pay well to cultivate. Many of the *Sapiums* are indigenous, and there is one variety identified at Kew as *Sapium higlandulosum*, which thrives on the mountains at a considerable altitude, and yields a rubber valued some years ago at 2s. 10d. per pound. Some species of *Hevea* are also found in Colombia, and Cartagena rubber, badly prepared as it is, is well known. Many of the *Sapiums* and a few species of *Hevea* are also found in Venezuela, and in British, Dutch, and French Guiana; but it would appear that, except in Colombia, no attempt has been made at cultivation. There still remain a score or more of rubber-yielding plants and trees to enumerate, but they are scarcely within the scope of this article as the prospect of their cultivation is very remote. One, however, ought not to be omitted. It is *Manihot Glaziovii*, a native of Brazil, yielding Ceara rubber, which is worth about 2s. 4d. per pound. This tree is wonderfully hardy, and it will thrive on arid lands; but its yielding capacity is very small. The rubber gatherers of Ceara nearly all emigrate to the Amazon, the home of the *Heveas*, which fact speaks for itself.

Ceylon.

Some recent correspondence published in the Ceylon papers shows clearly what has been, and what is being, done in rubber plantations in that Island. It is now twenty years since the Government of India procured seed from South America and introduced it into India and Ceylon. In the latter country three species have been established, and seed freely. Mr. Thiselton-Dyer now draws attention to another variety, the *Kicksia africana*, a West African tree of great value. Ceara, *Manihot Glaziovii* rubber, was cultivated in

Ceylon about 12 to 14 years ago, but the yield was extremely disappointing. Panama (*Castilloa elastica*) is very scarce in the Island, while the Lagos (*Kicksia africana*) has only been introduced the last two years. The only rubber of importance now cultivated is the Para (*Hevea brasiliensis*) variety which was introduced in 1876 and were planted in the Heneratgoda Gardens. These are now 60 feet high and 4 feet in girth (6 feet above ground), and the 450 trees produce annually 75,000 seeds a year, which is many times under the demand. The price at which it is sold is Rs. 5 per 1,000 seed, not more than 3,000 seed being given to any one applicant. Private planters are now getting Rs. 20 per 1,000. The 3,000 seed are only sufficient for four to five acres. The best land is fairly flat land at about sea level. Good soil, uniformly wet climate and not subject to frequent floods or heavy winds. Observations of the yield obtainable from a single tree at Heneratgoda shows $\frac{1}{2}$ lb. per tree per annum for the 10th year upwards. The trees being planted 30 feet apart gives 75 lb. per acre as the annual yield. This is not sufficient to pay well. A new series of tapping experiments on 11-year old trees planted 12 feet apart give a yield of 112 lb. per acre (6 oz. per tree). This should pay fairly well, considering the high price of rubber and the small cost of cultivation. Good para rubber in London is worth from 2s. 6d. to 3s. 6d. per lb., so that 112 lb. equals about £15 to £16. To judge from the great demand for seed, seed-bearing plantations would pay handsomely, as much as Rs. 200 per acre. It is noteworthy that though, as stated above in the article on Brazil rubber, para rubber does best in flooded lands in its native habitat; in Ceylon floods were the cause of portions of the plantations dying out altogether. There are about 600 to 700 acres of young rubber (1 to 10 years) now planted in Ceylon held by private owners.

LETTERS TO THE EDITOR.

BANANA MEAL.

SIR,—Having seen several articles in your paper on the exportation home of 'plantains' or 'bananas' and on the making of 'banana flour,' I should be extremely obliged if you could get or give me some further or particular information on the subject.

A.B.C.

SAKLASPUR, }
26th October 1897. }

[If our correspondent will specify the particular points on which he desires further information, we shall be glad to help him as far as possible. Very little that has been published on the subject up to date has failed to be noted in these columns.—Ed.]

EFFECT OF FORKING ON YIELD OF TEA.

DEAR SIR,—Will those who are able to give statistics kindly state what result in yield of tea leaf and quality of resulting tea has followed upon the trenching up of the ground or forking any depth during monsoon or growing season?

What depth below the surface have the small feeding rootlets of the tea bush usually been observed, and has any planter succeeded in persuading his tea bushes to throw out rootlets lower down in the soil than they were previously found.

This seems to me an important matter in view of the very great stress that our Ceylon brethren lay upon avoiding all disturbance of the roots of tea bushes.

PLANTER.

E. LITHOSPERMA SEED.

SIR,—To meet the great and increasing demand for *E. lithosperma* seed, I have for some time been conducting experiments to overcome the notorious delicacy of the seed and ensure its successful germination. Not only have I carried my experiments to a successful issue, but I have been in communication with Messrs. Sutton and Sons, who have very kindly advised me as to the best way of preserving the vitality of the seeds. While I am prepared to guarantee the germination of 50%, I expect in future a very much higher percentage will germinate. I hope the advantages of the guarantee will be appreciated, for it enables the cost of plants to be calculated exactly on the basis of the guarantee. They cannot cost more than calculated on 50%, and may cost a great deal less with a high percentage germinating.

At the guaranteed rate, *E. L.* may safely be claimed, without fear of contradiction, to be the cheapest fertiliser ever known for coffee.

B. NELSON.

ARIENKOW, }
SHENKOTIAH, 18th October 1897. }

COFFEE.

Nyassaland.

The present British Central African crop is estimated at 9,000 cwt., and shows—we speak from memory—a healthy increase on that of last year. The local Chamber of Agriculture and Commerce have decided to obtain the seed of suitable shade trees from Bengal, as there is little danger of importing the dreaded leaf disease therefrom. They will have to do without *E. lithosperma*, though, as it is unobtainable (the thornless species at least) except in Southern India.

The Market.

A further addition of 7,670 tons in the European stocks, and of 37,160 tons in the world's visible supply, has, says the *Produce Markets Review* of 9th ult., brought the latter up to 351,310 tons, which is an increase of 133,000 tons over the same date last year. Against this, however, must be put the fact that the deliveries, both in Europe and the United States, show a steady and consistent growth, amounting in the nine months of this year to an increase compared with last year of nearly 65,000 tons. To many it may be surprising that with such figures the market remains so steady, but the explanation is no doubt that there is comparatively only a small supply of either good medium or fine Coffees, and that there is a strong consumptive demand for such, while the commoner sorts, of which the bulk consists, have fallen to as low a price as can be expected. Any little favourable sign is no doubt made the most of to raise quotations in the terminal market, but the weight of Coffee eventually causes a reaction again, and prices con-

COFFEE SHADE TREE.

Sun-dried *Erythrina lithosperma* loppings, &c., contain per ton:—

61.50 lbs. of Nitrogen, 57.38 lbs. of Potash, 14.92 lbs. of Lime, and 13.68 lbs. of Phosphoric Acid.

Orders should be booked early for the coming crop of seed from the parent trees of the above analysis at Rs. 6 per pound containing about 2,000 seeds. Germination guaranteed.

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE, SHENCOTTIAH.

sequently are constantly fluctuating within 1s. or so. At auction coloury New Grenada and similar qualities have fetched full prices, while East India and Plantation have sold steadily. The Dutch Trading Company have advertised their next sale for Tuesday, when 20,100 bags and 30 cases will be offered, against 24,503 bags and 346 cases at the corresponding sale last year.

TEA.

Exports from Calcutta. The total sailings of Indian tea from Calcutta from the 1st of April to the end of September was only a little over 69½ millions, against 71½ last year and 65½ the year before. The exports to America, notwithstanding this decrease in total sailings, is 866,000 lbs odd against 677,000 and 546,000 previously. Those to Australia on the other hand show a decrease, as also those to "other places" unspecified. Great Britain again has absorbed about 1½ million pounds less than last year. Ceylon, total exports this year to the end of September show an increase of over 7½ million.

"Sirocco" Machinery.

Messrs. Davidson and Co.'s latest edition of their catalogue of tea machinery conveys a vivid impression of the excellence which they have attained in this line. They have the unique reputation of being the only firm who can supply the factory with a complete rig-out of the most modern machinery from leaf lifter and witherer to sizer and packer. And without a suspicion of advertisement paragraphing, vulgarly known as "puffs," we can safely affirm that each and every item compares favourably in all respects with those turned out by other firms, though these make specialities of one or two branches only. New worlds there are yet to conquer, however, though it may seem ungenerous to say so, and in the field lie many branches untouched by the inventive genius of the firm. Perhaps the important need of the latter-day planter is a good mechanical plucker, to invent which individual attempts have been many. May it be soon that our congratulations shall be proffered to Messrs. Davidson and Co. on the successful solution of the difficulty!

To economise labour.

The last of the answers to the series of questions under this heading has been published by the Ceylon *Observer*, and this is its summary thereon, terse and to the point:—

"Tramways are unsuited to most estates, and their initial cost stands in the way of their use, except under very exceptional circumstances. (2) Wire tramways are doing good work on the few places on which they have been erected, and their extended use should follow the high appreciation of them which our circular has elicited.

(3) Wire shoots are in tolerably extensive use; and their use is likely to spread, through the removal of the prejudice against them for the transport of leaf, on the strength of the testimony of experienced planters who have reduced the damage to leaf to a minimum by the exercise of ordinary care. (4) Among other labour-saving appliances must be included roads, carts, telephones, up-to-date machinery and a well-ordered Factory—all directed by strict, yet considerate oversight. (5) The great majority of planters prefer clean weeding partly on the principle that what is, must be best, and, partly, because the kangany must be propitiated, and weeding contracts have been his immemorial and most welcome perquisite; but a few who are not afraid to tackle a new difficulty are experimenting with water holes and selected weeding, as a means of reducing wash and conserving the soil-constituents. (6) The principle is sound of the system of drainage; but modifications, called for by local circumstances, should be more readily adopted. (7) The multiplication of boutiques carries with it risks of theft of produce, illicit sale of arrack, and growing indebtedness. (8) Arrack Taverns and Liquorshops are an evil; but they are the lesser of two evils; as, in their absence, illicit traffic is inevitable. (9) Just, firm treatment of the cooly is the great panacea for labour troubles and discontent; and to secure this, the master must be in touch with his men, sympathise with them, and not be too often absent from the estate, whether on pleasure or business."

The London Market.

INDIANS.—Many of the Teas brought forward have been of better quality, says the *P. M. Review* of 9th ult., and as there has been a good selection on offer, an active and large business has been transacted. The firmer tendency noticed last week has been maintained, and for the common descriptions a further slight advance has been established. Souchongs and Pekoe Souchongs, with a clean useful infusion, are not obtainable under 5½d, and are scarce even at this price, and the same remark applies to Broken Teas. The next higher grades offered included a much better and more useful assortment of Sylhet and Dooars Teas, which, in consequence of their improved quality, met with a good inquiry; and although they have brought higher prices than similar marks of previous shipments, the intrinsic value is equally favourable to buyers. For the finer sorts the demand remains steady, and business continues fairly active at late prices. The only movement of importance has been in the finest grades, which are not so freely offered, and on the whole a higher range of prices has been obtained, especially for the Assam growths, which are likely to become less plentiful later on. Judging from latest advices of the crop it would appear that the deficiency is not likely to be so marked as was recently expected, the reports of the weather being much more favourable; at the same time, it is quite possible that the supply from Assam will not exceed, if it equals, that of last season. The figures of the past month, compared with September, 1896, are not encouraging to an advancing market, as it will be seen that the increase in the stock has made further progress, while the deliveries are only 243,000 lbs. in excess of last year. The comparative figures are: Imports 21,134,000 lbs., against 19,436,000 lbs.; deliveries 10,161,000 lbs. and 9,918,000 lbs. respectively; while the stock stands at 36,775,000 lbs., as against 32,236,000 lbs. The public sales comprised 41,425 packages, and only 4,175 were withdrawn.

CEYLONS.—The quantity offered at auction has again been small and firm prices have been paid all round, while a further advance was noticeable in some descriptions, more especially in the case of the medium Pekoes and Pekoe Souchongs. Notwithstanding the rise in values, there

seems every prospect of a still further advance, as the supply of Tea available for this market will be insufficient to meet the requirements of the trade for some little time to come. The quality, however, has been steadily improving, and some of the Teas on sale last Tuesday were distinctly better than we have seen for a long time past. Of the 20,300 packages offered at public auction, only about 700 were withdrawn, and most of these have since been sold. The sales advertised for next week only comprise about 16,000 packages. The following are the figures for the past month, compared with September last year:—The imports amounted to 6,867,000 lbs. against 6,315,000 lbs., and the deliveries were 8,937,000 lbs. against 7,884,000 lbs., while the stock stands at 22,646,000 lbs. as compared with 20,831,000 lbs. The exports from Colombo for September were 6,250,000 lbs., with a low estimate for the present month.

DISTRICT ASSOCIATION.

SHEVAROY.

PROCEEDINGS of the Monthly Committee Meeting of the Shevaroy Planters' Association held in the Victoria Rooms, Yercaud, on Monday, October 4th, 1897, at 10 A.M. Present: Messrs. R. Gompertz, Rahm, Junr., W. W. Hight, Revs. * M. Andersen, J. M. Kempf, Messrs. C. G. Lechler (*Chairman*), H. W. Leeming (*Honorary Secretary*)."

Notice calling the Meeting was taken as read.

Read and Recorded for disposal, at the General Meeting to be held to-day, correspondence re the proposal to charge a commission on Currency Notes presented for encashment at the Yercaud Sub-Treasury.

Read letter from Mr. C. D. Ricketts, dated September 29th, 1897, complaining that one of his cases had been struck off the file of the 2nd Class Magistrate's Court, at Yercaud, without his knowledge.

Resolved "that the matter be laid before the General Meeting to be held to-day."

Read and Recorded Circular, dated 15th September 1897, from Secretary, U.P.A.S.I., re Reserve Fund Circular, dated 12th September 1897, from Secretary, U.P.A.S.I., re North Wynaad Planters' Association Circular, dated 15th September 1897, from Secretary, U.P.A.S.I., re Finances.

Read and Recorded with satisfaction letter No. 5058, dated 29th September 1897, from the Collector of the District re Roads on the Shevaroyas.

Read and Recorded, for disposal at the General Meeting to be held to-day, letter dated 20th September, 1897, from the Secretary, U.P.A.S.I., asking what sum this Association is prepared to subscribe towards defraying the salary of an Agricultural Chemist, &c.

The following Papers were laid on the Table:—(i) *Planting Opinion* for September 11th, 18th, 25th and October 2nd, 1897. (ii) Agricultural Ledger, No. 8 of 1897. (iii) Proceedings of Board of Revenue, No. 6785, dated 24th August 1897, re Carrot Seed. (iv) Proceedings of the Lower Pulneys Planers' Association. Proceedings of the Wynaad Planters' Association.

With a vote of thanks to the Chair the meeting terminated.

C. G. LECHLER, *Chairman*.

HERBERT W. LEEMING, *Hon. Secretary*.

THE LIGHT THAT CAST NO SHADOW.

CURIOUS stories are told about the powers possessed by certain natives of India who live up among the Himalaya mountains. These old men, it is said, have devoted scores of years to the study of natural laws and forces which the rest of the world knows nothing about. Lately a German professor visited the "adepts," as these queer Hindus are called, for the purpose of finding out the secret of their remark-

able performances. They treated him rather scurvily, but interested him all the same. One day the professor wanted to examine some ancient Sanskrit manuscripts. An adept went with him to a cave wherein the books were kept. The place was dark as the bottom of a well.

"I can't see to read, here," said the visitor.

"Then we will have some light," was the reply, and immediately (the professor says) a soft, pearly light brightened the cave. He could not tell whence it came, but he noticed that it had one strange quality—*It cast not the slightest shadow.*

This is a story hard to believe, yet its truth is affirmed by a man of vast learning and high character, and you who now read it have no reason for doubt except that all the lights *you* have seen have cast shadows. Belief or unbelief commonly runs parallel with one's own experience. Dr. Johnson sniffed at the account of the Lisbon earthquake, yet credited the tale of the Cock Lane ghost.

A man who has been ill for years, and failed to find a cure, is sceptical when friends tell him of a medicine which they believe will make him well. What else but doubt could result from his experience? Take an example:—

"In the spring of 1888," writes our correspondent, "I fell into a low, weak, and languid state. I felt low-spirited and out of sorts. At first my stomach was deranged, my appetite poor, and after eating I had pain and weight at the chest. I was much troubled with wind, and frequently spat up a sour fluid, also bitter bile. Later on I suffered from nervousness and great depression of spirits. I kept up with my work, but had always a sense of discomfort. Off and on I continued in this way for two years, nothing that I took relieving me. At last I heard of Mother Seigel's Syrup and procured a supply. After I had taken only a few doses I found relief; my food digested, and gradually all nervousness left me. Although I had no reason at first to feel any confidence in this medicine, never having used it or seen it used, I now gladly admit its value, and its power over disease. Since my recovery, for which I thank Mother Seigel's Curative Syrup, I have been in the best of health and spirits. In the interests of suffering humanity, I deem it a duty to send you this testimony. (Signed) D. Griffiths, tailor and outfitter, 151, Hockley Hill, Birmingham, June 8th, 1893."

There is a deal of difference between Mr. Griffiths' candid letter and the story about the light that cast no shadow. The latter may be true enough, but it cannot be verified without more trouble than it is worth. On the other hand, we have a trustworthy witness, who will answer letters of inquiry, and can be found at his address.

Finally, there is nothing mystic or magical about Mother Seigel's Curative Syrup. It acts on the theory that most ailments are but symptoms, forms, or phases of that universal disease—indigestion and dyspepsia; it cures that, and throws the light of health and happiness over hearths and homes where illness and pain had cast such dark and terrifying shadows. And that is why people believe all that is told of its success by eager witnesses.

THOMSON'S ANTI-MALARIAL PILLS, THE PLANTER'S FRIEND.

The only known Antidote against Malarial Poison.

A sure and efficacious Remedy for Malarial Fever, Enlargements of the Spleen, Malarial Cachexia (Anæmia after Malarial Fever) and other Malarial Symptoms.

A Planter from Assam writes:—

"I have tried Thomson's Anti-Malarial Pills and find them to be most efficacious among my coolies. I can strongly recommend them."

MARKET SUPPLEMENT.

SATURDAY, NOVEMBER 6, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (October 15, 1897) says:—Auctions continue on a limited scale; the superior grades still attract good competition, but other kinds rather slow of sale.

About 600 bags East India were catalogued and mostly sold at previous rates.

Columbian, of which the sales chiefly consisted, realised very full prices for fine colory qualities, but the commoner descriptions in some cases had to be bought in.

Futures have been very quiet this week with only a small business passing, and quotations at the close have declined 3d to 6d since our last.

Movements of Tea in United Kingdom from 1st Jan. to 30th Sept., as shown by Custom House Returns.

OTHER PRODUCTS.

The Chemist & Druggist of 16th ult. reports:—

CARDAMOMS.—At auction only 29 cases were offered. These met with a very strong demand, and although holders were firm, 17 packages sold at about 4d. advance, Ceylon-Mysore, fair, long and round mixed medium pale, 3s. 6d.; ditto, mixed sizes, brownish, partly split, 3s. per lb. For medium to bold bright Mysore, 4s. 9d. is asked; and for small to medium a bid of 4s. 2d. was refused. Tellicherry sold at from 3s. 2d. for small up to 4s. per lb. for good medium to bold brown, and for Seed 4s. per lb. is asked. The imports this week include 51 cases from Colombo per Java.

CINCHONIDINE is still extremely scarce. This week 8d. per oz. has been paid for small available parcels.

CINCHONA.—Seven catalogues, comprising 1,263 packages, were offered at auction on Tuesday. They were divided as follows:—

	Packages.	Packages.
	420 of which	337 were sold.
African cinchona	...	...
Ceylon cinchona	273	157
East Indian cinchona	235	170
Java cinchona	168	107
South American cinchona	361	92
	1,457	863

The anticipation that prices would be fully up to the limit of the Amsterdam sales was fully realised. In some instances, in fact, the Amsterdam unit was exceeded. The average unit realised by manufacturing bark may be put down at 1¼d. per lb.; but in some cases red barks realised comparatively much higher prices, on account of their cinchonidine-content. The following are the approximate quantities of bark acquired by various buyers:—

	Lbs.
Agents for the Mannheim and Amsterdam fact	67,830
Messrs. Howards & Sons	43,828
Agents for the Auerbach factory	34,710
Agents for the American factory	21,698
Agents for the Frankfort-on-Maine and Stuttgart factory	8,040
Agents for Paris factory	2,620
Agents for the Brunswick factory	80
Various buyers	13,311
Total quantity of bark sold	192,117
Bought in and withdrawn	42,490
Total quantity of bark offered	234,607

The prices realised were as follows:—Ceylon and E. I. barks: Ledgeriana, 4½d. to 7½d. per lb.; officinalis, 2½d. to 4¼d. per lb.; succirubra, 2½d. to 7½d. per lb.; hybrid, 3¼d. per lb. Java barks: hybrid, 7½d. to 7½d. per lb.; W. African succirubra quill and chips, 3½d. to 6¼d. per lb. South American bark: Soft Columbian, 4d. per lb.; yellow cultivated Bolivian quill, 5¼d. to 8½d. per lb. At auction to-day 29 cases red Java bark in Druggists quills were offered. The whole of this parcel has been lying in London since 1888, and might have lain perdu here for years to come yet, but for the recent rise in bark. The lot was in fine stout druggists' quills both long and short, and was valued variously at from 7d. to 1s. 4d. per lb. At auction, however, no bids at all were made, and the parcels were bought in at from 9d. to 1s. per lb. A parcel of 29 packages red E. I. bark was also bought in. Bold to medium druggists' quill, at 10d. to 1s. per lb. Dull to fair quilly chips were bought in at 6d. per lb. Of a parcel of 20 bales South American grey bark (Guayaquil) fair thin bright to dull rusty quill, 12 bales sold at 9d. to 10d. per lb. for fair quality. Fifty bags "Mossy Lima-bark" in pale dusty chips were bought in at 4d. per lb. Of 88 bales thin fair hard partly dark flat Bolivian Calisaya (nearly all damaged) the greater part found buyers at 9d. per lb. for sound, and from 4d. to 8d. per lb. for damaged quality. Nine bales fair Carthagena, slightly damaged, are held for 6d. per lb.

Since the last Amsterdam auctions several parcels of manufacturing bark have been sold in the market privately at advanced rates, as much as 7c. per unit per ½ kilo. having been paid. The shipments of cinchona-bark from Java show a not inconsiderable decline—viz:—

	1897	1896	1895	1894	1893
	Amst.	Amst.	Amst.	Amst.	Amst.
	lbs.	lbs.	lbs.	lbs.	lbs.
Jan. 1 to Aug. 31.	5,005,000	6,029,000	5,013,700	5,557,000	5,376,000
Month of Sept.	750,000	1,389,000	816,000	1,071,000	500,000
Total Jan. 1-Sept. 30.	5,755,000	7,418,000	5,829,000	6,625,000	5,876,000

JALAP.—It is pointed out that most of the root now seen in the market is of very small size, and the inference is that such quality would not be shipped if there were any bolder root left in Mexico. The stock in New York is said to be unusually small, and so far very little jalap has been sent from the primary shipping ports this season. At auction 39 bags unworked, partly dull and small mixed, partly good bright tubers were shown. The holders require 7d. per lb. for the best, and 6¼d. per lb. for slightly inferior lots, but there was no response.

KOLA sold fairly well at auction, seven packages fair bright washed West Indian realising from 7d. to 7¼d. per lb., while for mouldy kolas from 5¼d. to 6¼d. was paid. For ordinary African 3d. per lb. was refused, and for fair washed Grenada a bid of 5½d. per lb. was also rejected.

Christmas Cards.

A large and varied selection of Raphael Tuck's artistic Christmas Cards may be seen at ADDISON & Co.'s Stationery and Fancy Goods Stores, Mount Road, Madras. These Cards are of the very latest designs, and are very moderately priced.

Any description of PRIVATE CHRISTMAS CARDS made to order. ADDISON & Co.'s facilities for manufacturing Fancy Cards of special shapes and designs are unequalled in Madras.

DIE SINKING & DIE STAMPING.

Crests and mottoes, Address dies, business dies, carefully and correctly engraved and stamping neatly executed in any colour. Copper-plates for visiting cards engraved at short notice.

At Home Cards, Dinner Invitation Cards, Menu Cards, Ball Programmes, Pencils and Tassels, and any description of Society Printing.

STATIONERY AND FANCY GOODS in immense variety.

A large stock of articles suitable for Christmas Presents.

ADDISON & CO.,

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 19th November 1897.

S. E. Wynaad.

PUNDALUR, 10th November.—*Weather.*—Heavy rains on the 2nd, 3rd and 4th instant. Fine bright weather ever since. *Crop.*—Picking has begun, and the ryots are harvesting chamai; the price of grain is still high. *Plant-disease.*—The leaf-disease is disappearing. *Labour.*—Sufficient.

Coorg.

POLLI BETTA, 12th November.—*Weather.*—No rain since last report. Clear, chill days with east wind have alternated, with cloudy still and comparatively warmish days. Yesterday there was a mist over everything, and the day proved a cloudy one. *Crops.*—Gathering proceeding slowly. Crop not ripening up very fast. A lull in the picking in parts. *Plant-diseases.*—Some leaf-disease about, but coffee still looking up. *Public Health.*—On the whole fair.

KITES AND RAIN.

THE marvels of modern engineering never cease; each year brings with it fresh triumphs. But the path that leads to perfection is a long one, and each successive obstacle removed only discloses fresh hindrances that block the way to the goal. Yet the pathway is not impassable, and the powers of science grow with each rebuff, and in the end victory is hers. Thus it seems with the attempts in recent years to produce rain artificially. Despite elaborate trials, they have hitherto failed till quite recently, owing to the faulty methods adopted, *i.e.*, by the explosion of dynamite or gunpowder at high altitudes. Another way has been now discovered, and given to the world by Lieut.-Col. Baudoin in the *Bulletin de la Société des Agriculteurs de France*, and translated in the Journal of the Royal Agricultural Society of England by Sir John Thorold.

It seems to be a curious practice in Chinese India for the citizens in the plains to fly a large number of kites at regular seasons of the year in order to "propitiate the spirit of agriculture." Ridiculous superstition as it may seem, Col. Baudoin did not pass it over with the scorn it would apparently deserve. He noticed that this kite flying was usually followed by beneficial rains an appreciable time before the regular rainy season began, allowing early planting of their ricefields. This set him thinking. Now the configuration of the country is peculiar. French Cochinchina is the south-west of the Chinese Indian peninsula; Annam is the east. A chain of wooded mountains separates the peninsula into two parts. Annam, the eastern part, receives the N. E. monsoon from April to October, formed in the China Sea. The chain of wooded mountains does not allow the clouds to pass over, and the rain falls in Annam till the N. E. winds cease. French Cochinchina, to the west, suffers all this time from absolute drought, but its turn comes when the S. W. blows from October to April, when it gets all the rain, while Annam is absolutely dry. Very similar effects may be annually noted in South India on either side of the Western Ghats. Naturally the rains of either monsoon were greatest on and near the wooded chain of hills.

What the Chinese in the plains were really trying to do, though they knew it not, was to replace the distant mountains by their kites. And very effectual the substitute proved.

To explain this puzzle we must follow Col. Baudoin in his scientific disquisition into the ultimate causes of the above phenomena, which are electrical in their nature.

Round our globe there exists a current of electricity running from east to west. This is called the Great Earth Current. It escapes into the atmosphere by means of the clouds, which are formed by evaporation caused by the current whenever it finds moist points, such as the waves of the sea, or grass, wet with dew, on the earth. The evaporated moisture is in the form of tiny bubbles, which drift together by the action of the wind and form clouds. Thus clouds are always charged with electricity. These clouds float about hither and thither till they meet with conductors in the shape of mountains, or wooded plains (if the clouds are sufficiently low). These conductors draw off the electricity to the earth, and the water bubbles collapse, falling as rain. This is the theory. Now for a convincing laboratory experiment:—

"A glass tube of fine bore is filled with water and the point broken: the water falls in spherical drops. If the tube is placed in contact with the current of electricity generated by a plate-glass machine, the water no longer falls. It is changed into bubbles, and forms a cloud of fine vesicles which can be gathered on a sheet of paper. If the cloud thus formed is directed towards an upright conductor in contact with the earth, and furnished with point, the electricity which draws the cloud returns to the earth, and the water reforms, drops and falls to the ground. Tree produce the same effect."

Ampere's law regarding the formation of hail may be instanced as further explaining the conduct of clouds. Currents of the same direction attract one another, those of an opposite direction repel one another. Contrary currents of wind, one above the other, often exist in our atmosphere. Thus it is that clouds of a certain strata may be moving in an opposite or contrary direction to those above and below it. These clouds, which are all charged with electricity, exert a mutually repulsive action, which tends to raise the uppermost layer of clouds to a very considerable height. When of a certain height, the great fall in atmospheric pressure causes a tendency in part of the water of the uppermost clouds to evaporate. To effect this, it borrows the necessary heat from the remainder, thus so reducing its temperature that some of the water is converted into ice falling through the clouds below by its own weight.

From this theory of the formation of hail by electrical repulsion, we may draw the following practical conclusions:—

"By suppressing one or more intermediate clouds, we remove the cause of the elevation of the highest cloud towards the cooling space.

"By removing the cause, the effect disappears.

"To suppress one or more clouds, we have to withdraw their electricity to cause them to fall as rain. That is what our apparatus, 'the rain-maker,' will do."

The "rain-maker" is merely an apparatus to perform artificially what the mountains do naturally, or even improve on them, *i.e.*, to intercept passing clouds, withdrawing their electricity, and causing them to fall as rain. Such apparatus is to be found in the ordinary kite, or special modifications to suit special circumstances. In a country of great elevation, such as our own Western Ghats for example, it would be sufficient to fly a large kite to reach the clouds. For the plains, however very little above the level of the sea, a special *aërostatic* machine would be required, with sufficient ascensional power to allow of its lifting its cable, when there was no wind.

To test the above theory, certain important experiments have already been made, which we purpose quoting *verbatim*:—

"In 1876, at El Meridji on the frontier of Tunis, a great kite, 3 metres long by 2 metres broad (or 10 feet by 6½ feet), caused a fall of rain each time it was flown. El Meridji is a plateau 850 metres (2,790 feet) high, situated between two groups of mountains—the Bon Kedeia to the west and the Djebel Dyt to the south-east. The distance between the two ridges is about 30 kilometres (19 miles). The clouds pass from Bon Kedeia to Djebel Dyt, leaving the plateau of El Meridji without rain. According to the Arabs, it had not rained for five years. At the first trial a fine rain was obtained from a small cloud; at the second trial also. At the third trial the cloud attacked was turned

into rain, and two other clouds that had already passed gave up their electricity and watered several square kilometres with an abundant rain. The delighted Ouled Deredji sent the experimenters a horse as a present."

More recent experiments were made in 1893 and 1894. In the former year, thanks to the generous assistance of M. M. F. Dreyfus and Boissieu, trials were made at Paris. But Paris, being only 28 metres (92 feet) above the sea level, necessitated the construction of numerous kites capable of supporting a much heavier cable. The last one made was 5 metres long by 4 broad (or 16½ feet by 13 feet). It can reach a length of 2,000 metres (about 1¼ miles) in a strong wind, but not more.

On October 15th, 1894, at five in the evening, a very large cloud, estimated to be about 1,300 metres (4,260 feet) high, came in contact with the kite at Courbevoie. The cloud came down, forming a local fog in the shape of a reversed cone, while near the ground it partially turned to rain. As soon as the kite was lowered, the remainder of the cloud rose and the sky became as before."

As supplementary to the foregoing, it may be of interest to add that "A Monograph on the Mechanics and Equilibrium of Kites," written by the Professor of Meteorology, has just been published by the Weather Bureau of the United States Department of Agriculture at Washington..

* * * *

Thus runs Col. Baudoin's fascinating paper. The practical importance to India of the verification of his theories must strike the most casual reader as stupendous. To control the waste of waters that yearly descend in such fruitless abundance on the mountain ranges that bound the land, so that the most arid plains of Ind would be refreshed at seasonable times with grateful and life-giving showers to lift the curse of famine from the teeming populations of the land, that were a task worthy of the greatest and noblest. To effect such tremendous results, the simple, almost trivial, agency advocated by Col. Baudoin seems ludicrously impossible. Yet science has seen effects perhaps even greater produced by causes as simple.

As a not unimportant unit of the agricultural classes, the practical bearing that the subject has on the planting community is worthy of attention. Drought, long continued and severe, is happily of but rare occurrence. Yet, as the success of coffee plantations, for instance, depends so largely on the timely occurrence of the "blossom-showers," it can be readily recognised by our readers how valuable might prove in practice the French "rain-maker." Situated mostly at a considerable elevation above the sea, and in the direct line of the great march of the clouds, no elaborate apparatus would be required,—a large kite, some 10×6 feet, with twine or fine cord of sufficient strength and length to enable the kite to reach the passing clouds: this completes the outfit. The practical results? Ah, these are scarcely likely to rival in interest the fascination of the theory.

GENERAL NOTES AND ARTICLES.

A South Travancore planter writes Drought: coffee and tea. on the proposed experiments with tea in Mysore: "I fancy the droughts in Mysore will be against it as a tea-producing country. Tea, strange to say, suffers far more from drought down here than coffee does."

Cholera and planters.

The Indian Tea Association has, we understand, recently engaged the services of a Dr. Mulheim in introducing his cholera specific in the coolie depôts. The Doctor has accepted the moderate remuneration offered him, i.e., Rs.150 a month and all his travelling expenses for three months, and proceeds to Gauhati.

The watch as a compass.

It is often highly necessary, especially in the jungle, to be able to find out the points of the compass. Few carry compasses with them. Almost everyone wears a watch. Point the hour hand of the watch in the exact direction of the sun. Due South will be exactly between the hour indicated and 12 on the dial, no matter what the hour of the day may be. Thus if it is four o'clock by the watch, and the hour hand is pointed directly to the sun, due South will be in the direction indicated by the figure two on the dial.

Scientific planting.

Dr. Leather, Agricultural Chemist to the Government of India, has addressed the planters of Northern India through their representative body, the I. T. A., stating that his engagement was about to terminate, and enquiring whether it would be worth his while to commence practice as an Agricultural Chemist in connection with Tea, Indigo, &c. Unluckily, sufficient inducement could not be offered him at the present time, as there is "practically no work for an Agricultural Chemist." No work indeed! Rather should it be said that the necessity for such work is not recognised. Madras the Benighted will soon, we hope, give North India a lead, and a long one, in this matter.

COFFEE, TEA, AND CINCHONA.

THE following extracts from Mr. O'Connor's Trade Review of India in 1896-97 were crowded out of our last few issues, but will be useful for reference.—

COFFEE.

The exports have been as follows:—

	Cwt.		Cwt.
1887-88	273,773	1892-93	296,687
1888-89	365,299	1893-94	278,735
1889-90	239,795	1894-95	281,297
1890-91	233,451	1895-96	290,902
1891-92	311,864	1896-97	210,797

The exports fell to the lowest level known for many years, the result of a scanty crop. The estimates of the present crop are also unfortunately very unfavourable, and the crop of the present year will, it is anticipated, be much worse than that of last year. Brazil, on the other hand, is reported to have a splendid crop, so that the Indian planter will apparently not even have the consolation of high prices with his short crop. In the six years ending 1896-97 the exports of coffee have been on the average 278,380 cwt. annually, while in the five preceding years (1886-87 to 1890-91) the average was 296,555 cwts. The trade therefore does not expand, notwithstanding the encouragement given by the continuance of a high level of prices during the last eight or ten years. According to the figures obtained from the local Governments, the production (which is mainly confined to Mysore, Coorg and Madras) averaged 33·5 million pounds in the decade ending with 1895 and in the same period, the exports averaged 3299 million pounds. The quantity retained for local consumption may, therefore, if the figures of production are correct, be taken at about 580,000 pounds annually, or about 5,200 cwt.

TEA.

The exports of the year exceeded those of 1894-95 by about 8½ million pounds (totalling 148,908,000 lbs.), and the total quantity exported was more than twice as large as the quantity exported twelve years ago:—

1891-92 ... lbs.	120,149,000	1894-95 ... lbs.	129,099,000
1892-93	114,722,000	1895-96	137,710,000
1893-94	126,332,000	1896-97	148,908,000

An increase of 8½ million pounds in 1895-96 was followed last year by another increase of 11½ million pounds. It is estimated that the production of tea in the present year is from 8 to 9 million pounds in excess of the production of last year . . . The decline in prices which occurred in 1895-96 was followed by a further fall last year and prices approximated (except as regards the comparatively limited quantity of orange pekoe) to the range of prices of 1891-92.

The exports were distributed as follows in pounds (100's omitted):—

To	1895-95	1895-96	1896-97
United Kingdom	118,417	123,947	135,457
Australia	4,872	6,775	6,156
Persia	3,173	3,188	1,994
Turkey in Asia	1,396	1,356	1,981
United States	228	581	785
Canada	317	408	823
Russia in Asia	44	486	422

The bulk of the tea was as usual shipped to the United Kingdom, about 91 per cent. of the whole having been sent thither, an even larger proportion than in 1895-96 (90 per cent). The exports to Australia were not maintained on the level of 1895-96, and there was also a marked decline in the exports to Persia and Russia. The trade in tea with these two countries is chiefly carried on from Bombay, and the epidemic in that city sufficiently accounts for the reduction. As a set-off, it is satisfactory to note the continued success which has attended the efforts made by the Indian Tea Association to develop the trade with the United States and Canada, about 1,600,000 lbs. having been shipped thither last year. Both these countries also receive a fairly large quantity of Indian tea through the United Kingdom, the exports thence being:—

To	1895	1896
United States, lbs.	908,743	902,619
Canada	823,207	905,597

So that the total consumption in both countries now approximates to 3½ million pounds. There is, however, manifestly room for at least a tenfold expansion of the trade even now, with indefinite possibilities of further expansion hereafter, and doubtless the Indian Tea Association are alive to the expediency of continuing their efforts to promote the trade. Since 1884 the imports of Indian tea (into the English market) have more than doubled; the imports of Ceylon tea have reached nearly 95 million pounds from the small beginning of 1884, when coffee was being supplanted in the island by tea; and the imports of China tea are less than one-fourth what they were in 1884. It was confidently stated before the closure of the Indian Mints in 1893 that that event would enable China to recover her supremacy in the tea market, and the prediction has even been hazarded since by some very rash prophets (not, however, in India). These figures furnish a singularly conclusive refutation of such assertions. In 1884 China was sending to the English market more than twice as much tea as India and Ceylon combined: in 1896 India and Ceylon sent to England more than six times as much tea as China. And the decline in the importation of China tea has been as great and rapid since 1893 as before. Messrs. Gow, Wilson, and Stanton state that the consumption of tea in the United Kingdom in 1896 was: Indian 54 per cent., Ceylon 35 per cent., China 9 per cent., other kinds 2 per cent. The places of shipment of Indian tea are:

From	1894-95. lbs.	1895-96. lbs.	1896-97. lbs.
Bengal	123,000,733	130,495,190	143,235,822
Bombay	2,828,746	3,940,295	2,413,247
Sind	1,067,359	674,795	505,344
Madras	2,149,006	2,510,059	2,690,027
Burma	53,472	89,866	64,021
Total	129,099,316	137,710,205	148,908,461

There is also a small export from Travancore and Cochin. The considerable decline in Bombay was due, as already stated, to the epidemic of plague which dislocated business, while quarantine regulations in Russia treated even tea as a suspected or susceptible

article. Here it may be mentioned that the export of tea seed from Bengal, mainly to Ceylon, has been in the last two years as follows

	Cwt.	Rx.		Cwt.	Rx.
1895-96 ...	3,232	35,985	1896-97 ...	4,173	52,825

CINCHONA.

The trade in cinchona bark, which at one time seemed to present a brilliant prospect of development, has dwindled almost to vanishing point, the exports last year (321,478 lbs.) being less than a third of the trade of 1895-96 and less than a tenth of the trade of seven years ago. The cinchona tree is now in fact hardly grown except by the Government which manufactures all the bark produced into alkaloids and the sulphate of quinine for use in India. Planters who took up the cultivation, some fifteen or twenty years ago in the hope of making large profits have been greatly disappointed, and in most cases the trees have been uprooted to make way for tea or coffee. The trade will go on with fluctuations for some years to come perhaps, but there is no appearance now that it will assume any importance. It would seem that, at the present low level of prices for these drugs, the Indian bark cannot compete in Europe with bark from Peru or the countries where the tree is now grown, and that the bark we grow cannot be profitably used (unless there should be a radical change in existing conditions) except for manufacture for Indian consumption.

COFFEE.

Maragogipe hybrids.

A Nilgiri planter draws attention to the good effects of hybridisation

He writes: "I was much struck with the good outturn of last season's coffee from one of my places, and pleased with the large proportion of A. A. size. I attribute it to my having some years ago filled up the vacancies with Hybrid Maragogipe plants. The neighbouring plants seem to have been 'inoculated,' so to speak. I have a field of 5 acres of them just coming on. They are remarkably healthy and free from disease. There is no doubt about it: we have gone on too long planting Arabica, and the introduction of a fresh strain is desirable."

The Market.

At the Dutch sale, on Tuesday, prices showed a decided irregularity. The *P. M. Review* of 16th ultimo, the lower grade being from ½ to 1 per cent. cheaper, while the better one sold at a similar advance. Here there has been little change to note; the absence of fresh arrivals in any quantity makes it almost impossible to expect a large business, while the demand having shown a decided falling off has tended still further to make a quiet market. Little beyond Colombian has again been brought to auction, while the better qualities have fetched full or rather dearer rates, the lower one having sold at a slight decline. Privately, with the exception of a few sales of Costa Rica and East India, only a small business has been done. The reports of the next crop of the latter are so bad that some holders are not at all anxious to sell, feeling sure of a higher market even when the new crop begins to arrive. Mocha continues neglected.

COFFEE SHADE TREE.

Sun-dried *Erythrina lithosperma* loppings, &c., contain per ton:—

61.50 lbs. of Nitrogen, 57.38 lbs. of Potash, 14.92 lbs. of Lime, and 13.68 lbs. of Phosphoric Acid.

Orders should be booked early for the coming crop of seed from the parent trees of the above analysis at Rs. 6 per pound containing about 2,000 seeds. Germination guaranteed.

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE, SHENCOTTAH.

the stocks being too large for the limited trade that is done in this kind. In the terminal market there has been no new feature, but prices have tended downwards.

ASSIMILABLE NITROGEN AND LEAF DISEASE.

THE following papers are in continuation of the series by "Nitrogen" published under this heading last year, to which we then gave deserved prominence. The delay in publishing this second part was due to the enforced absence of the author from India, due to severe illness. Regrettable though this break in continuity may be, yet the matter treated is of such vital importance to the industry that the subject has lost no jot of its original interest.

We may mention that the problem to be solved is the unravelling of the relations of the soil conditions to the presence of leaf disease in the plant, which unravelling in effect is a treatise on the most scientific cultivation of the shrub that has yet been attempted. We would ask our unscientific readers not to allow themselves to be scared by the more or less scientific language used. For the main facts of the arguments can be easily grasped by any one who studies the question with ordinary care.

In conclusion, we can safely assert that the conclusions arrived at have been proved in practice to be irresistibly sound.

Your issue of the 18th September last contains a letter by the pen of "M.," which strikes the key-note of a subject (in which I have already written in this paper) which was laid before Professor Dunstan. The subject, I mean, of the occurrence of leaf disease arising from either the extreme malformation of the Proteids in the coffee tree, or from the fact that the formation of these bodies within the plant (certainly when cropping) was not at a sufficient rate to both feed the plant and the seed. In other words, that the parent tree was drained in its system by a progeny which required some 10% to 15% of these valuable bodies to form themselves, that this drain of these extremely essential materials was going on throughout the tree, while the parent was unable to form them at sufficient pace to enable it to keep up its own health or strength.

Coffee soils difficult to form Nitric Acid.

In short, whether the tree was producing seed or not, it was able to be shown by analyses of coffee soils from four districts, a distinct peculiarity in their inability to form Nitric Acid—a digestible nitrogen which should have then formed for the plant its Proteids, caused by interesting lack of soil oxidation.

Proteid or Nitrogen bodies largely absent in diseased coffee trees.

It was able by analysis to point out the great want of these soluble, and therefore active, Nitrogen bodies in the diseased plant, that these materials which form such a large proportion of the whole tree were at least four times more absent in the diseased to the healthy tree, and yet they must be essentially the strength-givers to vegetation.

Nitric Acid artificially given can completely cure disease.

Further, it was pointed out that the application artificially of that Nitric Acid to these soils, so slow themselves in forming it naturally, had the power of keeping off disease absolutely—not partially.

The following were also pointed out:—

(1) That disease distinctly seemed traceable as coming on those soils least able to form Nitric Acid, and once come, hung longest to those soils slowest to form it afresh.

(2) That in the wet season, and also in the very dry season, precisely the two times of the year when Nitric Acid would be least at the roots, disease was worst.

(3) That three symptoms of vegetation poor in Nitrogen attended the tree before and during disease attack.

(4) Last, yet hardly least, that the coffee tree had to withstand a drain on itself of a crop which was composed of some 15% or more nitrogenous bodies.

The exceedingly high lack of oxidation of the soils, and therefore the non or poor formation of Nitric Acid within them, was noted by the Professor, and the ensuing lack of Nitrogen bodies in the diseased tree was noted also, and on questioning me whether giving that Nitric Acid to the plant disease was cured or kept off, the answer was able to be given that it was possible to keep it off entirely with it, under conditions, but that those several conditions were so often wanting that it made results exceedingly variable, but the quite complete cure for a whole year and more to an estate (even bearing 5 cwt. per acre) was effected by giving this in the form of Nitrate of Soda alone. May I say that Professor Dunstan on seeing these very effective analyses of the soils wished me to see Professor Voelcker on the subject. I now regret that time at that moment prevented my doing so.

Theory and practice.

If those foregoing four points enumerated are correct (and I am sure they can each be followed out and proved so), i.e., that the time when Nitric Acid is least present at the roots is the time for leaf-disease appearance—that it is traceable as appearing worst on those soils least able to form it, and also that there are three symptoms in the plant one cannot associate with vegetation rich in nitrogen, then it makes the analysis of the diseased plant and of the soils bearing out this lack of Nitrogen, in their own particular way, the more interesting,—the practical bearing out the theoretical—also perhaps it is not sufficient to see on analyses a lack of or even a big lack of Nitrogen in the soil and diseased plant as totally proving the case. One wants to see or have it backed up in other ways, and it makes one question why this Nitric Acid placed on the soils artificially has such very varying results. These varying results, sometimes a complete failure, I do not wish to refer here to, except to say that the good result must inevitably much depend on the good or better amount of oxidation of these low oxide soils—also in suitable conditions of rainfall after application, but other things must come in also to spoil or at any rate minify the good chances of Nitrate of Soda or of Potash or other organic Nitrogen application, but especially this low form of soil oxidation must mitigate against the success, as can be proved—success nearly proportionate to soil oxidation, it is thought, whether forced or natural oxidation.

Nitric Acid the only source practically of coffee tree's Nitrogen.

I am convinced, Mr. Editor, that coffee to-day has one continual struggle for its Nitrogen (whatever was the case in former days, and on this matter Professor Oliver will not, I think, object to publishing an interesting letter to me closely bearing on this subject), but it is possible to show how extremely difficult, how exceptionally averse these soils are to

present this Nitrogen to the plant as Nitric Acid, and yet this oxidation of organic matter in the soils causing that formation of this assimilable Nitrogen (Nitric Acid) will be acknowledged the source of the coffee tree's nutrition in nitrogen, without going into any arguments about coffee taking its Nitrogen elsewhere (by ammonia through leaves or by the 5 lbs. Nitrogen per acre by rainfall or by what happens in *open healthy soils, i.e., ammonia of air entering and attaching itself to the various bases to form nitrates*); but accepting organic matter as the source for the coffee tree's Nitrogen, yet, not till it has received that oxidation to decay it and form this Nitric Acid. This is the important point: organic matter as food is useless till oxidised and Nitric Acid produced.

Coffee tree needing more active soil than jungle growth.

This soil aversion, however, is felt by only one of the points which produces this lack of Proteids although a strong one, since the extremely limited sphere of action of the coffee roots, feeding on such a small area, will immediately suggest to one that a far more active soil in forming its soluble foods is required than the forest trees whose roots ramify to great distances and great depths, where a slow-acting, even acid soil, is sufficiently rapid for them. But here in coffee, especially where these tropical downpours have to be reckoned with, taking down most rapidly this slow-forming Nitric Acid below this surface feeder, it will be admitted a rapid oxidation of organic matter is incomparably more necessary for such a feeder than jungle growth, and again if the coffee should happen to be in the open and not under shade, a still further again more active soil would be required to keep pace in the freeing of its constituents on account of the extra draught upon it caused by the much enhanced quicker growth. This is found in practice to be so by the increased amount of tillage, etc., and the more necessity or necessity of quick-acting manures on estates in the open over those under shade. Where tropical rains attack a soil in so thoroughly carrying this fugitive Nitric Acid below the roots, it is I think obviously a necessity that this organic matter should again rapidly form this, and the more heavy and more continued the rainfall, then the more necessity for a soil in a more rapid state of decay; in other words oxidation. This, however, can be shown, I think, as not the case—the heavy organic matter soils of the wet districts seem far the least capable of forming it, notwithstanding their large reserve of Nitrogen.

Soil activity or oxidation.

It will admittedly be that a soil having six times the amount of oxygen passing through it has practically six times the fertility of another soil (of something of the same composition) which has not this oxygen passing through it, *i.e., six times the amount of mineral and organic foods are set free by this acid*. In the laboratory, Hydrochloric Acid may be formed on to a soil and certain constituents *pulled out* (unnaturally) from the insoluble portions of the soil and one, by that analysis, is able to say that there are so many tons of Phosphoric Acid per acre, so many tons of Potash, etc., etc., per acre in a one-foot soil which only require oxygen (this acid which in nature takes the place of Hydrochloric Acid in the laboratory) to pour through the soil as rapidly as possible and free these as plant food, *i.e., decay the soil in its mineral matters and organic, that pulled out by Hydrochloric representing more a part of that enormous soil reserve than that which is actually ready as plant food*.

Analyses of coffee soils proving difficulty of oxidation or activity.

One *does* require to know, therefore, are these constituents being freed by the action of oxygen, or is the soil lying in an inert state? Analyses are able to be produced from the various coffee districts which strongly go into this matter of soil oxidation—into this life of the soil—into its naturally freeing itself and becoming active by means of oxygen, and they prove that they have the very greatest difficulty to perform this soil duty even when the soils are given the most exceptional and unnatural opportunities to do so.

Lack of oxidation, more effect on Nitric Acid than mineral matter.

It effects the mineral matters of course seriously, but cannot touch the ill-effects the lack of oxidation has on soil Nitric Acid. This lack of oxidation (1) prevents it forming; (2) may also dispel it; (3) and further actually aid its loss in rainfall, and yet this is the assimilable nitrogen of coffee which should have gone to form the Proteids! Reasons given with analyses for the three ways this lack of oxygen illy affects Nitric Acid.

Noticeable fact in Nature. Lack of oxidation by wet, causing distress, disenable tree with stand drought.

Notice how on the coffee soils where water on flattish land, especially if in a basin, giving an extra lack of oxygen (since water fills the soil pores) and therefore lack of Nitric Acid—this wet place is the first to feel drought, and yet Nitric Acid if it had been there would have been THE THING to have pulled it through the drought—this power of Nitrogen keeping vegetation moist and in growth in dry weather every one knows, but there is one case in point, the extra lack of oxygen having those hindering influences on Nitric Acid. This lack of oxydation according to these detailed analyses runs through the coffee soils of S. India at any rate, extremely strongly, but that case of a thoroughly wet soil is an exaggerated case in not having this Nitric Acid, but still these analyses are capable of showing the extremest and interesting lack of oxidation and therefore of Nitric Acid when it is afforded to them in an unnatural way in quantity to them; yet oxygen must be the life of this Nitric Acid and preserver of it also, too.

Difficulty of oxidation observable in Nature.

But this difficulty of these soils to oxidise is observable, too, in Nature, if the length of time some of these yellow ferrous silicates turned up from a sub-soil or from a cutting take to turn to their red or ferric state. Admittedly I think this change in colour often needs months, but it bears out precisely what analyses of these soils are also able to show in a very strong way, and then this reflects in an adverse manner on the foods, organic and mineral set free, but far most chiefly on the essential Nitric Acid which it affects in so many ways. State of sub-soils must have a great deal to say to the non-reappearance of Nitric Acid after rainfall has carried it below the roots, but returning to the point both analysis and nature are able to point out the length of time and quantity of air it is necessary to pour on a coffee soil before oxidation takes place, and through the kindness of a planter friend I wish to bring certain analyses forward later to prove the points.

I should like to bring forward here two soils—one where naturally everything went to promote oxidation, the other where everything went against it, and notice the results.

Entire prevention of disease a whole year with 2 oz. only Nitrate of Soda. Estate formerly victim of disease.

The first one, the healthy one, is that briefly alluded to before the complete stoppage of disease by application of Nitric Acid in the simple form of Nitrate of Soda. Two ounces only of this Nitric and Soda were given to each tree, and the trees were carrying a 4 cwt. to 5 cwt. crop, yet with that simple manure and small dose, there was not, I think, a trace of disease throughout the estate, where formerly this estate had had these annual and periodic visitations of Hemeleia Vastatrix, as the manager remarked "eaten up" with leaf disease. This application of manure, however, had a remarkable power of lasting and preserving a healthy, vigorous and nitrogenous look upon those trees decidedly over a year, and allowed those trees not only to mature all their crop, but placed on a large healthy wood growth for the ensuing season.

It is interesting to notice also that on that part of the estate where a higher oxidation was forced upon that soil by means of a previous application of Carbonate of Lime, the effect of that Nitrate of Soda application outlived the rest of the estate by some three or four months, showing therefore that where a higher soil oxidation is procured, then the soil has much better retaining powers for this Nitric Acid in these tropical rains, or in that other precarious time for Nitric Acid, *i.e., prolonged dry weather*.

Exceptional oxidation of soil.

The soil of this especial estate is one which cannot be called like the run of the ordinary coffee soils of some of the other districts or even of some of this. Fairly light in organic matter, but in the surface soil there is a large admixture of sand with the clay, giving it in that way an enormous help to an extra aeration. In the sub-soil it is a mass of large and also minute stones, showing more stone than soil and coming up to within a short distance of the

Advertisers are notified to send all advertisement matter and answers to advertisements direct to Manager, this paper, 3, Esplanade Row, Madras.

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

surface soil, exactly the very soil therefore by this extra natural drainage which gave it better health and condition, giving it precisely what was wanted for a Nitrate application. It should be again remarked that this soil seemed to have exceptional natural facilities for drainage, therefore oxidation, therefore stronger powers of retention. On taking up the surface soil, this organic matter, &c., seemed exceptionally rich in sand, and there was a large sprinkling of stones throughout the surface soil.

Porous sub-soil. The sub-soil is nothing but a mass of stones of various sizes. While referring again to the surface soil, as the owner remarked, there is not a place over the whole estate that the actual surface soil has more than a foot and a half of depth, generally a foot, before it is met by what might be called sub-soil; in other words, a far still larger mass of stones. I am certain if this soil were analysed, a far higher state of oxidation and health and therefore retaining Nitric Acid power would be found existing in this soil.

It is true that this estate before shade was planted suffered severely from drought, but this is not the point, the point being that such a small application of Nitrates on this healthier soil *entirely* prevented, and especially so on that part of the estate where a further oxidation was forced upon the soil by means of Lime Carbonate.

Nitrate of Soda less used on un-healthy soil. Here is a case, therefore, in which, giving to a soil that Nitric Acid, it failed to form (in any quantity) naturally, that disease is entirely kept off, but every planter in using Nitrates or a quick-acting organic manure has noticed the same power of averting and even curing disease by this means, but it must be maintained that *health* of the soil before a Nitrate application has enormously (almost everything) to do with the success or non-success in averting or curing disease.

Not the least interesting part is it to notice that where that higher oxidation was enabled by the use of Lime Carbonate at a previous period, there this Nitrate had best and most lasting effect.

I am able to vouch that where these points have been looked to, *i.e.*, the helping of these somewhat obstinate soils, in the formation of their oxides and Nitrates, (in other words oxidation and nitrification,) by means of really frequent tillage and drainage, and also in giving frequent applications of a rapidly Nitric-giving manure, *then* the results may be seen to be rather over $\frac{1}{2}$ ton per acre off the whole estate in a succession of three years at *least*. But with all this, bearing the great point to be observed, is that leaf disease is non-existent. While again on a certain twelve-acre stock considerably over this amount has been produced—one year 17 cwts. per acre. [To reassure doubting spirits, we (Editor) are authorised to state that all genuine enquiries will be welcomed, and chapter and verse given for the above statements.—Ed.] followed up the next year by 11 cwts. per acre, and yet with that drain upon the plant of this crop, the block is to all intents and purposes free of disease. Although attention is given to mineral constituents, the chief aim is in giving this Nitrogen in assimilable form and placing the soil into a condition capable of better retaining this fugitive Nitric Acid, for on the better health of a soil must depend its greater retaining powers.

A Mysore soil least able to form Nitric Acid. I do not wish to more than just touch on a soil here, far the most interesting of the lot which were analysed, which exhibited the strangest reluctance to form this assimilable nitrogen. Interesting as the others were in showing a distinct perversity to perform this soil duty, a Mysore soil outstripped the others in its difficulty to form this constituent in both the amount and also rate the others could do it in, notwithstanding it had some 23% of organic matter and combined in that organic matter some 540% Nitrogen, an amount of the latter equalling some 30,000 lbs. Nitrogen per 18-inch soil per acre.

Wet district need-active soil. The importance or absolute necessity, (certainly for a surface feeder) will be recognised of a soil situated in a district with the heaviest of tropical rains, of rapidly forming this valuable but fugitive Nitric Acid again. For after it has been so completely successfully taken below the roots, quicker to is felt by these inches of rain a day than could possibly allow the roots of vegetation a chance to appropriate it, then a soil *must* or should (it is distinctly obvious) be able to form its organic matter rapidly in the short spells of fine weather which that district may get and once more give a chance to vegetation to renew itself, which either its own growth or influence of seed upon that vegetation will require its presence in the plant.

Above soil believed typical.

This highly organic matter soil of Mysore, I believe, is thoroughly typical of such soils pertaining to wet district. As often as not it is a noticeable fact, I think, that very high soils very rich in organic matter are more generally found where there is heavy rainfall, and especially often happen to overlay clays (*i.e.*, the oxidation or decay of organic matter on an open sandy soil takes place quicker on soil with extra good drainage). But to cut short any arguments here, for it is useless to discuss it at length without analysis, there was the strongest of evidences that this soil, notwithstanding its large amount of organic matter, was the soil far the least able to form its assimilable Nitrogen. While the other soils, much poorer in organic matter, which showed a far greater porosity, were quickly able to recuperate themselves after wet weather, and afford to plant life that necessity of necessities: Nitric Acid. Having such large amounts of organic matter, Nitrogen has nothing to do with the case; but if (as Storer it is I think says) a soil's fertility can be almost reckoned by its amount of Nitrogen, this fertility must depend (1) on the amount of reserve Nitrogen at soil's back, (2) on the rate the soil is able to form Nitric Acid, (3) or the power of its retaining it in wet weather.

Bacteria effects. I have already gone further than intended on this soil's peculiarities, but must state that if the destruction, oxidation, or decay of organic matter had been going on by the work of the soil bacteria, these, emanating from the bodies of these bacteria as the result of their feeding upon this organic matter, *should* be found Nitric and Carbonic Acids. Yet, although this heavy humus soil one would naturally expect to show *most* of these decay products because of its large amounts of organic matter, it is really the one to show them *least*! While the healthier open Pulney soil shows that these bacteria are far more busy.

Cause and effect shown in soil. Further, the reason why this important work is not going on in the soil is also shown in its analysis. Firstly, its high organic matter gave it actually ten times the water-holding power of some of the other soils. Secondly, and partly by the result of its high water-holding powers, it had large quantities of low oxides of iron. Useful as a soil is which is capable of holding water, yet when it is held to excess, hindering by its means the access of oxygen to the soil (and especially if this organic matter is associated with much low iron oxides like the Mysore one), then it is obvious how a soil can be most seriously hindered from working. The details of this analysis show both cause and effect.

Suspicious of Soluble Ferrous Sulphate. I will go further than this about this soil and state that this soil with these very high amounts of organic matter and high amounts of low iron oxides and high water-holding power showed by these every suspicion that decay, destruction, oxidation, or whatever one calls it, was being arrested by the presence of an antiseptic or preservative Sulphate of Iron (Ferrous Sulphate),—a very soluble low oxide salt of iron, which causes acidity, as this soil showed.

Injurious effect in Nitric Acid and Bacteria. This very soluble salt, because of its solubility (and therefore power of being carried from surface soils to lower soils and lower soils to surface soils according to state of weather) would mean death to bacteria, death to formation of Nitric Acid, and death to what little Nitric Acid forms.

I am aware one must not over-state the case, but say that the strongest suspicions exist for saying traces, perhaps faint traces, of this objectionable salt were apparent. It is a pity it was not analysed I feel every confidence that a soil so high in organic matter, so high in low iron oxides, so high in water-holding power would have shown this as existing.

One knows how this very same salt which is here suggested as present in this Mysore soil, and many others is usefully used in cholera and other disease-infected places to kill on soils bacteria or germs of disease; this I believe will be often found present in the coffee soils, as then *very frequent* acidity suggests, especially so the lying ill-drained ones under heavy shade, unable to relieve themselves at any

Advertisers are notified to send all advertisement matter and answers to advertisements direct to Manager, this paper, 3, Esplanade Row, Madras.

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

rate quickly of their excess moisture. It may be risky to say so, but I believe full 90% of the heavy organic matter soils will be found with traces of acidity showing at any rate lack of oxidation and therefore non-presence or poor presence of Nitric Acid, a soil slow acting like this and holding such quantities of water, eminently suited for jungle growth but scarcely suitable (till a quicker oxidation takes place) for a shrub like coffee, feeding on a surface soil and in a very limited area of food.

Finally, I do not wish to say that many of the coffee soils even have this soluble ferrous sulphate, although five out of seven analysed soils from the various districts showed acidity. Because so much must depend for its formation on configuration of land, depth of organic matter, depth of sub-soil from surface, porosity of surface and sub-soil especially, whether near much water or in a wet district or one with much humidity in atmosphere. But I do wish to insist that there is generally extreme perversity of the coffee soils of S. India at least to form and also preserve Nitric Acid. I regret being so emphatic on this. But when one knows how very reluctant, or actually stubborn, such soils have shown themselves even when artificially aerated in a way soil would never actually be subjected to in nature, and also when one is able to perceive in nature after three or four days heavy rain, a plant loses all semblance of a nitrogenous look about it within a fortnight of that fall, *then I do feel*, with that nature showing it, with those analyses most strongly proving it, it is allowable to be emphatic on the Nitric Acid powers of a soil, that is to say in the way it can form and retain it.

Voelcker as witness.

It will be noticed in Professor Voelcker's analysis of three Munjerabad soils that fertility is dependant on the *proportion* the ferrous is to ferric; in other words, practically speaking, the rate and amount of oxygen which is pouring through the soil again; in other words, the rate Nitric Acid is formed, and what must inevitably follow, the power it has of being retained in the soil by this better oxidation.

The chain of argument.

The chain of argument seems to me complete in every way. Even without recourse to analysis of the diseased plant to show this lack of nitrogen, and without recourse to the soils to demonstrate its absence there also, we can see from Nature herself: (1) That Nitric Acid under certain, perhaps exceptional, conditions can stove off and even wipe out leaf-disease. (2) That the three precursory symptoms of disease are purely and solely non-nitrogenous ones. (3) That the disease is traceable as belonging to those soils which one may safely prejudge as being poor in the formation of Nitric Acid. (4) That disease appears at those two very times of the year when Nitric Acid is least appropriable by the roots—i.e., extremes in dry or wet weather.

I signed myself in a previous communication on this subject as "Nitrogen," but here give what I feel is a truer nom-de-plume, i.e.,

NITRIC ACID.

(To be continued.)

TEA.

American consumption of tea.

After a long period of stagnation in the *per capita* consumption of tea in the United States, we are greatly pleased to note that during the year ending 30th June 1897 a very satisfactory improvement was noticeable. The consumption was 112,900,000, showing an increase of 19½ millions over 1896, or nearly 20%.

South Indian statistics.

We observe that Messrs. Gow, Wilson and Stanton have written to the Indian Tea Association, pointing out that the crop estimates furnished by this body did not include figures from Travancore and Nilgiris. They stated that it would be an advantage to the trade generally if estimates and figures for the whole of India could be given. The I. T. A. have addressed the Central Travancore Association on this matter.

In their Monthly Report, dated London, 15th October 1897, Messrs. Arbuthnot and Co. write:—

South Indians.

There was a considerable decrease in the quantity catalogued compared with August, only 1,601 pkgs. having passed the hammer *versus* 5,131 pkgs., though the average was the same, viz., 6½d. per lb. The Travancores offered were, as a rule, of rather indifferent quality, and some of the results were in consequence poor. Where, however, planters had been able to send teas with colory liquor, there was good bidding and quotations were more satisfactory, among the best shipments being those from Arnakel, Balamore and Teafield. Arrivals from the other districts were unimportant, and call for no special notice.

The Market.

INDIANS.—Although the supply has been larger than in the preceding weeks, writes the *P. M. Review* of 16th October, the market has shown a decidedly firmer tendency, and occasional advances have been established. The teas most affected are the lower and good medium descriptions, especially the former, which have in many cases advanced ¼d. The supply of clean sweet Teas is very limited under 5½d., and at present there does not appear to be any probability of its increasing. The medium grades are also difficult to obtain at former prices. The trade are taking them freely at current rates, especially the Sylhet and Dooars teas, which now show useful quality. So long as there is no further upward movement in values, a good business will no doubt continue, as prices appear to be on a safe level to hold good working stocks. The next higher descriptions, ranging between 9d. and 1s., show no material change, as there is an ample supply to meet the prevailing demand, although the quality generally is not up to the earlier standard, Assam kinds particularly being deficient in this respect, while most of the Darjeeling growths show a falling off as compared with those offered a week or two ago. The finest kinds are not so plentifully offered as formerly, consequently values are firm and somewhat higher. At the public sales 53,156 packages were brought forward, of which 5,950 were withdrawn. The bidding was active for all good descriptions, and the market closed generally firm.

CEYLONS.—The continued scarcity in the supply of Ceylon teas keeps prices at a high level, and in no instance has there been any decline from last week's rates, while a further advance was in many cases noticeable, more particularly in the good medium kinds. Fine and common teas are equally in request and a strong demand prevails, the bidding having been very active for the small quantities available at the sales. The public auctions comprised 16,893 packages, nearly all of which were disposed of at firm to higher rates. Shipments from Colombo to the United Kingdom to the 21st September were 72,561,369 lbs., as against 68,251,012 lbs. during the same period last year.

DISTRICT ASSOCIATIONS.

SHEVAROY.

PROCEEDINGS of the Annual General Meeting of the Shevaroy Planters' Association, held in the Victoria Rooms, Yercaud, on Monday, October 4th, 1897, at 1 P.M. PRESENT:—Messrs. S. M. Hight, W. W. Hight, C. D. Ricketts, T. B. Nicholson, W. Rahm, Dickins, E. H. King-Harman, Revs. J. M. Kempf, M. Andersen, Messrs. S. M. Pritchard, S. Campbell, R. Gompertz, C. Ram, Junr., C. Iarge, C. Dickins, C. G. Lechler (*Chairman*), H. W. Leeming (*Honorary Secretary*).

1. Notice calling the Meeting was taken as read.

2. Read and recorded, for future reference, correspondence re the proposal to charge a commission on Currency Notes presented for cashment at the Yercaud Sub-Treasury.

3. Read letter, dated 29th September, 1897, from Mr. C. D. Ricketts, complaining that one of his cases had been struck off the file of the Second Class Magistrate's Court at Yercaud without his knowledge.

Resolved "that this, also complaints from Messrs. King-Harman, Leeming, T. B. Nicholson, and the Rev. M. Andersen, as well as any others, should be sent in, in writing, to the Honorary Secretary, to be forwarded to the Collector of the District."

4. Read letter, dated September 20th, 1897, from the Secretary, U.P.A.S.I., asking what sum this Association is prepared to subscribe towards defraying the salary of an Agricultural Chemist, &c.

Resolved "that the Honorary Secretary be requested to circulate this letter, and to ascertain the amount Members are willing to contribute towards the above, as well as the number of analyses they will require for a period of three or five years."

5. Confirmation, or otherwise of the Committee's Proceedings for the past quarter.

The Meeting, unanimously, approved of the above.

6. The Honorary Secretary then brought forward the Annual Report and accounts as follows:—

R. CHAIRMAN AND GENTLEMEN,

I have the pleasure to lay before you my third Annual Report and accounts. From the latter you will observe that the year closes with a credit balance of Rs.176 to the Police Reward Fund and of Rs.450-15-9 to general account [besides a sum of over Rs.800 remitted by us to the Reserve Fund of the U.P.A.S.I.], after deducting the arrears in subscriptions amounting to Rs.30, as well as Rs.65, which will have to be paid to the Forest Department when the Bamboo Pass Books, in issue, are returned. Under these circumstances, it would be quite feasible to reduce the subscriptions by 50% and yet leave more than enough for all practical purposes. However, I should not, personally, recommend such a course, as the number of Members may vary at any time, and it would not be expedient to lower the rates for the present only to raise them on some future occasion. The rapid strides in Agricultural Science render it imperative that Planters should keep abreast of new times, and this can only be done by their having ready access to some of the more important works on the subject. For this purpose, I would suggest that any surplus should be devoted towards purchasing Books, Pamphlets, &c., with a view to forming the nucleus of a Planting Library. I, also, think that, when funds allow, exhaustive analyses of soils from various parts of the Shevaroy should be undertaken at the expense of the Association for the benefit of its Members. The state of the Finances can be considered satisfactory when it is noted that the expenditure, under some heads, has increased—that for Postage being one of the principal items. The rule hitherto has been to circulate the Proceedings, &c., by the Peon; but owing to the larger number of members and to the great distances apart at which many live, I have found it absolutely impossible to continue the former arrangement and have been obliged to adopt the method of sending notices, &c., by Post—which, besides expediting business, ensures Members receiving communications about the same time, and thus enables all to have

ample leisure to think over the various points that are to be discussed before a meeting is held. The Peon, however, has his time fully occupied in taking round the Subscription Book and Papers each month. The year commenced with 29 and closes with 35 Ordinary and 4 Honorary Members [*viz.*:—The Collector, the Superintendent of Police, the Forest Officer and the Executive Engineer of the Salem District]. During this period 13 joined and 7 have resigned without stating any reasons for so doing—six out of this number being members of one family and the seventh a Superintendent in their employ. This, I think you will agree, is a course to be much regretted, as it might, in the eyes of the Public, cast some stigma on the Committee and the Honorary Secretary, who have, I assure you, had the interests of each individual Member at heart, and who have been only too glad to receive fair and open criticism as well as any suggestions that might increase the usefulness and popularity of the Association.

The past year has witnessed some changes in the internal economy of the Association. The old system of Committee Meetings each month has been re-introduced with the improvement of a Quarterly instead of an Annual General Meeting of Members. Judging from the attendance at all meetings, and the way in which business has been accelerated, it cannot be doubted that the departure has proved entirely beneficial. On the initiative of Mr. C. G. Lechler, the first dinner of the Shevaroy Planters took place about the middle of October last, and its success has caused it to become an annual occurrence. Another novelty has been that of the quarterly breakfasts which were started in hopes of drawing Planters together and getting them to take a more friendly interest in each other's work, so that eventually it may be possible to regulate wages, advances, cost of contract works, &c., to a certain extent—these being points that most certainly should and could be agreed upon to the satisfaction and lasting benefit of the whole community.

Through the courtesy of the Deputy Tahsildar, who has regularly favoured me with a notice stating the days on which the kutcherry would be open each month, I have been enabled to circulate this information to all Members, and I trust it has been found a boon, especially by those who live some miles from the Station.

It will be unnecessary for me to do more than touch upon a few of the important matters of business transacted during the past year. The idea of trying to establish a Coffee Association, under the control of the U.P.A.S.I., somewhat on the same lines as the Indian Tea Association, in order to increase the consumption of Indian Coffee by advertising, &c., has been allowed to stand over for the present, as it was thought inexpedient to push the matter further in view of the efforts now being made by a large number of Planters to mitigate the very serious injury being done by Green Bug, and also to procure the services of an Agricultural Chemist to check and to prevent, if possible, the ravages caused by Leaf Disease. This project, however, will not be lost sight of when the time is ripe to bring it forward again.

A Special Meeting was held in January last to start, with the help and sanction of Government, a Fund for the construction and repair of all Public Roads and Rights-of-way other than those which are already kept up by the District and Taluk Boards. The object is purely one of self-help, and though Government did not accept our proposals in their entirety, we were referred to the Collector who, I am convinced, will assist us with funds wherever practicable, and I think our hearty thanks are due to this gentleman (Mr. H. C. Mounsey) for the interest that he has taken in the matter. Since this question has passed into his hands, the inordinate and vexatious delays have become a thing of the past; and any "Road Needs" of Planters up here have only to be brought to his notice to receive prompt and careful consideration from him. However, if pecuniary assistance cannot always be given, we must accept the inevitable, as my experience on the District Board has shown me that there are many demands of the same nature from the various Taluqs.

We have no doubt been indirectly affected by the Plague and Famine, though happily this part of the country has escaped both these calamities, which have caused an unusually heavy drain on the resources of Government, so that funds for the construction of the Shevaroy Bandy Ghaut Road have not been available. Still we are confident that H. E. The Governor has not lost sight of our needs, and that the Road will be *au fait accompli* when finances allow, as the

Survey for the same has already been commenced by the Public Works Department.

Through Mr. Robert Gompertz' able advocacy, Yercaud has at last been constituted into a Union under the direct management of the Salem District Board and, even during its short period of existence, the roads have been considerably improved, and doubtless the sanitation of the place will be taken in hand before long.

It is needless for me to comment upon the Proceedings of the U.P.A.S.I., as a full report of the Annual Meeting has so recently appeared in the papers.

Though less in number than before, there are still a few Planters who seem unable to realize that union is strength, and urge, as their excuse for not joining the local Association, that little good would accrue to them by becoming Members thereof, as nothing definite is accomplished. To all such objectors on the Shevaroy, and they are not many I am glad to say, I would mention that the Association is primarily intended to safeguard the interests of the whole planting community and not to be continually effecting startling results.

The opening of the Government Forest Reserves, the privilege that Members enjoy of issuing their own Bamboo Passes, the starting of the Yercaud Rifle Volunteer Corps, the opening of the Telegraph Office and the formation of Yercaud into a Union may all be mentioned as some results of its labours, and the U.P.A.S.I. is but the outcome of the union of District Associations. It must also be borne in mind that requests and complaints through the Association must carry far more weight with Government and its officials than communications from private individuals.

In conclusion, Gentlemen, I place my resignation as Honorary Secretary in your hands, and do not intend to seek re-election as I am shortly proceeding to England. I thank you all for the hearty support you have always accorded me, and I lay down my office with the hope that my efforts on your behalf have met with your approval.

HERBERT W. LEEMING, *Honorary Secretary.*

Resolved (i) "That the Accounts and Annual Report be adopted, printed and circulated to all Residents on these Hills." (ii) "That a hearty vote of thanks be accorded to Mr. Leeming for his able conduct as Honorary Secretary."

7. Before the Meeting proceeded to elect Office-Bearers,

The Rev. M. Andersen *proposed*, and Mr. Leeming *seconded*, an amendment, "that a Permanent Chairman other than the Honorary Secretary should be elected for the coming year."

Carried with 2 Dissentients.

It was also *resolved* "that the sum of Rs. 15 per mensem be allotted towards the salary of a Writer to be at the disposal of the Honorary Secretary."

The following Committee was then elected for the ensuing year:—

Mr. C. G. Lechler, Mr. R. Gompertz, Mr. C. Rahm, Junr., Mr. J. G. Large, Mr. S. M. Hight, Rev. M. Andersen, Rev. J. M. Kempf, Mr. C. Sice, Mr. H. W. Leeming, with Mr. C. G. Lechler as Permanent Chairman and Mr. R. Gompertz as Honorary Secretary in the place of Mr. Leeming, who did not seek re-election owing to his proceeding to England shortly.

With a vote of thanks to the Chair the Meeting terminated.

C. G. LECHLER, *Chairman.*

HERBERT W. LEEMING, *Honorary Secretary.*

PROCEEDINGS of the Monthly Committee Meeting of the Shevaroy Planters' Association, held in the Victoria Rooms, Yercaud, on Monday, October 4th, 1897, at 10 A.M. PRESENT:—Messrs. R. Gompertz, Rahm, Junr., W. W. Hight, Revs. M. Andersen, J. M. Kempf, Messrs. C. G. Lechler (*Chairman*), H. W. Leeming (*Honorary Secretary*).

Notice calling the Meeting was taken as read.

Read and Recorded, for disposal at the General Meeting to be held to-day, correspondence *re* the proposal to charge a commission on Currency Notes presented for encashment at the Yercaud Sub-Treasury.

Read letter from Mr. C. D. Ricketts, dated September 29th, 1897, complaining that one of his cases had been struck off the file of the 2nd Class Magistrate's Court at Yercaud without his knowledge.

Resolved "that the matter be laid before the General Meeting to be held to-day."

Read and Recorded Circular, dated 15th September 1897, from Secretary, U. P. A. S. I., *re* Reserve Fund Circular, dated 13th September 1897, from Secretary, U. P. A. S. I., *re* North Wynad Planters' Association; Circular, dated 15th September 1897, from Secretary, U. P. A. S. I., *re* Finances.

Read and Recorded with satisfaction, letter No. 5058, dated 29th September 1897, from the Collector of the District *re* Roads of the Shevaroy.

Read and Recorded, for disposal at the General Meeting to be held to-day, letter dated 20th September 1897, from the Secretary, U. P. A. S. I., asking what sum this Association is prepared to subscribe towards defraying the salary of an Agricultural Chemist, &c.

The following Papers were laid on the Table:—(i) *Planting Opinion* for September 11th, 18th, 25th and October 2nd, 1897. (ii) *Agricultural Ledger*, No. 8 of 1897. (iii) *Proceedings of Board of Revenue*, No. 6785, dated 24th August 1897, *re* Carrot Seed. (iv) *Proceedings of the Lower Pulneys Planters' Association*. *Proceedings of the Wynad Planters' Association.*

With a vote of thanks to the Chair the Meeting terminated.

C. G. LECHLER, *Chairman.*

MARKET SUPPLEMENT.

SATURDAY, NOVEMBER 13, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (October 22, 1897) says:—A quiet tone has prevailed at auctions this week, and the small supplies brought forward sold slowly; desirable kinds, however, realised fully previous rates.

No East India was offered.

The Central American catalogued consisted chiefly of common descriptions which met a slow demand at unchanged prices, but bold color grades went all against the buyer.

Owing to the continuance of the heavy Brazilian receipts, the Terme market has again declined, and quotations at the close are 1/- lower than last week.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending October 20th, 1897, says:—Bank rate 3%. Bombay Exchange closes at 1s 3½d. Brazil Exchange 7½d. Rupee paper 3½% 63½. Silver 27½d per oz.

This market has been dull throughout the past week, and the small supplies catalogued have only partly been sold at about steady prices for good, whilst the ordinary and common kinds are again cheaper. Brazil markets are flat.

Daily receipts in Brazil have averaged 12,625 bags in Rio and 25,625 bags in Santos.

Futures are dull and lower, closing about 1s below last week's quotations, viz.:—Good average Santos in Havre, December delivery, fcs. 40.75, in Hamburg pf. 33½, and No. 7 low ordinary Rio in New York \$6.25.

To-day's London official quotations are:—

	Oct.	Dec.	March	May	July	Sept.
Rio	—	32/6	—	—	—	—
SANTOS	33/-	33/3	33/9	34/-	34/3	34/6

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated October 22nd, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	527,860 packages.	520,408 packages.	17,589 packages.
1896-1897...	524,904	466,300	20,196
54,522 pkgs. INDIAN	Total 66,340 packages were offered in public auction this week.		
20,108 " CEYLON			
710 " JAVA			

Indian. The quantity brought forward was rather smaller, the market all round being well supported at last week's prices, except that here and there one or two of the less desirable liquoring parcels sold at slightly cheaper rates. The quality of the crop generally is about up to the average, both Assam and Darjeeling in particular being of a satisfactory character. The Official Wire gives exports to U. K. for first half of the month as 8,790,000 lbs. against 9,200,000 lbs. last year, and the total from 1st April as 77,840,000 lbs. against 77,230,000 lbs. last year.

OTHER PRODUCTS.

The Chemist & Druggist of 23rd October reports :—

CARDAMOMS.—The latest mail reports from Ceylon state that the demand for cardamoms for Bombay continues to be very strong. Parcels of Mysore pods have changed hands at prices ranging from 2'12r. to 2'50r. per lb., and Malabar is selling for the same market at from 1'70r. to 1'80 per lb. Business with the European market was almost at a standstill in both these grades. Closing prices ranged from 2r. to 2'05r. The London market is extremely firm. There has been an arrival of between 50 and 60 cases, but this will no doubt find ready buyers, although it is probably limited at high figures. For common Malabar cardamoms, such as generally sell at about 1s. 5d. per lb., 3s. 1d. per lb., c.i.f. terms, is asked, and bills of 2s. 8d. per lb., c.i.f., have been refused.

CINCHONA.—The Amsterdam cinchona auctions of November 4 will consist of 5,691 bales and 437 cases, representing a total of 555,810 kilos. of bark. Of this quantity 521,997 kilos. are bark from private plantations, and 33,813 kilos. from the Government gardens. The first-hand stock in Amsterdam on October 12 consisted of only 2,040 packages of Government and 5,778 packages of private bark. This includes the quantity to be offered for auction. The shipments from Ceylon, from January 1 to September 21, are as follows :—

1897.	1896.	1895.	1894.
Lbs.	Lbs.	Lbs.	Lbs.
526,093	881,743	733,288	2,181,459

	1897.	1896.	1895.	1894.
PEK. SOUG. (Blackish greyish, inferior liquor).	5d	5½d	5½d	5½d
PEKOE. (Blackish greyish, some tip, inferior liquor)	... 5½d	6d	6½d	6½d

Ceylon. The auction was again comparatively small, while the strong demand of the past few weeks was fully maintained, causing the market to be very steady at the recent advance. Private telegraphic advice gives exports to U. K. for first half of the month as 2,100,000 lbs., against 3,500,000 lbs. same time last year, and estimates the total for the month as 4,500,000 lbs., against 6,750,000 lbs. last year. Avge. for week 8½d., against rather under 8½d. same period last year.

Ceylon Tea sold on Garden Account 1st January to date 1897, 906,996 pkgs., av. 7½d. 1896, 814,053 pkgs., av. 8½d.

Comparative prices of Ceylon Tea in London :—

PEKOE SOUG. (Rather bold leaf; indifferent liquor)	... 5½d	5d	6½d	6d
PEKOE (Somewhat bold leaf; indifferent liquor)	... 6½d	5½d	7d	6½d

Java. The few Javas brought forward sold with good competition at rather dearer rates. 108 pkgs. from "Perbawatee" brought 11½d. per lb. 5,030 pkgs. were offered in Amsterdam on the 20th last.

JALAP.—From New York it is reported, under date of October 5, that there have been no arrivals, that there has been an improved demand, and that 33 bales have been sold at 9c. per lb. In London 7d. per lb. is asked.

QUININE.—Last week the market closed quietly, with second-hand sellers of B. & S. and Brunswick bulk quinine at 1s. 2½d. per oz., but on Saturday a small parcel of new B. & S. quinine is said to have been sold at 1s. 3d. per oz. This week the demand has been slack, and some second holders have shown much anxiety to sell. We only hear of one sale of 5,000 oz. early in the week at 1s. 2½d. per oz. for new German bulk (second-hand). To-day there are sellers at 1s. 2½d., but no buyers over 1s. 2d. per oz. Pelletier's brand is quoted by the makers at 1s. 4½d. to 1s. 5d. per oz. in vials. The New York market during the week ending October 9 is thus described by the O. P. & D. Reporter :—"During the week the demand has been rather active, the makers being full of orders. Dealers are selling cautiously, preferring to hold back. The cost to import from London is over 30c. Sales have been made here in 1,000 oz. lots at 30c., but earlier in the week large sales were made at 27c. to 28c. perhaps 40,000 oz., the bulk for shipment to London against sales made there.

Pepper is easier all round. Black Singapore has been dealt in on the spot at 3½d. to 3¾d., and close with sellers of October-December and November-January delivery at 4d. per lb.; fair black Atchin realized 3½d. at auction. White pepper is also lower. At auction fair Singapore realized 6½d. per lb., and for delivery prices are also lower. The same applies to Penang pepper.

COIMBATORE COFFEE WORKS.

Coffee Cured and Shipped to London on Planters' Account.

ADVANCES MADE ON CROPS ON MODERATE TERMS.

Tools, Roofing and Planters' Stores kept in stock.

SPECIAL MANURE WORKS.

Separate Manure Works have been recently erected, giving greater facilities for the Manufacture of Manures.

White Castor, Black Castor, Neem and Hoongay Poonacs, Bone Meals, Superphosphate, Nitrate of Soda and Saltpetre now in stock.

MIXTURES MADE FREE OF CHARGE. FOR QUOTATIONS AND FURTHER PARTICULARS,

Apply to **T. STANES & CO.,**

Coimbatore and Coonoor.

THE "MADRAS STANDARD," Published Twice Daily—Morning and Evening.

THE OLDEST, THE CHEAPEST & THE MOST POPULAR ORGAN
IN SOUTHERN INDIA.

Its chief features are:

A LONDON LETTER written weekly by a distinguished Member of Parliament.

Letters from Hyderabad, Mysore (and Bangalore), Travancore, Cochin, and Pudukota contributed by Correspondents well versed in the affairs of those States.

Letters from Far and Near } Political sketches and Caricatures of
and } the leading men in Southern India.
Telepathic Interviews. }

Portrait Gallery—Lives of distinguished men in Southern India with their Portraits. Spicy Jottings on current topics. Amusing Notes, Stories and Sketches. News from various Mofussil Stations. Interesting Extracts.

RATES OF SUBSCRIPTION.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORT.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 26th November 1897.

Nellampathy (British). 17th November.—*Weather.*—Rain for fortnight, 1·8; to date, 160·54. The days have been very 'muggy' until Sunday, when some rain fell and has cleared the air a bit. *Crops.*—On almost all estates pulping is progressing and on one place I hear crop is nearly over. *Plant-diseases.*—"Leaf" still bad in young clearings, but almost all gone from old coffee, and places are looking well. Grub and wire worm are at work on clearings however. *Health.*—Good.

SULPHATE OF AMMONIA AND NITRATE OF SODA.

WHETHER well-founded or not, there undoubtedly exists a strong prejudice in agricultural circles in favour of applying the requisite nitrogen in the form of nitrate of soda, rather than in that of sulphate of ammonia. The producers of the latter valuable fertiliser are trying to combat this impression, for it has had, and still has, a serious effect in limiting the demand for their product. As is the case with

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for fine advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "*Planting Opinion*," Esplanade Row, Madras.

basic slag (Thomas' phosphate powder), sulphate of ammonia has become a most valuable by-product of blast-furnaces, and ironmasters have recently opened a campaign setting forth the merits of their wares. All they seek to do just now is to establish the parity in the manurial value of the nitrogen units in both nitrate of soda and sulphate of ammonia. Mr. F. J. R. Carulla, F.C.S., Chairman of the Nottingham Section of the Society of Chemical Industry, has written an instructive pamphlet on the subject, which has been issued by the Iron and Steel Institute.

We learn that until quite recently there was no question of the equal value of the unit of the rival fertilizers, $\frac{3}{4}$ cwt. of sulphate being acknowledged of equal fertilizing power to 1 cwt. of nitrate, or to be perfectly safe, that 4 cwt. of the former equalled 5 of the latter. This is explainable by their relative percentages of nitrogen, sulphate of ammonia containing nearly $21\frac{1}{4}\%$ nitrogen, while nitrate of soda only contains $16\frac{1}{2}\%$ per cent. Now, however, since the blast furnaces have materially increased the supply of the sulphate, it is held that weight for weight the two fertilizers are of equal value, the balance being in favour of the nitrate. What are the reasons for such a change of opinion? Mr. Carulla can only answer "Prejudice, instilled by the nitrate producers."

Among one of the means recommended to remove this prejudice, it is suggested that sulphate of ammonia should be re-christened, so as to convey the same idea of nitrogen as nitrate does. "Nitrogenous sulphate" would be an excellent term to employ for this purpose.

A more serious method is to enquire into, and publish, the results of comparative experiments made with the two fertilizers. The literature on the subject is extremely slight, we are told, the most important being that contributed by Professor Paul Wagner, the well-known German *savant*, Director of the Darmstadt Agricultural Research Station. In his work on "The Increase of the Produce of the Soil through the Rational Use of Nitrogenous Manures,"* some tables of his comparative experiments on the effect of manuring with nitrogenous sulphate and nitrate of soda, he says, † "In my researches, which were carried out with grass, oats, rye, buckwheat and rape, usually no considerable difference between the effect of ammonia and that of nitrate showed itself, if the manure was applied in spring, and immediately before the sowing, to a clayey soil which contained a small quantity of carbonate of lime. In several series of experiments, the effects of ammoniacal nitrogen was fully equal to that of nitric nitrogen, as the following examples will show:—

Manure Nitrogen per acre in lbs.	Yields of Rye.		Grass.		Buckwheat.	
	Nitric Nitrogen.	Amm. Nitrogen.	Nitric Nitrogen.	Amm. Nitrogen.	Nitric Nitrogen.	Amm. Nitrogen.
18	43.1	47.4	...	...	35.9	37.2
27	50	51.7	...	...	41.8	39.7
36	56.4	55.6	15	15.7	45.7	45.6
45	58.1	58.2	17	16.9	46.1	48.4
54	62.8	61.6	17.5	18.4	51.8	53.3
63	...	...	18.7	19.3	...	...
72	...	...	20.6	20.8	...	...
0	38.0		7.6		31.5	
Average	54.1	54.9	17.8	18.2	42.3	42.8

To prevent any misconception, it may be again pointed out that sulphate of ammonia containing a larger percentage of nitrogen than nitrate of soda, proportionately smaller quantities of the former were used in the above experiments.

Whatever difference there is between the comparative results lies in favour of the nitrogenous sulphate, i.e., ammoniacal nitrogen.

In conclusion Mr. Carulla quotes the following example of the extreme unfairness with which facts may be presented so as to injure sulphate of ammonia—possibly without any real intention to do so:—

* "Some experiments which I carried out with winter rye gave the following numbers as the averages of four closely agreeing parallel experiments.

"Every 10 lbs. of nitrogen as compared with no manure gave the following increase in the crop:—

	Grain.	Straw.	Grain and Straw.
	lbs.	lbs.	lbs.
1. No nitrogen in autumn, all the nitrogen given in the spring in the form of nitrate of soda	215	729	954
2. All the nitrogen given in autumn in the form of sulphate of ammonia, no nitrogen in spring	41	169	210
3. The smaller part of the nitrogen given in autumn in the form of ammonia salt, the larger part in spring as nitrate of soda	145	575	720
4. The smaller part of the nitrogen given in autumn in the form of nitrate of soda, the larger part in spring, also as nitrate of soda	156	594	750

Our pamphleteer waxes indignant over the unfavourable position sulphate of ammonia occupies in the above table to the eye of the casual reader. And with justice. For, as he says, the fact that, in the first case, the nitrogen from the nitrate of soda was given the plants at the most favourable period, and that the opposite was the case with the sulphate of ammonia, will avail little in the long run. The majority of readers will simply remember the good

* London, Whittaker, 1888.

† *Op-cit.* P. 63.

* Wagner, "Nitrogenous Manures," page 38.

effect produced by the nitrate of soda and the failure of the other manure.

Yet, in spite of all that Mr. Carulla has advanced, there is no doubt that the action of sulphate of ammonia and nitrate of soda are by no means precisely similar, the former being better held up in soils than the latter. While on the other hand, nitrates have been found to act in a quicker period than sulphates. In many instances, the former quality may be more desirable than the latter, but again, in other instances, nitrates might rightly be preferred.

GENERAL NOTES AND ARTICLES.

Cattle trespass. We direct the attention of all Nilgiri planters to the N. P. A. Honorary Secretary's letter under this heading. As Mr. Windle points out, all that a Nilgiri planter need do in future, when suffering from cattle trespass, is to complain against the owner or keeper of the cattle to the Magistrate, not to the Police. The amount of the fine leviable is up to Rs.50, and it may be recovered by the sale of the trespassing animals, whether caught in the act of trespass or otherwise. We trust this will effectually settle the great annoyance and loss suffered from cattle trespass in this district. It would be an excellent thing were similar provisions applied to all planting districts of South India.

Notice to correspondents. We desire to draw the prominent attention of our correspondents to the fact notified on the first page of every issue some months past, that letters for publication alone should be sent to our Editorial Office at Coonoor. All communications bearing on advertisements (being orders for insertions or answers to advertisers) and subscriptions should be sent to the Manager of this paper, 3, Esplanade Row, Madras. Much delay and annoyance will be saved on both sides if this very simple rule is observed.

Another point that our correspondents might keep in mind is that letters unauthenticated by the name and address of the writers are summarily consigned to our Waste Paper Basket, however impersonal the subject treated on may be.

"PLANTING OPINION" OFFICE,
3, ESPLANADE ROW, MADRAS.

Jadoo.

"Jadoo Limited" has not of late obtruded itself on our notice, but has been pursuing the business tenour of its way in successful, if uneventful, success. From the report of the second ordinary general meeting of the shareholders at Exeter on October 20th, we learn that the financial result of the year's trading enabled them to recommend the payment of a dividend at the rate of ten per cent. on the amount for the time being paid on the shares. The steadily increasing sales of Jadoo would, without anything else, justify the Directors in expressing their belief that the Company is on the road to a great success, but the report of the Committee on results of using Jadoo in France pointed to the probability of the rapid fulfilment of the hopes expressed in the prospectus issued in January last. The fact that the Silver Medal of the "Societe Agricole et Viticole de la Charente" was given to a Vineyard, almost entirely grown in Jadoo, as the best plantation of young vines in the whole Charente district, was a most extraordinary success to have gained in the first year that Jadoo had been experimented with there, and results with vines elsewhere had been equally satisfactory. The fibre was also favourably reported upon from tobacco-growing countries and from Australia, while from India the Directors had had reports as to the very satisfactory results obtained with using Jadoo for growing tea. According to a report from the Sathgao estate, Sylhet, the difference between the number of plants brought to maturity when using Jadoo mixed with earth was 68.8 per cent. and 68.7 per cent., against 21.4 per cent. and 39.5 per cent., respectively, in earth alone; and experiments made by the Agri-Horticultural Society of India proved that tea seeds germinated in ten days in Jadoo, as against 37 days in earth.

LETTERS TO THE EDITOR.

WORMS IN COFFEE ROOTS.

SIR,—I shall be obliged if you or some experienced planter can give me a cure for a pest which I find is playing havoc among my last year's clearings. Since the S. W. Monsoon stopped, in a certain ridge in the estate, the plants, which were remarkably fine ones for their age, have been drooping, and in some cases died altogether for no apparent reason. I had the pits opened out and the earth sifted, to find in every case one or two long, thin, reddish worms—by 'thin' I mean about as thick or a little thicker than a pin—in the region of the roots, and the plant itself had lost all its tiny feeding roots, while the main root was pulpy and peeled an inch below the surface of the ground and right down to the tap root. I had the earth in the pits of plants that were looking all right also sifted out, but found no worm of this description in them. I hope this will not be left unanswered as so many queries in the paper are.

"YOUNG PLANTER."

Advertisers are notified to send all advertisement matter and answers to advertisements direct to Manager, this paper, 3, Esplanade Row, Madras.

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

Total	5210	5234	4315	8645	3785	8595	5832	4985	4998	5755	4264	5812	5310	5670	5457	4468	5050	4521	5764	7332

The average for the first 10 years of the record is 53.95 inches, and for the succeeding 10 years 57.35, an appreciable increase. Unluckily the increase is accounted for by two extra heavy years 1891 and 1893. The most remarkable falls are in 1891, when

44.15 inches fell in October; in 1893, when 22.65 inches fell in March, an usually very dry month; in 1895, when 14.85 fell in April, a fairly dry month; and lastly, in 1896, when 20.90 inches fell in May, an also rather dry month.

YOUR COONOR CORRESPONDENT.

CATTLE TRESPASS.

SIR,—In a letter, dated November 13th, the Collector of the Nilgiris requests that I will give the "utmost possible publicity" to his exposition, copy of which I enclose, of the effect of the recent Notification of Government, No. 315, dated 18th August 1897, published at page 1077, *Port St. George Gazette*, of 24th August. I shall be obliged, therefore, if you will publish the enclosed in *Planting Opinion*.

E. G. WINDLE, Hon. Secy.

NOTIFICATION.

Ootacamund, August 18, 1897.

No. 315.—In exercise of the powers conferred by section 26 of the Cattle Trespass Act, [1871, as amended by Act I. of 1891, and in supersession of Notification No. 431, dated

* The definition of cattle includes elephants, camels, buffaloes, horses, ponies, mules, asses, pigs, sheep and goats. 19th November 1891, published in the *Port St. George Gazette* of 24th November 1891, His Excellency the Governor in Council is pleased to direct that in the Nilgiri district section 26 of the Act shall be read as if it had reference to cattle* generally instead of to pigs only, and as if the words "Fifty rupees" were substituted for the words "Ten rupees."

And under the provisions of section 12 of the said Act, and in supersession of the above notification, His Excellency the Governor in Council is pleased to direct that on every head of cattle which may be seized or impounded within the local areas mentioned below in the said district, poundkeepers shall levy fines at double the rates specified in the above section, viz.:—

1. Ootacamund	...	...	...	Double the rates of fines within municipal limits.
2. Kandal	...	...	...	
3. Coonoor	...	...	...	
4. Kotagiri	...	...	...	
5. Karteri	...	...	...	
6. Musnigudi	...	...	...	
7. Naduvattam	...	...	...	
8. Upper Gudalur	...	...	...	
9. Lower Gudalur	...	...	...	
10. Pandalur	...	...	...	Double the rates of fines within a radius of 3 miles from the pound.
11. Nellakotta	...	...	...	
12. Yedupulli	...	...	...	
13. Denad	...	...	...	
14. Thatapallam	...	...	...	
15. Konakarai	...	...	...	
16. Manjakombe	...	...	...	
17. Sholar	...	...	...	
18. Mukkatti	...	...	...	
19. Sakkatha	...	...	...	

J. F. PRICE,
Chief Secretary.

Under Sec. 26 of above Act, as extended by notification:—

"Any owner or keeper of cattle who through neglect or otherwise damages, or causes or permits to be damaged, any land or any crop or produce of land, or any public road, by allowing such cattle to trespass thereon, shall on conviction before a Magistrate be punished with fine not exceeding Fifty rupees."

All therefore a planter who suffers such damage has to do in future is to ascertain the name of the owner or keeper of the cattle, and complain against him to a Magistrate, not to the Police. And sec. 25 enacts that any fine thus imposed may be recovered by sale of all or any of the cattle by which the trespass was committed, whether they were seized in the act of trespassing or not, and whether they are the property of the person convicted of the offence, or were only in his charge when the trespass was committed.

COFFEE.

Worms on coffee roots. Attention is invited to the letter under this heading by "Young Planter." It is a pity that such practical queries are usually left unanswered by our readers, showing a degree of apathy which is lamentable. We trust some experienced planter, with similar experience may be found who will find time to advise our anxious querist.

In the meantime, we should counsel "Young Planter" to forward specimens of the worms and roots (the former in alcohol) to the Director of the Indian Museum, Calcutta, for identification and advice.

Belts to arrest spread of blights. We doubt if sufficient attention is paid nowadays to the great importance of preserving or planting belts of trees on plantations. Not so much to preserve the coffee from wind as to form more or less impermeable screens to the passage of blights, such as leaf disease, and black and green bug. There is little doubt that, were such belts liberally provided, that the course of the blights will be a great deal slower in travelling from end to end of a district than is at present the case with our large stretches of almost unbroken cultivation.

Certainly both forms of the slower spreading and less mysterious bug could be arrested on a belt-protected plantation with far greater ease than is now possible. On the first appearance of bug, remedies could be concentrated on the particular field affected with considerable chances of success.

INFLUENCE OF BEES ON CROPS.

As bearing intimately on the question we recently alluded to, the following extract from the Hawaiian *Planters' Monthly* will be of great interest:—

[In the August issue of the *Planters' Monthly* (page 387) was printed a portion of a very interesting article on the part which bees take in producing an abundant harvest of fruit. The writer of that article, Mr. Albert Gale, continues the subject in the May number of the *Agricultural Gazette* of New South Wales, giving details of the process of fertilizing of various plants, and the part which bees and other insects take in it. We reproduce such portions of it as will interest our readers, and would here state the result of our own convictions that the productiveness of fruit trees, including coffee, will be greatly insured by the introduction of a few hives of bees among the trees or near by. Perhaps the absence of bees or other fertilizing insects may be one of the principal

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contain per ton:—

61.50	lbs. Nitrogen.
57.88	" Potash.
14.92	" Lime.
13.68	" Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only *thornless variety extant*, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,

Shencottah.

causes of failure in the expected crops, after the trees have blossomed heavily.—EDITOR, *Planters' Monthly*.]

It will be noted hereafter, the most essential parts of a flower are the stamens and pistil. These essential organs are most vigorous, healthy, and free from blemish in the earlier parts of the day. Just after the corolla bursts these unfurl, the anthers become distributive, i.e., the pollen they contain is sufficiently mature to be wafted by the wind or gathered by insects or other agencies for fertilizing purposes—and later, the stigma becomes receptive. The atmosphere during these early hours, in spring time, as a rule, is characterized by a dead calmness, or at the most by gentle breezes. This calmness is most beneficial and is a highly necessary agent in ensuring successfully the fructification of entomophilous fruits. The more frequently the bees trip to and fro from home to orchard and orchard to home, the greater and better are the results that follow their labours.

I have used the terms bloom, flower, and blossom indiscriminately. They are synonymous. The two former are generally applied to the flowers on ornamental plants and the last to fruit trees.

To understand how the all-important work of fertilization is carried on by bees and other insects, it will be necessary to glance over the accompanying diagrams and have a slight knowledge of the functions each portion of a bloom has to perform.

The pistil is divided into ovary style and stigma. The stigma is the end of the style turned inside out. It has four very peculiar characteristics: First, it is skinless; secondly, it is adhesive—if it be applied to down or a light feather it will adhere to it; thirdly, it is porous; and in the fourth place, it is covered with a lot of hair-like hooklets. The peculiarities in the stigma form important parts in the economy of fertilization taken in conjunction with the offices performed by bees in relation to fruit and the reproduction of plant life. The style is traversed internally by a canal forming a tube which is the connecting link between the stigma with the ovary.

The stamens are the masculine reproductive organs, and, like the pistil, different portions of it receive different terms—the anthers and filaments. The filaments are thread-like appendages, and are generally attached to the base of the corolla, and not to the ovary, as in the case of the style; neither is it tubular. Their office is to support the anthers, and to keep them in their proper position. The anthers, generally two in number, are situated at the summit of each filament. They are different forms, according to the class of fruit borne by the tree—round, angular, elongated, or sometimes twisted. When the blossom first opens, the anther is usually of a bright colour—generally yellow. Its upper surface is a flat, smooth disc. As the day advances, and the anther matures, each one opens with a longitudinal slit its entire length. It can then be seen that each anther is a pocket or sac filled with pollen—a very fine dust-like flour. Pollen is of a variety of colours—white, red, pea-green, etc., are of frequent occurrence—but the predominating colour is some shade of orange. By watching at the entrance of a beehive, different bees will be seen to enter with pollen of various shades, although they prefer to work on those blooms that are yielding the greatest quantity. By taking a piece of honeycomb containing bee-bread, and cutting a cell filled with it longitudinally, strata of various colours are always to be seen. In flowers that are fertilized by insects, the pollen is usually of a sticky nature. This property is availed of by the bees. By this they knead it into small pellets, and neatly pack it in the pollen baskets on their hinder legs. The pollen of pumpkins and other members of that family, on account of its non-adhesive quality, they cannot so treat, but carry home in the hairs of their bodies. The pollen of blossoms fertilized by the wind is also non-adhesive. Pollen grains are of various forms, according to the class of plant it is taken from. * * *

The beneficial influence of bees on certain crops, and the imperative necessity for their location within a near radius of fruit-trees, demands more than the usual passing glance. I say a near radius, because the nearer the home of this insect is to the orchard or fruit garden, the more frequently can they visit the blossoming fruit-trees. The earlier in the day the bees visit the blooms, the more certain will be the act of fructification and the resultant fertilization the more effectual. Bees have been seen on their foraging ground beyond a radius of three miles. These long journeys must be undertaken at the expense of the number of trips made during the day.

Blossoms open at various hours, both in the day time and in the hours of night—the majority in the early morning just after sunrise, some at noon, others in the twilight, and a few varieties after dark. Some classes of blooms are very sensitive to light and darkness and

will only open when the sun shines brightly. Those that open in the earlier portion of the day generally close towards sundown and reopen the following sunrise. Those that open at twilight and after it close at dawn. Evening and nocturnal opening flowers are visited by moths and other insects that are on the wing during the time between twilight and dawn. During a heavy flow of honey, bees will work for some time after sunset and well on towards darkness. On warm evenings the writer has more than once seen bees return home by the light of the moon when the latter has been shining brightly. Of course diurnal flowers are visited by diurnal insects.

Anemophilous flowers (those that are fertilized by the wind) do not close after they have once opened. The anthers being attached to the filament so tenderly, the slightest movement caused by a passing breeze is sufficient to shake the pollen to the stigma. It is the soft, gentle breeze that is efficacious in the fertilization of cereal crops—wind just sufficiently strong to carry the pollen a few feet from the anther that produced it. At the time wheat and other cereal crops are in flower, when the pollen is mature and hanging loosely in the anthers, heavy wind storms are as destructive as late frosts. Many a crop that has appeared promising enough when in blade has failed to give a heavy yield, owing to strong winds catching up the pollen and wafting it away in the bush, or elsewhere, where its influence is lost.

TEA.

Those lively Japs!

While the Chinese are still talking of what they want to do to rehabilitate their trade in their old markets, Japan has already entered the lists. The following are the contents of an advertisement in the *Philadelphia Inquirer* with a type border of Japanese work to attract additional attention:—

The undeniable superiority of Japanese tea and the distinguishing popularity which it has attained on this continent are due: First,—To certain peculiarities of soil and climate common to no country other than Japan. Second,—To the exceptional intelligence with which its culture has for centuries been conducted. Third,—To the traditional care and cleanliness with which it is prepared for market. That its refreshing excellence is appreciated in the United States is shown by the interesting fact that of the 93,000,000 pounds of tea imported into this country last year, 61,000,000 pounds came from Japan. Official Japanese Recipe—use one teaspoonful of leaves for each cup. Pour on freshly boiled water. Steep two or three minutes. Never boil the leaves. Neither sugar nor milk recommended.

Java's future.

Despite the low average obtained by most Javanese teas in London, the acreage under the shrub is steadily increasing, and the improved jats and methods now adopted will go far to making this country a formidable competitor in the not distant future.

Mr. J. H. S. Davidson, who went to Java some three months ago, in the interests of the firm of Messrs. Davidson & Co., has returned to Colombo, we learn from the *Ceylon Times*, with a very good impression of tea-growing prospects there. He says that, though tea has been grown for a long time past in Java, the success of the place as a tea-growing country undoubtedly lies in the future. It is only recently that tea growing and tea making on lines such as are in vogue in India and Ceylon has been introduced, and the result is that enormous tracts of land are being opened up, and there is a great demand for the newest kind of machinery. Mr. Davidson has had good opportunities of seeing tea cultivation in India, Ceylon, and Natal, and he says he never saw a place better fitted for the industry than Java. From what he could see, the soil is excellent, and there is very little trouble in regard to labour. It is all Malay labour, of course, and it is free;—that is to say there is no such a thing as coast advances, as in Ceylon, or

agreements to work for a certain period, as in India. He says the Malays are slower workers than the Tamil, but far more plodding and reliable. Mr. Davidson saw two estates of over a thousand acres each, being opened up by Dutch colonists, and he says that not only is the soil very good but it takes less trouble to clear it than in Ceylon. These estates were at an elevation between 3,500 ft. and 5,000 ft. and gave promise of bearing very good tea. There are also many other recently opened estates not yet in bearing which promise well. Mr. Davidson was also much struck with the facilities for travelling in Java. The gradients are not so steep as in Ceylon, and he says that, besides a railway which runs into the heart of the tea-growing district, they have remarkably good roads. A kind of tea they grow in for there to some extent is known as "white tips." It is a very delicate, light liquoring tea, made without fermentation, and is shipped to Bombay *en route* for a market in Arabia, where it seems to be much appreciated. Mr. Davidson was also struck with the coffee grown in Java, and says the island seems to have a future in mineral products as well as vegetable, for while he was there some large new petroleum springs were discovered, and syndicates were formed to manage them. He says all the Dutch planters seem well educated, go-ahead men, and speak English very well, while, unlike Ceylon planters, they appear to regard Java as their home and to have settled in the country for good and all. He only met two English planters in Java, but both were doing well. One is Mr. Bingley, who was in Ceylon for a time, and the other Mr. Evans. Mr. Bingley has with him Mr. Adams, who went out from Ceylon at the recommendation of Mr. Wright not very long ago. According to Mr. Davidson, when all the newly opened estates in Java come into bearing, it will make an appreciable difference on the tea market.

Darjeeling on Ceylon.

The well-known Darjeeling planter, Mr. Christison, is engaged in a lengthy tour throughout the tea districts of Ceylon and India. He has first visited the Island, and speaks very highly, though cautiously, of what he has seen there. He proceeds to Travancore, thence to Upper India, and lastly, if possible, to the Wynaad.

These are his impressions on Ceylon as compared with Darjeeling:—

ADVANTAGES.

1. Climate.
2. The slopes are more gentle, lending themselves better to terracing, manuring and surface draining.
3. The estates are less costly in the preparation of the land for planting and in after cultivation.
4. In regard to transit, you have splendid roads with easy gradients. Even in the gardens themselves, you have the advantage over us, for everything is carried on men's backs in Darjeeling.
5. In regard to water-power, you are most advantageously situated, the water being more easily brought to the side of your factories than is the case with us.
6. The soil is even (though I consider nothing I have seen anywhere in Ceylon equals our best Darjeeling soil), and the land less broken up. There are fewer uncultivable portions. The gardens are much more compact.
7. Looking at the physique and health of Europeans of long residence, I am convinced that even with the fine climate of Darjeeling you have an advantage.
8. Through all the hill districts, so far as I have seen, the rivers are gentle in their flow; to some extent they are navigable with slight artificial aid. They are such a contrast to the mountain torrents of Darjeeling.

POSSIBLE DANGERS.

Nature (continued Mr. Christison) has been so lavish and so liberal to you that I am afraid you do not realise the importance of some sources of danger. May I diffidently suggest the following:—

1. I have spoken as to the healthiness of the plant I have seen; but I believe in no instances in any former experience in any crop where there has been such a surface covered has there been exemption from blight. This ought to be thought about. I sincerely hope you will escape, but you will be exceptionally fortunate if you do. Wherever there is a large area of cultivation, no matter what plant, in any country and in any climate, there comes in time blight.

2. The want of rest for the plant is another source of danger. You are always plucking or pruning. Pruning is not a rest, but a surgical operation more trying than plucking. I look upon it as a more severe process for the plant than plucking.

3. I have seen some indications of waste of soil by wash, and this requires to be seriously thought about—the effects of wash year by year, the carrying away of the constituent properties of the soil by rain. Yours is a light friable soil, and in spite of your admirable and complete system of drainage, this requires grave attention.

4. We do not know the life of the tea plant yet. When tea is reduced to a science, the deterioration of the plant will be understood and must be reckoned with. Wherever the plant comes into full bearing, you ought to write off a sum for annual deterioration of the plant in the same way that you write off for deterioration of buildings and other property.

5. In many districts the want of firewood fuel will become very pressing, and, though I give you credit for much planting along roadsides and also separate plantations, further steps in this direction might be carried out with advantage in the shape of separate forest plantations.

FACTS ABOUT TEA SEED.

[CONTRIBUTED TO THE "PLANTER."]

ABOUT the middle of September the seed begins to fall, and previously to this we have cleared all the jungle from the foot of the bushes, so that picking it up may involve as little trouble as may be. As soon then as the first signs of falling seed appear, the children and some of the women are put on to grope for what they can get. At first this is little, but the seed ripening, the night breeze shakes down more and more until there is sufficient to justify the cleaning preparations in view of the first challan; so we spread the seed out in the sun, and down beside it plant such of the garden labour force whose physical incapacity for arduous labour best fits them for the matter in hand. These strip off the outer skins and throw the cleaned seed into baskets. Next day the cleaned seed is put little by little into a tub of water. Such as floats is thrown aside, and that from the bottom and floating in mid water is gathered up and spread on *chalnies* to dry. Some make a second quality of the mid-water seed, and keep it separate. Dried, the seed is buried in layers in beds of clean dry sand heaped up on a leaf-house floor, ready for packing. The seed ripening still further, artificial assistance is necessary to cause it to fall, so some able-bodied men are put on to give the trees a good shaking. This brings down a lot, and soon we are in the thick of our season cleaning, sorting and packing as fast as we can.

The packing requires a little care in its supervision. We here use tea chests cut in half, as we find, filled with half a maund of seed packed in charcoal, lidded, nailed down and bound with iron; the finished chest turns out just a maund. This is as much as the despatch service allows.

The mi-tri first cuts the boxes in half. The bottom half is then taken, and the bottom and all four sides lined with stout paper. Then a layer of charcoal is dropped in thick enough to bed a seed in. Ideas vary as to the best transporting medium. Some use charcoal, others charcoal mixed with sand or earth, others again light dry earth only. On the first layer of any of these seed is scattered as close together as may be, but not lying double. This is

covered with the packing mixture and another sheet of paper laid down. Then the operation is repeated until the chest is full up, and a final sheet of paper is put down under the lid.

The seed and charcoal or otherwise are weighed out for each box, and one or two seed taken out from each as a test to determine the percentage. Now in this testing much difference of opinion is shown, and until a uniform method is agreed on, it is as well in agreeing to a minimum per cent. good to know how this will be arrived at. This is the usual method. Take one hundred seed, and breaking the shells, split them open into the two natural halves. Then all absolutely bad is counted out in one row, so many as are 'spotted' in the second, and the good seed is in the third. The bad is at once counted out. In the spotted, two out of three are counted good, and these plus the third good row give the percentage. This is a very fair method, and is usually accepted. The difference of opinion lies in the spotted seed. Some men testing will count out the absolutely bad as before, and into this count all seed spotted near the germ. Those spotted away from the germ, on the other hand, being reckoned all good, there is not very much room on the surface of an opened seed, and the meaning of the word "near" may be read differently, as one is seller or buyer. It is a delicate matter. Others again—these being buyers—will split a seed into four, lest any imperfections should remain hidden after a single cut.

The boxes are hooped, marked and sent off by the quickest route. The price runs from sixty to two hundred rupees a maund, and a further charge of rupees three per chest is made for packing. The expenses of collecting it on the garden are small, so the profit is fair. First, however, catch your seed.

ACME TEA CHESTS.

THESE chests are now being largely used in India, and the two firms who act for the "Acme" Tea Chest Company have begun to keep stocks in Calcutta. For the benefit of our readers we give here a short sketch of this patent carrier. It goes without saying that, being made of thin plates of steel, and therefore taking up much less room on boardship than wooden chests, the "Acmes" effect a considerable saving in freight, and in consequence of their lightness they carry a greater quantity of tea under the same gross weight and so save in warehouse charges.

These chests are sent out to the garden in the flat form, the different parts of about a dozen chests being packed together in a wooden skeleton case, on the outside of which is very legibly marked the capacities and tare weights of the chests it contains. The manager of the garden can always have a stock at hand in small bulk of the several sizes suitable for his tea. The storage space taken up in the factory is less than one-half the space occupied in storing the same quantity of wooden shooks.

The minimum of trouble is secured in putting the "Acme" together in taring, weighing, filling and fastening up. We learn from a manager of long experience in India, who now uses no other chest, that the putting together and completing 60 per day is the ordinary work of one factory mistry, or three times as many as the same mistry could do of wooden chests.

The "Acme" chest, when completed, with its load of tea, has a very taking appearance, and assuming that our informants, who doubtless have large experience with them, are correct in saying that they deliver the tea in excellent order in London and are popular with tea-buyers there, we do not see that in simplicity, handiness, and general efficiency these chests leave much to be desired, and we would recommend for them a fair trial.

No tea lead, hooping iron, or solder are required, so that pilfering of these stores on the garden—a not inconsiderable item—obviously

Advertisers are notified to send all advertisement matter and answers to advertisements direct to Manager, this paper, 3, Esplanade Row, Madras.

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

disappears. Of late complaints of "cheesiness" in teas arriving in the market have become increasingly common. The taint attributed to the use of unseasoned wood in the making of chests is a serious matter for all concerned. Local contractors so frequently fail to deliver to time, that planters have practically no alternative but to use planking which is not properly seasoned, and in consequence the teas when put up to sale do not meet with the competition awaiting invoices which are free of taint. In view of these considerations, and the economies in freight and charges claimed by the makers for their package, it seems more than likely that the "Acme" tea chest, now that it is available on the spot, will speedily make an enduring place for itself. As to the strain it is able to bear, we cannot do better than quote from the Indian Tea Association's Report by the Special Committee appointed to investigate the handling of tea chests by the Port Commissioners:—"From what we saw at the warehouse and jetties, we have arrived at the opinion that it is almost impossible to expect chests containing over 100 lbs., except perhaps the 'Acme' chests, to be safely and properly handled."

ROUND THE BUNGALOW.

NOTES BY A PLANTER'S WIFE.

More liberal use of butter. No dietetic reform would, I believe, be more conducive to improved health among children, and especially to the prevention of tuberculosis, than an increased consumption of butter. Our children are trained to take butter with great restraint, and are told that it is greedy and extravagant to eat much of it. It is regarded as a luxury, and as giving a relish to bread rather than in itself a most important article of food. Even in private families of the wealthier classes these rules prevail at table, and at schools and at public boarding establishments they receive strong reinforcements from economical motives. Minute allowances of butter are served out to those who would gladly consume five times the quantity. Where the house income makes this a matter of necessity, there is little more to be said than that it is often a costly economy. Enfeebled health may easily entail a far heavier expense than a more liberal breakfast would have done.

Cod-liver oil costs more than butter, and it is besides often not resorted to until too late. Instead of restricting a child's consumption of butter, I would encourage it. Let the limit be the power of digestion and the tendency to biliousness. Most children may be allowed to follow their own inclinations, and will not take more than is good for them. The butter should be of the best and taken cold. Bread, dry toast, biscuits, potatoes, and rice are good vehicles. Children well supplied with butter feel the cold less than others, and resist the influenza better. They do not "catch cold" so easily. In speaking of children, I by no means intend to exclude other ages, especially young adults. Grown-up persons, however, take other animal fats more freely than most children do, and are besides allowed much freer selections as to both quality and quantity. It is not so necessary to raise any clamour for reform on their account.

Some time ago I was asked how to get rid of flies. Since then I have come across the following recipe which reads as though it would be very efficacious and certainly would be very easy to try.

Destroying flies.

Take some jars, mug or tumblers, fill them half-full with soapy water, cover them as jam pots are covered with a piece of paper, either tied down or tucked under the rim. Let this paper be rubbed inside with wet sugar, treacle, honey or jam, or anything sweet; cut a small hole in the centre, large enough for them to enter. The flies settle on the top, attracted by the smell of the bait. They then crawl through the hole to feed upon the sweet beneath; meanwhile, the warmth of the weather causes the soapy water to ferment and produces a gas which overpowers the flies, and they drop down into the vessel. Thousands may be destroyed this way, and the traps last a long time. A large handsome Japanese lily (*lilium auratum*) kept growing in the room will drive them away.

Hints various.

Lamp wicks should have the charred part rubbed off with a rag kept for the purpose. They should very seldom be cut. They should not be used so long that the webbing becomes tight and non-porous.

When it is required to use carbolic acid as a disinfectant, it should be mixed with boiling water. This promptly overcomes the usual antagonism between the acid and the water and converts them into a permanent solution, which will keep for weeks.

Here is a receipt for cleansing delicate laces which an old lace maker, who has woven many a gossamer web for the great connoisseurs and lover of laces, Mdme. Modgeska, gave to her pupil and patron. Spread the lace out on paper, cover with calcined magnesia, place another paper over it, and put it away between the leaves of a book for two or three days. Then all it needs is a little skill to scatter the powder, and its delicate little threads are as fresh and clean as when first woven.

To clean zinc articles, rub them well all over with paraffin oil applied on a piece of flannel; then make a lather of hot water and soap, and wash them well in it. This treatment will render them almost equal to new.

DISTRICT ASSOCIATION.

SHEVAROYS.

PROCEEDINGS of the Monthly Committee Meeting of the Shevaroy Planters' Association held in the Victoria Room, Yercaud, on Monday, 1st November, 1897, at 1 P.M. *Present*:—Mr. H. W. Leeming, Rev. M. Anderson, Messrs. J. C. Large, Messrs. C. G. Lechler (*Chairman*), Rev. J. M. Kampf, Messrs. C. Rahm, S. M. Right, and R. Gompertz (*Honorary Secretary*).

Read and Recorded letter from Secretary, U. P. A. S. I., dated 9th October 1897, forwarding copy of a letter from the Accountant General, No. 3044, of 2nd instant, re charging commission for changing currency notes.

Read letter No. 1062, dated 16th instant, from the Deputy Inspector-General of Police, forwarding abstract of Coffee Stealing Act, copy of his instructions to his subordinates, and of a letter to the Collector recommending that all warrants for arrests of coolies, &c. should be registered by the Station House Officer, Yercaud.—*Recorded with satisfaction.*

Read letter from Secretary, U. P. A. S. I., dated 22nd October 1897, forwarding copy of a letter from Sir W. Mackworth Young thanking U. P. A. S. I. for their appreciation of his services.—*Recorded.*

Read letter from Mr. Leeming giving notice that he will propose that surplus funds be devoted towards purchasing books, &c.

Resolved that Mr. Leeming's proposal that surplus funds be devoted to purchasing books and pamphlets, &c., with a view to forming the nucleus of a Planting Library be adopted, and that the Honorary Secretary be requested to invite all members to send him the names of any works they may wish for.

Read and Recorded letter from Mr. Leeming, dated 18th October 1897, withdrawing his complaint referred in para. 3, clause 2, of Proceedings of last General Meeting.

The following papers were laid on the table:—Proceedings of Coor and Nelliampathy Associations. *Planting Opinion* for 9th, 16th, 23rd and 30th October. 2 Copies of Agricultural Ledger No. 17 of 1896 (Water lifts). No. 9 of 1897, Lagerstræmia Flos Regni (Jarul).

C. G. LECHLER, *Chairman*.

ROBERT GOMPERTZ, *Hon. Secretary*.

IN CASE OF FIRE.

Your house takes fire. What burns first? The lightest and most inflammable stuff, of course—furniture, doors, shelves, floors, paneling, and other woodwork. If it is a stone or brick house, the wall will probably remain standing—a melancholy sight.

Were not this a principle of universal application, Mr. Medding would never have compared himself to a skeleton, as he does in the letter to which your attention is now invited.

"In the autumn of 1891," he says, "I fell into a low, weak state of health. My ordinary energy appeared to have gone out of me, I always felt tired and languid, and couldn't account for it. Nothing seemed to rest me. I was as tired in the morning as when I went to bed. I had a bad taste in the mouth, my appetite was poor, and after meals I had a pain at my chest and left side.

"I was in this condition until the 14th of March, 1892, and then I had to give up work. The reason was, I was too weak to work."

I act, I was so weak that it was about as much as I could do to walk across the floor. Besides this I had a dry, hacking cough; and at night I sweat so the bedclothes were wet. Sometimes during the day cold, clammy sweats would break out all over me.

"I lost flesh rapidly, until I was like a skeleton. My muscles seemed to be shrunken and withered. There was no feeling of warmth in me; it was as though my blood had gone cool and thin. I was too feeble and helpless to wash or dress myself, and people said I was wasting away, as though they expected to see the end of it presently.

"I consulted two doctors and they gave me medicine, but it did me no good. One day my aunt, Mrs. Benton, of Francis Street, Walsall, called, and in the course of talk she said that the medicine that did her good when she was ill was Mother Seigel's Curative Syrup. Although it didn't look reasonable to believe that it could cure a case as bad as mine, nevertheless my wife got me a bottle from Mr. Grove, the chemist in Park Street, and I commenced taking it. In a few days I found myself much better; my appetite was better, and I had gained a little strength.

"To make the story short, I kept on taking the Syrup and continued to get better. As soon as I could digest my food, the night sweats and the cough abated, and in a few weeks I was able to go back to my work. That is two years ago, and since then I have been in good health, for which I have to thank Mother Seigel's Syrup. (Signed) Arthur Thomas Meddings, 115, Farringdon Street, Walsall, March 6th, 1894."

In a fire, as we said, it is the light, inflammable stuff that burns first. That's why Mr. Meddings got to be so ghastly thin. The flesh or fat is the fuel of the body. In health it keeps up the warmth and furnishes the power. And to keep up the fuel we must eat.

Now, disease is a conflagration; it tries to burn the house up, and often does it. And it always burns the flesh up, more or less of it. The fat goes first, the muscles, &c., afterwards. That's the way of it. About that time the tenant moves out.

Our friend was well on towards that point. But it wasn't lung disease that ailed him, albeit he had the cough and the sweats. They go also with indigestion and dyspepsia—his real and only malady. He got feeble and thin because his disease wouldn't allow the stomach to digest food. Hence he consumed all the flesh he had stored up, and then (luckily for him) he began to take Mother Seigel's Curative Syrup, which set his stomach and liver right, and gave his victuals a chance to feed him.

All the same, it is dangerous to let a fire get headway. When it is in your body, quench the first spark with Mother Seigel's Curative Syrup.

MARKET SUPPLEMENT.

SATURDAY, NOVEMBER 20, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (October 29, 1897) says:—Small supplies are still noticeable in Public Sale, but the demand is slow for all descriptions except the superior qualities.

Only second hand parcels of East India were offered, which sold slowly at unchanged values.

Columbian formed by far the greater part of the Central American catalogued, good colory grades realised full rates, but mixed and common kinds declined 1/- to 2/-.

The 'Terme' market has been weak and prices have given way 2/6 since our last in consequence of an estimate of 9 million bags for the present Brazil crops, and cheap cost and freight offers.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending October 27th, 1897, says:—Bank rate 3%. Bombay Exchange closes at 1s 3 $\frac{1}{2}$ d. Brazil Exchange 7 $\frac{1}{2}$ d. Rupee paper 3 $\frac{1}{2}$ % 62 $\frac{1}{2}$. Silver 27 $\frac{1}{4}$ d per oz.

This market continues dull and lower for ordinary and common, which are difficult of sale, whilst there is good competition for the finer qualities at fully previous prices; business is generally very slow. Brazil markets are again lower, on larger estimates, and there seems no doubt now that the present crops will be, if not larger, at any rate quite as big as last year. Good average Santos is worth about 30s, c. & f.

Futures opened rather firmer, but have since been depressed, and close 1s 6d lower, viz. — Good average Santos in Havre, December delivery, fcs. 39.75, in Hamburg pf. 34 $\frac{1}{2}$, and No. 7 low ordinary Rio in New York \$6.10. To-day's London official quotations are:—

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report dated October 29th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1897-1898...	574,436 packages.	540,402 packages.	18,383 packages.
1896-1897...	578,869 „	485,507 „	20,196 „

46,576 pkgs. INDIAN } Total 67,364 packages were offered in public
19,994 „ CEYLON } auction this week.
794 „ JAVA }

With the expectation of lighter supplies than was anticipated a few months ago, business continues brisk, and offerings of both Indian and Ceylon Teas are readily taken at steady prices.

Indian. 46,576 packages were brought forward against 45,522 last week. The market for all grades, except perhaps medium whole leaf Teas with poor liquors, being steadily supported. Competition throughout the sale was fairly general.

It will be seen from the following table that the average price obtained for all Indian Teas sold on garden account since 1st June is a half penny less than last season, the details of the various districts being given below.

The following averages are worthy of note:—“Beheading,” 1/ “Oaklands,” 1/2; “Solimbong,” “Assam Co Dhole Bagan,” “Mohokut” and “Towkok,” 1/1 $\frac{1}{2}$ d.

Week's av. of Tea sold on Garden Account, 1897, 35,898 pkgs.

SUPPLEMENT TO "PLANTING OPINION."

Ceylon. The auction was again light, consisting of 19,994 packages against 20,108 last week. The recent advance was fully maintained, bidding being steady and competition strong for all descriptions. Only a small sale is advertised for next week, consisting of 18,589 packages.

The following averages may be mentioned:—"Newera Eliya T Co. Concordia," 1/3; "S T Co. St. Leonards," 1/2; "Ormidale," 1/1½; "Haputale T Co. Kellie," 1/1½; "Portmore T Co Port," "Henfold," "St. Clair," and "Scottish Trust and Loan Co Alnwick," 1/1.

Average for the week 9'03d., against 8½d. for the same period last year.

Ceylon Tea sold on Garden Account 1st January to date 1897, 923,952 pkgs., av. 7½d. 1896, 830,146 pkgs., av. 8½d.

OTHER PRODUCTS.

CARDAMOMS.—At auction 160 packages were offered of which about 130 sold, at 3d. to 4d. lower for medium grades: Ceylon-Mysore, fair long, and round medium pale, realised 3s. 9d.; medium to bold fair yellowish sold at 4s., subject to approval; fair medium, 3s. 6d. to 3s. 7d.; specky and split, 3s. 4d.; dull, lean, and shelly, 3s. 4d. For Ceylon-Malabar, medium to bold brownish pale 3s. 6d. is asked, a bid of 3s. 4d. being refused. Common yellow Seed realised 3s. 3d. per lb. Mail-reports from Bombay, dated September 29, state that a fairly good business continues to be done in cardamoms. Transactions have taken place in Mysore at prices ranging from 2.25r. to 2.50r. per lb., while in Malabar several parcels changed hands from 1.65r. to 1.90r. per lb. The market is very steady, and there is a good demand, especially for Malabar. "Seeds" are quoted at 2r. to 2.10r. per lb. The exports from Ceylon in the periods between January 1 and September 21 of the last four years have been as follows:—

Year	1897	1896	1895	1894
lbs.	366,033	243,177	260,255	212,462

Of this year's shipments, 195,788 lbs. have gone to the U. Kingdom, 29,330 lbs. to Germany, and 140,503 lbs. to India.

CINCHONA.—Seven bales fair West African *Succirubra* quill were shown at auction and bought in at 6d. per lb. This variety now realises prices far above its quinine-value on account of the demand for it on the part of Cinchonidin makers. Of 44 bales *Guayaquil* bark 25 sold at 5½d. to 5½d. per lb. for fair partly brown thin quill, and at 5½d. to 7d. per lb. for fair to good Loxa kind, but damaged. Twenty bales *Carthagera* bark, slightly damaged, but of good quality, were bought in at 7d. per lb.

COCA-LEAVES.—Of 60 bales offered at auction, 41 sold at 4½d. to 4½d. for fair green, rather broken *Truxillo*, slightly damaged, and 2d. to 4d. for more damaged ditto. Fair broken leaf is held for 9d. per lb.

CROTON SEED.—The only parcel offered to-day was one of five bags dark mixed and dull seed from Colombo, which was bought in at 45s. per cwt.

IPECACUANHA.—The supply of Rio root consisted of 52 bales, including some very ordinary damaged and woody "pickings." Altogether 29 bales sold at from 6s. 3d. per lb. according to quality. For good thin sound root 6s. 3d. to 6s. 4d. per lb. is asked. Four packages only of *Carthagera* were offered and sold at from 4s. 6d. to 4s. 8d. per lb.

JALAP.—Somewhat more freely offered and dull of sale. The two parcels at auction aggregated 65 bales, but only a few lots sold. A parcel of 11 bales, slightly wormy Vera Cruz sold cheaply at 5½d. per lb.; another of 15 bales fair, partly small unworked ditto, was bought in at 6½d. per lb. The remainder consisted of fair unworked root, which was bought in at 7½d. per lb.

KINO.—At auction 3 cases (total 205 lbs.) of red *Zambesi* gum, which have been repeatedly offered, were again bought in at from 6s. to 8s. per lb. Of 5 small tins (7 to 14 lbs. each) of good genuine *Cochin* grains, 2 sold at 15s. per lb., showing how firm the market really is.

KOLA.—Barely steady. Four bags good bright bold West Indian realized 6d. per lb. at auction to-day. Seven bags small dry fair African kolas were bought in at 4d. to 5d. per lb. Another parcel of 20 bags was bought in, fair bright washed, at 4d. to 6d. per lb.

QUININE.—On Monday of this week Messrs. *Howards & Sons* established a new scale of prices for their quinine salts. Their rates for 1,000-oz. lots of sulphate are now as follows:—

In	...	100-oz. tins	25 oz. tins	4-oz. bottles
Per oz.	...	1s. 3d.	1s. 3½d.	1s. 4d.
In	...	1-oz. vials	½-oz. vials	¼-oz. vials
Per oz.	...	1s. 5d.	1s. 6d.	1s. 7½d.

Smaller wholesale quantities, 1d. per oz. extra (in 1-oz. vials):—pure quinine, 2s. 1½d.; arseniate, benzoate, and citrate, 2s.; salicylate, hydrobromate, and hydrochlorate, 1s. 11½d.; hydrophosphate, 3s. 4d.; valerianate, 2s. 2d.; phosphate, 2s. 0½d.; and tannate, 1s. 3d. per oz. At auction 5,000 oz. of *Brunswick* quinine in bulk were offered and bought in at 1s. 3d. per oz. The *Auerbach* agents are offering to-day at 1s. 2d. per oz., which is rather lower. A parcel of 2,000 oz. of *Auerbach* quinine in 100-oz. tins was bought in at 1s. 2d. per oz. to-day.

Wax (Bees') was in large supply at to-day's auctions, but met with little demand. 692 packages *Madagascar* were offered, of which about 76 sold at from 5l. 7s. 6d. to 5l. 17s. 6d. for dark warmy to good brown quality. Forty-one packages *Jamaica* were bought in at 7l. 10s per cwt., no bids being made. *Spanish*, of fair quality, is held for 6l. 10s.; *Australian*, of fair colours, 6l. 15s.; *Italian* at 7l. 10s. for good yellow to fair. One package *Mozambique*, of fair quality, sold at 6l. per cwt., and Zanzibar of good colour at 5l. 17s. 16d. Bleached *Calcutta* wax was in fair supply but nothing sold at auction. For a lot of low brown dark quality 10s. was bid—then 11s.; but the lot was taken out. Dull grey *Calcutta* is held for 6l. 10s. per cwt.

Christmas Cards.

A large and varied selection of Raphael Tuck's artistic Christmas Cards may be seen at ADDISON & Co.'s Stationery and Fancy Goods Stores, Mount Road, Madras. These Cards are of the very latest designs, and are very moderately priced.

Any description of PRIVATE CHRISTMAS CARDS made to order. ADDISON & Co.'s facilities for manufacturing Fancy Cards of special shapes and designs are unequalled in Madras.

DIE SINKING & DIE STAMPING.

Crests and mottoes, Address dies, business dies, carefully and correctly engraved and stamping neatly executed in any colour. Copper-plates for visiting cards engraved at short notice.

At Home Cards, Dinner Invitation Cards, Menu Cards, Ball Programmes, Pencils and Tassels, and any description of Society Printing.

STATIONERY AND FANCY GOODS in immense variety.

A large stock of articles suitable for Christmas Presents.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c. Letters to the Editor should be addressed to Coonor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 3rd December 1897.

South Travancore. SHENCOTTAH, 15th November.—I don't think we shall get much more rain this year. A couple of showers between this and Christmas would be all we want, as our N. E. rains have been early and continuous. Some of our coffee has quite enough leaves on already, which is very unusual for the time of the year.

Nellampatty (British). 24th Nov.—*Weather.*—Very bright and pleasant, with cold, sharp mornings. No rain since last report, and water running very short in all the streams already. It clouded up this morning and we may get a shower this evening. *Crops.*—Coffee coming in slowly. What has been picked was the first blossom fruit, and the larger half is just beginning to come in. *Labour.*—Plentiful. *Health.*—Good. *Interesting Items.*—Our local Selous bagged three bears, I hear, the other day.

Nilgiris. COONOR, 24th November.—Still bright and sunshiny, with cold clear nights. The N. E. Monsoon has apparently left us for good and all. The springs are very dry for the season of the year. For a parallel to this exceptional weather we have to go back to 1878, when December (and the latter end of November) made up partly for failure of the early monsoon. We shall certainly suffer next year for this dislocation of the season. As it is, things are getting serious in parts, as coffee is not ripening up at all well. It is on the other hand looking extremely fit, with lots of good bearing wood for next year, and with dark green beautifully glossy foliage. Tea is flushing away as strongly as ever, and is turning out very well in manufacture. Food grains are high, but soon we hope to see a great reduction in the high prices of the last year or so. No one has yet bagged an ibex in these parts, I believe, though several attempts to do so have been made.

Kadur.

MUDIGERE, 24th November.—*Weather.*—Continues fine. Mornings are cold, the thermometer being 58. *Crops.*—Rain is wanted to help to ripen the crop, which is still very slow in coming in. Estimates are being reduced in many cases, and very few original estimates will be realized. *Plant-diseases.*—Leaf-disease still about but not bad. *General Health.*—Good. It is remoured that the plague has made its appearance in Chikmagalur. Another Hospital Assistant is greatly needed; the one at Mudigere is often away for a week, having to visit Kalasa and other places 30 miles away. *Labour.*—Plentiful, and if it continues so, it would be a good opportunity for all planters to keep down advances next year or not advance at all. *Interesting Items.*—*E. lithosperma* plants are to be seen all over the district and seem to do very well. The great desire about here is that the P. O. should be a fortnightly paper. Your "special" correspondent wishes it were monthly.

SOME DANGERS ATTENDANT ON CATTLE MANURING.

WE have been taken to task by a correspondent for not earlier satisfying the curiosity of our readers, aroused by a mention of the remarkable article of Professor Henry Somerville on "Recent Experiments in Denitrification." We will now do our best to redeem our promise. The article, which appeared in the last number to hand of the Journal of the Royal Agricultural Society of England, is unluckily too long to extract in full. Our task will be therefore to present our readers with as clear a *résumé* as possible consistent with the small space at our disposal.

Professor Somerville begins by dwelling on the foremost position still held in the rank of manurial agents by the oldest fertilizer known, *i.e.*, farmyard manure—a position moreover which no artificial manure can be said to have displaced, despite their almost universal application. So important is the old favourite of farmers and planters, that whether we accept them or not, the results of recent investigations held in Germany into their character are so startling that we are forced to give them our serious attention.

Following the headings in the article under notice, we will begin with the

NITROGENOUS COMPOUNDS OF FARMYARD MANURE,

as nitrogen is undoubtedly its most valuable constituent. This element exists partly in the solid fæces, partly in the liquids and partly in the litter. In the solids of the horse, cow and ox, Maercker has shown that most (from 80 to 90 %) is in the albuminoid form, the rest being present as ammonia, nitric acid and amides. The albuminoid nitrogen is extremely slow in its action, and probably but little of it is ever assimilated by plants at all. Of the other three forms of nitrogen, the ammonia and nitric acid are of almost equal value as that in sulphate of ammonia and nitrate of soda, the amide nitrogen being also very active.

The nitrogen in urine is for the most part in the form of urea, which passes with great rapidity into carbonate of ammonia and is practically as available as the sulphate, though no doubt more liable to waste. Wagner found that in ordinary temperature the nitrogen in a mixture of urine and water was practically all converted into ammonia in three or four days.

The nitrogen in straw is chiefly in the albuminoid form and is of but little value.

ACTION OF DUNG IN OTHER NITROGENOUS SUBSTANCES

When various samples of pure horse, cow and ox-dung were employed for supplying nitrogen to plants cultivated in pots filled with soil that contained abundance of universal food, the results were most unexpected. Maercker found that by applying to vats nitrogen in the form of nitrate of soda, the increase over the unmanured yield was 186 per cent. When, however, he gave the same quantity of nitrogen in the form of horse, cow and ox-dung, respectively, the yield was actually decreased. The horse-dung reduced the yield in one case by 20% and in the other by 48%, the cow-dung reduced the yield by 27% only, ox-dung alone increased the yield, and that by 4% only. In two of the above cases, the nitrogen taken up by the plants was less than when unmanured, in the other two cases a slight increase was shown. From vats, Maercker turned to white mustard, but with practically concordant results, though showing still more strongly, if possible, against the use of farmyard manure.

Wagner's experiments were conducted with white mustard, each test, as in Maercker's case, being repeated three times, and the results show great uniformity. With nitrate of soda the increase was about thirty-fold over unmanured output, while cow-dung and horse-dung actually showed a decrease of 69 and 75 per cent., respectively, below the unmanured yield. In these latter cases also, the plants had taken up even less nitrogen than when grown without any but mineral manures. Even assuming albuminoid nitrogen of dung to be absolutely inoperative, yet the ammoniacal and amide nitrogen would certainly if applied above, have produced an increase in the crop. In some way or other, then, the action of this otherwise active nitrogen was hindered. In Maercker's experiments it was found that nitrate of soda and urea were respectively capable of more than doubling the yield when applied to soil without dung, their action was very much less when they were applied in conjunction with either horse, cow or ox-dung. He found that the action of the dung dissipated from 12 to 47 per cent. of the nitrogen in nitrate of soda, the loss being greatest when the largest quantity of cattle manure was used.

Wagner found that mustard recovered 65 per cent. of nitrogen from the nitrate, when this was used alone; only 30 per cent. was recovered when used on a moderately horse-dunged soil. Nor was this action confined to nitrate of soda. When active nitrogen was applied in the form of urea and chopped lucerne, the recovery was, when applied alone, 60 and 38 per cent. respectively; but when in conjunction with dung, the recovery fell to 38 and 8 per cent.

In other and very extensive experiments with white mustard, Wagner tried the effects of applications of nitrate, sulphate of ammonia, blood meal, chopped grass, cow urine, horse and cow-dung, and various samples of farmyard manure. The results were very similar to those already given, and need not be repeated. In each case the harmful effect of the dung was clearly apparent.

What then is the cause of the depressing action of dung in the more active forms of nitrogen? When fresh or comparatively fresh dung is applied to a crop, and especially to a cereal crop, it frequently causes the plants to assume a pale, yellow, unhealthy colour. This condition might be due to two causes: either the dung unfavourably affects the physical condition of the soil, or it exercises a harmful

fluence on the available nitrogen already present in the soil. In the latter case, it would amount to starving the plants of their nitrogen; and that this is the true explanation is clearly indicated by Wagner's experiments with rats. When the plants were about six inches high, it was found that those in the dunged pots were much yellower than those in the unmanured soil, and while in this condition they received a weak solution of nitrate of soda. Doubtless some was neutralised by contact with the dung, but enough was absorbed to markedly change the colour in three days, while in a week the sickly yellow colour had entirely disappeared.

To show that the disappearance of the nitrogen of the nitrate of soda in presence of dung is not due to its sinking into the subsoil, and is only partly due to its appropriation by plant-roots, Wagner carried out the following experiment, in which no plants whatever were grown. A number of pots were all manured with mineral plant-food. Some of them were given $\frac{1}{2}$ gramme of nitrogen in the form of nitrate of soda, others received 600 grammes of horse-dung, while others received both. Six weeks later, the soluble contents were carefully extracted with water. Where no dung was used, 93% of the nitrate of soda was still present, whereas in dunged pots only 42 per cent. of the nitrate was left. More than this, the dung, besides dissipating the nitrogen in the nitrate of soda, had also acted in the natural nitrates of the soil. For the horse-dunged pots gave a filtrate containing only 0.15 gramme of nitric nitrogen, while that from the unmanured and undunged pots gave 0.72 gramme. Yet in another set of experiments, very similar results were obtained by Wagner, showing that the percentage disappearance of nitric nitrogen was greatest where least nitrate of soda had been used, and in the presence of the larger application of dung.

HOW DOES DUNG CAUSE WASTE OF NITROGEN?

Does this nitric nitrogen take the form of some insoluble compound, or of ammonia, or free nitrogen? Wagner, Maercker, Stutzer, Pfeiffer, Dietzell and others have conclusively shown that it is dissipated in the elementary form and escapes of course into the air. This was proved as follows. A given quantity of nitrate of soda and dung was placed in a flask, through which air was drawn by an air-pump. The air that enters the flask is rid of ammonia, and escaping gases are caught and analysed. In every case it was found that the nitrogen was liberated in the elementary form. If the air is altogether excluded, denitrification ceases, but the free natural circulation of air would appear to create as favourable denitrifying conditions as are secured by more rapid and perfect artificial aeration.

Wagner has shown that this loss of nitrogen is due to the action of bacteria. Fresh horse-dung and carbon disulphide were placed together in a flask, being left in contact for six days. At the end of that time part of the mixture was taken out and placed in another flask, and heated in a water-bath of 60 to 65° C. for four hours. All the carbon disulphide having then disappeared, a solution of nitrate of soda was poured over the dung. Another sample of dung was treated in exactly the same way, except that it received no carbon disulphide. In four days the unsterilised dung reduced 56 per cent. of the nitrate, whereas the sterilised solution had effected no trace of denitrification. In three days more, the whole of the nitrate was denitrified

by the unsterilised dung, while denitrification was only just beginning in the sterilised sample. In 14 days from the date of placing the nitrate and sterilised dung together, 12 per cent. of the nitrate had been reduced, augmenting to 19 per cent. in 25 days. The carbon disulphide had evidently cleared the dung of the denitrifying bacteria, whose subsequent recurrence was due either to spores unharmed by the carbon, or else to immigration from the atmosphere.

The conclusion is inevitable that nitrates, natural or artificial, are rapidly destroyed by organisms contained in dung and also to a lesser degree in the soil. Maercker found that numerous samples of farmyard manure from dung-heaps gave much the same results as those from pure fæces. The wheat straw found in farmyard manure, when chopped up and applied to oats, reduced the yield by 89 per cent., and the aggregate yield of three crops of mustard, grown in succession in the same pots, by 74 per cent. Various mixtures were also tested, with the result that the crop was least and the loss of nitrogen greatest in the mixture that contained most straw.

Straw was also found by Wagner to possess very strong denitrifying influences. Thus complete denitrification of nitrate of soda was effected in seven days by means of straw and dung, against 12 days when dung alone was used. Again, an addition of straw to rotted dung denitrified the nitrate in eight days against 22 days for the dung alone. In another series of experiments Wagner found that in a mixture of garden soil, water and nitrate, denitrification was not quite completed in 400 days, whereas the addition of chopped straw completed it in six days. Corroborative results were obtained when straw was given to crops of mustard.

CAN THE DENITRIFYING ACTION OF DUNG BE PREVENTED?

Maercker and Wagner both found that the denitrifying ferments disappear to some extent with age. Maercker prepared a series of pits filled with soil, to all of which was added fresh horse-dung. In one case he applied nitrate of soda along with the dung; in another case it was withheld for fourteen days, in another for twenty-eight days. In each case mustard was sown at the time the nitrate was applied. In the first sample the dung reduced the yield (as compared with that from nitrate alone) by 38.8 per cent.; in the second case the dung reduced the yield by 52.4 per cent.; while in the last case—when the nitrate was given 28 days after the dung—the crop was reduced by 54.4 per cent. Evidently four weeks were not enough to modify the harmful effects of the dung, which were worse after 28 days had elapsed than before.

Directly the first crop of mustard had been reaped, a fresh supply of seed was sown in all the pots, nitrate of soda being simultaneously applied. In one case the yield was reduced by 8.2 per cent.; in another by 5.7 per cent.; while in a third case an *increase* of 7.1 per cent. was obtained by the mixture of dung and nitrate than by nitrate alone.

Advertisers are notified to send all advertisement matter and answers to advertisements direct to Manager, this paper, 3, Esplanade Row, Madras.

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

After reaping, a third crop was sown (the intervals between the three sowings being about five weeks) and again nitrate of soda was simultaneously applied. The results were practically the same as obtained in the second crop, if anything a trifle greater loss ensued.

Wagner experimented in the same direction, and showed that the denitrifying bacteria are much less energetic in old than in fresh dung. He prepared cemented pits, into each of which half ton of fresh horse-dung was placed. From these pits samples of dung were drawn every fourteen days, and the effects of the bacteria present tested on flasks containing solutions of nitrate. In one series the pits were turned over every seven days, in another once a fortnight, but no difference could be observed. Confining ourselves to one series—where the dung was turned once a fortnight—we find that the sample fourteen days' old took thirteen days to denitrify the nitrate solution; a month old sample took nineteen days; a six weeks' sample took thirty-one days; a two-months' sample forty-one days; a ten-weeks' sample took sixty-five days. This supports the well-known agricultural value of well-rotted over fresh manure. Wagner demonstrated this with vats. Nitrate of soda alone produced an average of 244.3 grammes, while dung of equal nitrogen value produced 177.0 grammes when fresh and 243.3 grammes when rotted.

Wagner and Maercker have been and still are occupied with an extensive series of experiments into the conservation of the nitrogen and organic matter of farm-yard manure, with results, says Professor Somerville, of the highest interest and value. Briefly, although great loss of elementary and combined nitrogen takes place in dung heaps, the loss is almost entirely confined to the nitrogen of the urea, the albuminoid nitrogen of the solid faeces and straw being dissipated to a very slight extent. As, however, the nitrogen in the urea alone is of much value, the consolation derived from the stable form of nitrogen in the solids is not great.

REFERENCE TO ENGLISH RESULTS.

The laboratory experiments described above are supported in a striking manner by the field experiments conducted in recent years in England. Year after year, the addition of artificials to dung failed to increase the crop, and in some instances have positively decreased it. The conclusion arrived at was that farm-yard manure in average quantity gave the crops all the food they required. Now, however, a flood of light has been thrown on the subject, showing that the denitrifying bacteria attack the nitrates and dissipate their nitrogen. This action moreover is not confined to nitrate of soda, but is met with almost proportionately in sulphate of ammonia and organic manures. Further, the addition of even purely phosphatic and potassic manures to dung has often resulted in no increase of crop whatever.

It has already been pointed out that the denitrifying action of dung decreases with age, but Wagner has shown that various substances, such as superphosphate of lime and kainit, have the power of greatly intensifying and prolonging this deleterious action. Cemented pits of half ton each were filled with dung, and in certain cases approximately three parts of the substances referred to were carefully mixed with every 100 parts of dung. The dung was turned every ten days. In ten weeks samples were drawn and used to denitrify a definite amount of nitrate of

soda. On the average the pure dung samples took 63 days to effect complete denitrification, while those mixed with supers and kainit only took 41 and 37 days respectively. After 112 days had passed, fresh samples were drawn and tested for 56 days. The pure dung only reduced 8 per cent. of the nitrate, while the superphosphatic and kainit dung had reduced it by 40 and 66 days respectively.

In another series of experiments, where the dung was turned, it was found that samples taken at the end of storage of eleven months denitrified as follows:—

Dung without any addition completely denitrified in	31	days
" with addition of superphosphate completely denitrified in	22	"
" with addition of kainit completely denitrified in	20	"

This 3 per cent. addition is the proportion adopted by farmers when they use 6 cwt. of phosphates or kainit with 10 tons of dung, a very usual mixture. This seems to explain, says Professor Somerville, why he found in Northumberland that, in experimenting with 12 tons of dung per acre, the average crop of swedes on nine farms was 2 cwt. per acre heavier with $2\frac{1}{2}$ cwt. of supers than when 5 cwt. were used. In another year, in Durham, the average crop of swedes on eleven farms was 14 cwt. greater per acre with the smaller quantity. On the average of nine farms in Cumberland, Durham and Northumberland, the crop of swedes was $\frac{1}{4}$ cwt. per acre heavier with 5 cwt. compared with $7\frac{1}{2}$ cwt. In the same year (1895) on the same farms, $2\frac{1}{4}$ cwt. of dissolved bones produced a crop 4 cwt. per acre heavier than that grown by a double quantity of the same manure. In all these cases the artificials were used with equal (i.e., 12 tons per acre) dressings of cattle manure.

Why the addition of phosphoric acid and potash should intensify and prolong the activity of the denitrifying bacteria in dung has not been explained. It is supposed that the minerals are used as food by the bacteria. The German investigators, whose work has been reviewed here, have shown that the organisms can be largely destroyed (a) by frequently turning dung-heaps, so as to induce rapid fermentation, oxidation and a high temperature, and (b) by adding certain substances, of which the most effective were found to be sulphuric acid and copper sulphate. And conversely certain of our commoner artificial manures must be placed amongst the number of those substances that favour the growth and development of these organisms.

The conclusions to be drawn from the above by planters are obvious. Keep your cattle manure as free from straw and bedding of any sort (presumably) as possible; never apply it when fresh, but keep it as long as possible—under cover so that it may be perfectly rotted; apply it alone and never use nitrates, phosphatic or potassic manures in conjunction therewith.

GENERAL NOTES AND ARTICLES.

An interesting interview with Mr. G. L. Acworth, ex-Chairman of our U. P. A. S. I., was recently published in the *Times of Ceylon*. We note that the agitation amongst our planting community was started by a letter from the South Travancore Planter, Mr. Clarke, in 1894. Mr. Acworth is of opinion that a compensating export duty on the exchange left free by Government, would have to

a great deal more than the 5% proposed by the present Chairman of the U. P. A., more like 10 to 15% in fact. However, the tax levied by the present high exchange is from 40 to 60 per cent.; it would be worth our while to pay even 20 per cent. direct export duty. He thinks the collapse of the present high exchange inevitable, and in getting up the agitation to open the mints, Mr. Acworth declares that the West Coast merchants at any rate would refuse to join the planters. The real support will come from the producing classes all over India; growers of tea, coffee, indigo, opium, wheat, rice and cotton all compete at present against silver countries. They are therefore all subject to the same tax.

Plantains.

A Mysore planter wishes for all the information that we can give him on the exportation of plantains to England, both in their green state and manufactured into flour. With regard to his first query, we are unaware of any instance of Indian plantains having been placed on the English market, either in bulk or flour. Certainly in bulk, the extremely high rates of freight, coupled with the heat of the voyage, would render any prospects of profit extremely slight. Nothing, we believe, has yet been done in India in either the manufacture or export of plantain or banana flour. This product is an experimental one, it must be remembered, and it would be highly unsafe to make any estimates as to profit without figures based on actual consignment. The mode of its manufacture has already been described in these columns. Briefly, the fruit is picked green, and then dried thoroughly in the sun or with artificial heat. The skin is then removed, and the dry chips ground into meal by means of a suitable mill. Another way of preparing them is in the form of "figs." Plantains are kept, on the tree preferably, until dead ripe. They are then thoroughly dried and pressed into boxes in much the same way as the ordinary dried fig of commerce. The industry is principally confined to Jamaica, but Queensland is said to be bestirring herself now in this direction.

We would advise our correspondent, if he takes more than academic interest in the subject, to procure a few bunches of green plantains in the nearest bazaar and convert them into powder the best way he can. To ensure their preservation during the voyage, the meal itself should be exposed to great and lengthened heat; then, when cool, packed in air-tight canisters or tea-chests (lined with paper inside the lead) and sent home to, say, Messrs. John Haddon and Co., or Thos. Christie, or other enterprising brokers. He should ask for samples of the meal sold by Jamaican planters to compare with his own, and, in short, go practically into every detail. Once the manufacture and prices are more or less fixed, he should go into the question of the relative profit of buying or growing the raw product. For the first year, we should strongly advise him to confine his operations to the bazaar and not to attempt planting on his own account.

It is with great pleasure that we note "A. B. C.'s" interest in the matter, and are sorry we cannot help him further in the matter. Were there a royal road to the successful undertaking of new products, we would gladly point it out. Personal experiment, and personal work and worry, are, alas, the only factors that will lead to success in the plantain, as in all other new, and old, industries.

LETTERS TO THE EDITOR.

TEA FLUFF AND COBWEBS.

DEAR SIR,—I sent out a consignment of Dust Tea for local sale in which was one or two tiny specks of *Tea* "fluff." The merchant writing to me informs me that some customers had returned the tea, complaining that there were cobwebs in it!

"PLANTER."

[The first part of your letter has been omitted.—*Vide* our leading article in this issue.—ED.]

FLUSH WORM IN TEA.

DEAR SIR,—If any of your readers could tell me the cause of, and suggest any remedy for, flush worm in tea, I should feel deeply grateful.

16th November 1897.

"FLUSH WORM."

[This pest is very common on the Nilgiris, this year it has been particularly bad. The usual treatment is for the pickers to squeeze the affected leaves between their finger and thumb, thus killing the worm inside. More information is urgently called for on the subject.—ED.]

A TEA-MACHINERY COMMITTEE.

SIR,—It seems to me that if a few members of the Local Planters' Association would form themselves into a Committee of Enquiry in order to investigate the claims of the ever-increasing improvements in tea machinery and consequent alterations or modifications in manufacture, the planting community would be greatly indebted to their kindness. Can you, Mr. Editor, do nothing in that line without giving rise to the suspicion of inspiration? With reference to the last great invention of the oxydizer for fermenting our teas, the authority of results on the Lungla Estate seems given and accepted on every hand, but on reference to that estate for confirmation, the reply received is that no report on results had yet been received from London. In spite of such a paucity of reliable statistics to enable one to form an opinion regarding the machine, it seems the inventor is likely to have his hands full of orders!

"INDIAN PLANTER."

[Noticed elsewhere.—ED.]

COMMERCIAL VALUE OF PLANTAINS.

SIR,—*Re* my former query about the exportation of plantains from India, and the making of plantain or banana meal, is there any actual instance on record in which plantains exported from India have been placed on the English market either in bulk or sample and the nett profit obtained therefrom?

If the experiment has not actually been tried, perhaps you could kindly ascertain whether it is practicable to export in bulk from India to England and the profits likely to arise from such a transaction.

Perhaps some idea could be obtained *re* the practicability of export by comparing the probable number of days to be occupied in transport with the time occupied in transport from plantain-exporting countries.

As the subject will probably prove an interesting one to many readers of *P.O.*, I hope that you, Mr. Editor, and the many readers of your paper may be able to throw some light on the matter.

Again, there is plantain flour. How is it made, and who are the makers and sellers of it?

Can any direct information be obtained on the subject.

SAKLASPUR, 15th November 1897.

"A. B. C."

[Noticed elsewhere.—ED.]

FORKING TEA.

SIR,—Your querist "Planter" recently asked for statistics giving the result in yield and quality of tea followed by trenching or forking during monsoon or growing season. Being unable to give any statistics, I have waited a bit to see if any answer would be forthcoming. For lack of better, I venture to offer my opinion, backed only by observation. I have found that a good nine-inch forking on unforked soil has been followed by a marked increase in flush. Trenching, as far as I have observed, has an opposite result, doubtless due to the hacking of the large sub-soil roots on whose well-being generally depends that of the bush. Comparing unforked tea on one estate with another where forking is the rule throughout the year, I have found that the depth of feeding rootlets in the latter soil is far greater than in the unforked tea. The yield of the forked tea was decidedly greater, about 50 per cent., than that on the unforked tea, which latter by the way was mostly trenched and mamoty-weeded. Again the quality of the forked tea was many degrees better than that of the other, though against the above must be set differences in soil and methods of pruning, both, I should say, much in favour of the forked estate.

I have observed, on forked land, the feeding rootlets of tea to go down about a foot or less, according to the quality of the soil. In unforked land I have never observed them below six inches, except in exceptionally good soil.

As far as I can judge, the great stress laid by our Ceylon brethren upon avoidance of all disturbance to the roots of the tea bush lies rather in the danger that must consequently arise from wash of soil than the disturbance of the roots *per se*.

But there are ways and ways of forking. One consists in completely overturning the clods, thus effecting what is called "clean-forking," I believe, on coffee estates. In other words, all weeds are buried beneath the upturned clod. Excellent as this may appear to be, there is a great danger of forcing the large sub-soil roots, or water-roots, upwards and out of the soil. I have seen striking examples of the great damage thus caused, resulting in the dried roots partially killing that side of the tree. I prefer the other plan myself, simply inserting the fork to its full depth, and loosening the soil, without overturning the clod.

Where practicable, I should be inclined to follow the example of Upper India, where the *young fields* are deep hoed, cutting off at the outset any of those strong side roots that might subsequently interfere with cultivation.

"TEA ROOT."

CROP ESTIMATES.

DEAR SIR,—In former times, managers used to estimate their crops very accurately. Agents and owners relied on their estimates with confidence, and would have been surprised and disappointed if a deficiency of crop of so much as ten per cent. had occurred. Such short falls as have become quite frequent of late were quite unknown. Estimates were generally received and settled about July, when the fruit showed up. But such a thing as a deficiency of 30 or 40 per cent. being first discovered after crop had commenced was never heard of until quite recent times. Such disappointments are now, however, unfortunately but too common. Is it that the present generation of planters are less able, or more careless than their predecessors? Certainly not! Even those old planters who, in former days, used to be so accurate, have since 1870 been so far out in their reckonings as their younger neighbours. I have in mind a recent instance of a crop, originally estimated by a very careful manager of great experience, subsequently confirmed by an old stager, who knew the estate intimately, and again by a visitor who prides himself that he is never deceived, yet this crop fell

short by 50% of the estimates so made and confirmed, and the deficiency was not suspected till the gathering began. The simple fact is that of late years, leaf disease and adverse seasons have so impaired the strength of the trees that they cannot now mature their fruit as they used to do. Original estimates, doubt not, are as accurate now as they were formerly, but there is now a continuous shedding of the young berries which is often quite unperceived and unsuspected until revealed by early gatherings. The berries in the cluster become reduced in number as they increase in size. As the first fruits swell, the failure of that which should follow eludes observation, until gathering begins, when the astonished manager discovers that there is little or nothing left behind.

Such serious disappointments as have lately occurred but too frequently are extremely embarrassing to agents and financiers, especially when they are revealed at so late a period of the year, and they beget distrust as well as confusion. Hence the paramount importance of adopting such means as we possess for preventing them; and this may assuredly be done by ascertaining the actual fall of the immature fruit. The method I adopt and confidently recommend is to select in each field two or three branches, on different trees, representing the average bearing branches of the field, and to count the berries in each of these selected branches from time to time, beginning a month after the blossom and continuing throughout the season to recount them every fortnight. Each selected branch should be marked and numbered, and a careful record should be kept of the result, which will indicate infallibly the loss of premature fall of fruit, and enable the manager to foresee the proportion of the whole which he is likely to harvest. The counting of berries should be continued until near the end of the crop, and should be done by the manager himself, or a very trustworthy assistant, who, as crops begin to ripen, should always precede the pickers and gather from the selected branches all the ripe berries, taking due account of the number gathered. Each successive counting will tell its tale, and a serious failure of the fruit must become evident quite early in the season. I think it probable that the method of counting the berries on selected branches in each field might serve as a very useful means of forming original estimates of crop, but I have not tried it with that object. The ordinary method of estimating has been proved by long experience to be sufficiently accurate unless disturbed by an abnormal fall of fruit. I have therefore confined my attention to the method for the latter purpose only, and have found it effectual. How indeed could it be otherwise?

"OLD PLANTER."

COFFEE.

The Gold Coast.

During the last two years, we learn from the *H. & O. Mail*, the Government has introduced machinery for pulping and curing coffee, and consignments of both coffee and cacao from the Gold Coast have been forwarded through the Colonial Agents for sale in the London market. This plan affords the best means for testing the commercial value of the produce, and the result shows that coffee and cacao can be grown in West Africa capable of realising good prices in European markets. Much, however, still remains to be done to induce the natives to cultivate and cure their produce in a satisfactory manner.

The Market.

Further very heavy receipts, and an increased estimate of the present Brazil crop, the amount now given being 9,000,000 b

has caused considerable pressure to sell, says the *P. M. Review* of 30th October, and a much larger business has been done in the terminal market, resulting in a decline of fully 3s. per cwt. The quotation for good average for March delivery is now 30s. 9d., while the price in Santos is 31s., cost and freight. Such a price, even with the present low rate of exchange, can hardly be remunerative to the growers, and therefore we might look for a decreased production in the near future; but as new plantations have been laid down in recent years, there is not much prospect of it. The decline in the terminal market has produced a flat tone at the auctions, and although supplies have been small, quotations have given way for medium qualities from 1s. to 2s. per cwt., but fine colory parcels have fully maintained their values. Recent shipments of Nyassaland have sold with considerable competition at very full prices.

Nyassaland. A correspondent to the *Central African Planter* holds that the absence of curing works in the country seriously detracts from the value of the coffee. *Pour faute de mieux*, Nyassaland coffee is shipped home in parchment, and is finally cured and garbled in London. Labour, however, being so expensive at home, the coffee is not properly garbled. We are inclined to agree with the writer, and our contemporary itself, that Nyassa coffee is, in itself, perhaps equal to the best grades of East Indian. Our contemporary waxes very wroth with us and with the *Ceylon Observer* for allowing derogatory notes on the African coffee industry to appear in our respective columns, more especially with regard to a correspondent asserting that he had noticed leaf disease present on certain plantations he had visited. Let not our African brethren be dismayed: friend Hemeleia will visit them, too, in its own good time. A writer to the *C. A. P.* draws attention to the fearful amount of damage done to the grevilleas in the Cholo District planted out as coffee

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contain per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.68	"	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

shade. Luckily they only seem to attack the young plants. *Albizia Moluccanas*, by the way, perhaps by reason of their towering high above the coffee, have been studiously left alone.

TEA.

Japan.

In a report recently issued by the Department of Agriculture and Commerce in Tokio, it is stated that the area under tea is decreasing, but the quantity produced is steadily increasing, showing an improvement in the methods of cultivation.

New-make Chinas.

In a recent number of the *London Grocer* we find that this season's arrivals of machine-made Chinas have resulted in great disappointment to the promoters of the new methods. Improved colour and strength have been obtained it is true, but with the result of even lower prices than for old-make Chinas. The fact is, that China tea is not wanted in England to any extent, but where it is required, it is for its own intrinsic merits and not as a more or less colourable imitation of Indians or Ceylons. Yet it must not be forgotten that both China and Japan are increasing their trade out of England year by year, though not so fast as British-grown tea.

Mr. Acworth's views on tea in South India.

The Ceylon papers are ever eager for interviews, and the *Times* naturally seized the opportunity for interviewing Mr. Acworth when in Colombo *en route* for a long visit home. The extension of tea in Travancore is proceeding at a terrific rate, says Mr. Acworth, and also in the Wynaad. We learn with interest that he is one of a Syndicate to take up 2,000 acres of land in Coorg for tea, which is to be opened up in earnest two years hence, though a beginning is to be made this year. This land is from 3,200 to 3,500 feet elevation, and was given the Syndicate as a free gift from Government, no taxes moreover being leviable for five years. The greater part of the land is old abandoned coffee-land.

New Tea Machinery.

"Indian Planter's" suggestion to form a "Tea-Machinery Committee" to investigate improvements in machinery and consequent modifications of manufacture is an excellent one. For South Indian planters the matter would be extremely simple. Each district should form a sub-committee, collect information and forward it to the U. P. A. Tea Committee (to be formed) for dissemination. A start could easily be made say in "Indian Planter's" own district. He has only to propose it at the next meeting of his district association for it to be carried *nem. con.* Three or four men with "go" would be quite enough, with the most energetic as secretary. Naturally, it would not take long to exhaust the subject in the present state of the tea-industry in South India. But let them be content with this to begin with, for the success that they are bound to achieve will spur them on to find suitable means of going further afield. The matter is certainly one of urgent importance and one that we shall gladly do all in our power to further, and freely offer our columns for the publication of any information connected therewith.

The Market.

INDIANS.—The supply continues fairly large, said the *P. M. Review* of 30th October, and although the demand has been somewhat less active, no change of importance has taken place, excepting in the common descriptions. A considerable proportion of the quantity offered has been of these kinds, and clean sweet teas are more easily obtainable at from $5\frac{1}{4}d.$ to $5\frac{3}{4}d.$ than for some time past. Although the prevailing idea is that the outturn of the crop will not exceed that of last year, the proportion of these grades will probably be larger, and this will, no doubt, have a steadying influence on values. On the other hand, as there is likely to be a falling off in the Ceylon supply, it would appear that current rates are about as favourable to buyers as they are likely to be. The teas showing the best value, and which are being largely dealt in, are the medium kinds, a good assortment of which is offering, and, judging from the activity of the demand, the trade are fully alive to the exceptional value obtainable. For the better sorts there is a steady inquiry and a fairly good business has been done, the quantity brought forward has been larger, and prices show no change of importance. Most of the growths continue to improve in quality, this being very marked in some kinds compared with the earlier shipments. At the public sales there was good competition, and 42,588 sold out of the 46,576 packages brought forward, while a good portion of the quantity withdrawn has since been disposed of.

DISTRICT ASSOCIATION.

LOWER PULNEYS.

PROCEEDINGS of the Postponed Annual General Meeting held at the Dindigul Club on Saturday, 2nd October 1897. *Present*:—G. Mengel, Esq., F. R. Gerrard, Esq., H. Rowland Newport, Esq., W. H. Gerrard, Esq. (*Vice-Chairman*), Howard Newport, Esq. (*Honorary Secretary*), W. E. Underwood, Esq. (*Visitor*), T. J. Ferguson, Esq. (*Visitor*). Mr. W. H. Gerrard, Vice-Chairman, opened the Meeting.

Read letter from L. J. Creed, Esq., regretting his inability to be present at the Meeting. Mr. Creed resigns his Membership of the Association on giving up his interests in Coffee Planting and leaving the District. The Honorary Secretary proposed a vote of thanks to Mr. L. J. Creed for his services as Chairman during the greater part of last year, and regretted his having left the District. Seconded by Mr. F. R. Gerrard.—*Carried*.

Read letter from Mr. Twigg, Collector of Madura, regretting that he would be out in Camp in an opposite direction at the time of our Meeting. Mr. Morgan being unwell could not attend.

The Chairman called on the Honorary Secretary to read the Annual Report.

1. *Report*. The following report was therefore read:—

MR. CHAIRMAN AND GENTLEMEN,—This Meeting closes the third year of our existence as a District Association. I regret I cannot say we have had a prosperous year; in fact it has been a hard time for our District for many reasons. Prospects are fair, however, for the coming year, and we can but hope for better times during the next twelve months. With regard to the work we have had in hand, we are, I am sorry to say, not much more forward than we were at last year's Annual General Meeting.

Roads and Communications are still our most important subject. Last year I gave a *résumé* of the progress of matters in connection with the *Ahtoor-Kodaikamal Ghat*, which ground I need not go over again. After the Resolution passed at last year's U. P. A. Meeting, we sent up our Resolution to the Secretary to forward to headquarters, but were told that he could only forward a general Resolution on this subject, and could not make any special references. We heard also that we were wrong in concluding that a grant had been sanctioned for the construction of this road last year, though we heard later that the matter was under consideration by Government. We decided that it was of no use bringing the matter up

before this year's meeting of the U. P. A., considering the straiter condition of Government finance, owing to Famine, Plague, etc., and only asked that the matter might not be lost sight of, but allowed to stand over for another year. As H. E. the Governor is to be in this District shortly, I do not think we should let the matter pass without sending a Deputation to him while he is on the spot and can make local enquiries even if he has not the time to see to parts in question of the country personally.

Railways.—Nothing has been done either with regard to Dindigul-Pothanur or Palghât Railway, which subject was brought up at the last U. P. A. Meeting. This matter might, I think, be also included under the heading of Roads and Communications if it is decided to send the above-mentioned deputation. H. E. Sir Arthur Havelock.

Dispensary at Ardaloor.—In consideration of our original Resolution that Government should be asked to open a small Branch Dispensary at Ardaloor, Surgeon-Major F. C. Reeves, who was at that time District Medical and Sanitary Officer of this District, suggested the removal of the Thandigudi Dispensary to Sholakas, which suggestion was approved of by the Taluq and District Board, but was quashed on being again referred to the Dindigul Taluq Board this year. In doing this the President of the Taluq Board made no mention of, or reference to, our original Resolution; the matter therefore remains where it stood, no definite reply having been received to our request.

District and Taluq Boards.—The Lower Pulneys are represented on the Dindigul Taluq Board at present by myself. In reply to a request to the President of the District Board, Madura—backed by the Kannan Devan Planters' Association—that we might be also represented on this Board as there are at present no Members from the Hill Districts, we were notified that no vacancy would occur in June, when the President would take our claims into consideration. The President has not, as yet, made any appointment and has apparently either forgotten the matter, or considered our claims as representation not sufficiently good, and these two large planting districts are therefore still unrepresented in any way at the District Board Meetings.

Coffee Stealing Act.—In addition to those rules drawn up by the Superintendent of Police, which were before you at the last Annual General Meeting, some additions were suggested, and were taken into consideration by the Superintendent of Police. Books of passes have been printed, and we have now before the Meeting some correspondence on the subject to discuss. Coffee thefts were of somewhat frequent occurrence on the Sirumallais during the latter part of last year, and the judgments in two or three cases were obtained by the Association, who decided to watch the development of the cases.

Statistics of artificial manures and the ordinary acreage statistics have been sent in to the Secretary, U. P. A.

Postal Arrangements.—With regard to the Post Office at Ardaloor nothing further has been heard, and although the Superintendent of Post Offices did not see his way to giving us the direct communication between the Branch Office at Ahtoor and the Head Office at Dindigul that we asked for, we have both in this case and in the case of the Branch Office at Virupatchy had appointed men as Post Masters who understand and can read and write English.

Lady Birds and Green Bug.—During the year this matter has come to a head, and the United Planters' Association has, I am glad to say, taken the matter up, and has come to see the grave necessity for speedy action. As this matter is still, so to speak, *sub judice* and is moreover gone into very fully elsewhere in these Proceedings, I need say no more here.

U. P. A. S. I. P. E. C.—The Proceedings of this year's Meeting of the U. P. A. have been marked by the excellent and thorough report of the S. I. P. E. C. We must indeed acknowledge ourselves exceedingly fortunate in having had our grievances so carefully and impartially enquired into at the hands of such able and energetic Commissioners. We were not in a position to increase our one vote in the U. P. A. to two, as we had hoped earlier in the year, and the voting arrangements having now been altered, as I have already explained to you, we shall be able to send up more than one Delegation if we wish to.

Membership.—We started the year with 15 names on our Roll, exclusive of Honorary Members; during the year three Members have resigned, and we had to chronicle the sad death of our old planter. Including those that have just joined us at this Meeting

we have four new Members for the year and two new Honorary Members; thus we have now on our Rolls fifteen Members and six Honorary Members.

Finance.—I am laying on the table copies of our Balance Sheet for the year and the lists of subscriptions by Members of our Association to the U.P.A.S.I. Trust Fund and Famine Fund.

Coffee Stealing.—Thefts were prevalent on the Sirumallais during the latter part of last year, and although several thieves were caught and handed, difficulty was experienced by the Police in obtaining conviction.

Labour Supply and Crops.—If only our crops had been as plentiful as our Labour Supply for the year, we should have little to grumble at. Unfortunately owing to unseasonable rains in February and to the terrible effects of green bug last year, our crops have been very much below estimate. This is practically speaking the cause of three of our Members having left the district. We have had considerably more than the average rainfall for the year. I have now but to place my resignation in your hands, and I would add, Gentlemen, that I do not stand for re-election.

HOWARD NEWPORT,

Honorary Secretary,

The Lower Palnays Planters' Association, Dindigul.

The Chairman proposed the adoption of the report as it stood, but remarked that with reference to the Post Office at Virupatchy an English-speaking Post Master had not, as a matter of fact, been appointed. The Accounts having been examined, were passed.—*Carried.*

Mr. F. R. Gerrard suggested that the election of office-bearers be proceeded with at the close of the Meeting. Seconded by Mr. Newport.—*Carried.*

2. *Roads and Communications.*—(a) *The Ahtoor-Kodaikanal Ghat Road.*—Read letter from Mr. Twigg saying that he would be pleased to arrange for a deputation to His Excellency on his visit to Madura if we decided to approach His Excellency on the subject. Discussion in Committee. Proposed by Mr. W. H. Gerrard: That we, as an Association, approach H. E. the Governor at Madura on his coming visit in re the Ahtoor-Kodaikanal Ghat Road, and that the following gentlemen comprise the deputation:—Messrs. Howard Newport and Fred. R. Gerrard. Seconded by Mr. Mengel.—*Carried.*

(b) *The Dindigul-Pallakanoth Road.*—Mr. F. R. Gerrard said that this road was in a very bad state, and owing to the late heavy rains is almost impassable in parts. Statement supported by Mr. Howard Newport. Mr. Underwood said that some repairs were being carried out on the road in question, and that he had submitted an estimate for extensive repairs which has been ordered to be brought up again by the District Board.

Mr. F. R. Gerrard proposed: That the District Board are now practically re-metalling the first seven miles of the Dindigul-Pallakanoth road, and that as at the last meeting of the Board they recorded an estimate of Rs. 6,000 for continuing the metalling to Pallakanoth, the attention of the District Board President be called to the importance of carrying out this work. Seconded by Mr. Newport.—*Carried.*

(c) Mr. Howard Newport asked Mr. Underwood whether he knew of the mile or so of road between the Ahtoor village and the Government road near Shempatty, and asked whether he thought there was any likelihood of its being kept up by the Board. The road in question was a short one, but a good deal of traffic went over it. It was not at present kept up and was now, as it usually is in wet weather, all but impassable for country carts. Mr. Underwood replied that he would go and see the piece of road in question and would let the Association know his opinion.—*Recorded with satisfaction.*

The Dindigul-Pothanur Railway.—Mr. Ferguson said:—In my opinion there is no chance of your getting the Madras Railway to construct the line to Pothanur The South Indian Railway is the most enterprising line in Southern India, and if this branch is opened up, we are much more likely to get it done by the S. I. Ry., as the narrow gauge would represent so much less invested capital, and the S. I. Ry. is a well-to-do Company. Your line should run round the base of the Annamallais so as to tap all the present and prospective traffic, which will be very considerable, and join the Madras line at Palghat. It would run through Palni, Udamalpet (at the foot of the road to the Travancore Tea and

Coffee Estates), and straight on to Palghat, following the old road through Palni, Udamalpet, Comungalam, &c., to Palghat, a distance of 133½ miles; while from Dindigul to Olavakode junctions *via* Pothanur it must be 125 miles *at least*, so the Palghat line would be much the cheaper for the carriage of coffee, manures, etc., and there is a large carrying business in timber, cotton, etc., along the old, direct road to Palghat.

Laid on the table Pamphlet received from the Traffic Manager, M. R. C., *re* the Railway in question. Discussion in Committee as to the advisability of approaching H. E. Governor on the subject during his coming visit to Madura.

Resolved—that a petition be got up and forwarded to the Chief Secretary to Government at an early date, urging the necessity of opening up the Branch Railway between Dindigul and Palghat. Proposed by Mr. Howard Newport—that Mr. W. H. Gerrard be asked to undertake this and to draw up and obtain signatures (with the help of Mr. Ferguson of Calicut) from the towns along the route and subsequently present the petition to the proper authorities. Seconded by Mr. F. R. Gerrard.—*Carried.*

3. *U. P. A. Finance.*—Read Circulars dated 12th, 13th, 14th, 15th and 17th September 1897.—*Recorded.*

Resolved—that as much as possible be collected by an assessment of 1 anna per acre under cultivation, and be forwarded to the U. P. A. as our subscription for the current year. And the usual subscription of 12 rupees per annum asked for from each Member which is necessary for the ordinary expenses of the Association remain as heretofore.

The U. P. A.—Mr. Howard Newport then read his report of the U. P. A. Meeting which he attended as Delegate for the L. P. P. A. on 9th August 1897. *Resolved*—that this be printed separately and included in the Annual Proceeding Book. *Read Circulars*, dated 1st July, 17th August, 24th August and 16th September.—*Recorded.*

5. *S. I. P. F. C.*—*Read Circular*, dated 17th August 1897, and draft letter from U. P. A. Chairman to Chief Secretary to Government, dated 13th August 1897.—*Recorded.*

6. *Coffee Passes.*—*Read letter* from Superintendent of Police, Madura District, dated 4th September 1897, and Honorary Secretary's reply, dated 22nd September 1897. The Honorary Secretary said that the Superintendent of Police had not mentioned either the price of the book nor the number of pass forms each would contain, but that he had heard that the book contained 50 passes and would cost 12 annas each. *Resolved*—that all those who required such Pass books should send in their names to the Honorary Secretary, and that the Honorary Secretary correspond with the Superintendent of Police and obtain as many books as may be needed.

7. *Miscellaneous Circulars.*—*Read Circular*, dated 20th September, *re* Agricultural Chemist. Discussion in Committee. Proposed by Mr. Mengel that this matter stand over till the Proceeding of the U. P. A. General Meeting for 1897 is published. Seconded by Mr. F. R. Gerrard.—*Carried.* *Read Circular*, dated 17th August, *re* Casket. *Resolved*—that any Member who require copies of the *Graphic* containing the photo of the Casket send in their names to the Honorary Secretary.

Read Circular, dated 7th September, *re* Malaria, 15th September *re* Cinchona, and 15th September *re* N. Wynaad P. A.—*Recorded.*

8. *Lady Birds and Green Bug.*—*Read letter* from the Hon'ble Mr. H. Percival Hodgson to Mr. Newport, dated 2nd September 1897, and copy of letter from Mr. Hodgson to the Hon'ble G. Stokes, dated 1st September 1897.—*Recorded with satisfaction.* The Chairman in opening the discussion said—That Mr. Beardsell had been up to the District recently and regretted that he could not stay to be present at the Meeting. That they had talked the matter over and that Mr. Beardsell would like to see the Lady birds introduced. That he thought, however, an Entomologist would be necessary to receive the Lady birds on importation, for, as none of us are Entomologists and do not know their habits, we might not be able to breed them. That although there did not seem to be much difficulty in getting the Lady birds, and although we might succeed in getting the right varieties and bringing them safely to India, an Entomologist would be necessary for breeding them. That if this experiment was not a success, we should be risking a large sum of money. That Mr. Beardsell was willing to join with the majority and fall in with anything they decided to do. Mr. Mengel said that if we go to the expense of going

and getting the Lady birds and bringing them out, it would be best to get an Entomologist. Mr. Howard Newport said that he found himself in a somewhat invidious position in rising to give them his views on this question because, through no wish of his, he had been suggested as the one who should be sent to Australia to bring out the Lady birds, and that before saying more he wished to thoroughly disabuse their minds of the idea that he was in the slightest biased in his remarks or opinion on this account. That with regard to the remarks that had been already made, he was quite in accord with them—that so were the Madras Government and so were the U. P. A. That, however, it must be borne in mind that this matter had been already gone into and that the Madras Government had replied to the effect that they could not make an appointment of an Entomologist without the sanction of the Simla Government. That it was decided in discussion at the U. P. A. Meeting that this would entail considerable delay, and that the question had then come up as to whether we should, since the Madras Government had already expressed its willingness to help us in importation of experimental consignments, get the Lady birds out without an Entomologist. That the U. P. A. had decided in the affirmative, and the resolution they passed was that he had already read to them. That we had all through agitated for speedy action, and that we were still of that opinion and needed it more than ever. That the U. P. A. resolution said “a qualified person,” and that we must cut our coat accordingly and do the best we can. He had suggested Mr. Green’s name, and he still thought that Mr. Green might advise us advantageously even if he could not go and get the Lady birds for us. That the quickest and most satisfactory way to get them was for a planter interested in the matter to go out and collect the insects, at the same time, of course, collecting information. It was possible that the insects might be obtained without any one going out, but that this would entail endless correspondence and a lot of delay, and moreover we should know still less what to do with the Lady birds when we had got them out by post. That the information and experience we want is in Australia waiting to be asked for, and that if any one who knew *anything* of the subject went there, he could learn a great deal, especially if he went with letters of introduction from the Madras Government. He thought very little could be done without the support of the Government. Mr. Stanes had tried to get some specimens, and understood that the authorities were willing to help him, but, when written to a long time afterwards, the latter replied that they had made no promises. The matter was now in the hands of Government, and we could now do nothing further, except arrange our subscription list till a reply had been received to our Legislative Member’s letter just read. He hoped this reply would come soon, that the Green bug was now disappearing and would probably appear again in February as was usual, and as Lady birds commence to hibernate soon after the New Year in Australia, he thought it would be a good time to collect Lady birds, and if the person going out was to be back in time with the Lady birds to attack the Green bug as soon as it appeared, he ought to leave India in November if possible. Mr. Ferguson did not think it likely that the Honorary Entomologist to the Ceylon Government would be able to go to Australia. The Meeting approved of the suggestion that Mr. Green should be consulted if Government gave an affirmative reply to the letter now before them and approved. Discussion in Committee *re* Subscriptions. Some Members wishing to refer to Proprietors it was decided that the list be left open.

9. *Election of Office-Bearers.*—Mr. W. H. Gerrard said:—Before proceeding to elect new office-bearers, I would like to propose a hearty vote of thanks to Mr. Howard Newport for the way he has conducted the affairs of our Association for the past two years. The Honorary Secretaryship has been no sinecure, and the work of arranging everything as well as conducting meetings and reporting has been heavy. That he had not only undertaken all the duties of Secretary, but had spent a lot of time and trouble in going into the question of Green bug and Lady birds, and had also represented us at the U. P. A. Meetings ever since the Association was formed. While regretting that he does not stand again for re-election, we would wish to express our appreciation of his services. Seconded by Mr. Fred. Gerrard.—*Carried.* Mr. Newport replied, and after thanking the meeting for their cordial vote of thanks proposed that Mr. Fred. R. Gerrard be asked to take up the Secretaryship. He had been associated with him ever since he came into the District in 1889, and he was indeed his only white neighbour for several years. He knew him as a sociable neighbour and a pushing and

successful planter and a good business man. He was more (owing to the sad death of our Pioneer Mr. E. de Fondelair) now oldest resident Planter. On the Office-bearers being ballotted Mr. Fred. R. Gerrard was elected Honorary Secretary, W. H. Gerrard, Chairman, and Mr. Howard Newport, Vice-Chairman and Committee man. Mr. Fred. Gerrard replied shortly.

New Members.—Messrs. Ferguson and Underwood were proposed as Honorary Members by Mr. Howard Newport and seconded by Mr. Fred. R. Gerrard. Mr. W. A. Beardsell was proposed Member by Mr. W. H. Gerrard and seconded by Mr. Fred. Gerrard. With a vote of thanks to Mr. W. H. Gerrard, who had conducted the Meeting, the Meeting then closed. Mr. Howard Newport was asked to draw up the proceedings of this Meeting and to edit the Annual book of Proceedings.

W. H. GERRARD, *Chairman.*
HOWARD NEWPORT, *Hon. Secy.*

MARKET SUPPLEMENT.

SATURDAY, NOVEMBER 27, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (November 5, 1897) says:—A dull tone prevailed at auctions this week and, the supplies consisting chiefly of mixed descriptions, there was very little competition, a considerable proportion having to be bought in.

Only a few parcels of second hand East India were offered and attracted little attention.

Columbian of inferior quality formed the bulk of the catalogues, and this meeting a slow demand, prices ruled easy; a few colory lots, however, realised previous rates.

A weak feeling has been apparent in the Terme market and quotations have given way a further 9d to 1/-; but just at the close the market is rather steadier on slightly reduced Brazilian receipts.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending November 3rd, 1897, says:—Bank rate 3%. Bombay Exchange closes at 1s 3½d. Brazil Exchange 7½d. Rupee paper 3½%. 63½ Silver 26½d per oz.

We have to report a flat market throughout the past week, and an absence of demand for anything except fine. The low middling and ordinary kinds of Columbian are difficult of sale, and from 2s to 3s lower, in some cases even more.

Brazil markets continue extremely quiet at the decline reported last week.

Futures remain flat at the decline, the closing shewing but little change since our last, viz.:—Good average Santos in Havre, March delivery, fcs. 37.75, in Hamburg pf. 30, and No. 7 low ordinary Rio in New York \$5.90.

To-day's London official quotations are:—

Ceylon. With fair competition the market was steady, although in some instances prices were hardly up to those lately recorded. The Official Wire gives exports to U. K. during October as 6,000,000 lbs. against 6,750,000 lb. last year, and the total from 1st Jan. 83,500,000 lbs. against 79,750,000 lbs. The estimate for Nov. is 7½ to 8 million lbs. A for week 9'04d., against 8½d. same period last year.

Ceylon Tea sold on Garden Account 1st January to date 1897, 940,525 pkgs., av. 7½d. 1896, 845,598 pkgs., av. 8½d.

OTHER PRODUCTS.

From the *Chemist & Druggist* of November 6, 1897:—

CARDAMOMS.—A mail report from Colombo states that a brisk business continues to be done for the Bombay and Calcutta markets, and the tendency is towards a steady increase in prices. Several parcels of Mysore changed hands from 2'15r. to 2'60r. per lb., and of Malabar from 1'95r. to 2'10r. per lb. A small parcel of seeds has fetched 2'12r. per lb. We do not hear of any business of importance in London since the last auctions. A fair quantity will be offered next week. There have been several small arrivals.

CINCHONA.—The following figures relate to the exports of cinchona-bark from Java during the month of October, and the ten-monthly periods from January 1 to October 31 of the past five years:—

	1897	1896	1895	1894	1893
	Half-kilos.	Half-kilos.	Half-kilos.	Half-kilos.	Half-kilos.
October	735,000	862,000	1,100,000	952,000	349,000
Jan. 1—Oct. 31.	6,490,000	8,280,000	6,929,700	7,577,000	6,225,000

The exports from Ceylon from January 1 to October 5 have been:—

	1897	1896	1895	1894
lbs.	599,346	881,743	803,834	2,219,688

The Amsterdam public sales of cinchona have been fixed as follows:—January 20, February 24, March 31, May 5, June 9, July 14, August 25, September 29, November 3 and December 8.

CINCHONIDIN.—Howard's sulphate of cinchonidin, in tins, has been advanced to 9d.; in vials, to 10d. per oz.; pure cinchonidin, to 1s. 1d. per oz. Ditto, *Citrate of iron and cinchonidin*, in vials, to 5½d.; in bulk, to 4½d. per oz. Whiffen's cinchonidin is quoted at 8½d. to 9d. per oz. German offers at 8½d. per oz.

HONEY.—A quiet market. *Chilian* honey is tending rather easier, offering at from 28s. per cwt. for fair yellow, up to 32s. 6d. per cwt.

for fine pale. A parcel of *Peruvian* honey has recently changed hands at Liverpool at 21s. 6d. per cwt.

JALAP.—Good Vera Cruz quality is held in London at 7d. per lb. From New York it is reported that there have been no arrivals of jalap at that port lately, and that there were only 50 bales in first hand. The market, however, remains dull, at 9½c. to 10c. per lb. for fair quality.

KOLA-NUTS.—At auction on Wednesday 3 cases, together about 345 lbs., of fair bright *West Indian* (Grenada) sold steadily at 6d. to 7d. per lb.

QUININE.—On Tuesday, when the result of the cinchona-shipments from Java for October became known, the quinine-market assumed a considerably firmer tone, and about 70,000 oz. second-hand German bulk were sold at from 1s. 2d. to 1s. 2½d. per oz. On the following day 1s. 2d. per oz. was paid for about 10,000 oz. B & S, or *Brunswick* quinine. The *Brunswick* agents on Wednesday offered quinine of recent manufacture at 1s. 3d. per oz., either on the spot or for forward delivery, and sales of about 10,000 oz. were reported for either position. To-day, however, there are no further offers for forward delivery by any of the agents, and yesterday's quotation is generally looked upon as only an attempt to influence the course of the Amsterdam auctions. Further sales of 10,000 oz. *Brunswick* quinine (spot) are reported to-day at 1s. 3d. per oz.: and a small parcel has been done in second-hand at 1s. 2½d. per oz. The *B & S* agents have no price, *Zimmer* quotes nominally 1s. 3d., *Whiffen* 1s. 5d. for vials and 1s. 3d. per oz. for bulk. Market strong.

SPICES.—*Pepper* has shown a firm market for all varieties, chiefly on account of the statistics cabled from the East, showing much smaller shipments during the month of October. At auction fairly large supplies of black pepper were bought in, excepting one lot of Singapore, which sold at 3½d., and 31 bags of small Lampong, which realised 3½d. per lb. There were no white Singapore pepper offered at auction. Of 328 bags Siam, 25 sold at 6½d. for fair and 9½d. to 9½d. per lb. for superior washed quality. White Penang pepper has been sold up to 5½d. per lb. on the spot. At the close the market is again rather easier.

COIMBATORE COFFEE WORKS.

Coffee Cured and Shipped to London on Planters' Account.

ADVANCES MADE ON CROPS ON MODERATE TERMS.

Tools, Roofing and Planters' Stores kept in stock

SPECIAL MANURE WORKS.

Separate Manure Works have been recently erected, giving greater facilities for the Manufacture of Manures.

White Castor, Black Castor, Neem and Hoongay Poonacs, Bone Meal Superphosphate, Nitrate of Soda and Saltpetre now in stock.

MIXTURES MADE FREE OF CHARGE. FOR QUOTATIONS AND FURTHER PARTICULARS,

Apply to **T. STANES & CO.,**

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 10th December 1897.

S. E. Wynaad.

1st December.—Weather.—Since my last report no change in the weather. Except on the 28th, 29th and 30th November we have had heavy showers of rain. To-day it is bright and sunshiny. *Crop.*—Picking is being continued; the ryots have finished chamai harvest, and are harvesting paddy here and there. Grain is still ruling high. *Plant-disease.*—Showing very little here and there. *Labour.*—Sufficient.

Nellampatty (British).

1st December.—Weather.—There has been a fresh burst of the N. E. Monsoon and we have had 3·10" rain. It began on Friday morning and stopped yesterday, and during that time the weather was the most "monsoonish", we have had during this N.E. It seems gone now, however. *Crops.*—Rice selling 8½ to 9 measures for the rupee. Gram 12 measures. My coffee crop consists of berries, so don't blame me if I can't tell you much about it this week! Been too busy to make observations elsewhere. *Plant-diseases*—Coffee looking well everywhere, and clearings that have had leaf-disease are recovering nicely. *General Health.*—Good. *Labour.*—Plentiful. *Interesting Items.*—"Light on the dark places"! We are no longer to be left to our own sweet wills in matters ecclesiastical, as it is said a "Padre" comes up this month. Missions to the "lapsed masses" have been found rather uncomfortable businesses when tried up here on account of bad roads, transport, &c.; but now they have made a bold effort, and let's hope they'll keep it up, and some day we may hear at home, from the missionary platform, the stirring capture of the Nellampatties!

GENERAL NOTES AND ARTICLES.

A correction.

Last week, in our article on "Some Dangers attendant on Cattle Manuring," the substitution of "oats" for "vats" will explain some of the passages.

MIXED MANURING.

WE extract the following very interesting notes from the *Calcutta Planter* :—

When one hears of a mixture of manures being applied, in which some one ingredient is in excess of the other necessary ingredients, one is apt to think that it discovers an ignorance of the rudiments of manuring. For example, if a mixture of nitre and fish guano go together, both of which contains a large percentage of nitrogen, one would naturally think that an unnecessary supply of this ingredient had been provided. Or, again, if bones and phosphates in some other form be mixed together, one would conclude that there was an unnecessary predominance of this manurial ingredient, and so on. But surprising as it may appear, the practice of mixing manures in this way has been proved to be scientifically correct. In an exhaustive paper on the subject of manuring which Dr. Somerville read before the Farmer's Club, an account of which appears in the *Field* of the 14th November, 1896, in dealing with the mixtures noticed above which Dr. Somerville calls submixtures in contradistinction to mixtures which form a complete manure, he is represented as having said that "by a submixture he meant the use of more than one kind of nitrogenous, phosphatic, and potassic manure to supply the element concerned; that he explained that, so far, his experiments in this direction had been chiefly confined to nitrogen and phosphates, but his inquiries with these substances had practically never failed to show that the average yield is improved by going to more sources than one for the element wanted. The yield clearly indicated that for nitrogen it was more economical to employ $\frac{1}{2}$ cwt. nitrate of soda and $\frac{3}{8}$ cwt. sulphate of ammonia in combination than 1 cwt. of the former or $\frac{3}{4}$ cwt. of the latter separately. In the same manner superphosphates and basic slag were more effective in combination than when either was used in double quantity alone. . . . Even more complex substances than those named gave better results when used in conjunction with other materials of the same class. Dissolved bones, bone meal, and fish guano all operated to better advantage along with other phosphatic and nitrogenous articles than when alone." These manurial substances were not in all cases to be mixed before application. Dr. Somerville thus explained the results obtained by the mixing recommended. "The reason why a complex dressing produces a larger crop than a more simple application is not far to seek, where plants are fed on, let us say, one form of phosphate, the probabilities are that their phosphatic food is either too soluble or not soluble enough, so that they either get too much in the early part of the season, and are starved later, or *vice versa*. But, on the other hand, if one offers plants a mixture of phosphatic foods differing in their degree of solubility, the plants feed upon the most easily assimilable portion in the early part of the season, and as that is gradually exhausted, the other forms come into use and supply the crop with sufficient nourishment later in the year. And similarly with regard to nitrogenous and potassic food."

CEARA RUBBER IN SOUTH INDIA.

EXPERIMENTAL plantations of this variety of rubber have proved, in South India as in some other countries, a failure. It is the usual thing: the growth of trees is excellent, but the yield of rubber is insufficient to make the undertaking a profitable one. We excerpt from an article in the *Madras Times* the following details bearing on the experiment :—

While the trees grow and seed well in Malabar, and more especially so in South Malabar, and while the rubber yielded was of good quality, clean, very elastic and free from disagreeable odour and not unduly sticky, they do not yield sap in sufficient quantity.

From certain trees in North Malabar two lots of rubber, weighing each under 1½ lb., were collected by the District Forest Officer from 21 and 40 trees respectively. The revenue per tree would be something ranging from a half penny to a penny at English prices, the average cost of collecting the gum having been about Rs. 1-13-0 for each collection. In the January of 1895 one hundred ceara rubber trees, according to the report of the District Forest Officer, South Malabar, were tapped in Iravallikavu. Each tree was tapped six times, twice a day morning and evening, for three days, and 10 lb. of rubber, valued in England at 1 shilling 6 pence to one and nine pence per lb., was collected. At the end of December, 1896, 309 trees were tapped, which yielded 24 lb. of rubber. The largest tree

tapped, 3 ft. 9 in. in girth, gave 8 oz. of solid rubber, and the smallest which ringed 3½ inches, gave ½ of an oz. The average per tree was 1 oz. For taking the rubber to the home markets, or even to the sea coast, the rubber produced by the ceará trees is of no use as a commercial product, and as compared with the varieties *Para*, *Elastica* and *Heva Brasiliensis* is not in the running. The Government, however, in spite of the very discouraging results of the experiments, are still keeping it in mind, and are trying to improve the cultivation.

Soil and surroundings with rubber trees, as with all things, have a great influence on the results. Trees growing in moist alluvial soil, as is very natural—though the Forest Officer *narrates* wonders at it—bleed more freely than those growing on dry soil. A small tree of 21 inch girth, on good moist soil and standing some distance from teak, gave 4½ oz. of rubber, while a tree of 1½ inch girth on dry ground and ringed with teak seemed to run in wood and gave only ¾ oz. The best season for tapping is from December to February; tappings in March and April meet with scant success. The trees, too, bleed more freely in the early morning than later in the day, the vents keeping open for nearly twice as long. The method of tapping, as described in the report under review, are interesting. Trees were tapped after two fashions. In the first instance a few trees were tapped by making incisions in the trunks, of various shapes, and small cups, formed of the leaves, were pinned underneath these to collect the milk. The milk, however, did not flow into the cups, but trickled down the stem in dribbles which set, and were, after three days, removed in long strips, giving a few grains of rubber per tree, of good quality and free from grit. The other trees were tapped in a different manner. The large roots near the surface were laid bare, and incisions 1½ to 1 inch long and ¼ an inch apart were made on the exposed roots with a bill-hook, and the milk collected in little pits dug in the ground under the roots to receive the milk. The trees were tapped twice a day, three days, *i.e.*, between 6 to 10 A.M. in the morning and between 4 and 5 P.M. in the evening, and on the next morning the milk was found to be coagulated in hard tongues. These were removed and the tree tapped again as before. It is suggested that the value of the rubber by the Kew authorities and the English rubber experts should be published in the district, if the tree has been grown to a certain extent by planters.

LETTERS TO THE EDITOR.

INTERNAL ESTATE BOUNDARY STONES.

DEAR SIR,—When Madras Act No. IV. of 1897 (an Act to amend the law relating to survey of lands and settlement of boundary disputes) was before the Legislative Council during the last session, a clause was inserted, at my suggestion, in section 14 of the Act, by which the local Government might from time to time, by notification, exempt owners of estates from the necessity, which previously existed, of keeping internal and useless boundary stones.

I was led to press for the insertion of this clause in the amended Act, by the representation of certain planters in the district who complained of the trouble, expense, and damage to their estates arising through the enforcement of the then existing clause.

In order to take advantage of the amended clause, I would suggest that owners wishing to bring their estates within the operation at once signify the same to you in writing, and to alter the names of estates claiming the exemption above referred to have been collected, they may be forwarded to the Collector of the District by the Association with a letter asking that the necessary steps be taken to bring such estates within the operation of clause 14 of the Act.

To save time and correspondence, applicants should give the names of their estates, with particulars as to situation and area, giving also the subdivisions and their areas, and stating whether they are held under the waste land rules or otherwise.

I shall be obliged by your circulating this letter to the members of the Association, and publishing it in *Planting Opinion* for the information of planters generally in the District.
31st October 1897.

H. PERCIVAL HODGSON.

[This letter has been forwarded us for publication by Mr. Windle, n. Secy., Nilgiri P. A.—Ed.]

E. LITHOSPERMA SEED.

DEAR SIR,—May I be allowed to intimate through P. O. the many planters who have booked orders for E. Lithosperma seed that the crop this year is considerably earlier than usual, and that orders that were booked for January-February delivery will be executed next month.

There is another point I should like to mention, and that is the importance of keeping crickets out the nursery. They play great havoc, nipping the plants as soon as they show above ground, and unfortunately the plants never shoot again.

There is a very simple way of testing the soundness of the seeds: put a certain number in a flower pot, cover the seeds with sand and keep constantly moist and in the shade; at the end of a week most of the seeds will have germinated and can be planted out, and this can be done daily until they have all germinated. Any bad seed can easily be detected after a few days in the wet sand by its dull, dirty, black colour, the healthy seeds all having a reddish appearance.

COFFEE.

No bees, no berries. A CORRESPONDENT sends us the following extract from *Good Words*, written by Professor Wilson in 1881:—

The common flowering currant is much frequented by bees as well as other species of insects and usually produces abundance of berries. The writer last summer carefully covered with muslin several of the newly-opened blossoms of this bush. This had the effect of preventing any insect gaining access to these flowers, and it was observed that they continued fresh and bright long after all their unprotected neighbours had withered, and that whilst an abundant crop of berries was produced on all the exposed branches which had been visited by bees, not a single berry appeared on any of those from which insects had been excluded by the muslin.

Lady Coffee Planters. The Hawaiian Islands can boast of several Lady Coffee Planters, the richest of whom bears the somewhat appropriate name of Wildwood. She is now 23. Two years ago she was a stenographer in a law office with no capital except a thousand dollar legacy that she was saving for burial expenses, as working spinsters sometimes do. She heard of the coffee plantation possibilities in Hawaii, and she decided to risk the funeral, and invest her capital. She induced her brother, who had an equal capital, to join her. In Hawaii they took up 260 acres of land at £1 an acre. A friend of theirs with some experience in coffee growing joined them. Within two years they have all made the venture pay. Miss Rita Wildwood expects to be earning an annual income of £2,000 at the end of four years.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61.50	lbs.	Nitrogen.
57.38	„	Potash.
14.92	„	Lime.
13.68	„	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. Germination guaranteed.

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

ASSIMILABLE NITROGEN AND LEAF-DISEASE.

II.

Review of the position.

In my last letter to your paper on this subject, I mentioned how complete prevention of leaf-disease, even cure, was possible under favourable conditions by adding artificially the missing Nitric Acid to the soil. Only one of the conditions to ensure such success was suggested, though others must play an important part. The one brought forward was important, in that the much higher state of oxidation naturally acquired by a soil which when the missing Nitric Acid was applied gave it complete immunity from disease which could possibly exist. So successful was that application that one might walk through acres of heavily-bearing coffee without being able to find one leaf through these acres, and throughout that year, with a trace of disease. The treatment there was completely successful.

A strong contrast to this healthy soil was given in the form of a highly organic matter one of Mysore, containing probably some four to five times the actual amount of reserve nitrogen, yet fettered in many various ways from presenting its nitrogen to vegetation in an assimilable form, especially to such a feeder as coffee happens to be.

The energy-givers.

Even if Nitric Acid (in form of Nitrate of Soda or of Potash) had been given to such a soil, it would seem impossible that any really good or permanent results could follow, at any rate not attended with the phenomenal success which was so prominently visible on the much healthier soil. It must mean waste of money, i.e., dispelling of much of the Nitric Acid. It could not give the wished for effects in placing the tree in a position to obtain its nitrogen—to form its valuable proteids (those strength-givers). Thus it could not render itself strong enough to resist the invasion of any of those thousands of *Hemileia Vastatrix* spores which may be floating in the air. But if provided with its energy-givers, the proteids, the tree does not become mere organic matter and a prey of bacteria. It has its own life, so to speak, within it intimately connected with this organic matter protecting it against the disease germs.

Feeling the immense value of these nitrogenous bodies to the tree, I had written a somewhat lengthy paper suggesting their use to vegetation, which has made this paper later in appearing than it otherwise would. I wish now to defer the paper on the proteids and go straight to the soils, to carry on the thread of what has already been begun, i.e., the many interesting ways one can prove by FULL analyses the small power certain soils have to form and retain in assimilable nitrogen.

Some soil analyses.

Yet these peculiarities of soils are felt to be only one of three (at least) important ways. Shrubs such as coffee are starved of their nitrogen. Now to show this, I am enabled to bring forward here, through the kindness of a planter, some most valuable analyses; valuable because it will be seen they go into detail such as to reveal the state of health and condition of the soils tested, i.e., in most cases their non-activity. To make them all the more convincing, however, I must bring forward Professor Voelcker's analyses of three Munjerabad soils, one set of which analyses confirm and help the others in different ways. For instance those by Mr. Robinson, though so full in other ways, leave out the important test for nitrogen as Nitric Acid. Professor Voelcker's, which would help to prove my point, leave out the test for Carbonic Acid. But I am anxious to show by several ways that the organic matter of these low oxide of iron and alumina soils is only decaying slowly and giving to the soil as the products of that decay Nitric and Carbonic Acids. Here is the important point of course, the Nitric Acid.

Then if the results of this decay of Organic, the Nitric and Carbonic Acids in the soils are not visible, ask yourself the reason why. This seems to me extremely clearly answered in Mr. Robinson's analysis. The very poor state of oxidation, plus the high water holding power causing this slowness of decay (after all these two factors are much of a oneness, though not altogether). Later on, I repeat, it can be easily shown that the Mysore soil in Mr. Robinson's analysis, so rich in organic matter and therefore in nitrogen, is the very soil

least able to give in its present condition Nitric Acid to the plant—poor as the others are also in this respect.

I here, therefore, annex below the analyses of Professor Voelcker and of Mr. Robinson. The analysis of the latter gentleman shows a state of such extremely low oxidation and such low amounts of Carbonic Acid that they more clearly demonstrate how extremely slow the decomposition or decay of organic matter is taking place within the soils analysed. They show, therefore, how meagre the resulting Nitric Acid is. Nitric Acid never appears high in a soil naturally, only the merest fraction, but it will be noticed that it is so low in the Professor's as to be untraceable by the weaker detective power of analysis over that of roots. What must it be in those done by Mr. Robinson?

Any discussion on these I leave till next time, but would at the same time ask my readers to note the very high proportion of the ferrous (the protoxide of iron) in Mr. Robinson's analyses. With this low oxide of iron so very high, it is impossible to have Nitric Acid in any reasonable proportion.

Dr. Voelcker remarks that No. 1 is considered good coffee soil, and that coffee does not do so well in Nos. 2 and 3. From this he infers that the supply of nitrogen is of lesser importance in the case of coffee and that the superiority of soil No. 1 to Nos. 2 and 3 would appear to rest on the excess of potash, the lesser proportion of iron salts, and very probably also in the fact that these latter are present in the more fully oxidized state of peroxide and not in that of protoxide of iron.

Ferrous and Nitric Acid inconsistent together.

One might close any arguments by saying that the presence of Nitric Acid is inconsistent with that of Ferrous because the formation of this food is not only prevented in its presence but further, what little forms stands the great chance of being dioxidised and being converted into useless Nitrogen gas in the pores of the soil and thus made useless to vegetation. Coming on to these points later, I ask that the extremely high proportions of this low oxide form of iron are noted in relation to the higher oxide of Ferric, in other words Peroxide. Nitric Acid must exist in close relation to it. It is this proportion of one to the other that is the important point, and, as I think, can be shown depends, not only on the soil's fertility, but the duration of such fertility.

The quick way these soils "go back" in fertility is well known and this is a thing peculiar to Ferrous soils. See Storer on the subject. Yet the whole main point after all is: (1) the very slow way such soils can form this assimilable nitrogen, (2) the great risk Nitric Acid runs of being chemically lost (dioxidised) in the soil, (3) the poor way it can be held in the soil in times of heavy rainfall.

To these I trust to refer next time and go into more closely.

NITRIC ACID.

TEA.

The Madras Gold Medal!

A "gold medal" is an excellent advertisement, so the many competitors in the local markets should do their best to secure the medals offered by the Madras Agri-Horticultural Society in February. The conditions are simple:—

- * 1. — A gold medal for the best sample, and a silver medal for the second best sample of Tea so moderately priced as to be suited for general consumption.

N.B.—The samples exhibited shall be not less than 30lb. in weight, and competitors must sign and forward a declaration that they are

* Samples of Tea must reach the Garden by 31st December, 1897.

Advertisers are notified to send all advertisement matter and answers to advertisements direct to Manager, this paper, 3, Esplanade Row, Madras.

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

the growers and preparers of the same, and that they have been grown since the last exhibition, and form part of a "break" of at least 1,250lb. The Exhibits will be sent for valuation to a Tea Broker in Calcutta, and the prize awarded by the Judges in accordance with the Broker's Report.

We fancy that the usual very small number of competitors would be materially increased if notice were given to the public of the standard to be used in valuing the teas by the brokers, *i.e.*, by the London market standard or the drinking tea standard. For these are by no means identical. An excellent drinking tea may not fetch more than 6d. in London, while a London shilling tea may be, by the drinking public, considered far inferior to the 6d. drinking tea. What are the medals given for? To improve the London or drinking standard of Madras-grown teas? If the former, they are well-nigh useless. If the latter, the brokers should be instructed accordingly.

Indian exports.

The total sailings from the 1st April to 31st October from Calcutta were 91 millions odd, an increase of nearly 1 million on last year's figures. Sailings to Great Britain are still lower than those of the preceding season, while those to Australia show a gratifying increase of nearly 1 million pounds, about 30% more than 1896. America also shows a distinct increase. The total exports from Ceylon from the 1st January to the 19th October were roughly 92½ millions against 83½ last year, and almost 70 millions in 1894.

Tea lead.

A correspondent to the Calcutta *Planter* writes that he had a letter sent him the other day intimating that tea lead can now be supplied to any length and breadth which may be wished. The idea seems to have been prevalent that only certain sizes were obtainable, *viz.*, 37" x 22" and 25" x 19", and so these sizes have always been ordered and sent out to India. Now it seems it has been found out by suppliers that these particular sizes are not capable of lining a chest of tea of any size without a good deal of patching and piecing. The suppliers write as follows:—The idea is that it takes two sheets 37" x 22" to go round the sides and two, 25" x 19", one each for the top and bottom, for each chest, but in any case this involves soldering two sheets 37" x 22" together, and they might just as well be sent as one sheet and save the join and the 1" lap, but we think that you will find that in all probability the size for the top and bottom sheets is incorrect, as it is obvious, if the sheet 25" x 19" is used for a top and bottom, two sheets 37" x 22" would not go round the sides. We have been told by some merchants that "our having called attention to this has saved the gardens a considerable sum of money, as formerly there used to be a great deal of waste in making up the tea boxes." Now what I have always wondered at was, why tea lead should not be sent out in continuous rolls of certain breadths, and that the lengths required be cut off on the gardens. I find out that in full-sized chests that hold 100lb. Pekoe, 120lb. Broken Pekoe and 85lb. Pekoe Souchong lead of the following sizes is required, one sheet 84" x 22" and 2 sheets 27" x 22". For half chests holding 50lb. Orange Pekoe, 80lb. Fannings, one sheet 62" x 20" and two sheets 18" x 18" are required. Now any one who has experience of the cutting and soldering of

the lead which we receive from Calcutta must often have pondered over the trouble and waste of labour and solder required to make the lead fit the boxes. I remember some years ago, a member of a Calcutta firm being up here and my speaking to him on this subject, and he informed me that rolls of tea lead could be got in Calcutta. I made a good many enquiries, but could get nothing except the standard size, and no one seemed to know anything whatever about any other kind of tea lead, so I had to give up in disgust. I wrote to my informant and told him the result of my enquiries, and he said he had found out he had been mistaken in what he had told me.

NEW SYSTEM OF WITHERING TEA LEAF.

We condense the following from a recent article on Mr. Edward Robinson's new witherer in the *H. & O. Mail*:—

He mentions that a complete installation has been sent out to Ceylon and will be set to work without delay, and that a large number of planters inspected his working model, and opinions highly favourable to this new departure have been expressed. He points out that an important part of the system has already been thoroughly tested in practice and has proved a remarkable success, namely—the arrangements for producing and evenly distributing large volumes of warm wind. Some forty installations of this special apparatus are, it is mentioned, at work, and there are excellent testimonials respecting it. Having thus been able to secure in large buildings the exact conditions necessary for successful tea withering, the inventor has turned his attention to this widely-felt requirement, and has designed and patented an arrangement of swinging trays which he claims is not only very simple, but which introduces a distinctly new idea into the practice of using trays as spreading surfaces for withering. The new method may be briefly described thus: Strong trays, having each an area of thirty to forty square feet, and made with a frame of round iron, covered with wire netting, and all galvanised, are attached on one side by means of staples to a strong angle-iron frame-work. They are fixed about four inches apart, and will swing about from one side to the other like the leaves of a book. To the side opposite the hinge-like attachment ropes are fastened, which ropes are connected to a continuous roller or windlass, carried overhead and supported by angle-iron uprights. The windlass is worked by a worm-wheel gearing, so that a boy can easily raise up a whole row of trays at once. On commencing to spread leaf, the whole row of trays is made to recline back upward. The first of the series is then turned over by hand and the leaf spread, the same with the rest of the trays in succession. The row of trays being thus spread, a few turns of the windlass raises them all up at once to any desired elevation. It is then found that the leaf rests securely on the trays when raised to an angle of 45 deg., or even more. To about this elevation the trays are raised and left until the leaf is withered. Obviously trays standing in this position, with clear spaces of about four inches between each tray, admit of a free up-draught of wind to carry away moisture from *both sides* of the leaf. The air pipes are so arranged as to disperse a constant gentle current of fresh dry air *under each row of trays uniformly*; thus each tray gets its own supply of fresh drying wind, such wind having only to pass once between the trays, after which it is driven out through the upper ventilators by the constant incoming wind from below. Thus in bad, wet weather it is only necessary, according to the inventor, to close all doors and windows, and set heater and fan to work, and first-rate withering can be done irrespective of the weather outside. Many planters of large experience, the inventor mentions, have told him that this system of withering is well calculated to save a large portion of the losses now unavoidable during heavy flushes of leaf in the rainy seasons. Should this expectation be realised, it is scarcely possible to over-estimate the importance of such an improvement.

As to the great saving of labour, that, the inventor contends, is obvious on the face of it, for the spreading of the leaf upon a flat open surface some two feet from the floor is much easier than the stooping down and climbing up, and reaching between the tats necessitated

by the present mode of working, whilst for gathering in the withered leaf a few turns at the winding gear raises a row of some fifty or sixty trays to an upright position, and the leaf at once shakes down upon the sheet spread out under the series of trays. The sheet is then wound in upon a simple roller having a handle and light gear-wheels. The leaf can be dropped through an opening in the floor or picked up as desired. There is nothing in the process that can break or bruise the leaf, which is another very important consideration, having regard to all the vexed questions about small siftings.

At first sight it does not strike us that there would be the saving of factory space which is claimed for this system. It is, however, a matter of simple computation, but the inventor contends that upon a careful comparison of the spreading space obtained by the new arrangement with the actual spreading space available in numbers of factories of the ordinary kind, more than *twice the area of spreading space* is obtained under the new method in the same area of building.

It is further claimed that in the wear and tear of plant a saving of fully 50 per cent. will be realised. The wire trays are never moved from their places, and the only handling required is just to swing them over for spreading the leaf. Strong trays so used are calculated to last for some years.

The inventor claims that the most important results are expected to arise from the control the system gives over the necessary conditions of withering in bad weather. When the weather is good and quite favourable for natural withering, the windows of the house are opened and no heater or fan used. The arrangement of the trays he regards quite as suitable for natural atmospheric withering as the ordinary trays now in use, plus the saving of labour, space, &c. If the weather is hot, dead, and still, the fan alone can be worked, imparting a nice gentle motion and life to the air and expelling the vapour. When the outside air is saturated with moisture and will not wither leaf, a little steam can be let into the heater, raising the temperature a few degrees; vapour will then be freely carried away, and good withering done. By increasing the inlet of steam, the temperature of the house can be raised so as to wither well on the coldest and wettest of days. Thus it is claimed that without in the least interfering with any existing advantages, natural or otherwise, this new system affords the planter the means of effectively withering his leaf, whatever the weather may be. The same thing is being done, says Mr. Robinson, now in numerous factories larger than any withering house on this system would need to be, the conditions obtained being identically the same as the well-known conditions required for withering tea leaf.

INDIAN TEA ASSOCIATION.

FROM the proceedings of the General Committee Meeting held in Calcutta on the 8th ultimo, we extract the following:—

Bulking in London. Letter of 1st October, from the Secretary, Indian Tea Association, London, stating that the Committee had given their attention to the contents of the letter signed by "An Anxious Planter" in the *Home and Colonial Mail* of 30th July, forcibly urging that tea which is turned out for the purpose of bulking should be repacked by machinery, instead of being trodden into the packages by dock labourers. The London Committee noted that the General Committee were of opinion that a different system of weighing should obtain in London, as mentioned in their letter of 8th September, and their Secretary pointed out that after several years of strenuous efforts the Committee had obtained

the concession from the Custom House authorities to have tea weighed nett, and that it was now within the power of anybody who was able to get his tea properly bulked in India so as to pass the scrutiny of Brokers, and to pack it in chests of even weight, to avoid having it turned out on that side, but that unless both the tea and the tares were fairly even in a break there was no course open but to have the contents turned out on the floor of the warehouse. It was regretted, however, that in too many cases Growers and Importers appeared to have given up the attempt to meet the above-named conditions. He would, however, consult the trade in the matter. There was no doubt that the introduction of machinery for repacking tea would be a great improvement.

The London Secretary stated that the Committee had authorised him to write to the Secretary of the Tea Brokers' Association to express their approval officially of the alteration in clause 4 of the Public Sale Conditions as recommended by the Special Committee. The alteration when made would require all teas to be sold as bulked either in the country of production or London.

The letter was ordered to be recorded.

Letter of 8th October, from the Secretary, Indian Tea Association, London, with further reference to the system of repacking in London warehouses, and to the views expressed by "An Anxious Planter," with extracts from the sixth, ninth and tenth Annual Reports of the Association, in which reference was made to the subject of net weighing, from which it would be seen that the system had already been in force for about three years, and was reluctantly suspended owing to the opposition of the trade to have teas weighed in that manner.

The London Secretary stated that from enquiries made he found that it was not now an uncommon practice to leave the process of bulking the tea to be done in London, notably by several well-known concerns, presumably with the object of avoiding claims, although in the opinion of the trade it had been avowed that a decided preference is given to teas bulked in the factory. He considered that it was much to be desired that a continued effort should be made to lay down tea in London in such a condition that it might be kept untouched without risk of deterioration owing to the humidity of the climate.

In reply to a letter of enquiry on the subject of the use of machinery in repacking tea, the Managing Director of Butler's Wharf wrote to Mr. Tye as follows:—

"We do not use any machines for repacking teas. It has been an utter failure at the London Tea Warehouse. We fail to see how an average sample of tea can be drawn from any machine-packed chest. All bulked teas are weighed gross, and nett, both under the supervision of Her Majesty's Customs; teas not bulked are weighed gross, and average tare fixed by Her Majesty's Customs."

In this connection the Secretary was instructed in writing to London to embody the remarks made by Mr. Traill, when the letter was in circulation, which were to the effect that the Association should press for nett weightment of all teas turned out for bulking in London. Nett weightment meant the actual weightment of the contents of each chest, and not as at present, weighing the chest gross, deducting fractions of a pound, then turning the tea out and taring the chest, taking any fraction of a pound as a full pound. By this system it is quite possible for the Customs weight to show 1 lb. 15 oz. less than is in the chest. There is no doubt that many claims for loss in weight are largely due to this antiquated and unfair method of weightment. It was presumed that the wholesale dealers could not reasonably object to a system that would ensure their getting the weights of tea they paid for.

The American Fund

Letters of 24th September, and 1st, 8th and 15th October, with their respective enclosures from the Secretary, Indian Tea Association.

CENTRAL HOTEL, INFANTRY ROAD, BANGALORE.

(Under English Management.)

The most comfortable and convenient for visitors.

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

association, London, in connection with the American Market Fund, which had previously been circulated to the Committee, now came for consideration.

In his letter of 11th September, Mr. Blechynden stated that the decision of the Board of Appraisers on the "Tea dust" question, as a most important one, and if matters were allowed to take their course, there was little doubt that practically all fine teas would be kept out of that market. He proposed, however, to continue pushing his side of the question to the utmost of his ability, and hoped his efforts would be successful.

In his letter of 21st September, Mr. Blechynden stated that he had called a meeting of a few houses of importance in New York to draw up a petition to the Treasury Department, which he would take to Washington with as little delay as possible.

The Committee were glad to note that Mr. Blechynden was doing all in his power to remove the restrictions with regard to "dusty teas."

Letter of 15th October, from the Secretary, Indian Tea Association, London, in connection with the American Market Fund, came for consideration, and the Committee noted that he had received samples of Oolong teas manufactured by the Kausanie Tea Company, and that he had recommended samples to be forwarded to Mr. Blechynden for inspection, and to get a report on their value. He also stated that he had had a call from Messrs. T. Barlow and Brothers the other day, who wished him to point out that the Derby Tea Company, which subscribed to the American Market Fund, does not appear in the published list of subscribers for 1896.

The Committee expressed their regret that it had been omitted from the list through an oversight.

DR. LAMONT'S STRONG FINGERS.

"I was afraid you were going to slip through my fingers," said good old Dr. Lamont.

The writer was a boy of about seventeen, then. While a student at school, more than 300 miles from home, I was taken down with pneumonia. I had a tough time, and for two or three weeks my life was despaired of. But youth and good care won the fight, and one bright morning I was ready to go home with my dear father who had come for me. I was weak still, but well and happy clear up to the brim. Oh, what a ride! Oh, what sweet air! Oh, what a glorious world I had got back into! and what a reception from mother and sisters at the familiar house. Oh, life! Oh, health! Oh, *dulce, dulce domum!*

Such an illness, if one survives it, only makes the sense of existence and its blessings more keen and delightful. It is good rather than bad. Lucky boy, not to have slipped through the doctor's fingers.

But when a man with most of his days behind him has to write a line like this "*All my life I have suffered more or less from disease*"—why that is another and sadder story. It is the odds between an occasional thunderstorm and a sky always covered with clouds.

We quote what he says, reminding the reader that in this matter Mr. William Hodkinson voices the experience of millions. He says: "I always had a bad taste in the mouth, no proper relish for food, and after eating had pain and fulness at the chest."

These sensations are symptoms of acute indigestion. In the stomach there is marked loss of power. The food is neither rolled over at it should be so that the whole of it in turn may be presented to the digestive fluid, nor is it duly moved on towards the outlet into the bowels. As a result it ferments and gives off irritating acids and gases; hence the patient complains of pain, weight, distension, acidity, and flatulence in that region. Thence the poisons proceed to every other part of the body, and headache, vertigo, gout, rheumatism, depressed spirits, and a score more of evils follow; among them,

possibly, nervous prostration, progressive anæmia, locomotor ataxis, and more or less complete paralysis.

"Frequently," continues Mr. Hodkinson, "I was sick, and as time went on I became very weak and feeble. I consulted one doctor after another, and took various medicines, but obtained no real or lasting relief from any of them. This describes my general condition until the fortunate day when I read about Mother Seigel's Curative Syrup. I was impressed by the statements others had made concerning it, and proceed to try it. After taking one bottle I found relief, and was soon entirely free from my old complaint. Since that time (now eight years ago) I have enjoyed good health. Knowing personally of its virtues, I have recommended this remedy to hundreds, and have never heard of its having failed to give relief. But for Mother Seigel's Syrup I should have been in my grave years ago. (Signed) William Hodkinson. Hollington, near Uttoxeter, Staffordshire, August 11th, 1893."

Mr. Hodkinson is well known and highly respected. He is a local preacher in the Methodist church, and by employment a quarry master. Had he gone into the grave, as he feared he should, he would have been missed and lamented by the community in which he has long been useful, and will live to be useful, we hope, for years to come.

Now let us repeat our leading thought. Short illnesses, even though sharp and dangerous, may result in good rather than harm. But a disease that drags its victim through decades of lingering distress—what shall we say of it? The trouble and suffering it inflicts is beyond estimate, and its name is indigestion and dyspepsia.

And the name of the medicine that cures it Mr. Hodkinson has done you the favour to mention with clearness and emphasis.

TO STAMP COLLECTORS.

5,00,000 Foreign Stamps, (well-mixed,)

Includes some very good varieties. The best offered at the price, which is extremely low.

MARKET SUPPLEMENT.

SATURDAY, DECEMBER 4, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (November 12, 1897)
s:—No Public Sales were held on Tuesday on account of the Lord
yor's Show, whilst yesterday the fog was the cause of another blank
. The small supplies brought forward met a slightly better demand
the market is still very dull.

No East India was offered.

A fair quantity of Columbian was catalogued and good home trade
alities realised steady prices, but mixed common sorts were all in buyer's
our.

The 'Terme' market has fluctuated considerably during the week in
nsequence of conflicting crop reports, but at the close quotations show
y little change since our last.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for
e Week ending November 10th, 1897, says:—Bank rate 3%. Bombay
change closes at 1s 3½d. Brazil Exchange 7½d. Rupee paper 3¼% 63½.
ver 26½d per oz.

The spot market continues very unsettled and the sales unimportant.
the close there is a slightly better demand, and there has been more
d at auction than on any other day this week. Prices show an irregu-
decline of 3s to 5s per cwt., the ordinary qualities being very difficult
sale. Brazil markets are flat and lower.

According to Messrs. Duuring and Zoon the European stocks on
t instant showed an increase of 15,380 tons, and the visible supply of
950 tons, the figures being 150,650 tons and 361 220 tons respectively,
ainst 135,300 tons and 354,270 tons on the 1st October.

Futures have given way another 1s, and the estimates issued this week
6½ million bags Santos for next crop have had a depressing effect.
osing prices are—Good average Santos in Havre, March delivery,
s. 37.50, in Hamburg pf. 30½, and No. 7 low ordinary Rio in New York \$5.65.

To-day's London official quotations are:—

	Dec.	March	May	July	Sept.
SANTOS	29/6	30/-	30/3	30/6	30/9

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, “Planting Opinion,” Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 17th December 1897.

S. E. Wynaad.

DEVALA, 8th December.—*Weather.*—Since my last report, at nights it is very frosty and cold until 8 A.M., and during the day the sun shines brightly. *Crop.*—Stripping is nearly finished. *Grain.*—Rice 8, cholum 18, ragi 16, and salt 8 seers per rupee. *Plant-disease.*—The leaf-disease has disappeared. *Health*—Good. *Labour*—Sufficient.

Nellampatty (British).

8th December.—*Weather.*—No more rain since last report, and weather has been all that could be desired for pleasantness. Mornings are very sharp, and at night, as a rule, there is a high wind which is bitterly cold. *Crops.*—Coffee coming in, but not quite in full swing. Grains as last reported. *General Health*—Good. *Labour*—Plentiful. *Interesting Items.*—The place is getting quite civilised! We have a photographer up just now, and a group was taken of the planters on Sunday, (but alas, the *esprit de corps* could muster only ten out of a total of nineteen!) and this Sunday we are to have a “padre” and two services.

Nilgiris.

COONOOR, 8th December.—Since my last report we have had a few heavy but very local showers, of great use in ripening up backward crop. The N. E. current as a whole has proved up till now very nearly a complete failure. Very few planters expect anything more till March next year. Natives on the other hand are confident of a moderately heavy fall before Xmas. Light clouding up points to slight showers only. The air is very cold and bracing. Our largest local tea-garden, Glendale (now of the N. P. Company), is extending rather largely. A notable exception, this. From all over the district the same tale is told of the wide-spread selling off of estate cattle, due to the loss of faith in the efficacy of cattle manure. Labour plentiful. Health good. Even betting that the twentieth century will give our railway pounds and a beating. The gaudy station buildings are all ready and waiting. I can't say I agree with Friend Mudgere that the paper ought to relapse to once a fortnight.

GENERAL NOTES AND ARTICLES.

The "patriotism" of consumers. As regards coffee and tea, the moral derived from the cane-sugar question is decidedly encouraging.

Consumers, in ninety-nine cases out of a hundred, do not care a rap about the "nationality" of the article they purchase. They buy it for the value offered for the money. This has been very conclusively proved in the lengthy discussions about the ruined cane-sugar industry of the West Indies. Being more expensive than beet-sugar, which is made on the Continent, it is little used, despite the fact that cane-sugar is produced in British colonies and that a vast amount of British capital is invested in the industry, both in the colonies themselves and in refining works at home. So that the fact of British-grown coffee and tea being held in such high favour at home speaks exceedingly well for their intrinsic value, and encourages a hope bordering on conviction that in time the wide world will come round to the same impressions.

Exchange and the Export Duty.

A reader suggests that it is a risky proposal to ask Government to impose up to a 20% export duty on produce to compensate for the wished for opening of the Mints. It would be easy enough for Government to impose the duty, but it will be very difficult to get them to remove it, *vide* Income Tax.

We have no desire to urge the public to take hasty ill-considered action in the matter, more especially in view of the widely-spread belief that a very heavy fall in Exchange must follow the inevitable sale of Council bills to meet home charges. Yet there is no harm done in inviting preliminary expressions of opinion from all the producing classes of the country, if only to show Government that the question of Exchange possesses two very different sides.

We note by the way that the Singapore Chamber of Commerce are doing their best to convert the silver currency of the Straits Settlements to the gold standard. It would be interesting to learn how far, if at all, the wishes of the producers of the colony have been considered. For we do not think that we are altogether one-sided in our ideas, when we express the conviction that the interests of the producers, and therefore consumers, to be of paramount importance in a question of this nature.

Lady-birds for South India.

A writer signing himself "All Bosh" delivers himself of certain views concerning this question, which it is as well not to pass unnoticed. For cursory study of the subject has doubtless influenced many besides our correspondent to form similar and erroneous opinions. He evidently, and strongly, holds the idea that, because certain species of lady-birds indigenous to South India have natural enemies that keep their number woefully in check, other and different species of lady-birds introduced from far-distant countries must necessarily be attacked in India by the same enemies that have proved so fatal to their Indian brethren. The fallacy involved is, superficially, a specious one. Yet very easy to expose. For it has been proved that, by taking care not to import its natural indigenous enemies, a given species of insect can, under suitable conditions, increase in foreign countries (free from their original enemies) to an extent absolutely impossible in their native

habitat. Not with insects alone has this been proved, but in many instances with animal and vegetable life. To mention a few cases where certain forms of animal and plant life have multiplied exceedingly in foreign lands, take the rabbit in Australia, the mongoose in Jamaica, the sparrow in America, the thistle in New Zealand. Lastly, and perhaps most to the point, are those instances where the introduction of certain species of lady-birds from Australia proved the salvation of orange growers in the United States and coffee-planters in Hawaii. We have published "All Bosh's" communication solely as a peg whereon to hang a refutation of views common to all who have bestowed but the most cursory of attention on an exceedingly interesting subject. We hope the extra funds required will be raised without difficulty, and that the much-discussed experiment will soon be a *fait accompli*.

Some remedies for plant diseases.

The following are some reliable formulæ for the treatment of fungi and insectpests. They are published in Vol. IV., No. I., Indian Museum Notes, 1896, and are taken from the Report of the Agricultural Experiment Stations of the University of California:—

For *Fungi* in general use Bordeaux mixture, made as follows:—For every 10 gallons take 1 pound of lime and 1 pound of bluestone. Dissolve these separately in hot water and mix when cool, adding the rest of the water. Spray on the plants. Or spray with ammoniacal copper carbonate solution made as follows:—Dissolve 1 ounce of copper carbonate in 6 ounces of ammonia and add 10 gallons of water.

For *Fungi* and *Scale Insects* use lime, salt and sulphur mixture as a *winter* wash composed of lime, 8 pounds, salt 3 pounds, and sulphur 4 pounds for each 12 gallons of water. Mix one-fourth of the water, one-fourth of the lime and a fourth of the sulphur and boil for one and a half hours; put the salt with the rest of the lime and slake with hot water; add to the above and boil half an hour longer; add the remainder and boil. Use as a spray.

For *Scale Insects* use resin soap as follows:—For 100 gallons for *summer* use take resin 18 pounds, caustic soda (98 per cent.) 3½ pounds, and fish oil 2½ pints; for *winter* use, resin 30 pounds, caustic soda 6½ pounds, and fish oil 4 pints. The material is put in a kettle and covered with four or five inches of water. The lid is put on and the mixture boiled two hours or more, and then the rest of the water is added, a little at a time. Spray on plants. Or use the gas treatment: cover the plant with an oiled tent, and for each 100 cubic feet contents, place in a bowl beneath the tent ½ ounce of water, ½ ounce sulphuric acid and ½ ounce potassium cyanide. Be careful not to inhale the poisonous gas, nor allow it to escape from the tent for half an hour. The leaves may be injured if used during the middle of the day.

As far as we are aware, the trials hitherto made by planters with various insecticides and fungicides have been very disappointing. The cause, we are persuaded, can be traced in most instances to the extremely amateurish manner in which they have been employed. As farmers at home have found out by sore experience, the science of applying these remedies has to be thoroughly mastered before success can be attained. We are not, in this instance at least, posing as carping critics, for personally we have no great belief in such "cures." Most plant diseases are but symptoms of

graver disorder existing in the soil itself, which latter must be restored to its right condition before the plant-life existing thereon can be rendered perfectly healthy. However, we are not so utterly convinced of our infallibility as to refuse to publish both sides of a question. We trust, therefore, that previous failures in applying insecticides will not deter our readers from repeating their trials with greater care than ever before. If perfect cures cannot be achieved, palliatives are welcome and often valuable enough.

THE CACAO CANKER.

SOME explanation is needed as to the publication of such a long paper on a product that is not practically known in South India. Yet though the plant is foreign to our planting districts, the information given by the highest English and Ceylon authorities on the treatment and cure of fungoid diseases is such that we are sure their remarks will prove of great value and interest.

Memorandum from the Assistant Director, Royal Gardens, Kew, to the Director.

The probability is that the canker in cacao trees in Ceylon is caused by a fungus, the nature of which is at present imperfectly known.

2. It is understood that since the attack of the *Helopeltis Antonii* some change has taken place in the method of cultivating cacao in Ceylon. More shade is used than formerly, and the trees are covered in to such an extent that the ground underneath is constantly kept moist and covered with a heavy layer of damp dead leaves. There is no definite information in regard to the amount of drainage provided. This is a vital point. In all damp situations and those liable at any time to the lodgment of water during heavy rains there should be drains cut two feet or more deep between every row of trees. In fact, the bottom of the drain should be below the level of the feeding roots of the tree.

3. In Trinidad and Grenada draining cacao has lately received considerable attention. Where the soil is "sour" through accumulated moisture the trees have died over considerable areas. The only cure for this is deep draining, turning over of the soil, and the application of a small quantity of lime or other suitable ingredient.

4. Everywhere young cacao appears to require some shade, but the extent to which mature trees require shade depends very much on the locality. In Trinidad the trees are usually shaded all over the island. In Grenada, on the other hand, the trees have little or no overhanging shade, but are usually protected by shelter belts planted or allowed to grow on the ridge.

5. The Ceylon cacao planters would do well (1) to examine the drainage of their estates very carefully; (2) to break up the soil where the trees have died and treat it with lime to kill the mycelium* in it; (3) to isolate the healthy trees from the unhealthy by deep trenches, and give only the amount of shade absolutely necessary.—D. MORRIS.

Report by Mr. G. Masee, Principal Assistant (Cryptogams) in the Herbarium, Royal Gardens, Kew.

The material sent for examination is insufficient for the determination of the fungus, but the exact agreement in structure, &c., of the mycelium* present in the different pieces of bark suggest a fungus as the cause of the disease, and furthermore, that the fungus belongs to the group causing root disease. If the roots of a diseased tree are removed and portions kept moist under a bell-jar, the characteristic snow white nodulose mycelium would in all probability cover the roots in a few days.

The sporophores† of such fungi are only produced on dead and thoroughly decayed host plants.

* The body of a fungus, made up of fine colourless threads, as may be readily seen on examination of a piece of mildew or mould with a good lens.
† The spore-bearing organs of the fungus: the spores are the detached portions which reproduce the fungus; placed under suitable conditions a spore germinates and gives rise to a new mycelium.

The two conditions favouring the spread of root disease are: (1) accumulation of humus,‡ &c., on the ground, which retains moisture and favours the spread of the mycelium from tree to tree; (2) overhead shade.

Diseased trees should be isolated by narrow trenches, 8 to 10 inches deep. These retard the spread of the mycelium. The removal of the roots of dead trees and sterilization§ of the soil (by fire, &c.,) is most important.

Ascertain if the disease attacks native trees, may be in a modified form.—G. MASSEE.

It will be seen from the above that the home authorities regard the fungus as one of the class of root-disease fungi. Without the reproductive organs, the exact identification of a fungus is all but impossible, and until quite lately no sign of such organs has been discovered on any of the diseased cacao.

It is obvious that if the canker on the stem be merely an indication of diseased roots, the treatment recommended in the preceding Circular will have to be modified: mere removal of diseased parts of the stem will be evidently only a temporary measure.

Most observations made in Ceylon seem to contradict the supposition of its being a root disease, and the publication of this Circular has therefore been delayed for further investigation of the subject. It so happens that the group of fungi causing many of the bark cankers of trees is very closely allied to the group causing root diseases.

These bark canker fungi as a rule can only enter the stem by way of wounded surfaces on the bark, but a very slight wound is often sufficient. The frequent connection of the cacao canker with wounded places has been pointed out in the preceding Circular.

Reproductive organs which appear to belong to the fungus causing the cacao canker have recently been discovered on the bark of the stem, and indicate that the fungus does belong to one of the two groups just mentioned. As no sign of these organs can be found on the roots, and the mycelium mentioned in Mr. Masee's report has not been seen on roots treated in the way there described, it seems more probable that the canker is only a bark and not a root disease. As however the final decision of this question requires experiments in the infection of healthy trees, &c., which are now being carried on at Peradeniya, and also further reference to the authorities at home, it has been decided to publish this Circular without further delay.

The presence of the disease, as stated in the preceding Circular, is largely connected with insufficient drainage, and Dr. Morris's recommendations on this subject deserve careful attention. In many cacao plantations in Ceylon the soil has become sour through insufficient drainage, and the application of lime in some of these cases has been most beneficial.

Besides its action in removing the sourness of the soil, the application of lime helps to kill the fungi that may be present, and is therefore much to be recommended.

Dr. Morris's remarks on shading should also be noted. Mature cacao can do with very little shade from the sun, but requires protection from wind. In the Botanic Garden at Anuradhapura the *Forastero* cacao does excellently with practically no overhead shade at all, hot and dry though the climate is. The shade in most Ceylon plantations was provided to avoid the attacks of *Helopeltis*, and now that the trees have grown very large, it is probably denser than is necessary for that purpose. The reduction, if made, should be very gradual, otherwise the sudden increase of the crop will tend to weaken the trees. This reduction would act upon the fungus causing the canker in two ways: by drying the soil and thus helping to prevent its getting sour and so weakening the trees, and by the direct action of the sunlight which checks the growth of fungi and is often fatal to fungus spores upon which it acts. Care should be taken to see that cacao is well sheltered from wind: not merely is wind harmful to the plant itself, but it also carries the spores of disease from one plant to another.

The period at which further spread of the disease usually takes place is now approaching, viz., the wet weather of the north-east monsoon, and especial care should be taken to destroy as far as possible all diseased trees, and parts of trees, to prevent the diseases

‡ Decaying organic matter, whether of animal or vegetable origin.

§ The killing of all living matter: spores, mycelium, &c.

extending. The reproductive organs both of root and bark diseases are produced only on dead and decaying parts of diseased trees, and if these reproductive organs can be destroyed, or prevented from forming, as the case may be, the disease will thus be prevented from spreading to fresh trees.

To this end it is essential that the destruction be *by fire*, which alone is certain to kill the fungi. Also, the destruction should be on the spot where the diseased tree grew. If infected trees or parts of trees are carried about the estate, they will spread the disease as they go by scattering the fungus spores. For the same reason coolies should be prevented from going amongst healthy trees immediately after working amongst diseased ones. They should wash themselves before doing so. It would be advisable to employ a separate gang of coolies in working with diseased trees.

All diseased trees should be cut down to the ground, or better rooted up, and burnt upon the spot, and at the same time all the dead leaves and other rubbish lying round about them should be burnt. The surface soil should be turned over and treated with lime and the ground left fallow for some time. If planted again in cacao, *Forastero* varieties should be employed (see remarks on pages 10 and 11 of the preceding Circular).

On estates where the disease is widespread it would be well to burn all the dead leaves and lime the soil, as there will probably be fungus spores lying on the ground ready for germination in all parts of the estate.

In dealing with diseases caused by parasitic fungi, the aim is prevention rather than cure. Once a tree is fairly attacked cure is usually impossible, and it is best to kill and destroy it.

In the neighbourhood of diseased trees not merely the soil, but also the surrounding healthy trees (including of course the shade trees) will be more or less covered with spores of the disease. Those on the soil may be killed by the lime treatment above described, but considerable danger remains from those on the trees, which under favourable conditions will germinate there and produce further attacks of the disease. These spores may be killed by the application of various fungicides. The best general fungicide is Bordeaux mixture. In Europe this can be applied to leaves as well as stems, but as it is said to cause damage to the former in wet seasons, it would be well in Ceylon to apply it only to the stem. This, however, is of less moment, as the disease does not appear to attack leaves or young shoots, and if all the leaves that fall from the plants are raked up and burnt, the danger from the spores that may be resting on them will be lessened. The composition of Bordeaux mixture is:—

Copper sulphate (blue vitriol)	...	...	6lb.
Quicklime	...	...	4lb.
Water	...	...	45 gallons.

The vitriol should be dissolved in a little water and boiled; to it should be added, while hot, the lime which has been slaked in a small quantity of water and stirred into a paste. The two should be thoroughly mixed and the mixture diluted to 45 gallons. It should be tested by holding a clean steel knife in it for two or three minutes. If a reddish stain of copper is formed on the knife there is not enough lime present, and more must be stirred in until the mixture is neutral and no longer produces any stain. Before use, and while in use, it must be kept thoroughly stirred, as the important part of it is the sediment rather than the fluid. The mixture may be applied with a brush or a spraying apparatus. The latter, if used, must be thoroughly cleaned with hot water immediately afterwards, or the tubes and taps will be clogged.

Another useful fungicide is the lime and sulphur wash, but it must not be applied to the leaves. Its composition is:—

Unslaked lime	...	25 to 40lb.	Sulphur	...	20lb.
Salt	...	15lb.	Water	...	60 gallons.

To mix, take ten pounds of lime, twenty of sulphur, and twenty gallons of water; boil till the sulphur is thoroughly dissolved; take the remainder of the lime and fifteen pounds of salt slake, mix with the first lot, and add enough water to make up to sixty gallons. Strain and use when milk-warm.

Either of these mixtures will kill the spores on the bark, but if the disease is already established on the tree, it is useless to apply them, and the tree should be killed.

Of course the stems of the shade trees should be treated with the mixture as well as those of the cacao itself.

Heavy rains will soon wash off most of the fungicide, and a new coating should be given every month or so.

If care is taken to destroy all dying and dead stems, leaves, &c., on which the fungus might develop its reproductive organs, and if

fungicides are applied regularly for at least six months, there would seem to be a fair chance of eradicating the disease to a large extent. To completely exterminate it may be regarded as all but impossible. All that can be done in cases like this is at best to reduce the prevalence of disease to a large extent by killing and burning diseased trees, applying the preventive measures to the survivors, disinfecting the soil as far as possible, and taking more care in cultivation to keep the trees in good health, and thus render them less liable to disease.

The chief causes of ill-health among cacao trees have already been mentioned in the preceding Circular, and attention may again be drawn to the recommendations there made, especially those relating to the treatment of wounds and the planting of *Forastero* varieties.

There is a good deal to be said in favour of the method employed by some planters of allowing the suckers to grow. Unskilful removal of them affords openings for disease to attack the trees. Probably on estates where there is much disease it would be better to leave them on the trees.

JOHN C. WILLIS,
Director, Royal Botanic Gardens.

LETTERS TO THE EDITOR.

GYPSUM.

SIR,—Can you or any of your readers tell me where I can get gypsum, and the price of it?

How much should be put to an acre?

“D.”

[Arbuthnot & Co.'s Kallai Works, Calicut.—Ed.]

LADY-BIRDS.

II.

SIR,—I see it is proposed by some Planters' Associations to raise funds to supplement the allotment of Rs 2,000 from the Reserve Fund of the U. P. A. towards expenses of sending a qualified person to Australia to bring over lady-birds. Have you ever thought of the enemies the lady-birds have in this country? And do you not think it is waste of money to try and introduce them.

The few varieties of lady-birds we have never increase in any proportion to do good. The much-talked of good that the lady-bird will do is

“ALL BOSH.”

[Noticed elsewhere.—Ed.]

WORMS IN COFFEE ROOTS.

DEAR SIR,—I have just seen “Young Planter's” letter in your issue of 20th about worms in coffee roots. It promises to be very interesting, so it would be well if “Young Planter” would send specimens with roots to the Indian Museum, Calcutta; or if you can get them for me, I shall be glad to forward them all.

Did your correspondent apply any manure to his young plants? There is a variety of wire worm (*Elatér*) that is attracted by manure common in some districts. A little digging or breaking up of the soil around the plants brings the wire worm to the surface, and it soon becomes a meal for one of our many birds. Sawdust sprinkled with kerosine oil and thrown broadcast around the plant may do good.

COFFEE.

Leaf disease and shade.

In the extract on the Cacao Canker, published elsewhere, will be noted some interesting remarks of Mr. John Willis, Director of the Ceylon Royal Botanic Gardens, on the effect of direct sunlight on fungus spores. The direct action of the sun, he

states, checks the growth of fungi and is often fatal to fungus spores on which it acts. The evils of overshadowing, and consequent sourness of the soil, are noted in the weakened state of the tree induced thereby and the multiplication of fungoid growths in congenial surroundings. The remedial treatment advocated is thorough drainage of the soil (narrow deep trenches between every row), thinning of the shade trees and liming of the soil. The further advice tendered of stamping out the cacao disease by fire is strikingly like what has been frequently advocated in our own columns relative to leaf-disease in coffee.

Lime and nitrates.

A Mysore correspondent wrote us last week for information from "Nitric Acid" regarding the proper time of application of nitrates and lime. The following is his reply:—

"I should think *now* would be a good time to apply lime, and so take advantage of the X'mas rains, if any. Good wood ashes seem to be as good as anything, *i.e.*, they contain some 80 to 90% carbonate of lime and have a more effectual oxidising effect than ordinary slaked lime. At least the ashes that I sent home had. I don't think two pounds spread over the roots too much. That is what I have just done.

"*Nitrates.*—The time I saw such wonderful effects was when I saw it applied in April or May, but then the rainfall of my district is not extra much in the S. W. Monsoon. More trials are necessary to determine the best time of application, but about April suggests itself to me. It gives the tree a chance of charging itself highly with nitrogenous sap, as the showers do not then wash it below the roots. But the poonacs have possibly a safer way of supplying nitrogen. I am sorry not to be able to give any fuller information, but hope the above may be useful. The nitrates above alluded to were *very evenly* spread, which must mean half the battle."

Danger of excessive shade.

The investigations that have been proceeding both in Ceylon and at the Kew Gardens at home into the disease attacking Ceylon cacao are interesting from the lessons they teach regarding the danger of over-shading cultivation. It is possible that coffee-planters may find them of interest. Some years ago, the Ceylon cacao plantations were subjected to very serious attacks of *Helopeltis antonii* (mosquito blight), which led planters to resort to shade as a protection against the pest. In this they succeeded. But it was only out of the frying-pan into the fire. For both the local and the home authorities agree

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61.50	lbs. Nitrogen.
57.38	" Potash.
14.92	" Lime.
13.68	" Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

as to the cause of the disease, however much they differ as to its exact nature of attack. The disease, they hold, was induced by the moist and sour state of the soil, which was brought about by excessive shade. Draining, thorough cultivation, liming, and gradual thinning out of the shade are all recommended as means to sweeten the soil. Incidentally we may note that the request of the Governor of Ceylon to have a specialist sent out from home to investigate the disease has been curtly refused by Mr. Chamberlain.

The Market.

During October the European stocks increased to the extent of 15,000 tons, and the world's visible supply by 8,730 tons, according to the *P. M. Review* of 13th ultimo. This has brought the latter up to the large total of 360,040 tons. Such an amount is sure, for a time at least, to have a depressing effect upon the various markets, but it must not be forgotten that the marketing of the Brazil crop has taken place this year with extraordinary rapidity, so that there is every reason to expect a falling off in the receipts at Rio and Santos before long. Another hopeful feature for the future of prices is that the deliveries have shown a remarkable increase, the total during this year in Europe and the United States amounting to 642,420 tons, against 572,093 tons last year. This increase, however, is not entirely in the consumption, but partly in the distribution of larger stocks over the interior of the various countries, the figures for which are not included in the monthly returns. A large business has been recorded in the terminal market at fluctuating though mostly rather lower prices, but only a very small trade has been done either for home consumption or export. Prices have, however, settled down more regularly from the semi-panic of last week, and several parcels disposed of then have since been resold at a considerable advance.

THE CULTIVATION OF COFFEE IN INDIA.

AREA.

THE following is the full text of Mr. J. E. O'Connor's, Director-General of Statistics, report on coffee for 1896, published at Calcutta on the 19th ult., a summary of which we have already given:—

At the end of 1896 there were 289,084 acres of land under coffee in India, all, with the exception of 319 acres in Burma, in Southern India. The cultivation of coffee is in fact restricted for the most part to a limited zone in Mysore, Coorg, and the Madras districts of Malabar and the Nilgiris. In Mysore there are 141,528 acres, in Coorg 84,820 acres, and in the Nilgiris and Malabar 41,208. If to these are added 5,564 acres in Travancore and Cochin, we find about 94.5 per cent. of the coffee-bearing area of India concentrated in the elevated region above the south-western coast where the rainfall is heavy and the climate generally approximates to that of the coffee-bearing area of Ceylon.

In the Madras Presidency coffee is not grown to any extent, except in the two districts already mentioned and in Salem and Madura. The only other province in which coffee is grown is Burma, mostly in Toungoo, and the cultivation there is of recent origin and very limited extent.

The area in Madras has manifested a tendency to contraction since 1893. In Coorg there has been a greatly expanded cultivation since 1894; in Mysore there has been a steady and considerable increase since 1889, the year in which prices took an upward turn. In Travancore and Cochin there has been no advance, and indeed many coffee-growers in Travancore have abandoned that industry for the less precarious cultivation of tea.

The largest part (nearly half) of the area under coffee is in Mysore; there is 29·3 per cent. in Coorg and 19·7 per cent. in Madras.

PRODUCTION.
The yield in 1896 was slightly in excess of 26 million pounds, being 35 per cent. lower than in 1895 and also lower than that of every other year since 1885 with the one exception of 1890. In Madras there was a larger yield on a smaller area in 1896 than in 1895; but in Mysore, Coorg, and Travancore and Cochin the reduction in the yield was remarkably great. But neither the decline in Coorg in 1896, nor the increase in that province in 1895, was as considerable as it would seem to be. The increase in 1895 was indeed probably more apparent than real, being due to a change of practice in calculating the outturn of that year. Before 1895 the only basis for an estimate of the yield was found in the returns furnished by toll contractors of the number of carts conveying coffee which passed through the toll gates, the quantity carried by each cart being assumed to be half a ton. In that year this practice was displaced by another, the yield being estimated to be 2½ cwt. per acre on plantations managed by Europeans and 1 cwt. per acre on plantations managed by natives. Though this is also a rough and imperfect method, it is possible that it gives less inaccurate results than the method which it has superseded.

Taking 100 to represent both area and production in 1885, the ratio of yearly increase or decrease is shown in the subjoined table:—

	Area.	Production.
1885	100	100
1886	97	90
1887	103	109
1888	104	76
1889	110	85
1890	114	63
1891	111	113
1892	110	97
1893	109	109
1894	117	101
1895	119	115
1896	122	75

The increase in the area in Mysore and Coorg since 1889 is due to the encouragement given to planters by the rise in prices which began in that year.

In 1896 the yield varied enormously in the different localities, the returns giving 469lbs. in the Nilgiris; 213lbs. in South Canara; 81lbs. in Mysore; 60lbs. in Coorg; 75lbs. in Malabar.

A noticeable feature in the returns is the record of a yield of 450lbs. an acre in Cochin in 1893, followed by a yield of 175lbs. in 1894, of 310 in 1895, and of 70 in 1896. The brief explanation given by the local authorities is "that a good crop is almost invariably followed by a poor one." The returns, however, would seem to be of doubtful accuracy. As regards Travancore, it is stated that planters are unwilling to give any information.

PERSONS EMPLOYED.

According to the returns there were, in 1896, 46,217 persons permanently, and 72,136 temporarily, employed on the coffee estates, making a total of 118,353 persons, which is equal to two persons to five acres (2·44 acres to one person), while in tea estates the average is nearly seven persons to five acres. The difference is explained by the much greater labour required in the repeated plucking of tea, the flushes of tea in the plains extending from March to November, and in the subsequent processes of preparing the leaf for the market. There is but one plucking of coffee in the year, and it is only then, while the berry is being prepared to be put on the market, that labour is at high pressure on a coffee estate.

EXPORTS AND CONSUMPTION.

The following figures are the average of the five years ending 1896-97:—

	lbs.
Indian coffee { Production	34,750,765
Exports	30,428,563
Left in India	4,322,202
Foreign coffee { Imports	1,364,406
Re-exports	738,102
Left in India	626,304

It appears, therefore, that 87·6 per cent. of the production is exported, and that of the coffee consumed in India, foreign coffee represents little more than one-seventh the quantity of Indian coffee. The rate of consumption is about half that of tea, amounting to only 0·017lb. per head of the population. It is said to be rather freely

drunk by the native population in Southern India, but it is practically unknown to the native population elsewhere in India.

The principal consumers of the 23,609,264lbs. of Indian coffee exported in 1896-97 were:—

	lbs.
United Kingdom	11,840,860
France	8,049,552
Austria-Hungary	790,832
Asiatic Turkey and Persia	720,272
Germany	628,656
Arabia	587,776
Ceylon	354,592
Australia	325,584

Thus the United Kingdom, which takes about nine-tenths of our tea, takes only about half of our coffee. It is interesting to notice that Arabia takes some of our coffee (it has been said that it is again exported as genuine Mocha) and that Ceylon is also a consumer. There should be an opening for a larger market in the Turkish and Persian ports at the head of the Persian Gulf.

Attention may perhaps usefully be drawn to the not inconsiderable quantity of foreign coffee imported (chiefly from the Straits) and consumed in India.

PRICES.

There is no trustworthy or complete record of the prices in India of Indian coffee; and in answer to enquiries, I am informed that there are no materials for the preparation of a record of prices, that the prices in fact depend upon and follow the fluctuations of prices in London of Ceylon plantation coffee, the price of Indian coffee being about 5s. less than the price of Ceylon coffee. This being so, the prices in London, in February of each of the last twenty-two years, of Ceylon coffee (plantation) are here subjoined:—

	Per cwt.		Per cwt.
	s. d.		s. d.
1876	89 0	1887	77 0
1877	85 3	1888	72 0
1878	80 0	1889	90 0
1879	64 0	1890	99 0
1880	68 6	1891	104 6
1881	59 0	1892	105 0
1882	64 0	1893	108 0
1883	74 0	1894	100 0
1884	69 0	1895	104 0
1885	54 6	1896	93 0
1886	56 0	1897	98 0

Ten years, from 1879 to 1888, of depressed prices, combined with the havoc wrought by the borer and the leaf disease, greatly discouraged coffee-planting in India and Ceylon, and the prospects of the industry seemed so forlorn that both in Ceylon and India much coffee land was placed under tea. In 1889, however, there was a sharp rise in prices, and the level has ranged high since that year under the operation of speculative corners, political troubles in Brazil whence the main supplies of the world are derived, and other circumstances. In 1896 prices receded to a lower level, owing principally to reports that the Brazilian coffee crop would be the largest on record. In March 1897 prices rose again to 102s., falling in July to 98 and in August and September to 96s. In October there was a recovery to 98s., which is a high level though lower than the range of price since 1890.

TEA.

Oxidizers 'again.' Yet another "cool oxidizer" has been invented. It is known as "Hurst's Patent," and is being manufactured by the Robin Hood Engineering Company of Nottingham.

Fall in price of teaseed. From all sides, India and Ceylon, do we hear the same tale of the collapse of the tea-seed market. In Ceylon, the decline has perhaps been greatest and most sudden, good indigenous falling to as low as Rs.30 per maund, with prospects of even lower levels being reached. The explanation is simple and satisfactory: restriction of extensions owing to low prices and high exchange.

A good roller.

We have received some copies of testimonials from India and Ceylon planters regarding the working of Messrs. Davidson & Co.'s new Sirocco Rollers. From all we can gather—and without, we trust, a suspicion of inspiration—the machine seems really an excellent one. While taking a full charge of 350 to 400 lbs. leaf, it needs under 2 H. P. to drive it, and moreover keeps the roll quite cool. The contrast between this roller and the well-known pattern of the old-style Little Giant is startling. The latter only takes from 70 to 80 lbs. of withered leaf, requires *over* 2 H. P. to drive it, and certainly does not keep the roll cool. We have been assured, however, on very good authority, that the term 2 H. P. is a very deceptive one, if taken to mean that a 2-H. P. engine will drive a roller requiring that amount of power. In fact, it has been demonstrated, we understand, that nothing under a 4-H. P. engine will drive the smallest and easiest running roller on the market.

The American Customs standard.

The agitation conducted against the sieve test is by no means at an end, as both China and Japan are protesting against the new regulations. It is yet satisfactory to learn that the Board of Tea experts appointed to consider the objections raised against the present standard have recommended the Treasury Department to adopt specific standards for Canton tea. The regulations regarding dust in Ceylon and India tea are modified, so that siftings from India and Ceylon teas may be resifted through a No. 26 sieve of No. 30 wire to separate needle leaf from dust. It is also recommended that all earlier rejections now open to appeal be settled as to dust, in accordance with the new provision for separating needle leaf by a No. 26 sieve.

The Board recommend that “flavor,” as referred to in the regulations, be considered by the Examiners as an index to quality and fitness for consumption, and must not be limited to the particular characteristics of the tea districts from which the standard comes. The Board advise fixing standards for next season early this month, and the appointment of a new committee, and to facilitate these recommendations tender their resignations to take immediate effect.

The Market.

INDIANS.—The demand has been fairly active, says the *P. M. Review* of 13th ultimo, but as the supply has been large, the market was less firm at the later public sales. Common descriptions sold irregularly, on the whole, at easier rates, and were readily taken at the decline. These kinds are now as cheap as they have been at any time this season, and, judging from the recent Calcutta reports of the weather, an increase of the latest estimate is not likely. It is, therefore, quite possible that values have now touched the lowest point. The supply of the medium grades has been large and varied, and those with a thin infusion, although good in appearance and make, have attracted but moderate attention, and are slightly cheaper. On the other hand, the more desirable

sorts, especially Pekoe Souchongs giving a strong infusion irrespective of leaf, brought quite former prices, and probably will continue to do so, as the supply of these kinds is not likely to be in excess of requirements. For the finer qualities there is a steady inquiry, and as the supply is moderate, prices are well maintained, particularly for those with strength and appearance. There were 57,160 packages brought forward at the public sales, and a larger quantity than usual was withdrawn, viz., 7,030.

CEYLONS.—There is scarcely any change in the Ceylon market, as the conditions prevailing during the last month still continue, namely, an absence of sufficient tea to meet the demand from the trade, resulting in strong competition and firm prices. For the common descriptions the demand has been rather more active, but no alteration in values has taken place, and the medium grades of both whole and broken leaf were freely taken at late rates. Thick liquoring teas continue scarce, and the few parcels offered realised extreme prices. At the public sales 16,440 packages were offered, of which about 2,000 were withdrawn, most of which afterwards found buyers.

China undismayed.

The Foochow Tea Improvement Company, whose pre-company ill-success in London we have already noted, lays great stress on the advantage China now possesses in the matter of cheap silver. The Company has now been floated, and the following extract from its prospectus will be found interesting:—

Recent experiments in the manufacture of tea carried out by the Association at Pehling with the aid of machinery have been attended with much success, inasmuch as teas of greatly improved character and quality have been produced, and it is, therefore, considered that the time has now arrived when capital on a larger scale can be successfully employed in various parts of the Fokheien Province. In this connection, it should be stated that the Chinese Government officials have shown themselves favourably disposed towards the Company, and have expressed their intention to protect and assist it in every way.

The property to be acquired from the Association, in consideration of the allotment of the 500 fully paid up shares, comprises the goodwill of the business and all trade marks and chops used in connection therewith: the lands and premises in the Fokheien Province of China used for the purposes of the business, with a two-storied factory, 100 feet by 48 feet, and a house for the Chinese manager, an office, and coolie quarters; also machinery, consisting of a new “Venetian” firing machine, and three new rolling tables, the largest being a Jackson’s 24-inch; also a sifting machine; the whole being worked by a water wheel 12 feet in diameter and 2 feet broad. Also the following machinery, namely: One Campbell’s Oil Engine, 10 horse power; one Davidson’s Sirocco, two Blackman’s Fans and one Davidson’s Cutter; also 4,400 withering trays and stands and scales and requisite godown appliances. The Company is also purchasing a cash balance at the credit of the Association, amounting to \$1,795.16. It is proposed that as the lands are situate in China they shall be vested in two Chinese shareholders as trustees for the Company. This course is necessary because doubts exist as to the legality of foreigners holding lands in China.

The Chinese growers in the vicinity of the factory, who are extensive growers of tea, have always been willing sellers of green leaf, of which an ample supply is at all times available for manufacture at the same price, as the price which they can obtain from their own countrymen, and from the first they have always welcomed foreigners.

As regards the prospects of the financial success of the Company, the directors would particularly draw attention to the advantage China now has over India and Ceylon in cheap silver, the exchange value of the rupee exceeding that of silver by fully twenty-five per cent. This fully compensates for the taxation which China tea has at present to bear. The cheapness of land, the low scale of

Advertisers are notified to send all advertisement matter and answers to advertisements direct to Manager, this paper, 3, Esplanade Row, Madras.

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

wages, and the excellent quality of Chinese labour are likewise facts which cannot be overlooked.

The machinery has been erected by, and is in charge of, an English Engineer, who is the manager of the Company's property and resides at the factory, and who has for some years been in charge of a tea factory in India.

The Chinese manager resides at the factory, and was recently sent to Ceylon by the Association, where he had practical experience in tea-making on several large estates.

THE CULTIVATION OF TEA IN INDIA.

THE following is the full text of Mr. J. E. O'Connor's, Director-General of Statistics, Tea Report for 1896, published at Calcutta on the 18th ultimo, a summary of which we have already given :—

AREA.

The area under tea in India at the end of 1896 extended over 433,113 acres, more than two-thirds (67·4 per cent.) being in the valleys of the Brahmaputra and Surma, which contain as much as 291,909 acres, namely, 165,079 in Assam (the Brahmaputra valley) and 126,830 in Cachar and Sylhet (the Surma valley). In extent of cultivation Bengal comes next, though the acreage is much smaller than in either of the divisions of Assam, the area under tea being 105,540 acres, or 24·36 per cent. of the whole.

The cultivation of tea is, therefore, to the extent of more than nine-tenths of the whole area, limited to the two provinces of Assam and Bengal.

The other tenth is divided between Northern and Southern India, thus :—

Northern India—

	Acres.
North-Western Provinces	7,919
Punjab	9,830
Total...	17,949

Southern India—

	Acres.
Madras	5,270
Travancore and Cochin	11,444
Total...	16,714

The principal localities in each province where tea is grown are these :

In Assam.

	Acres.
Surma Valley :	
Cachar	60,374
Sylhet	66,456
Brahmaputra Valley :	
Sibsagar	66,429
Lakhimpur	48,152
Darrang	31,867
Nowgong	12,617
Kamrup	5,298

In Bengal.

	Acres.
Darjeeling	47,027
Jalpaiguri	50,550
Chittagong	4,511
Lohardaga and Hazaribagh	3,352

In the North-Western Provinces.

	Acres.
Kumaun	3,091
Dehra Dun	4,828

In the Punjab.

	Acres.
Kangra	9,830

In Southern India.

	Acres.
Nilgiris	5,020
Travancore	11,377

There is a small area of 1,201 acres in Upper Burma, but in this province the leaf which is produced is not made into tea, but is pickled to be eaten by the Burmans, and the area and production may, therefore, be left out of account.

There are also a few small areas in Goalpara, the Naga hills, and the Khasi and Jaintia hills, in the Chittagong hill tracts, in Simla, Malabar and Cochin.

Tea cultivation in India has been mainly concentrated in tracts where a heavy rainfall and a humid and equable climate permit of repeated flushes and pluckings of the leaf. The yield is largest in

Travancore where it is reported to have averaged, in 1896, 628 lbs. to the acre. In the valleys of the Brahmaputra and Surma the yield averages about 443 lbs. and in Bengal about 394 lbs., the yield in Jalpaiguri (the Duars) being 534 lbs. and in Darjeeling about 276 lbs. Elsewhere the yield is much lower.

The area under tea has expanded from year to year without pause during the twelve years comprised in the second of the tables. In 1885 the area was about 284,000 acres; in 1896 it had increased to 433,113 acres, the increase being in the ratio of 52·5 per cent. The largest expansion last year occurred in the valley of the Brahmaputra and there was also a material increase in the Surma valley. In Bengal there was but a small increase, and in the North-Western Provinces and Madras there was an actual decline, while there was but a fractional increase in the Punjab. The expansion in Travancore is noticeable.

The number of acres added to the tea-growing area each year has been :—

1886	14,294	1892	12,432
1887	14,584	1893	20,970
1888	11,524	1894	4,688
1889	9,374	1895	15,190
1890	11,126	1896	17,396
1891	17,610		

The average addition in the last five years was much larger (14,135 acres) than the average addition (12,844 acres) in the five preceding years. The increase in 1896 was at the rate of a little more than 4 per cent.; in 1895 the increase was at the rate of about 3½ per cent.

The plantations vary greatly in size. In Assam, where the industry is mainly carried on by Europeans with ample capital where fusions of estates have been carried on for some years in view to economy of management, and where most plantations have large unplanted areas attached to them, the area of a plantation averages as much as 365 acres. In Bengal the average area of a plantation is 218 acres; in the North-Western Provinces the average falls to 95 acres, while in the Punjab, where natives grow tea extensively in the Kangra valley, there are less than four acres to each plantation and for the same reason this small area is but slightly exceeded in Travancore. In Madras the average is about 61 acres.

PRODUCTION.

The quantity of tea produced has increased in the past twelve years in much greater ratio than the area under cultivation, for while the area has increased by 52 per cent., the increase in production has been 118 per cent.

Representing the area and production in 1885 by 100 in each case, the ratio of increase in each compared with that year is stated below, the actual increase of production each year over the production of the preceding year being also stated :—

	Area.	Quantity produced.	Actual increase annually in lbs.
1885	100	100	...
1886	105	115	10,899,835
1887	110	129	9,826,270
1888	114	139	7,540,462
1889	117	149	7,250,331
1890	121	156	4,993,531
1891	127	173	11,831,496
1892	132	170	—1,873,628
1893	139	185	10,253,626
1894	141	188	2,465,144
1895	146	200	8,694,783
1896	152	218	12,617,847

PERSONS EMPLOYED.

The number of persons employed in the tea industry in 1896 is returned at 481,866 (permanently) and 106,685 (temporarily) or altogether over half a million people (588,551 persons), which would work out to about 1·36 persons to the acre.

EXPORTS AND CONSUMPTION.

The tea produced in India is exported mainly to the United Kingdom to the extent of about 96 per cent. of the average production. The subjoined figures give approximately the quantity of tea consumed in India, the figures representing the average of the last five years :

		lbs.
INDIAN TEA	{ Produced	137,677,744
	{ Exported	132,431,125
	{ Left in India	5,246,619

FOREIGN TEA	lbs.		
	Imported	...	7,842,608
	Re-exported	...	4,636,784
	Left in India	...	3,205,824

Thus the average consumption of all tea in India seems to be about $8\frac{1}{2}$ million pounds, of which $5\frac{1}{4}$ million are Indian and nearly $3\frac{1}{4}$ million are foreign. Ceylon provides India with about a million pounds of the foreign tea imported, the bulk of the imports being mainly Chinese.

This consumption comes to only 0.029 lbs. per head of the population according to the census of 1891, or less than three hundredths of a pound, a quantity which contrasts strongly with a consumption in the United Kingdom of about $5\frac{1}{2}$ lbs. per head. Broadly, it may be said that the Indian consumption of tea per head is exceeded by the United Kingdom two hundred times. Indeed, such as it is, the consumption of tea in India is to a substantial extent due to the European population, for more than one million pounds are purchased for the British army, and a larger quantity must be consumed by the European and Eurasian civil population. However, the consumption is increasing amongst the population of the larger towns, specially the Muhammadans, and there is room for great expansion in this direction.

As stated above, the principal market for Indian tea is found in the United Kingdom, as will be seen from the figures appended, which state the quantity exported (in lbs.) in the last two years:—

		1895-96.	1896-97.
<i>By Sea:—</i>			
To United Kingdom	...	123,947,369	135,456,884
Persia	...	3,188,099	1,993,823
Russia	...	486,255	457,634
United States and Canada	...	989,065	1,607,731
Australia	...	6,774,652	6,155,895
<i>Trans-frontier:—</i>			
Kabul, Kashmir, and other countries on the North-Western Frontier	...	1,195,264	1,499,120
Other trans-frontier countries	...	6,048	13,552

PRICES.

The prices of tea in Calcutta have fluctuated greatly since 1873. Taking the price in March 1873 to be represented by 100, it appears that until 1885 the level was well above that point, varying from 110 to 148. In that year, coincidentally with the great fall in exchange and in general prices, the level fell to 90, and a low level was maintained in the following years until 1895, when there was a rise again to a high level. In the last two years, however, there has been a further decline in price. These figures all represent the course of prices of Fine Pekoe in January of each year as given by the Bengal Chamber of Commerce. The level for each year from 1873 is stated below:—

1873	...	100	1882	...	126	1891	...	81
1874	...	123	1883	...	110	1892	...	71
1875	...	123	1884	...	116	1893	...	87
1876	...	136	1885	...	90	1894	...	52
1877	...	148	1886	...	90	1895	...	97
1878	...	135	1887	...	77	1896	...	84
1879	...	129	1888	...	84	1897	...	64
1880	...	126	1889	...	77			
1881	...	135	1890	...	63			

In the Statistical Bureau the average prices of the various descriptions of tea sold at the public sales held in Calcutta during the tea season have been computed for some years past and the results are regularly published in the review of the trade of India. From these returns of prices the figures below are taken, being the prices in annas and pies per pound of the three descriptions which form the largest proportion of the tea sold:—

	Broken Pekoe.		Pekoe.		Pekoe Souchong.	
	As.	Pies.	As.	Pies.	As.	Pies.
1889	...	9	9	7	5	5
1890	...	8	10 $\frac{3}{4}$	7	2	5
1891	...	8	7 $\frac{1}{2}$	7	0 $\frac{1}{2}$	5
1892	...	11	3 $\frac{1}{2}$	8	9	6
1893	...	9	2 $\frac{1}{2}$	7	2 $\frac{2}{3}$	5
1894	...	11	8	9	4 $\frac{1}{2}$	7
1895	...	9	0	7	3 $\frac{1}{2}$	5
1896	...	8	7 $\frac{3}{4}$	6	9 $\frac{2}{10}$	5

DISTRICT ASSOCIATION.

KANAN DEVAN.

Quarterly Meeting held at Manalle on 27th Nov. 1897. Present:—Baron J. VON ROSENBERG (*President*); MESSRS. J. HAMILTON HUNTER, C. BURN MURDOCH, W. MILNE, R. HEDGES, W. D. MARTIN, A. F. MARTIN, T. W. SCHMID, F. ARMSTRONG, A. H. SHARP (*Honorary Secretary*).

Notice calling the meeting was taken as read.

Read and confirmed minutes of last meeting.

Insanitary Condition of Bodinaikanur.—Read letter from the Hospital Assistant of Bodinaikanur. Recorded.

The following resolution was passed: That the Madura District Board do not take sufficient steps to keep Bodinaikanur in a fairly sanitary condition, the funds at the disposal of the Union being apparently insufficient.

Dilatoriness of the Travancore Police.—The Hon. Secretary stated that he had written to the Superintendent of Police, Trivandrum, but had not yet received a reply.

Bodinaikanur Rest House.—Mr. Milne stated that arrangements had been made to commence the building, but that it was at present delayed pending reply from the Assistant Forest Officer at the Periyar with reference to the necessary timber. The masonry work will be commenced at the end of the N. E. Monsoon.

Telegraphs.—The Honorary Secretary stated that he had written to the Director-General of Telegraphs, Calcutta, on the 5th September last, but had up to date received no reply.

Munaar Bridge and Devikulam to Mettu Road.—The promised grant to the Munaar Bridge, viz., Rs. 600, had been received, but the Honorary Secretary had not yet received either the grant or a satisfactory reply with regard to the Devikulam to Mettu Road. It was resolved that further action should be deferred until the arrival of the Chief Engineer, who was shortly expected.

By the President. GENTLEMEN,—Before passing to the regular business of this meeting, I would like to say a few words as to the work done at the last meeting of the U. P. A. S. I. which I attended on your behalf. You have no doubt all of you seen the full reports which appeared in the newspapers of proceedings in open meeting, and now that full proceedings are printed and circulated, you can gather all further information as to a large part of the work done in Committee. I therefore propose to merely refer to some points in which we are especially interested, and shall then be glad to reply to any questions that any of you may wish to put to me.

First as to procedure.—You are doubtless aware that a General Committee Meeting was held on the day before the Regular Meeting opened. This plan worked very well, and I hope to see it adhered to in the future. By its means we were able to briefly discuss all the questions and to decide in what form they should be presented to the General Meeting. It also enabled us by a certain amount of give and take to arrive at a fairly united expression of opinion and vote in open meeting—a matter of some importance in many of the questions we had to deal with.

Passing next to the *Report of the S. I. P. E. C.*, which is of as much importance to ourselves as to any other Association, more so than to some. It was the unanimous opinion of the delegates that this was a most painstaking and masterly exposition of the difficulties and drawbacks the planter experiences under the present law, and that Government would not and could not refuse us sufficient remedies in the near future. With regard to the *Constitution and Financing of the United Association*, the scheme ultimately adopted was arrived at after very full discussion, and is to a large extent a blend of the various opinions and schemes put forward. It enables such Associations as pay to the full extent of their area to command a large number of votes; in other words, the largest interests will, if they pay up, command the vote of the meeting, as it is only right that they should, while the smaller Associations will be able to increase their voting power and by the increased number of delegates they can send have their interests thoroughly represented.

Nor is there any doubt that the smaller Associations will in the future receive as much attention to their wants and wishes at the hands of the more powerful Associations as they have in past.

It is hoped that the new constitution will render the financial position of the U. P. A. S. I. secure, while the large number of delegates permitted to each Association will to a certain extent stamp the meetings with that "plebiscite" character which was one of the aims of the promoters of Individual Membership.

I am in favour of our taking the full number of votes possible, but this is a question for you to decide.

Exchange and the closing of the mints.—A few months ago the question of exchange was a very serious one to the planter. I do not deny that it is so even at present, though the interval has witnessed a considerable fall. This question in connection with the closing of the mints was taken up at the last moment by the U. P. A. S. I., and Mr. Acworth in a very able speech placed the whole matter before us. He advocated a memorial to Government on the subject being drawn up by the Association and sent to the various Associations and merchants dealing in exports and to the Chambers of Commerce. This proposal was agreed to, and Mr. Romilly and Mr. Hockin have drawn up a letter which is able and to the point and in general deserves our support. I say in general, because there is one point which I share Mr. Romilly's diffidence about as shown in his covering letter, i.e., para. 7, which deals with the question of an export duty. It may be more than probable the Government will not listen to our memorial without the financial *quid pro quo* in the shape of an export duty voluntarily suggested, but even then I distinctly disapprove of the proposal apart from the fact that an export duty is against the spirit of British commerce and that it would hardly be supported by other exporters. I think it might lead us into a position not better but worse than our present one. And this for the following reasons, which I think have been lost sight of by Mr. Acworth:

In 1891, before the mints were closed and when the value of silver, though higher than it is at present, was pretty low, exchange ruled very high for a considerable time. As far as I recollect it touched nearly, if not quite, 1s. 9d. It seems to me, therefore, even with open mints, quite within the bounds of possibility that exchange might run up to 1s. 6d. at present value of silver, while it might long stay at 1s. 4d. Add to this an export duty, and our last state would be worse than the first.

On the other hand, it should not be forgotten, and it has certainly been ignored, that since the mints have been closed, exchange has not been over 1s. 4d., while it has occasionally been down to 1s. 2d., or even below that.

I may not be quite correct in my figures, as I am quoting from memory, but they are sufficiently near to bear out my argument. I think I am right in saying that even when the mints were open, exchange on India never dropped to par value of silver or anywhere near it, showing that there are other factors in existence which tend to keep exchange on India higher than that on other silver currency countries. It seems to me quite possible that the closing of the mints has less to do with the present high rate of exchange than is presupposed in the memorial. I daresay I am not expressing myself correctly, but you will understand the drift of what I am saying.

But there is one thing that the closing of the mints probably can be credited with, which in the first instance it principally aimed at, i.e., in spite of occasional plunges, a very fair stability in exchange as compared with that of some years before such closing. That has been an undoubted boon to us and we should not forget it.

Mr. Gompertz's scheme of an export duty on a sliding scale may be a way out of the danger I have shown, and deserves, I think, more careful consideration than appears to have been given to it.

I would propose that we support the memorial with the exception of clause 7, and that a letter be drafted showing our reasons for objecting to that clause after ascertaining correctly the facts and figures which I quote merely from memory.

Cost of casket and address.—This, as you will remember, we decided ought to be met by voluntary subscriptions, and I did my best in committee to negative its being paid for out of general or reserve funds. The sum was small, and funds in hand were ample to meet it, but I stated our opinion that the precedent was bad. Our opinion was quite unsupported excepting by South Travancore, so I had to give in. Our subscriptions were returned.

Roads and Communications.—You have seen the resolution that

was passed at the meeting at my instance. I have only to add that the question of specially supporting applications, apart from mere forwarding them, would be left to the decision of the General Committee.

Re-opening of the Mints.—Read draft letter from the Chairman, U. P. A. S. I., and letter explaining Mr. Gompertz's scheme. Baron vonRosenberg proposed that the letter be supported eliminating clause 7, and that we consider Mr. Gompertz's scheme of an export duty on a sliding scale deserving of consideration as a way out of the difficulty we find in supporting such clause as it stands. Carried.

Funds for current year's expenses.—*Surianalli Road.* Proposed by Baron vonRosenberg that a charge of 4 as. per acre be levied for the Devikulam to Mettu Road for the current year, and that the cost of bridges at Punnar and Sembatulavu be borne by the Association the following year, provided that the subscription of 4 annas per acre during that year admits of it.

Subscription to U. P. A. S. I.—It was unanimously resolved that the full limit of anna 1 per acre be subscribed and that 9 pies per acre be subscribed for delegate's expenses, writer's pay, etc.

Resolved that the cost of the new store to be built at the foot of the ghat be divided *pro rata* between the estates making use of it.

U. P. A. S. I. Agricultural Chemist and Importation of Laid Birds.—Resolved that as an Association we are not prepared to subscribe to either.

Dacoity in the Cumbum Valley.—Read letter from Mr. A. J. Veale and minutes of General Meeting of the C. T. P. A. with reference to the above subject. Resolved that this Association strongly support the resolution passed by the Central Travancore Association, and testifies to the general lawlessness of the Valley teeming as it is with Kullans and Muravans.

The Apothecary's request for leave.—Resolved that the Apothecary be allowed one month's leave.

The Amanaiakanur and Bodinaikanur Agents.—Proposed by Mr. A. F. Martin and seconded by Mr. W. D. Martin that at each meeting of the Association an account of the sums due by members to the above mentioned agents shall be laid on the table. Carried.

Bodinaikanur to Tulican Tavalam Road.—The Honorary Secretary stated that the inhabitants of Bodinaikanur had signed a petition to the President, Local Fund Board, Madura, requesting that a road should be cut between Bodinaikanur and Tulican Tavalam. It was resolved that this Association unanimously support the petition.

Read letter from Baron vonRosenberg to President, Local Fund Board, dated 16th October 1897, with reference to roads. This letter still remains unreplyed to. Recorded.

Export Duty on Coffee.—Read letters dated 27th February 1897, 27th April 1897, and 22nd November 1897 from Baron vonRosenberg to the Dewan of Travancore, pointing out to him the injustice of the export duty on coffee as levied at the various mettus.

Resolved that as no notice had been taken of this appeal, the Dewan's attention be again called to the matter, and that the Association expresses its regret that the Dewan should have been unable to give his attention to this cause of complaint sooner.

Transport from the Hills.—Proposed by Baron vonRosenberg that the rates for transport from the various estates to Bodinaikanur be circulated in English and Tamil to the Superintendents who shall see that they are adhered to. Carried.

The Post Offices.—Read letter from the Postmaster-General Mr. Payne stating that although the guarantors of the Talliar Post Office are liable for all loss during each and every month during the year, they are not entitled to a refund of profits made during the other months; that is to say that while the guarantor is making a loss, the Post Office still shows a profit.

It was resolved that this Association address the Postmaster-General on the subject direct expressing their surprise at this.

It was also resolved that the Postmaster-General be addressed on the condition of the Devikulam Post Office, the delay in the despatch and surrender of parcels and letters, and the generally inadequate arrangements to deal with the large increase in postal traffic.

The meeting closed with a vote of thanks to the chair.

A. W. SHARP,

Honorary Secretary

FOR
**ESTATE PRINTING, STATIONERY,
ACCOUNT BOOKS, &c.,**

YOU CANNOT DO BETTER THAN GO TO

ADDISON & CO.,

Printers, Bookbinders, and Stationers,

MOUNT ROAD, MADRAS.

ADDISON & CO.'s Printing Works are the largest private printing establishment in the Presidency, and are fully equipped with the latest patterns of steam machinery for the economical and prompt production of all kinds of printing, ruling or binding work. Estate books of any description made to order at short notice. Check rolls, Labour Distribution books and other books in general use are kept in stock. Proprietors who use special forms of account books are recommended to order 2 or 3 years' supply at once, as by so doing the cost per book is considerably lessened.

Our sample book of Commercial Letter Paper shows a wider range of qualities than can be found elsewhere in the local market. All our commercial paper is cut from the flat ream, so that our customers pay for the paper only and not for fancy wrappers and labels. We claim to offer better value in this line than any other house in the trade.

Office requisites, and fancy goods of all descriptions in large variety. Sole Agents for Yost and Blickensderfer Typewriters.

PRINTING AND BINDING WORKS, 158, MOUNT ROAD.

Stationery and Fancy Goods Showrooms, 188, Mount Road.

Cycle Stores and Repairing Shops, 189, Mount Road, Madras.

MARKET SUPPLEMENT.

SATURDAY, DECEMBER 11, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (November 19, 1897) says:—The market continues in a weak and unsettled condition, and although the supplies brought forward in Public Sale were on a very small scale, there was little or no competition, the greater part having to be bought in.

No East India was offered.

The Central American catalogued met little demand, only a few parcels of Colory Columbian and Guatemala being disposed of at about previous rates.

Futures after advancing 1/6 during the first part of the week gave way again on the continuation of heavy Brazilian and an estimate of Messrs. Karl Krische & Co. of 9 million bags for the present Brazil crops and 10½ millions for the growing; quotations at the close mark a decline of 2/- from the best or 6d lower than last week.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending November 17th, 1897, says:—Bank rate 3%. Bombay Exchange closes at 1s 3½d. Brazil Exchange 7½d. Rupee paper 3¼% 62½. Silver 27d per oz.

This market has been dull during the past week, and only a small business has been done at very irregular prices, the quantity offered being on a small scale, and chiefly of an undesirable nature, which shows a further decline, finer kinds about steady. Brazil kinds flat.

At the Dutch sale held yesterday in Amsterdam, 22,079 bags were offered and sold at an irregular reduction of 5 to 10 cents, good ordinary Java selling at 35½ cents against 45 cents in October, and 46 cents in September.

Futures after advancing 6d to 1s close weak owing to an estimate of 10½ million bags for Santos and Rio next crop. Closing prices are—Good average Santos in Havre, March delivery, fcs. 37, in Hamburg pf. 30½, and No. 7 low ordinary Rio in New York \$5.90.

To-day's London official quotations are:—

The use of Indian and Ceylon Tea in North America shows decided progress, being 8,464,749 lbs. taken during the last nine months, against 5,622,994 lbs. during the same period of 1896. This increase having occurred in face of somewhat obstructive Legislation, the development is very gratifying. As these restrictions are likely to be removed, there is reason to believe that the use of British Grown Tea will become even more general.

INDIA and CEYLON TEA taken in NORTH AMERICA from 1st JANUARY to 30th SEPTEMBER.

Indian. Rates were about maintained at the slightly easier quotations ruling towards the close of last year. An Official telegram dated 9th November reads as follows :—"October outturn good, cold weather set in generally." The Official wire gives exports to U.K. for first half of November as 9,990,000 lbs., against 6,700,000 lbs. last year, making the total from 1st April to date 98,130,000 lbs., against 96,560,000 lbs. same date last year.

PEKOE. (Blackish greyish, some tip, inferior liquor)	5½d	5½d	6d	7d

Ceylon. With heavier auctions the market was somewhat irregular, and bidding not quite so animated. Buyers have recently operated with caution fearing that when the damage caused by the landslip is repaired, accumulated supplies may somewhat tax the market. Private telegraphic advice gives exports for the first half of the month as 2,700,000 lbs., against 3,680,000 last year, and estimates the total quantity for the month as 7,000,000 lbs., against 7,500,000 lbs. shipped last year. The following averages are worthy of note :—"Associated TCo Silver Kandy," 1/4; "Holmwood," 1/1.

Average for week 8'58d., against 9d. same period last year.

Ceylon Tea sold on Garden Account 1st January to date 1897, 970,971 pkgs., av. 7'68d. 1896, 868,541 pkgs., av. 8'21d.

Comparative prices of Ceylon Tea in London :—

	1897.	1896.	1895.	1894.
PEKOE SOUG. (Ordinary leaf; fair liquor)	6½d	6½d	6½d	7½d
PEKOE (Ordinary leaf, little twist; fair liquor)	7½d	7½d	8d	9d

THE "MADRAS STANDARD,"

Published Twice Daily—Morning and Evening.

THE OLDEST, THE CHEAPEST & THE MOST POPULAR ORGAN IN SOUTHERN INDIA.

Its chief features are:

A LONDON LETTER written weekly by a distinguished Member of Parliament.

Letters from Hyderabad, Mysore (and Bangalore), Travancore, Cochin, and Pudukota contributed by Correspondents well versed in the affairs of those States.

Letters from Far and Near } Political sketches and Caricatures of the leading men in Southern India.

Telepathic Interviews.

Portrait Gallery—Lives of distinguished men in Southern India with their Portraits. Spicy Jottings on current topics. Amusing Notes, Stories and Sketches. News from various Mofussil Stations. Interesting Extracts.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," Esplanade Row, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c. Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 24th December 1897.

Kadur.

MUDIGERE, 14th December.—Weather.—Fine bright weather, but a very strong east wind blowing nearly all day. No rain whatever in November, so a shower or two would be welcome now. **Crops.**—Ripening slowly; estimates are reduced on most estates. **Plant-diseases.**—Leaf disease still hangs about and in some estates is spreading. **General Health.**—Fever still prevalent. Two cases of small-pox occurred on one estate, and the Manager sent for the Hospital Assistant from Mudigere six days ago. This official has not troubled to reply or visit the estate. The Manager has reported the case to the Civil Surgeon at Chickmagalur. **Interesting Items.**—Mr. Weir, the Deputy Commissioner, was on tour last week. Planters heard with much regret of the death of Mr. Allardice at Jersey on 12th November. He was for many years at Mylemoney and was much respected.

S. E. Wynaad.

DEVALA, 15th December.—Weather.—Since my last report it is very chilly at nights and until eight in the morning; for the past three days it is cloudy and at intervals sunshiny. **Crop.**—Stripping is not completed as yet, and the crop is below the estimate; the ryots are harvesting paddy; the price of the grain is the same as last. **Health.**—Good. **Labour.**—Sufficient. I wish the Proprietors, Manager, Editor, Printers and the readers of the *Planting Opinion* A MERRY CHRISTMAS and many more happy returns of the same and a great success to the paper.

Nilgiris.

COONOR, 16th December.—Weather.—A little warmer, and clouds are gathering slightly for our usual dose of "Kismis mallay." No rain as yet this month. Coffee ripening up well, little leaf disease still hanging about. Tea flushing fairly. Pruning in swing. **Grain** still dear. **Labour** plentiful. Porcupines on the very active war-path, committing fearful havoc in gardens surrounded by jungle. Planters more or less (usually more) helpless to exterminate the brutes. Am trying roofing felt for godowns as a cheap substitute for iron. Has anyone tried it out here?

HOW TO SUCCEED.

A WORD TO YOUNG PLANTERS.

THIS is not meant to be a sermon. If it were, it would defeat its own object, for it would not be read. We have only a few, simple, commonsense notions to give, and we want to give them straight from the shoulder.

Honest, conscientious young fellows are generally divided into two classes,—those who look at the salary first, and then at their work; and those who look at the work first, and at their salary afterwards. The former want to give a fair day's work for a fair day's pay, and no more. These turn out steady, reliable planters in request indeed, but the demand does not exceed the supply. Ordinary honesty is expected from them, and they cannot complain if their services are not considered exactly invaluable.

The other class of young fellows are of a different sort. They are always striving to show themselves capable of fulfilling higher duties than they are at the moment entrusted with. They want to give more work than they get paid for. Their employers, very naturally, look upon these men as good bargains, not to be lightly parted with. Early promotion comes their way, and they succeed.

Ability alone, industry alone, or the two combined are not enough. Another quality is needed, and that is to identify yourself altogether with your work. To make your "boss" feel that while you are in charge, nothing will be neglected to push his interests to the uttermost. That he can rely upon you as upon himself, nay, even more.

It's not an easy thing to do. Harder still to keep it up. That is one reason why, when found, it is so highly valued. It is not the easiest thing in the world to describe, either.

It is not enough to work the estate as if it were your own. For if you scamp work on your own garden, it's your loss only. Working for another, you must feel that every bit of scamped or bad work passed is a breach of trust to your "boss." It is not your own money you are wasting. It belongs to your employer. In wasting it by passing bad work, you are proving yourself unworthy of the trust reposed in you. It is no good complaining that your boss does not trust you, when he examines your work periodically and puts searching questions that make you feel as if you were at school again. It's no good complaining, we say, when you know very well that it was only yesterday that you let off the weeders the fine they deserved, because you funk'd the row that might ensue. A row, you must remember, that would have been entirely your own fault for having slackened your personal supervision. If you do your work honestly, you need never complain of your honesty being doubted.

Your work should come before everything,—your personal convenience, pleasure and business even.

It should be no source of dissatisfaction that you should think yourself underpaid. By striving to be always worth a little *more* than your salt, it should be rather a cause of secret pride. These "notions" are not empty copy-book moralities. They are solid business-texts that can be relied on for success.

For if you simply do enough work, and no more, to just earn your salary, how can any one guess that you have any reserve capabilities in you? The only way to get a better billet than the one you've got now is to show yourself too

good for your work. Just make your boss feel that he is wasting your services in devoting them to your present work. Make him recognise, by the excellence of your work, that in a more responsible position you'd be a greater success still.

By only doing eight annas of work for eight annas' pay, you'll find your choice of even eight-anna billets very scanty. And as for the one, two and three rupee billets you gaze on wistfully, be very certain that they'll never be reserved for you. They are kept for eight anna men who put in rupee work.

GENERAL NOTES AND ARTICLES.

The taxed breakfast table.

While heavily taxing British grown tea, coffee and cocoa, we allow foreign sugar to enter free. A home exchange urges that part of least of the income derived from the first three should be obtained instead from the latter. Last year the imports and duties were, in millions: Tea 227½m. lbs., duty £3¼m.; coffee 27¼m. lbs., duty £173½ thousands; cocoa 24½m. lbs., duty £10 thousand; total 280m. lbs., duty £4m.

Land in New Guinea.

According to Mr. T. H. Hatto Richards, in the *H. & C. Mail* who has been lecturing on the subject, cultivators of land who know their business may find British New Guinea a profitable field. As far as was practicable, every inducement was given by the Government to the *bona fide* settlers. All that legislation could do had been and was being done but, so far, the attention to the country had been rather disappointing. Land might be found for almost every tropical product, but not in the vast areas that were dealt with in Australia, for instance. To the man with experience and a little capital, who chose a moderate quantity of land with care and prudence after personal inspection, good results should follow. He would find two great things in his favour. First, the country was never visited by cyclones. Secondly, with care and tact on his part he should always be able to obtain a plentiful supply of good labour at an extremely moderate rate. But the man who went to British New Guinea must be prepared to rough it in the truest sense of the word, be ready to put his hand to anything, and wait patiently for the fruit of his labours. The chief difficulty to be encountered was the one of climate, and as to this he thought it might improve in time as the possession was opened up for settlement, and it became possible to use the hilly portions of the country for purposes of change.

MADRAS AGRI-HORTICULTURAL SOCIETY.

FROM the July-September, 1897, Proceedings (woefully delayed in publication) of the Madras Agri-Horticultural Society, we extract the following items of interest:—

Opuntia as cattle fodder.

"Read article from the *Madras Mail* of the 16th July 1897 calling attention to the use of Opuntia as a cattle food and referring to the experiment of Mr. Boyce, a large land and cattle owner in Australia. Mr. Boyce's method is to boil the Opuntia leaves or rather to steam them before giving to the cattle."

"On page 246, *ante* of our Proceedings for December, 1892, there is an article on the Texan method by which the leaves are prepared by

roasting over a fire which cleans the spines away, after which they are greedily eaten by cattle and ponies; this way saves the cost of the square iron tank mentioned in Mr. Boyce's method, the expenses of which would most likely debar ryots from adopting it."

Mangosteen.

By request of Mr. T. J. Ferguson of Calicut, we wrote to Singapore, and received the following reply from Mr. W. Fox, the Assistant Superintendent of the Botanic Gardens: "In reply to your letter of 21st June 1897, enquiring about Mangosteen, I find that we can supply you with a case of 20 large plants free on board a Steamship at Singapore, for Twelve Dollars."

Rubber plant seed.

Read letter from Mr. J. W. Minchin, Honorary Secretary, Nilgiri Agri-Horticultural Society, dated Ootacamund, 17th June 1897, asking for *Castilloa elastica* seed, as a great many planters are desirous of cultivating this in consequence of the high prices ruling for India Rubber.

Letters were written to Dr. George King, Superintendent, Royal Botanic Gardens, Calcutta, and to Messrs. William Brothers, Heneratgoda, Ceylon, for *Castilloa elastica* seed. Dr. King says in reply that *Castilloa elastica* does not seed in his gardens and he does not know of anybody from whom a supply of the seed may be obtained. Messrs. William Brothers replied that they had a small quantity in stock for sale at Rs. 10 per 100 seeds; this item was communicated to Mr. Minchin.

Read letter from Mr. T. J. Ferguson, dated Calicut, 19th August, 1897, advising despatch of a small quantity of Para Rubber (*Hevea braziliensis*), for our acceptance, with the remark that these seeds are the first collected this season.

Fibre plant.

Mr. T. J. Ferguson forwards specimen of a pretty climber, found in Malabar, and wishes to know the botanical name of it.

He was informed that the name is *Holostemma Rheedii* and was asked for seed of it for trial in our gardens.

This plant, according to Watt's Dictionary of the Economic Products of India, is a fibre yielding plant, suitable for cordage and paper making. Royle states that it attains its best condition after the rains. The roots are used as medicine and the leaves and flowers as vegetables in parts of Bombay and Chota Nagpur.

Yca cotton.

An interesting letter on this variety of cotton from Mr. Holmes is published in our Coffee Notes.

Plants for members.

The following is a list of the plants available for distribution to Members:—

- Large plants of *Areca catechu*—Areca nut.
- Do. *Cocoa nucifera*—Golden cocoanut.
- Cola acuminata*—Kola of commerce.
- Myristica moschata*—Nutmeg.
- Castanospermum australe*—Moreton Bay chestnut.
- Tectona grandis*—Teak tree.
- Cedrela toona*—Toon tree.
- Dillenia indica*—
- Garcinia gambogia*—Gamboge tree.
- Oreodoxa regia*—Cuban cabbage palm.
- Elæis guineensis*—West African oil palm.
- Pithecolobium polycephalum*—the new coffee shade tree.
- Camphora officinale*—Camphor plant.

LETTERS TO THE EDITOR.

COONOR MAGISTERIAL SITTINGS.

DEAR SIR,—It would be a convenience if you would announce in your next issue that the Sub-Magistrate of Coonor will in future hold courts at Kotagiri on the first and third Mondays of each month, or, if that be a gazetted holiday, on the next office day following.

E. G. WINDLE.

A GOOD SUGGESTION.

SIR,—How many planters are aware of the unremitting courteous sympathy invariably extended to any planter requiring advice by Mr. Cameron of the Lal Bagh, Bangalore. His wide experience is always at the service of those whom he can assist.

It seems to me that the smallest acknowledgment that could be made would be that of inviting Mr. Cameron to become honorary member of our Associations. I just venture to throw out this hint.

PLANTER.

[A capital suggestion.—ED.]

THE WEAVER'S BEAM TREE.

SIR,—In the last journal of the *Bombay Natural History Society* there is a query about the Weaver's Beam tree (*Schrebera Swietenoides*). The gum is eaten by the aborigines, and it is said that it tends to keep off hunger and thirst, thus enabling them to go for several days without proper food. The gum is said to taste like bad brown sugar.

As this tree is not uncommon in Coorg and in the Malnad, I would be glad to have any information about the gum it produces.

The Forest Department might collect fuller information about this tree.

W. M. D.

POST OFFICE VAGARIES.

SIR,—Along with my tappal on Sunday evening last I received a copy of *Planting Opinion*, which on examination proved to be addressed to "The Editor, *Planters' Monthly*, Honolulu." I only mention this brilliant, but by no means unparalleled, effort on the part of the Post Office authorities, as I noticed, and quite agree with the remark of your Kadur correspondent, who says (referring to the "Sircar") that it is so easy to find fault, and that he thinks when good work is done it ought to be taken notice of. Let it be clearly understood, however, that I do not refer to this matter in a fault-finding way. I merely mention it as I not only consider it good but brilliant work. Hanbalu is my Post Office, and he must be dense indeed who cannot see a resemblance between Hanbalu and Honolulu. They are working up to Honolulu gradually, and little flashes of genius of this kind serve to make life in the "Gorgeous East" all the pleasanter and happier. I think they ought to be encouraged, and I would suggest that the "Sorter" who was responsible for the one mentioned be made permanent with an increase of pay.

ARCHULLU, HANBALU, }
7th December 1897. }

J. AIRD.

POACHING IN MYSORE.

DEAR SIR,—In the *Madras Mail* of December 1st, there is an interesting account of a day's fishing in Mysore. It is, however, painful to note that your correspondent mentions that both poison and dynamite are used with impunity in our rivers to destroy the mahseer and other fish. This would not be tolerated on the Nilgiris, so why should it be in Mysore?

The planting representatives from South and North Mysore have more than once brought to the notice of the Dewan the wanton destruction of game in this State, but it has no effect.

A Game Act or some protection is wanted badly, if not the few gaur and little game that is left will soon be exterminated. Every patel, in fact every gowda, has a gun, and the indiscriminate slaughter of game of all kinds is carried on by unscrupulous sportsmen.

An Act for the much-needed protection of wild birds is also necessary. All planters recognize the value of birds as insect-eaters, and natives as well as Europeans have noticed the scarcity of wild birds of late years. A tax levied on bird and other skins would help to fill the State Treasury.

W. M. D.

TERRACE DRAINAGE.

ON TEA, COFFEE, AND OTHER HILL PLANTATIONS.

SIR,—Having recently seen some tea and coffee estates in Southern India for the first time, I have been much struck by

the extraordinary system of planting and drainage that is adopted in nearly all of them, and as this system appears to me to be eminently calculated to denude the soil of its finer and really valuable particles, I daresay the following remarks will be of interest to the planters concerned.

The denuding action of water depends entirely on the velocity and body of water acting on the soil, and both of these are increased by the length and steepness of the course over which it has to travel. Moreover, as a very slight velocity and small body of water is sufficient to remove the finest slightest particles of matter in the soil, which alone are those that the roots of plants can assimilate and derive nourishment from, it is evident that in all places, and especially in those where the rainfall is heavy, every effort should be made to reduce the length and slope of the surface over which the water falling around the plants has to travel. But in the South Indian plantations (and, I am told, also in those of Ceylon) the plants are laid out in lines running straight up and down the hill slopes, which are very steep; and horizontal or gently falling drains are cut across these lines at intervals varying from 40 to 200 or more feet, themselves discharging into other main up and down drains. The surface water is thus carried down for lengths of forty or more feet between each two rows of plants at the steepest possible slope that can be provided for it, until it reaches the horizontal or cross drain, where its velocity has suddenly to be reduced to the much smaller velocity produced by the slight fall of the latter. The evil and direct consequences of this are: first, that owing to the steepness of the slope, the water has but little time to soak into subsoil, and so a much larger proportion of it runs down the surface, thereby increasing the body and greatly accelerating the velocity of the drainage water, and thus considerably augmenting its power of scouring out and washing away the fine particles of soil around the roots of the plants on either side. Second, the sudden reduction in the velocity of the drainage water, thus heavily silt laden, on its reaching the horizontal cross drain, immediately causes a deposition of silt in the drain, and so necessitates the labour and cost of periodically clearing it out. This, added to the original cost of cutting these drains and to the loss of the fine and valuable particles of soil, must annually amount to a considerable sum. Moreover, there does not appear to be the least necessity for this heavy loss and expenditure, for in Darjeeling, where the writer was some ten years ago, the rainfall is just as heavy and the hill slopes are quite as steep as they are in Southern India, and yet he cannot recollect having ever seen a single drain in any of the numerous tea estates that are there. Yet the plants there, instead of having to struggle for existence amongst bare gravel and stones, as can be seen especially in the lower portions of the up and down lines, in Southern India, are always embedded in the finest alluvium and consequently flourish and yield rich produce. The reason for this great difference is that in Darjeeling the plants are always laid out in horizontal lines following contours round the hill sides, and that the surface slope of the soil around the plants is reduced to a minimum by the system of "terracing" or cutting benches for each row of them. These benches are of a uniform breadth of about four feet (just sufficient for one plant) and vary in depth with the steepness of the ground from one to three or more feet. The upper surface of each bench is made with, and naturally retains, a slight outward slope. The great advantages of this system will be evident from what has been said at the commencement of these remarks about the evils of long and steep slopes for the flow of drainage water. The almost horizontal upper surface of each bench gives the water plenty of time to soak into the subsoil and draw down the fine matter to the root of the plants, and also reduces the velocity of the small proportion which flows off to a minimum. At the same time the short length of travel (four feet) which the water has across the width

of each bench reduces the body of the water flowing over it and the uniform, though slight, outer slope of the benches prevents any concentration of the water, so that drains are not where necessary. Thus not only is all scouring action reduced to a minimum, but each bench is converted into an area of deposit for whatever silt may be washed down, (chiefly from the vertical face of the upper bench,) and as each bench receives from the upper one as much as it gives to the lower, there is practically no loss of fine alluvium, even during the heaviest rain. In fact it may be said that the benching system checks denudation as completely as the South Indian system promotes it. Why the former has not been generally adopted is inexplicable for the first cost of benching, wherever there is any depth of soil suitable for cultivation, is considerably less even in the steepest ground than that of cutting and maintaining the South Indian system of drains for a period of three years, assuming that the latter are cut at every 40 feet, are 2 feet by 1 foot in section and are cleared of about twice their volume of silt in each year. And this without taking into consideration any of the indirect advantage in the shape of quicker and better growing plants and richer produce, etc. It is therefore to be hoped that the benching system will speedily be introduced into Southern India, especially as it can be in most cases adjusted to the existing positions of the plants, without in any way interfering with their roots or growth.

H. W. P.

PEERMADE, }
2nd December 1897. }

[Much of interest is contained in the above, but our correspondent must remember that terracing is no new thing in South India, and is only discarded because of its expense. If "H. W. P." can but prove by means of detailed comparative estimates of the two works, i.e. terracing *vs.* ordinary planting, that the former is as cheap as the other, he will be the means of conferring a great boon on South Indian planters. As a minor (!) detail has it struck "H. W. P." that the depth of Darjeeling and S. Indian soils varies rather considerably?—Ed.]

COFFEE.

Pithecolobium polycephalum.

This new shade-tree is included in the list, published elsewhere, of plants available to the members of the Madras Agri-Horticultural Society.

The branch fungus.

Mr. E. V. Carey, the well-known Selangor planter, writes to a Borneo contemporary regarding this pest: "It certainly attacks the finest trees, *e.g.*, the trees richest in foliage, but it is equally bad on both dry and dampish ground, and moreover infection spreads not only from branch to branch of the affected tree itself, but, if not carefully watched, to adjacent trees for a very considerable area in the vicinity. I look upon it as one of the worst enemies we have, its only redeeming feature being that it never affects the matured stem and, consequently, it is possible by allowing a sucker to grow from a point below its ravages to re-build the tree. I have tried treating it with applications and emulsions of various sorts, but without much apparent effect; the only thing seems to remove and burn all tainted branches."

The hawkmoth pests.

The same writer also gives some notes on the bee hawkmoth caterpillar, which, with the branch fungus above alluded to, he considers the two worst enemies of coffee in Selangor. This caterpillar spins its cocoon in the leaves of the coffee

in Borneo, but in Selangor it retires to the ground and spins a very small web for its cocoon an inch or two below the surface. It can be easily removed from thence by digging round the root of the tree.

The report of the heavy fall that took place at the Dutch sale has had a depressing effect upon the market here, says the *P. M. Review* of 20th November, although the actual decline of 9½ cents cannot be said to have taken place in a day. As it is the custom in Holland to value their sales by the previous one, which was held on October 12th, the fall represents the decline that has been going on during the last five weeks. In addition to this an estimate of 10½ million bags for the next Brazil crop was issued on Wednesday, causing a further fall in the terminal market, and entirely checking the steady buying which had been going on for some days, and had brought about an advance of 1s. Such estimates are really valueless, as the trees are only in flower, but it has had the effect of again bringing prices down to the lowest previously recorded. The auctions have been small, and have only consisted of undesirable qualities, very few of which were disposed of, while privately little has been done, although there is still some demand for fine qualities.

Yca cotton shade. There is no lack of novel departures in the young irrigated coffee industry in and round Bangalore. From the unusually interesting proceedings of the Madras Agri-Horticultural Society, we reproduce the following:—

Yca Cotton.—Mr. Hamilton Holmes, in his letter dated 14th August, asks if we can get for him from Peru 5lb. of each of Yca and Pinra cotton seeds. The Pinra variety is known as "Algodon de Pinra:" they are both perennial and thrive in a hot and dry country.

Read the following from a letter from Mr. H. Holmes, dated 5th September, 1897:—

"I herewith as promised enclose a few seeds of Yca valley cotton seed originally imported with the cinchona plants by C. Markham from Peru

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contain per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.68	"	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

in 1867, particulars of which you will find in the Government Farm Reports, Madras, of 1873, and subsequently and probably previous to this, but I have none previous to refer to. I know a tree of this variety which produced 1,200 bolls in one year, about 120 bolls or so to the pound, i.e., cotton and seed. If you plant these seeds 12 feet apart in rich well drained land, red soil for preference, you ought to have plenty of seed in about six or seven months time. Manure well. I am planting between every coffee plants 6' x 6' for shade for the young plants. Make your pits 18" or 2' deep, 12" diameter, round and put one seed in each."

Coffea stenophylla. In reply to enquiries *re Coffea stenophylla*, distributed by the Madras Agri-Horticultural Society in 1890, the following letters have come to hand:—

Mr. T. J. Ferguson of Calicut, in his letter, dated 7th September, 1897, says that "the tree I kept here grows well and is topped at six feet, and is perfectly healthy: it had a fine blossom in May, but nearly all has failed to set and there is scarcely any fruit on the tree. However, this is a very general complaint this year, and my hybrid coffee trees are bearing very badly. He further informs us that a Mr. R. Lamb, Wynaad, writes to him as follows regarding the *C. stenophylla* which I gave him: Mr. Lamb says I am sorry to have to report that *stenophyllas* have as yet shown only about half a dozen flowers which have come to nothing, though the growth of the trees and freedom from disease is very satisfactory. Wynaad is probably too high for this coffee: it might succeed at 200 or 300 feet. I will try this when I get some seeds."

Under date 26th August, 1897, Mr. W. E. Gilbert of Yercaud states: "In reply to yours *re the four Coffea stenophylla* plants you kindly sent me three years ago, I carefully planted them in large pits filled with good soil with forest loam and cattle manure. They have been highly cultivated and greatly cared for in every respect. They never had leaf disease, and although they always look very healthy, yet their growth is extremely slow, for you will be surprised when I tell you they are not more than sixteen inches high: perhaps they require a higher or much lower elevation than Yercaud to suit them. This is about 4,300 feet above sea-level. I am sending you a couple of twigs of my plants from which you will easily observe how they differ in size and shape from the foliage of the 'arabica'; as for crop, my plants never had a bud on them, and it is not likely they will blossom even next season."

Of the few plants we distributed ourselves in the neighbourhood of Coonoor, the only one that is thriving at all is at Burliar. The growth of the others was, up to the period of their death, extremely slow. Without doubt this variety will never do high elevations. Judging by its immunity from leaf disease, it is possible that hybrids or grafts might be of service.

TEA.

High elevation tea. It is a noteworthy fact that Sir John Muir's Company (which expects to turn out some 30 to 40 million pounds a few years hence from its Indian and Ceylon estates) is just at present confining its efforts at tea-extension in Travancore to land of an elevation from 1,500 to 6,000 feet. Lower than this is left untouched, in view of the vast amount of such land still unplanted in India and Ceylon.

Doctors on tea.

"Well, if you must drink tea, avoid the strong Indian and Ceylon kinds, and drink good China, which is not so strong." So say many of the worthy medical profession. But what do they base their convictions upon? If on the relative quantities of tannin, why, a shorter infusion would effect the purpose they desire. Theine is relatively the same in all three kinds. The commonsense of the argument will

rather increase the use of tea than diminish it, which a contemporary half thinks probable.

Best jats for high districts. To answer this question, which is so frequently asked, the particular market for which the tea is destined must be first ascertained. If for the local Indian or packet trade, a good class hybrid is undoubtedly the most profitable, being a very free flusher and of a hardier nature than indigenous. For the London market, on the other hand, we cannot think that there can be two sides to the question: tea made from hybrid leaf will never yield the same quality in the cup as that made from indigenous. Yet in poor soil it might perhaps be wise to replace old vacancies in high jat fields with sturdy hybrid plants.

Rogivue, limited. The alleged crimping of Mr. Rogivue, the well-known exponent of the merits of Ceylon tea in Russia, by the "terrible" Sir John Muir, is causing a great deal of excitement in the Island. Mr. Rogivue, it may be mentioned, was subsidised by the Ceylon Planters to push Ceylon teas in Russia. But this gentleman thought he could build up a far larger business with the aid of a larger capital. Coming to Sir John Muir's ears, the tea king promptly formed a Company with a capital of £70,000, with Mr. Rogivue as Managing Director. The objects of the Company are to push Ceylon teas as before, but also to devote considerable attention to Indian teas too. We don't quite understand why Ceylon feels so very sore about the matter, seeing that Sir John Muir's Plantation Company has some 17,000 acres of tea in the Island. Consequently Ceylon interests will be by no means neglected.

Fuel or tea? On favoured gardens which enjoy access to unlimited supplies of moderately priced fuel, it is not altogether an easy matter to decide whether it would be more advantageous to plant up some of the reserve land in fuel, or else in tea. The question of course resolves itself into the annual profit derivable from each per acre, which is not so easy to decide as one might think. For, granted that a hundred cubic feet of bought fuel cost so many rupees, the annual yield per acre of fuel must be ascertained (dating, say, from the fifth year). The calculations required to arrive at a conclusion between the comparative value of tea and fuel are somewhat intricate, and accurate data regarding the yield of fuel per acre are most desirable. At first sight it would appear that having one's own fuel plantations attached to the estate would be the first thought of all prudent proprietors. On the other hand, it is just as obvious that tea pays better than fuel. Naturally, wherever possible, a large proportion of the fuel trees required could be planted along roads, on extra poor ridges, and thinly interspersed among the tea itself. Care must be naturally exercised that the trees so used are not directly harmful, at least to the plants among which they would grow.

Remunerative fuel plantations. Touching again on the subject of fuel plantations, the careful planter should keep his eye wide open as to the possible alternative or subsidiary value of the trees planted for fuel. Some trees are good only for fuel, such as blue-gums. These grow very fast, it is true,

but have practically no value (supplying rough timber for coolie lines excepted) beyond their high heating qualities. Black wattle (*Acacia decurrens*) grows nearly as fast as gums, give a decidedly better timber, and contains in its bark a large amount of that tannic acid so useful in the tanning trade. *Acacia melanoxylon* is a slower grower than either, but gives a superior timber. Lastly, among imported trees, comes the little-known *Acacia mollissima* which possesses much the same habits of growth as the yellow water (*Acacia dealbata*), and affords the most valuable tanning bark of its species. Coppiced every three or four years, it gives a large quantity of fuel and bark. Decidedly a valuable and remunerative fuel-tree this, as is proved by the existence of the numerous "wattle-farms" in Natal. The Madras or Nilgiri Agricultural Societies would do well to indent for a supply of the seed from Australia for distribution to their members.

The Market. **INDIANS.**—The quantity brought forward has been smaller compared with the previous week (*P. M. Review* of 20th November), viz., 46,675 packages against 57,100, and although the demand shows improvement, the market generally has been less firm. The lower descriptions continue in good supply, and are more readily obtainable at a slight reduction in values, but the lower quotations are mainly attributable to the undesirable character of many of the teas. Parcels giving a useful infusion are, however, well competed for, fetch prices quite on a par with those ruling in previous sales, and will no doubt continue to be freely bought at the comparatively easy rates prevailing. The medium grades have also been in liberal supply, and although the bidding has not been so brisk, due probably to the fairly good stocks held by the trade, there is no material change in prices. This falling off in the demand for these kinds is but temporary, and in a great measure occasioned by the attention of the retailers being concentrated on the purchase of other goods for their Christmas trade. The finer descriptions are not so plentifully brought forward, but as there is sufficient to meet the prevailing demand, values are, on the whole, steady, excepting for the poor liquoring sorts, which are easier. At the public sales 46,675 packages were offered and 5,820 withdrawn, while the quantities catalogued for next week promise to be on a much smaller scale.

CEYLONS.—The quantity brought forward at public auction, although still small, was rather larger than has been the case of late. Prices generally were well maintained, the only sign of any decline being in Whole Leaf Teas below 7½d., and in these a weaker tendency was certainly noticeable. This weakness can, however, only be of a temporary nature, owing to the very limited supply coming forward, the sales advertised for next week only amounting to about 10,000 packages, which is abnormally small. All other grades were firm, and the quality of the teas has been about equal to late offerings. At the public auctions about 20,640 packages were brought forward, of which about 2,500 were withdrawn.

Some interesting information on **Brick Tea Trade in Tibet.** this branch of Tibetan Trade is given in the *H. & C. Mail*. Yatung is the town on the Tibetan side of the Jalep Pass, between

Sikkim and Tibet, which was opened to Indian trade by a recent convention with China. A branch of the Chinese Maritime Customs has been established there, and the report on the trade of the place for the past year is interesting reading. It is published in the Yellow-book of the Chinese Customs. At one time there was a considerable traffic between Tibet and Sikkim in brick tea; but no sooner was Yatung declared an open mart, and the question of introducing Indian tea across the frontier mooted, than the passage of Chinese brick tea into Sikkim was prohibited by the Tibetans for some inexplicable reason. Reduced supplies still reach Kalimpong and Darjeeling through Nipal and by other routes. Four kinds of brick tea are still to be purchased in the Chumbi valley at prices which are moderate when it is remembered that the tea has to be carried on pack animals ninety days' journey from the producing districts in Szu-chuan. The lowest quality, which is the tea of the masses in Tibet, is described as veritable rubbish. "Tea flavour it has none, and on careful boiling and examination a brick is proved to consist of mouldy leaves, many of them 4 in. long and longer, twigs, sticks 2 in., 3 in. or 4 in. in length, and some of them as thick as a slate pencil; sundry hard lumps of decayed leaves which barely separate when boiled, and, in addition, sweepings, dust, and various dirt. As is well known, the Tibetan system is to positively boil tea leaves; in fact, to make soup of them, and to add salt and butter, or mutton fat, or cheese, just as the decoction reaches boiling point. Thus it is rendered palatable, grateful, and comforting to the native. So far as this quality brick tea is concerned, it may be safely asserted that to European tastes equally pleasant tea could be made from a spadeful of good leaf mould dug from under an old oak, and, if prepared in their own peculiar style, it is doubtful if the Tibetan peasantry would notice any difference in the brew." It seems that during last year 6,444 Tibetans and Tomos, chiefly the latter, crossed the Jalep into the Chumbi valley under passports, and 6,268 went to India from the valley.

ROUND THE BUNGALOW.

NOTES BY "A PLANTER'S WIFE."

Good things for Christmas. I intend to devote my space this week to instructions for making nice Christmas dishes. Many of my readers may have the recipes I gave last year, but I have been told that many of them were too rich and expensive, especially in these times of poor crops; so I will give recipes this time which, though very nice, are not too expensive for most pockets.

Cheap plum pudding. Take half a pound each of shred suet and fine flour, a quarter of a pound of carefully-washed currants, and stoned raisins, a tea-spoonful of spice, a little lemon-peel grated, a dessert-spoonful of sugar, two eggs and enough milk to make it into a stiff batter. Tie it in a cloth, and boil for two hours. Serve with sweet sauce.

Advertisers are notified to send all advertisement matter and answers to advertisements direct to Manager, this paper, 3, Esplanade Row, Madras.

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

Christmas pudding.

One pound chopped beef suet, one pound of stoned raisins, one pound of washed currants, half a pound of bread-crumbs, a quarter of a pound of sugar, half an ounce of mixed spice, a quarter of a pound of candied peel, a gill of brandy, a gill of cream or new milk, four eggs well beaten. Mix thoroughly and boil in a cloth for four hours, or in a mould for six hours. Serve with wine sauce or burnt brandy.

Sauce au vin.

Pour half a pint of wine upon the yolks of three eggs; beat together for ten minutes; add sugar, grated lemon-peel, and cinnamon to your taste. Warm it, but do not let it come to a boil.

Burnt brandy.

Put four large lumps of loaf-sugar into a saucer with a gill of pale brandy; set fire to the sugar, and directly it is dissolved, serve it over the dish intended.

Mince meat.

One pound of beef-suet, one pound of currants washed very clean in two or three waters and dried before the fire, a pound of raisins stoned and cut up, a pound of sultana raisins, a quarter of a pound of candied-peel, two pounds of minced apples, one pound of moist sugar, the juice of two lemons, and their rinds pared off as thin as possible and shred small, a quarter of an ounce of mixed spice, and a gill of brandy.

Peach cream.

Steep half an ounce of isinglass in half a pint of cream, and stir over the fire until dissolved. When almost cold, mix with it the strained juice from a tin of peaches and the juice of a lime. Pour three parts of this cream into a glass dish, and allow it to set. Colour the convex sides of the halves of peaches delicately with cochineal. Place them with the coloured sides upwards upon the set cream. Pour the remainder of the cream carefully between the fruit. Allow this also to set, and the dish will be ready to serve. Three-quarters of a pint of blancmange, with the yolks of three eggs stirred to it while scalding hot, make a fair substitute for the cream.

Tinned fruits.

Tinned fruits are most useful and cheap in preparing dishes for the table, especially on great occasions like Christmas, and we must remember there are three senses to be gratified,—the sense of smell, the sense of taste, and the sense of vision. With a little ordinary care and thought many pretty dishes may be prepared from very ordinary and wholesome puddings which would delight and at the same time be very suitable for children. For instance, suppose we have an ordinary custard pudding usually served in the pie-dish in which it was baked, we would allow this pudding to get cold, then with a sharp knife cut around the edges and turn it out like a jelly on to a glass dish. Now make a star, and ornament the middle of the pudding with a preserved cherry and four little points or wedges of angelica about an inch long, half an inch at the base, coming to a point. Then place round the edge of the pudding at distances about an inch apart half a cherry and a little star of angelica. Instead of having a common-looking pudding, you have a dish which in appearance would be fit to place on any table.

Tinned pears.

On opening the tin these will be found to consist of very ripe and luscious pears peeled, cut in half, the cores having been removed, and surrounded by a very delicious pear syrup. These pears seem to melt in the mouth, and are probably more wholesome in hot climates than stone fruit. First of all open the tin, and the first thing that will strike you is how to make them look pretty? They are pale in colour like wax. Drain the pears from the syrup till they get almost dry. Next have ready some good rice that has been boiled till it is very tender, but not pappy. Pile up this cold rice in an oval-shaped glass dish, and then pour the syrup of the pears over the rice and let it soak. The syrup can be poured into the middle of the rice, as the surface should be as white as possible. Now take a few drops of cochineal, and with an ordinary pastebush or any other kind of brush paint the pears a bright red. It is wonderful what an improvement this will make in their appearance. Shortly before sending the dish to table place the pears reposing on the piled-up rice. The red pears reposing on the white bed look very pretty and a little chopped angelica will assist to brighten up the plain white surface.

Pear jelly.

Another method of serving pears is to make the juice into pear jelly. All that is necessary is a little gelatine to make the juice a jelly. The jelly will not be bright unless it is cleared in the ordinary way with the white of an egg, but there is no harm in having the jelly clouded. The jelly

can be allowed to set in a very small pie dish, and turned out into the middle of a glass dish. The red pears can now be placed round it, and the pears themselves can be ornamented by being stuck with little strips of almond like a tipsy cake. If the pears rest on the jelly with the stalk part or the smaller end uppermost, the dish would look prettier if you stick all the base with strips of almond, and use strips of angelica for the upper part only about an inch from the end. We have here green, red and white, which always contrast well so far as colour goes.

Greengages mould-
ed. Take one bottle or tin of greengages, a quarter of a pound of sugar, one ounce of gelatine. Soak the gelatine in a very little water, pour the liquor from the greengages into a stewpan, add the sugar and boil gently for a few minutes; stone the greengages, and add them to the syrup, and simmer for five minutes; then put in the gelatine and mix it thoroughly with the other ingredients; pour into a wetted mould. When firm turn it out and serve with whipped cream or a boiled custard. If tinned greengages in syrup are used, little or no sugar need be used in preparing this dish.

Blancmange with raspberries.

Required one tin of raspberries, two table-spoonfuls of cornflour, one pint of milk, two ounces of sugar, a little essence of lemon. Mix the cornflour very smoothly with the milk, add the sugar, and boil for ten minutes, stirring constantly. If too stiff add more milk. When cooked, mix in the lemon essence and pour it into a wetted border mould. When firm, turn on to a glass dish and heap the raspberries in the centre.

Table jellies.

Jellies always make acceptable dishes, and I can thoroughly recommend Chas. Southwell and Co's "Excelsior" Table Jellies, and they are very simple to use. Directions for use: Place the jelly tablet in a pint measure and fill up with hot water, turn into a larger vessel and stir occasionally till thoroughly melted, then pour into a mould and stand it in a cool place. A few hours are necessary to set the jelly. **NOTE.**—When firmly set, the jelly is easily turned out by dipping the mould for a second or two into warm water. A very little heat is sufficient to loosen the jelly from the mould. In hot climates I would advise a little less water than given in the above directions.

THEN DON'T WATCH THE POT.

A WATCHED pot never boils, and a watched clock never goes. Nothing is quick enough for impatience. Minutes, hours, and days are mere words after all. We are happy—a day is but an hour. We are miserable—an hour is a day.

From the summer of 1890 to the autumn of 1892 wasn't long to contented and busy people; but to Mrs. Annie Dutton it seemed like one of those tremendous geologic periods that the learned men talk about. For it was measured by weary heart-beats and footsteps taken in pain. Her trouble began as it begins with an uncounted multitude of women—the tired and languid feeling, the disgust with food, the distress after eating, the coated tongue, the grinding pain at the pit of the stomach, the nausea and vomiting of acid fluids, &c.—a dreary list.

Writing of her experience recently, she says: "After a time I had so much distress that I never wanted anything to eat; the very sight of it made me sick. Night after night came, bringing sleep to others, but not to me. I was low, miserable, and worn out, and would sit for hours all alone, wishing for no company. And, then, so nervous. Why, the slightest noise startled me.

"Two terrible years of this I was dragged through. In that time I lost four stone in weight, growing continually weaker. I consulted doctor after doctor, but they were not able to do me any real good. I tried change of air, yet was disappointed in my hope of any advantage from it. I only lost ground, and became more and more feeble.

"Then came unexpected help. In September, 1892, a neighbour of mine told me of the good Mother Seigel's Curative Syrup had done her, and urged me to try it. I had heard this medicine well

spoken of for years; still I had no faith that it would benefit me in my condition. However, my husband got me the Syrup from Derby, and after I had taken it a few days I felt better. I could eat once more, and my food agreed with me. After I had used three bottles I was a new woman. *I was well*; and I have been in good health ever since. Now I recommend the Syrup to all our customers and friends, and so does my husband.—Yours truly, (Signed) Annie Dutton, Nottingham Road, Borrowash, near Derby, October 6th, 1893."

As to the opening symptoms, the narrative of Mrs. Susannah Durose is identical with that of Mrs. Dutton, so we need not repeat them.

"In October, 1890," says Mrs. Durose, "I read about Mother Seigel's Syrup in a little book. I got a bottle, and after taking it a short time I was well as ever, although *I am 78 years old*. My daughter, who suffered from weakness and neuralgia, took the Syrup with great benefit. I know many others who have been cured by it after all other means had failed.—Yours truly, (Signed) Susannah Durose, Hawthorn Cottage, Borrowash, near Derby, October 6th, 1893."

The latter lady would be called very old, as she is 78; and, as lives average nowadays, she *is* old. Few of us, perhaps none, have any hope of living as long as she has. Why not? "The days of our years are three score years and ten," says David. But most of the race fail to reach 70, while many exceed it. There is no law, no edict on the subject. We are each entitled to live as long as we can, and to be as happy as we can; and both depend (accidents excepted) on health; and health means the continued natural action of the digestive process.

And that Mother Seigel's Curative Syrup promotes *that* a host of witnesses in England alone have testified.

JADOO LIMITED.

Capital £50,000 in £1 Shares.

The Directors are open to receive applications for shares to a limited amount at a premium of 5s. per share, which premiums will be carried to a reserve fund and separately invested. Application should be made to the Secretary, Palace Gate, Exeter, accompanied by a remittance of 7s. 6d. per share, being the premium of 5s. and 2s. 6d. on account of the shares. Forms of application can be obtained from Messrs. Parry & Co., Madras, or Messrs. Octavius Steel & Co., Calcutta.

YOU CANNOT DO BETTER THAN GO TO

ADDISON & CO.,

Printers, Bookbinders, and Stationers,

MOUNT ROAD, MADRAS.

ADDISON & CO.'s Printing Works are the largest private printing establishment in the Presidency, and are fully equipped with the latest patterns of steam machinery for the economical and prompt production of all kinds of printing, ruling or binding work. Estate books of any description made to order at short notice. Check rolls, Labour Distribution books and other books in general use are kept in stock. Proprietors who use special forms of account books are recommended to order 2 or 3 years' supply at once, as by so doing the cost per book is considerably lessened.

Our sample book of Commercial Letter Paper shows a wider range of qualities than can be found elsewhere in the local market. All our commercial paper is cut from the flat ream, so that our customers pay for the paper only and not for fancy wrappers and labels. We claim to offer better value in this line than any other house in the trade.

Office requisites, and fancy goods of all descriptions in large variety. Sole Agents for Yost and Blickensderfer Typewriters.

MARKET SUPPLEMENT.

SATURDAY, DECEMBER 18, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (November 26, 1897) says:—Owing to the thick fogs prevailing no auctions were held on Tuesday and Wednesday, but the small supplies brought forward yesterday met a poor demand and only a very limited quantity was sold.

No East India was catalogued.

A further reduction of 1/- to 2/- had to be accepted for the small proportion of Columbian disposed of, the rest being bought in.

There was a heavy decline in futures during the first part of the week, quotations giving way 2/- to 2/3; the last two days however the market has recovered sharply on firmer cost and freight offers and smaller Brazilian receipts, prices closing 3d. dearer than our last and 2/6 up from the lowest.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending November 24th, 1897, says:—Bank rate 3^o/_o. Bombay Exchange closes at 1s 3¹/₂d. Brazil Exchange 6¹/₂d. Rupee paper 3¹/₂ 62¹/₂. Silver 27¹/₂d per oz.

This market continues depressed, and there is no disposition to buy. Prices are more or less nominal, and in some cases fully 5s per cwt. lower. At the close the tone is slightly firmer. Brazil markets are again very flat.

Futures continued flat until yesterday when a reaction took place. The closing shews a fall of 1s 6d on previous quotations, being 1s above the lowest, viz.:—Good average Santos in Havre, March delivery, fcs. 34.75, in Hamburg pf. 28, and No. 7 low ordinary Rio in New York \$5.45.

To-day's London official quotations are:—

1896-1897...	786,737 „	558,332 „	21,764 „
34,428 pkgs. INDIAN	} Total 46,707 packages were offered in public auction this week.		
10,634 „ CEYLON			
1,645 „ JAVA			

Export from Ceylon direct to countries outside the U. K. from 1st Jan. to 30th Sept., 1897, was 11,911,213 lbs., against 10,053,323 lbs. in the same period of 1896, 8,813,641 lbs. in 1895. The bulk of this was sent to Australia, where the use of Ceylon Tea steadily increases. The quantity taken by China also shows an increase; doubtless for North America, while that taken by India is probably for the Persian Gulf. The figures for Russia look small, but almost all the demand is supplied from London.

Distribution of Tea exports from Ceylon from 1st Jan. to end of Sept.

Indian. The sale was small, consisting of only 34,428 pkgs.; this resulted in a very steady market for all descriptions, Teas with special point in quality meeting with strong competition. There is not much change to note in regard to quality, which continues on the whole fairly satisfactory.

Ceylon. The very small auction met with good attention from buyers rates for all descriptions being fully maintained. Quality continues fairly satisfactory and shows no material alteration, although arrivals generally are not quite up to those of a few weeks back.

Average for week 8'50d., against rather over 8 $\frac{1}{2}$ d. same period last year.

Ceylon Tea sold on Garden Account 1st January to date 1897, 979,425 pkgs., av. 7'68d. 1896, 885,360 pkgs., av. 8'22d.

Comparative prices of Ceylon Tea in London:—

	1897.	1896.	1895.	1894.
PEKOE SOUG. (Ordinary leaf; fair liquor)	6 $\frac{1}{2}$ d	6 $\frac{1}{2}$ d	6 $\frac{1}{2}$ d	7 $\frac{1}{2}$ d
PEKOE (Ordinary leaf, little twist; fair liquor)	7 $\frac{1}{2}$ d	7 $\frac{1}{2}$ d	7 $\frac{1}{2}$ d	9d
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	5d	5d	5 $\frac{1}{2}$ d	6 $\frac{1}{2}$ d
PEKOE (Somewhat bold leaf; indifferent liquor)	5 $\frac{1}{2}$ d	5 $\frac{1}{2}$ d	6d	7d

Java. The selection comprised a somewhat varied assortment; last week's rates being generally maintained although a few parcels were withdrawn for higher prices. Invoices from "Perbawatee" and "Goalpara" realized an average of 11 $\frac{3}{4}$ d. and 10 $\frac{3}{4}$ d. respectively. Last week's average of "Goalpara Estate" should have been printed 11 $\frac{1}{2}$ d. not 104d.

Bank rate 3 per cent. Exchange on London three months sight.—
Calcutta 1/3 $\frac{1}{2}$, Colombo 1/3 $\frac{1}{2}$.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 3, Esplanade Row, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 7th January 1898.

S. E. Wynaad. DEVALA, 22nd December.—*Weather.*—Since my last report, for three days it was very cloudy, rainy and very windy and since very hot during the day and very cold at night. *Crops.*—Stripping is being continued Paddy harvest is in full swing. *Health.*—Fever, headache, cold and cough prevalent. *Labour.*—Sufficient.

Coorg. POLLI BETTA, 21st December.—*Weather.*—Not so cold as previously. The last rain that fell was on the 27th and 28th ultimo about 35 cents, out east about 45 cents; 17th to 19th instant inclusive were overcast, and some moisture was even precipitated, but not enough to measure. *Crops.*—Crop has ripened up very well since, and second picking in some cases is going on briskly. In some they have been finished. Crops will be short, but not so bad as last season. *Health.*—Fevers and coughs and some dysentery prevalent.

Nellampatty (British).

21st December.—*Weather.*—Since Wednesday of last week till this morning we have had cold cloudy days, and on Saturday and Sunday fell what is to be our Christmas rain I think, as it is quite clear now; no more signs of wet. I had only 60 cents altogether, and I think that is about the average. Strong land wind blowing. *Crops.*—Coffee coming in slowly. *Plant diseases.*—Leaf still in clearings; almost gone in old

coffee. *General Health.*—Good. *Labour.*—Plentiful. *Interesting Items.*—Service last Sunday was a great success and all were present (save two I think). The result of it all is that the powers that be think we want a cemetery badly and are subscribing to help us!

Nilgiris.

COONNOOR, 21st December.—On Friday last our Kismis malay began and on Sunday the driving rain, though extremely thin, wetted the ground appreciably. To-day, Tuesday, all rain has disappeared. Frost will put in an appearance very soon, as the temperature is falling rapidly, ranging from 50° to 62°F. in the shade. The hills are getting brown, and weeds dying down on all sides. Talking about weeding, some men delay post N. E. monsoon weeding till the April showers begin, declaring that any disturbance of the surface soil must result in loss of moisture. Shallow forking on the contrary, and weeding effects just the contrary. What says friend "Coorg" or "Mudigere"? Happy Xmas to them and all my other brother correspondents! The climate is simply superb at this time of the year. Taken all round, it adds 25% at least to the value of Nilgiri property. [That's enough, though this paper is edited on these Hills.—ED.]

OURSELVES.

THIS issue is of extra large size to make up for the omission of next week's number during the short Xmas holidays. The year's index, alphabetically arranged, will be distributed with the first number of January 1898.

We will not adopt the usual style of printing the more or less wearisome retrospects for the year. We can point, however, with great pleasure to the marked increase of activity in the organic body of the planting community. The fates have not smiled on the industry this year, falling prices for both our staples, a rising exchange, and with blight attacks of more intensive nature than heretofore, do not leave much room for hilarity. But as dangers and difficulties increase, so however do the courage and spirits of the community rise. With steadfast energy at their backs, planters may well face the coming year with composure. Let combination and true unanimity be their watchwords.

In conclusion, hearty Xmas wishes to one and all.

BONES AND OTHER PHOSPHATIC MANURES.

THE yearly increasing exports of bones from India has already drawn the anxious attention of the planting community, who have addressed Government on the subject. Their proposal, however, that an export duty should be imposed both in the interests of planters and the ryots themselves, has not met with success. It is interesting therefore to observe the great importance in which phosphatic manures are held in some of our colonies. With the progress of the great farming industry of the Cape and South Africa generally, the demand for crushed bones is rapidly outstripping the supply. For not only are phosphatic manures for supplying the phosphoric acid so needed

in the soil, but also in the form of crushed bones or bone meal to be fed to the live stock. There are many ailments incidental to farm stock in Africa who are deprived of their requisite phosphates usually so abundant in other countries in the forage plants the animals graze on.

The extreme poverty of African soils in phosphoric is shown in a striking manner by various analyses of soils. Many of the samples tested showed that they did not even contain per acre of 6" surface soil the phosphates contained in 1,200lbs. of bones. The average ran out, however, to double that quantity. In both cases the phosphates were of course in an insoluble condition, and therefore not available as plant food.

As a natural consequence Cape farmers are turning their attention to outside supplies, in the shape of East Indian bone meal, which has been selling in London as low as £4-5-0 per ton, mineral and other phosphates. It may be useful to give the comparative value of the various phosphatic manures, as set forth in the *Cape Agricultural Journal*:—

Ordinary bones	contain	...	48 per cent. of bone earth			
			(Tribasic phosphate).			
Corprolites raised						
in Cambridge	...	56	"	"	"	"
Phosphatic rocks						
from Estamadura						
in Spain	...	72	"	"	"	"
Sombrero in						
West Indies	...	71	"	"	"	"
Carolina, United						
States	...	52	"	"	"	"
Canadian Apatite	...	82	"	"	"	"

There is no difference in the manurial value of the phosphate unit in the above substances, though the nitrogen in the bones of course adds to its value. Mineral phosphates are at present exceedingly cheap in England, an article quoted in the *Mark Lane Express* guaranteeing 35 per cent. of soluble phosphate @ £2-10-0 per ton, nearly half the price of East Indian bone meal already quoted. The prices of superphosphates have been greatly reduced in the last few years, mainly owing to the cheaper production of sulphuric acid.

The great source of sulphur, as furnished to the commerce and manufactures of the world, was at one time the mines in Sicily. The King of Sicily, thinking that he could make the world pay, put on an export duty. The English oil of vitriol manufacturers were taught by the chemists to use iron pyrites instead of brimstone, and much to King Bomba's surprise he found they could do without his sulphur; and when the duty was taken off again, the manufacturers stuck to pyrites and they have been used ever since. There are immense quantities obtained from Wicklow in Ireland, and these contain more than half their weight of sulphur.

Besides the above-mentioned sources of phosphoric acid we have basic slag, and this, when of first-rate quality, is a good substitute for bones, and is found more available for the use of the plants when ground to an exceedingly fine powder. This article is quoted in the *Mark Lane Express* at £1-13-6 per ton, bags included, guaranteed to contain 38 to 45 per cent. of phosphate of lime. This is an article in which of late there have been several cases of sham parcels sold, so that buyers must be careful to deal with firms only of first-class respectability. In one case, a large quantity was sold which was merely

ordinary slag from the iron furnaces without a particle of phosphate in it. In the ordinary course of things, these mineral phosphates cannot be used as cattle-food, though our African contemporary advocates a trial being made with basic slag. There are no signs of the demand for bone meal falling off anywhere, and the continued depletion of bones from India must eventually result in great loss of fertility to the soil. An export duty would tend to keep the selling price down, reduce the export, and force the ryots to utilise one of the most valuable manures they possess.

GENERAL NOTES AND ARTICLES.

Cocaine plants at Ooty. In noticing last week the report of the Madras A. H. Society, we omitted to note that they have sent two hundred plants of *Erythroxylon coca* for experiment in the Ootacamund Botanical Gardens, where we hope they will get on well.

Cryptogamist for the Ceylon cacao canker. We understand that Mr. J. B. Carruthers, late demonstrator at Downton Agricultural College, Wiltshire, has been engaged by private effort to investigate the causes of the cacao canker in Ceylon. The funds guaranteed amounted to £300.

Chocolate and earth-nuts. It was stated in a home paper that recently earth-nuts have been employed for adulterating chocolate on the Continent. Fortunately, however, the presence of arachis—orearth-nuts—in chocolate may be detected microscopically by the large starch grains (with nucleus) visible in aqueous or glycerin preparations, and by the cells with decided internal markings discernible in chloral preparations. Belgian chocolate is perhaps the most likely to be adulterated with earth-nuts, and attention was called to this by A. Bilteryst in a paper read before the Association Belge des Chimistes. If any of our readers care to consult this paper, they will find it in the *Bulletin de l'Association*, No. 10 (12), pp. 447-452.

Jodelite and white ants. How to outwit the white ants is a constant problem in tropical countries. They are everywhere, and they seem to defy all our efforts to get rid of them. We may dig up their nests and take out the queen, but it is only a temporary check. In this age of scientific invention such pests are not likely to be overlooked, and a preparation has been in the market under the name of "Jodelite," which is claimed to effectually protect timber against the ravages of white ants and other insects. The *British Trade Journal*, referring to this preparation, says:—"Jodelite is, we understand, coming more and more into use for the preservation of wood in tropical countries, protecting it against the attacks of the white ant, and preventing dry rot, fungus, and decay generally. It is also being used as a preservative of wood paving blocks, ropes, and as a preventative of dampness in walls, bricks, or stone. Jodelite is applied with an ordinary brush, and its action is described as both chemical and mechanical."

"Kites and Rain."

The American Weather Bureau have flown a new cellular kite, presenting a surface of 70 square feet to the wind, to a height of $1\frac{1}{2}$ miles. The framework is of spruce fir, joined by wires, not nails, and covered with white muslin as durable as black silk. The kite is rectangular, like that of Hargrave, the Australian, but the construction is different and superior to his. The kite carries an anemometer and a meteorograph, weighing $2\frac{1}{2}$ pounds in all. Very fine steel wire weighing 5lbs. to the mile is used for the "string." For a height of one mile, three miles of wire are required, and the total weight of the wire and instruments for the flight of $1\frac{1}{2}$ miles is about 25 lbs. The wire is cut in lengths of 7,000 feet, and after each thousand is reeled out, the flight is arrested, until the inclination of the kite is determined by looking through a telescope at a scale marked on the inner surface of the kite. When a kite has risen above the under currents of air, it is out of danger till it descends into them again. The wire is paid out by a small engine.

MURDEROUS PLANTS.

It must be conceded that many plants lead unexceptionable lives, the utmost violence of which they can be accused being limited to a certain insistence on their own rights to light and air in this already crowded world. But yet others, adopting drastic modes of self-preservation, habitually employ methods of destroying other species which, in their varying grades of ingenuity and cruelty, are comparable to every degree of homicide from culpable negligence to wilful murder.

The common ivy (*Hedera Helix*) is an occasional epiphyte (a clinging pseudoparasitic plant), and though its purpose in embracing the oak is merely to carry its own leaves as far as possible into the free light and air, yet the more successful the ivy, the more rapidly does the suffocation of its supporter proceed. The climber, however, receives no benefit from the death of the tree, which result can only be regarded as due to carelessness or immorality in selecting an animate instead of an inanimate support.

The fungi being vegetables without the green plant-pigment, light-sensitive, food-forming chlorophyll, are forced to rely upon extraneous organic matter for sustenance; and while some procure this from organisms already dead, a large proportion of the class make a systematised attack on other living beings. Nearly every species of fungus has its own special habitat, and both the animal and vegetable kingdoms are subject to their assaults. For instance, *Phytophthora infestans* attacks the potato, causing the disease special to the plant, while *Empusa Muscorum* is the direct cause not only of the death of house-flies but also of the peculiar appearance of the dead insect. The spores of this fungus obtain entrance by the stigmata or breathing apertures of the fly, and there germinating gradually extend throughout the whole system of air tubes. Even after the suffocation of the insect the fungus continues its growth (feeding on the abdominal viscera) until the stomach becomes so distended that its segments are forced apart and the white connecting membrane shows between, giving a ringed appearance to the body, a clear indication of the cause of death.

Bacteria, belonging to this group, are also responsible for the major portion of those epidemic diseases which spread death broadcast among the human species.

Larger and more highly organised plants carry out this insect-killing on a greater scale, and with varying degrees of ingenuity. *Sarracenia purpurea*, *Darlingtonia*, *Californica*, and the various species of *Nepenthes* all adopt the pitcher system, namely a container arranged for easy entrance and difficult egress, with devices to prevent the sides from being scaled, and at the bottom of the pitcher a supply of fluid which by reason of its digestive properties renders the whole arrangement a most effective "stomach." Even *Utricularia vulgaris*, the common Bladderwort, though not secreting a digestive fluid, finds some advantage in using its eel-trap fashioned bladders as snares for water-fleas, which when dead are attacked by bacteria, the plant receiving such decomposition products as it is

able to absorb by way of payment for its share in the destructive work.

Drosera rotundifolia, the Sundew, *Pinguicula vulgaris*, the Butterwort, and *Drosophyllum lusitanicum* retain their prey by means of an adhesive secretion rather than by traps, but they too pour out a digestive fluid and so gradually absorb the nutriment derived from the insects attracted by the delusively glittering aspect of the before mentioned secretion, which stands all over the leaf surface in sparkling drops.

Then, too, who does not know the wonderful Venus Flytrap (*Dionaea muscipula*) which seems to display an almost animal sensibility in opening and closing its leaves, either to reject the exhausted carcass of a captured fly or to retain a newly-arrived victim! Still these gross outrages, which (after all) resolve themselves into a mere catering for the day's necessities, are pardonable when compared with similar deeds which do not benefit the death-dealing plant.

Cordyceps, a genus of fungus, makes its attacks on caterpillars, and, after a period of rapid absorption and growth, throws up a hypha bearing a seed or spore-case of such size that the caterpillar is entirely consumed in its production and remains but a shell, filled only with fungoid tissue.

In one species of this genus, the period of rapid growth does not supervene until the larva attacked has buried itself in the ground in order to undergo its transformation in the pupa or chrysalis stage of existence; at this time the fungus sends up a hypha or fruit-stalk long enough to reach the surface—a distance frequently of six inches—and thereby secures wind distribution for the spores. This affords an illustration of attack specially adapted to ensure provision against the strain of reproduction: but in one instance at least there is a supply of food for the young plant provided in advance at the cost of another species. The usual system is, of course, the storage of food in the cotyledons (or to be popular, let us say the seed) at the expense of the parent plant.

Stapa Capillata, a Russian grass, has seeds provided with an "awn" or bristle, such as, if observant, we may see on every ear of barley, and this long, sharp pointed spike is set with hairs pointing to the rear so that motion forward is easy, motion backward almost impossible. The awn is very hygroscopic; in other words, it absorbs moisture very greedily, expanding in the process. Hence should the seed fall on the fleece of a sheep, the morning dew extends the awn and drives the point into the wool. The heat of the day causes contraction, thus drawing the seed-end closer down to the point, which is then ready for a further advance on the next accession of moisture. This continues until the awn having pressed through the wool enters the flesh, causing mortification and frequently death. It can be seen that this form of seed, in attacking animals not under the care of man, will not only ensure wide distribution, but also manure for the sustenance of the future plant.

In some species of Australian plants this arrangement is rendered more effective by the spiral form of the awn, which gives a greater hold in fur or fleece, and at the same time causes a wound of greater area and therefore, presumably, of more gravity.—*Science Siftings*.

INSECT PESTS IN THE TROPICS.

PERHAPS one of the most marked faunal characteristics of the tropics is the predominance and peculiarities of its insect life. Whether during the day we remark the brightly-colored butterflies, the varied forms of the beetles, the wonderful activities of the ants and termites, the lace-winged dragon-flies, the strange stick and leaf insects; or, at dusk, the large and small moths which flutter round our lights, the shrill note of the crickets accompanying the evening song of other night loving creatures, the flitting to and fro of the various fire-flies: or, still more, experience the tormenting mosquito, or on the trees in our gardens remark the prevalence of strange-looking scales and large and gorgeously colored caterpillars, do we realise the importance of the group here, compared with temperate parts. The constant dweller in the tropics, be he agriculturist or otherwise, has thus his attention continually directed towards the six-legged winged creatures, either in admiration of their form and beauty, or, perhaps more often, in execration at the petty annoyances to which they subject him and the more serious damage to agriculture resulting from their activities.

Seeing that insects have such a constant influence and importance in our daily lives, we shall observe them with greater interest, may

appreciate more their presence or be better able to deal with them as pests, when we know somewhat of their organisation and habits. Fortunately there is a general plan of structure applicable to insects which is readily grasped, and which enables us easily to distinguish them from all other animals. Other characters again ally them to creatures appearing at first sight very distantly removed. Primarily we observe their bodies to be made up of distinct rings or segments. This ringed body they have in common with worms, centipedes, lobsters, scorpions, and spiders. Their paired legs are likewise seen to be constructed of several parts separated by joints differing in form and purpose according to the position in the body of the part we select. In this they differ entirely from the segmented worms, which have only hairs or bristles to aid them in locomotion, but agree with the remaining groups mentioned. This common character of the appendages enables us to form a great group of the animal kingdom, the *Anthropoda*, or joined-footed animals. By the numbers of these feet we can also separate the insects from most of the other members of the *Anthropoda*. The centipedes, lobsters, &c., have a pair, of one shape or another, to every ring; scorpions and spiders have four pairs restricted to the front segments, but insects are all limited to three pairs of true walking legs in the middle division of their body. Again, lobsters and spiders have the whole body divisible into two main portions: insects have, with few exceptions, three distinct and separate regions—the head, thorax and abdomen. Finally, insects differ most advantageously from all other anthropods in the possession of wings; usually two pairs fixed to the two last rings of the thorax. These are to be regarded as out-growths from the body; perhaps, with their hollow veins, developed primarily for respiratory purposes, but afterwards taking on the very important function of aerial locomotion.

By their means insects alone, among the invertebrates, occupy an exalted and active position in the air, such as is occupied by the birds among the vertebrates. To the gift of wings must be attributed the wonderful numerical success of insects in the struggle for existence as well as that of birds; and, in a measure, their advance in activity and intelligence. To sum up, insects are distinguished from all other animals by the following combination of characters. The division of the body into three regions—head, thorax and abdomen—the two first being separated by a well-defined neck; the possession of one pair of feelers or antennæ on the head; the thorax with only three segments, each bearing a pair of jointed legs, and usually a pair of wings to the two last rings; and, lastly, the abdomen with nine or ten segments.

The paired eyes on the head are generally fixed, and differ much in plan from the eyes of higher animals, each being a combination somewhat equivalent to very numerous single eyes. Experiments seem to point to the conclusion that insects cannot distinguish by their eyes the forms of objects, or at best very poorly. The antennæ or feelers have important functions, probably connected with motion, touch, hearing, taste or smell.

The external covering of all insects, and indeed of all the *Articulata* or segmented animals, is a substance, usually more or less hardened, known as chitin. It is an excretion from the soft underlying cellular layer, the epidermis. In the burrowing earth worms a protective covering is not much required, and the cuticle is very thin and delicate. In crabs and lobsters it becomes impregnated with lime salts, and consequently very hard and a most effectual protection. This would, however, be too heavy for the air-disporting insects. It is to be noticed that the chitinous case is not stiffened at the joints so that movement of one part of the body upon another is allowed. The outer skin becoming hard and inelastic soon after exposure, the necessity for the creatures, while increasing in size, to be occasionally moulting their skin as a whole is obvious.

The internal structure of insects can best be studied in such a form as our common large cockroach. Although a very objectionable and much-despised creature, the cockroach is worthy of our great respect on account of its long ancestry. We occasionally give honor to individuals who can boast only of this as their recommendation, and it is certainly one redeeming feature in the present case. Forms similar to the cockroach are met with amongst the early fossiliferous rocks, and extend, unquestionably without any signs of extinction, down to the present day.

On pinning down a cockroach and cutting away the upper portion of the body-wall the interior is seen almost filled with a white loose substance, which is mainly fatty matter held together by the fine air-tubes or tracheæ. When this is cleared away, a partially coiled

ube is seen extending the whole length of the body. It is the food-anal of the animal and is divisible into different parts, each with a separate function in the complex process of digestion. Out-growths from it occur at different places; two in front are known as salivary glands, and produce a digestive fluid, and two other groups occur behind. The first, consisting of short, pouch-like tubes, secrete another digestive fluid, and the second group of long slender tubes has an excretory function. The dorsal heart and the blood-vessels are not readily seen. Running all the length of the ventral surface of the body-cavity which is not however a true *cœlome*, is the double nerve-cord, with enlargements corresponding somewhat with each segment, and from which are given off fine branches to all parts of the body. The complex reproductive organs are seen behind.

With some interesting exceptions, all insects develop from eggs. The life of most may be divided into three stages: the *larva*, caterpillar or grub; the *pupa* or *chrysalis*; and the *imago* or adult; the change from one to the other being spoken of as a *metamorphosis*. The differences between the various stages are, however, very diverse in the many groups, the obvious alterations being much more marked in some than in others.

THE HAWK-MOTHS.

The hawk-moths are among the large moths which, in the evenings, often fly into rooms. They are stout, strong insects, with large hairy bodies. The sucking tube or tongue is extended to a great length, so that it may reach the sweet fluids at the bottom of flowers with a long tubular corolla.

The caterpillars of the various species are large, stout, and smooth, with very beautiful and striking colors. They are continually brought into the Museum as remarkable objects. Those belonging to the family may usually be readily distinguished by the possession of a hump or horn on the eighth abdominal segment. The pupæ are occasionally met with in digging the ground. They are spindle-shaped, often with a long jug-like handle, which is really the case of the sucking tube. The green caterpillar with oblique white lateral lines and a curved hook towards the end of the body, and which lives mostly on the leaves of the tomato, is a well-known form.

PLAGUE OF CATERPILLARS.

Not far removed from the hawk-moths are the insects which have lately given rise in Jamaica to a plague of caterpillars.

A few weeks ago accounts appeared in the papers that the guinea-grass, covering extensive areas in different districts of the southern portion of the island, and also around Kingston, was being destroyed by caterpillars. Specimens of these were sent to the Museum, and were allowed to pupate and afterwards the moth was hatched. They are closely allied to the well-known "army-worm" of America. The long, slender caterpillar lives mainly upon grass, but attacks also corn and sugar-cane. It eats away practically all the young leaves, only the dead stalks remaining. In such numbers do they occur that a whole district may be quickly devastated. The pupal stage in similar forms elsewhere is passed through in the ground, but in the Jamaican species the caterpillar makes for itself a kind of chamber by joining portions of the leaves of grass and forming a thin lining by means of fine threads. In this the small, brown, spindle-shaped pupa passes through its metamorphosis, the result being a medium-sized moth. No further accounts have been received from the country for two or three weeks, so that very probably our worst times are over. The excessive development, at times, of different forms of caterpillars, as compared with other times, is mostly dependent upon peculiarities in climatic conditions.

Since this was first written I have heard from one of my correspondents that the caterpillars, which had disappeared, seem to be now returning in as great numbers, and are again destroying the grass. No doubt these are derived from the batch of eggs laid by the moths resulting from the first caterpillars, and there seems no reason why we should not look forward to a regular sequence of such visitations.

SCALE INSECTS.

The scale insects or bark-lice are well known to every observer in the tropics, and to those conservatories elsewhere with plants from warmer parts. In many respects they form a very peculiar group, and a wonderful variety of species exists within the family, *Coccidæ*, as it is termed. In appearance and habits they differ greatly from other insects, and even the two sexes of the same species are much unlike. The females pass the greater part of their life entirely motionless on trees and shrubs: nothing in their exterior would lead one to suppose them insects. When mature and ready for laying eggs

the scale appears rather as an excrescence of the tree. The males at one stage are lively and active, but have then only a single pair of wings, and no organs for procuring food. The mouth parts disappear during the metamorphosis of the insect, and a second pair of eyes appears in their place. The female is always sluggish and wingless, and in the adult the body is generally scale or gall-like or grub-like and clothed with wax. Though the body of the larval family is ringed and bears legs, all trace of segmentation is usually lost later. Among the *Coccidæ* are found many of the most serious pests of the horticulturist and agriculturist; scarcely any kind of fruit tree is free from their attacks. The numerous species described from Jamaica by one of the former Curators of the Museum, who made a speciality of this group, is evidence of their great abundance in this island, while almost daily specimens are still sent to the Museum for examination. During recent years much attention has been paid, more especially in America, to devising methods for destroying and checkmating the pests; the insecticides which are now most widely used being alkaline washes and kerosene emulsions.

Perhaps the scale of greatest concern at present in Jamaica is the Mussel scale, *Mytilaspis citreola*, affecting the oranges, more particularly in the lower, dried parts of the island. It is not rare around Kingston, and I have received oranges affected with it from St. Ann, but, in the higher orange-growing districts of the island, as at Mandeville, it does not appear to be very prevalent. In its structure and life history it exhibits some most remarkable conditions and may be taken as representative of the group.

The scale in the stage we are most familiar with is a minute brown mussel-shaped body, about one-eighth of an inch long, flattened on its adhering surface, but convex on the other; a slight margin of lighter, less dense material is present. If turned over and examined with a lens, it is seen to be either a dead hollow chamber with a partial membranous floor, or else to contain small eggs irregularly arranged. The manner in which this condition is brought about is one of the most striking processes in insect life. For what follows we are indebted mainly to the researches of the American entomologists. Starting with the eggs laid by the mother, we find that they undergo development, producing minute creatures, mere specks, scarcely distinguishable to the untrained eye. The newly-hatched scale insect is oval in outline, much flattened, furnished with six legs, a pair of antennæ, and an apparatus for sucking the juice from plants. After wandering about for a time, usually a few hours or even less, the young insect settles on some part of a plant, inserts its beak, and drawing nourishment from the tissues, commences its growth at the expense of its host. In a short time there begins to exude from the body of the larva fine threads of wax, which are cottony in appearance. Sooner or later the larva begins to excrete a pellicle, which, although very thin, is dense and firm in texture. The mass of cottony fibres either melts or is blown away. After a period the larva sheds its skin; in some species, after the permanent scale begins to form, in others before. In this latter case the larval scale is plainly visible either upon the surface of the scale, or at one extremity, as in *Mytilaspis*. The change which the larva undergoes in this first moult is a very remarkable one; with the skin are shed the legs and antennæ, and the young scale insect thus becomes a degraded grub-like creature, with no organs of locomotion. The mouth parts remain, and by them the insect is firmly attached to the plant and continues to draw its nourishment from it. From this stage the development of the two sexes differs.

In the second and last moult of the female the second skin is joined to the first, and with it forms part of the scale which covers the body of the insect, but generally it constitutes only a small proportion of the ultimate scale, the greater part of which is excreted subsequently to the second moult.

Soon after the second moult of the females, the adult males emerge, and impregnation is supposed to occur at once. The body of the female then increases in size, becoming distended with eggs; these are deposited beneath the scale, the body of the mother gradually shrinking to make room for them. Ultimately the parent dies, but the eggs continue their development; the dead body of the mother, with its scale, serving as a chamber or cradle for their protection until hatched. The male scale insect during the early part of its grub-life is indistinguishable from the female. At the first moult, like the female, it loses its legs and antennæ; the second moult agrees with that of the female, but there the similarity in form between the two sexes ceases. It is now in the pupa state, and has long antennæ and rudimentary legs and wings. After a third casting of the skin the adult male appears with three pairs of legs,

and a large pair of wings in front, by means of which it can fly, but the mouth parts are replaced by supplementary eyes, and it is unable to eat. In the particular genus *Mytilaspis*, to which the orange scale belongs, the scale proper of the female is elongated, and the exuviae or dead skins are seen at one extremity. The scale of the male is similar in form to that of the female, only smaller. Fortunately it does not appear that the scale injure the trees or the oranges very seriously in Jamaica, but the unsightly appearance given to the fruit when the parasite adheres in considerable numbers renders it desirable that measures should be taken to prevent the spread of the pest.

LETTERS TO THE EDITOR.

SOME KANAKS.

SIR,—It is a great pity that efforts are not made in each district to keep kanaks or tasks of various works uniform. A little combination that way would effect a very great saving in our labour bill, I am convinced.

If only to keep the ball rolling, I would mention a few kanaks on a Coonoor estate, a few miles from town:—

Earthwork	... 20 feet lead only, $\frac{2}{3}$ soft earth, $\frac{1}{3}$ hard gravel.
Wodders	... 12 cubic yards per Re. 1.
Badagas	... 9 " " "
Stone work in mud, workers to find all materials.	
Wodders	... 50 cubic ft. per Re. 1.
Bricks, Burning (fuel free)	... Rs. 4 per 1,000 bricks.
Building in mud	... Re. 1 per 1,000 "
Fuel, 3-foot logs per 100 cubic ft.	
in situ	... Re. 1
$1\frac{1}{2}$ "	... Rs. 2

Are the above rates cheap, dear, or the usual standard? Anyway, I should like to see more of the question of

KANAKS.

THE SIROCCO TEA ROLLER.

SIR,—I have read your remarks in your issue of 11th instant regarding Davidson's "Sirocco" tea roller.

My experience is that when empty, a child can set it in motion by pushing the pulley, and with a full charge, a man of ordinary strength can set the machine going. In fact very little power is required to exert the full capabilities of the machine.

Into the question of H. P. I will not enter, but a small trickle of water with a 16' wheel will give satisfactory results.

The machine only has to be known to be appreciated. The leaf is *always cool*, there is no leakage, and *no spit*, which was always a fault in earlier rollers.

The "Sirocco" tea roller revolutionises tea manufacture to a great extent, as pressure was formerly considered necessary to give a strong pungent liquor, but the Belfast firm have solved the question, and we have now a machine which gives unbroken "mal" oxidised during the process of rolling, turning out a full tippy tea, without being blackened by the exudation of juice from the leaf under treatment.

OOTACAMUND,
13th December, 1897.

S. HAWES.

FERTILIZERS.

SIR,—In speaking of fertilizers, Prof. S. M. Tracy dwells with some emphasis on the fact that since all the food of plants is absorbed in either a liquid or gaseous form, plant food even if it be present in abundance cannot be used by the plant, unless it is in a form in which it can be dissolved in water or in some of the very weak acids found in the soil. "Insoluble food," says the Professor, "is of no more value to the plant than is raw iron ore to a manufacturer of watch springs." The plant must not only have an abundant supply of food, but this food must be in such a mechanical and chemical condition as to be

available to the plant during the few weeks in which it is making its growth. However rich a soil may be in available plant food, he need not look for a good crop if the ground is so hard and lumpy that it cannot be penetrated by the roots, and it is useless to supply any fertilizer which contains food locked up in an insoluble form. So that whatever crop we may grow or whatever fertilizer we may apply, a thorough pulverization of the soil is "*essential to success*." Take note of the above, planters who are applying artificial and chemical manure.

"KOLA."

COFFEE.

Up and down trenching.

The most familiar method of continuous trenching on steep land is of course that as nearly right angles as possible with the slope of the hill. The down trenches are avoided for fear of wash. Those, however, who have tried trenching down hill, though for other than the usual reasons, declare that wash is far less frequent than with the cross trenches.

White ant pest in Selangor.

A correspondent to an exchange thus describes the serious ravages which white ants commit in Selangor:—"Can any of your numerous readers suggest a remedy for stopping the ravages of white ants which threaten on some estates here to be even a greater curse to the planter than either green-bug or leaf-disease was in Ceylon. This sounds like an exaggeration, but I only wish it were. Regular coolies are kept employed cutting out the dead trees and making holes for supplies. The ants work in patches as a rule, utterly destroying good as well as shuc trees with the utmost impartiality, and when a single tree is attacked, we know it is only the first of many surrounding it to go. The ants commence by entirely devouring the taproot, and when they near the surface of the ground, they work inside and clean up the centre of the tree. They are thus hidden from observation, and are secure from the attack of other varieties of ants which would destroy them could they only get at them."

Slump in Liberian.

Planters of Liberian coffee of the lower sorts must be prepared for a slump in prices, says a *Ceylon Times* correspondent. At the official coffee auctions, held on Tuesday last, at Amsterdam, there was a heavy fall in prices. Good average Java on spot declined from 45 to 35½. This sudden drop of 9½ c. is without precedent. The decline is ascribed to the large receipts and heavy crops, especially in Brazil. If coffee became cheaper, it would undoubtedly compete more with tea than it does at present. Drunk pure (and it is the pure coffee drinkers who would increase), at present prices it is far more expensive than tea. A good cup of pure coffee of that strength that I say the Britisher favours is rather an expensive luxury as prices have been. Consumption would improve with lower rates, and it would be a good thing to see less money going into the pockets of the cultivators of chichory at Bruges and elsewhere and more to genuine coffee growers. Chichory is not necessary to coffee, and its use is due to the two following necessities: a darker cup for the consumer and a bigger profit to the retailer.

pruning and leaf disease. The Coorg correspondent to the Calcutta *Planter* thus gives his ideas in the connection of pruning with leaf disease. Alluding to the loss of leaf caused by the disease, he says: "This being so, I should think it advisable to so direct the pruning as to aid the tree in recovering; and this cannot be accomplished in a better way than by leaving all the young shoots that may be on the trees when pruning time comes round. This at any rate would give the trees a chance of breathing. It has all along been the practice to cut off all the young shoots, in fact everything that has no promise of berries on it. In my humble opinion this is simply aiding and abetting leaf disease with a vengeance. In the case of trees that have lost a lot of leaf, I think leaving the young shoots would aid materially in bringing out a good blossom and setting it. In one place I know it apparently had this result, although the object with which the shoots were left was 'to shade the blossom!' In fact so convinced was a neighbour that leaving the shoots had put the good crop on the trees in this case, that he did the same thing next year with, as I think he thought, satisfactory results."

Native coffee. A correspondent writes: "I have on my garden now tea, formerly planted in coffee, a few old trees, the only survivals of many thousand coffee plants. One of them has evidently never been topped or pruned in any way and is a grand tree some 5 feet high, with two sound clean stems and no suckers. It has borne an excellent crop for many years past, and is now fairly well laden. It receives no care or attention at all, is situated in a remote corner of the estate, which by the way is about 6,000 feet. But this particular tree is growing just below a large rock. The other trees are in the open, lower down. These have all been topped and pruned in their early days, but have now shot up suckers. These, being surrounded on all sides by tea, and receiving no attention at all, naturally do not look extra thriving, but bear fair crops regularly every year. I do not profess to have any practical experience at all with coffee, but would point out what seems to me an interesting point. I have always understood that the stems of 'native coffee' bear a crop and die down every two years or so. This is certainly not the case with the trees on this garden. The sucker stems are quite six years' old, and in the case of the tree growing under the rock, which has only one stem, quite twelve years. The crop seems to be borne altogether on the primaries, which are very whippy and short. Secondaries and tertiaries do not appear to be developed at all. The pruning,

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contain per ton:—

61.50	lbs. Nitrogen.
57.38	„ Potash.
14.92	„ Lime.
13.68	„ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the coming crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

Shencottah.

save the mark, is automatic, and consists of the primaries, which die back after two seasons or so, falling off. These of course are replaced by new growth from the stems. One cannot of course argue on the *ex uno disce omnes* principle, but it seems to me that the lesson taught by these few trees is not wholly unimportant. I am thinking of planting up a small block of coffee the usual distance apart, forcing the alternate trees to the utmost till they get too crowded, say in six years or so, then removing these trees altogether, leaving the remainder twelve feet apart, in the Brazilian style. Shade is not practicable at this elevation, so I propose planting thick shelter belts round each square of twenty-five plants or so. I must stop here, for this is only theory."

ASSIMILABLE NITROGEN AND LEAF-DISEASE.

III.

GREAT RELUCTANCE TO FORM NITRIC ACID.

In my last paper it was suggested that Nitric Acid must exist in soils in much the same proportion as ferrous is to ferric, and in a much lesser ratio to the amount of organic matter.

The retention of Nitric Acid by the soil must also be in the same ratio, but I wish to confine this paper to-day to its formation only.

State of iron an indicator. It is a simple matter of fact that the formation of this most important constituent of the soil must be thus dependent on the state of the soil. For this reason. Remembering the extreme affinity of iron for oxygen, and seeing that Nitric Acid is purely a product of oxidation, you have in iron a useful INDICATOR of the amount of oxygen that is pouring through the soil.

Soluble salts. Lack of air, however, naturally does not, as hinted at before, effect only the formation of Nitric Acid, but also the different stages of solubility of the whole soil, including all the mineral foods as well. But it is impossible to take nitrogen of organic matter and see it in such different stages of solubility as one can mineral matter. Practically speaking it must be either tightly and insolubly bound up in organic matter, or else it must be directly soluble. On the other hand, the attacking power on the mineral matters of the soil by the acid juices on the tips of the roots is well known and well shown by the effects of roots on rocks. Yet it is well known also that roots have no such attacking power on organic matter—its nitrogen must be fully oxidised and loosened from organic matter to be fit for plant food. The exceedingly small proportion of the soluble salts as shown in the analysis thus further confirms the state of low aeration indicated by the excess of ferrous.

These soluble salts are of course found by merely passing water through the soil and analysing it for those materials which the water has dissolved and taken out. In really active and healthy soils Nitric Acid, as well as portions of each of the mineral foods, should be found present.

Organic matter has strong retentive powers on soluble salts, as also have alumina and iron soils. So that in those soils containing high proportions of both of these useful adjuncts, it cannot be for the lack of these that the soluble salts are so poor. No, on the other hand it must be that they never were formed. And it cannot be said that these soils were washed out by heavy tropical rains before analysis, as they were exposed to air unusually long before that process.

This however shall be related hereafter, so as to show the really exceptional difficulty these soils had to become active even when unhindered by any water. Other analyses are at hand now whose soluble salts in water are existing as high as '8, others as high as '4 and '6, yet these have not the advantages of the high amounts of organic matter of these coffee soils or of their iron and alumina constituents. These soluble salts bear out again the meaning of the excess of ferrous in the coffee soils and the effect it has on Nitric Acid must inevitably be greater than on the mineral matters, for nitrogen, as said before, is not rendered soluble by acid juices of roots.

The products of decaying organic matter.

The products of decaying or oxidising organic matter are Nitric Acid and Carbonic Acid—these are at least the chief ones. If organic matter is in a good state of decomposition, it is clear these two products should be visible in a healthily active soil. Both of these products, I am anxious to show, are exceedingly poor in coffee soils. It must be repeated that Professor Voelcker's analyses, and also Mr. Robinson's, must be taken together. For while Professor Voelcker shows Nitric Acid as so small as not to be detected by analysis, the analyses by Mr. Robinson have not taken notice of this important test, while they have rather minutely gone in for the separate test of Carbonic Acid gas. That is, they have taken this Carbonic Acid out separately and tested it, it will be noticed, to three places of decimals. This is extremely useful. For by it, one can pretty well gauge at what rate the other important product of the oxidation of organic matter, Nitric Acid, is going on. So that combining these two sets of analyses together, we may see both the two products of organic matter decay as exceedingly small indeed in such soils. Further than this, one can plainly see the cause of it set forth in analysis by certain hindering factors, not only low oxides of iron but high water holding powers necessarily belonging to clay and humus soils. Though of course this latter cause will induce the former low oxide state, but once the low iron oxide state is there, it acts as a further hindrance on the formation of Nitric Acid.

The following diagram may make clear the important action of the oxygen of the air penetrating the soil and attacking organic matter at its various depths.

The above shows the oxygen of the air penetrating the soil, breaking up or decaying organic matter, and rendering soluble in water the carbon and nitrogen in the form of Carbonic and Nitric Acids. Not that the former of these is any direct use to plant growth, but since Mr. Robinson does not analyse for Nitric Acid, it has its use, showing by its paucity, in his analyses, the very poor way this important Nitric Acid can form. The cause of the non-existence of Nitric Acid is ferrous and high water holding power. But although the organic matter of these soils is so high and should in consequence show good amounts of these two products of oxidation, yet there are several ways of clearly demonstrating the quite exceptionally low amounts of the assimilable nitrogen formed in such soils.

Oxidation by bacteria.

It is well known that the decay of organic matter is brought about by the intervention of myriads of bacteria. It is they that oxidise the soil and not the simple chemical process. They at least need ample oxygen in the pores of the soil to breathe with and accomplish their work of destruction of organic matter. They, feeding on and taking into their system organic matter, inhale with every breath

Correspondence and matter for publication to be sent to Editor, this paper, Coonoor.

oxygen. The waste products from their bodies are exhaled as Carbonic Acid gas; the other product, Nitric Acid, would be in the excreta. The soil is oxidised by the intervention of these bacteria, therefore, and it stands to reason, like all animal life, they need oxygen to breathe with and oxidise their food. But by the very ferrous nature of these soils (1) you prove absolutely that oxygen is not passing through the soils, at least only at the very slowest rate. (2) What little that does pass through has to run the gauntlet of the oxygen-loving ferrous oxide, so that the bacteria have extremely slender, if any, chances of getting a share. Also, it must be said that in Mr. Robinson's analyses there are distinct indications of the presence of ferrous not only in the lesser soluble forms, but existing and causing acidity in the highly objectionable form of ferrous sulphate. The properties of this soluble sulphate of iron are smothering or taking away oxygen from bacteria is well known and taken advantage of in medicine. These antiseptic or decay-arresting properties I believe strongly will be found to exist, if actually tested for, in some of the high organic soils, especially of wet districts and well-drained lands. Also in flat lands, those near water courses, those in humid situations and under heavy shade. It is to be regretted that this soluble ferrous sulphate, which gives such strong suspicions of being present at any rate in the Mysore soil of Mr. Robinson's analysis, was not analysed for, since let alone its dire effect on Nitric Acid already formed—it is clear how disastrous it is on soil oxidation, or call it bacteria, by the powerful way it collects and absorbs oxygen.

The following may be of interest. The analyses of our soils and of cattle manure vary little. In both the nitrogen is much the same. But cattle manure being organic matter that has passed through a process of oxidation in the body of the animal, the nitrogen rendered more soluble than that in our low-oxidised soils. The action of the cattle consuming the herbage is much the same as bacteria feeding on humus: oxygen being inhaled and passed through the food.

Differing ways of analysing soils. It will be observed that Professor Voelcker's analyses are done on soils heated to 212°F. The others by Mr. Robinson were merely dried before analysis, just sufficient warmth to drive off any excess moisture. Does this account for the far lower oxide state shown in the latter's analyses? Seeing this much lower state of oxidation in those done by Mr. Robinson, frequently bordering on acidity, and other things, one cannot help questioning whether once any peculiarity in this way is noticed as running through a class of soils, there not a better chance perhaps of the soils remaining in the natural low oxide state than if agitated to a temperature of 212°F. For this, by heat setting the soil particles in rapid motion would tend to oxidise soils of this nature and give them a more active healthier appearance? This is asked because the set of soils done by Mr. Robinson are so infinitely less aerated than those done by Professor Voelcker and yet they do not seem to have such a clayey nature, judging by the alumina amounts. Anyhow if this assimilable nitrogen was so small as not to be detected in Professor

JADOO LIMITED.

Capital £50,000 in £1 Shares.

The Directors are open to receive applications for shares to a limited amount at a premium of 5s. per share, which premiums will be carried to reserve fund and separately invested. Applications should be made to the Secretary, Palace Gate, Exeter, accompanied by a remittance of 7s. 6d. per share, being the premium of 5s. and 2s. 6d. on account of the shares. Forms of application can be obtained from Messrs. Parry & Co., Madras, or Messrs. Octavius Steel & Co., Calcutta.

Voelcker's analyses, what must it be if it were analysed for in those one by Mr. Robinson, with their infinitely lower state of oxidation.

Mysore and Pulney soil compared. These two soils were so opposite in their state of health or oxidation, that they were placed close together in analysis to facilitate comparison. The whole thing is to prove the difficulty of certain soils to form Nitric Acid.

Note how in the Mysore soil, with its huge amount of organic matter, the carbonic acid is merely 24%. This rich organic soil therefore, with its 23.061% of organic matter, is only able to show such a poor result as 240% carbonic acid from the decay of its organic matter. On the other hand, notice the healthier Pulney soil, only 8.223% organic matter and combined water and yet 783% carbonic acid. At what an infinitely quicker rate, therefore, may one perceive that oxygen is doing its work, decaying the organic matter AND THEREFORE FORMING this Nitric Acid, which is after all the point under discussion. Carbonic acid being no actual food for plant life, I have merely taken it as one of the products of decay, to show how slowly the other product of decay, Nitric Acid, must be forming.

The cause of slow decay.

If the proportion of ferrous to ferric is observed in both these soils, the rate at which air is passing through the interstices of the soil will be pretty clearly seen. One may imagine also, once that 5.097 of ferrous exists in the Mysore soil, what a hindering action it has on the formation of Nitric Acid.

Again, observe the water-absorbing power of the Mysore soil against the Pulney—over twice the power. Observe also that it only parts with $\frac{1}{3}$ rd of its moisture, while the Pulney soil parts with $\frac{2}{3}$ ds. This greater water-absorbing and water-holding power of Mysore soil would be brought about naturally by the three times greater amount of organic matter in the Mysore soil over that of the Pulney.

It could be said, therefore, that if a cubic foot of Mysore soil and a cubic foot of Pulney soil were taken and given precisely the same conditions and same amount of water, that the Mysore soil would contain over ten times the amount of water. Filling the interstices of the soil to this degree would naturally hinder the entrance of the air. The soil would remain in a lower state of oxidation—the carbonic and nitric acids would in consequence form in far less and in a far slower degree. The Pulney soil is one such as might feel a drought quickly, but is certainly one which would recuperate after rain, certainly five or six times quicker than the Mysore one, even given the same conditions. But, as said before, do not these highly organic soils often pertain to wet districts and often with poorer sub-soil drainage, perfectly suited to big jungle growth. But would it be possible to say, looking at the matter every way round, that the Mysore soil would be better able to afford Nitric Acid to the roots of coffee to that shown by the Pulney one? The comparison between the two soils is made only to bring forward certain points to show how slowly Nitric Acid can form in ferrous soils—not to say that the Pulney one is good in this respect, though the latter, it must be admitted, is not one heavily encumbered with moisture, ferrous, inactivity and therefore lack of that product of oxidation—Nitric Acid.

I trust I have not wearied your readers, but wish to emphasize this lack of soil aeration next time and show that this reluctance of coffee soils (of S. India at any rate) amounts to stubbornness to oxidise, that is by showing the unfair conditions these soils had to become aerated before analyses were made. Further oxidation than they would have had in ordinary nature by tillage and drainage.

NITRIC ACID.

THE INFLUENCE OF BEES ON CROPS—(Continued).

THE arrangement of the reproductive organs in blossoms vary very considerably in different classes of plant life, and the most casual observer must have noticed the many forms of insect life. Those insects that subsist on the honey they extract from flowers are, in many instances, so constructed as to appear to fit the flowers they visit. Again, the construction of certain flowers is only adaptable to the wants of certain insects. The nectary is so situated in different classes of flowers that the honey it contains can only be obtained by the insect designed to fertilize them. The length of tongue in moths, butterflies, and bees is well known, and its length plays no inconsiderable part in perpetuating varieties and species

of the vegetable kingdom. In Darwin's work, "Fertilization of Orchids"—a book everyone interested in the subject should read—he mentions one flower as having a spur-like form, from 10 to 11 inches long, with the nectary situated at its base, and for the purpose of obtaining the honey contained therein there must be an insect with a tongue of an equal length. It appears that this particular orchid is a native of Madagascar. Some orchid hunters, in searching that island for specimens, came across a moth with a tongue of corresponding length—evidently the agent employed by nature to fertilize this particular plant. Some plants are only met with in particular localities; in other localities, having the same conditions of soil, warmth, moisture, etc., they are entirely absent. Again, where some species of plants are found, certain insects are also to be met with, and *vice versa*. Thus, particular plants are dependent on certain insects, and particular insects on certain plants, for fertilization.

In a previous article it was mentioned that the pollen-bearing organs were not always to be met with in the same flower. In the melon, cucumber, and other plants belonging to that tribe, some of the flowers are male—i.e., possess stamens only, or have no pistil; while others are female—i.e., possess a pistil but no stamens. The pollen of this tribe of plants is comparatively heavy and viscid. It is therefore obvious, as the two sexual flowers are situated at some distance the one from the other, a foreign agent must convey the pollen from the stamen to the stigma of the pistil of the female flower. In some of the Egyptian palm-trees there are what are termed male and female trees—i.e., the sexual flowers are on separate and distinct plants. The trees are often at considerable distances the one from the other. The variegated laurel (*Aucuba japonica*) is another of these diœcious shrubs, and of course, like the palm-trees referred to, the male and female flowers are on different trees. It was introduced into England many years ago by the Dutch from Japan. It so happened that the plants first introduced were female plants, or in other words bore female flowers only. There were no pollen-bearing flowers, consequently no seed could be produced, and propagation was carried on by cuttings only. Some years afterwards a Mr. Fortune introduced some male plants. These were planted in close proximity to some of the old Dutch ones that had been perpetuated by means of cuttings. The result was that an abundance of fertile seed was produced the following season.

The pollen of the variegated laurel is now an article of commerce in the London Covent Garden Market.

The length of time the pollen of some of the palms and laurels retain their vitality is remarkable. The pollen in others must be utilized soon after it is discharged from the anther, or its procreative property is lost.

The quantity of pollen grains discharged from flowers is something enormous, especially in those plants where the sexual flowers are on different trees. The flowers on a Chinese laburnum (*Wisteria sinensis*) were calculated to contain no less than twenty-seven billions of pollen grains.

From these illustrations it will be noted the utter impossibility for certain plants to be perpetuated from seeds, or to produce fruit without aid from an agent outside themselves. Here the bee comes in to play its important part in our fruit-crops.

What I have said in relation to the distribution of the sexual flowers in the variegated laurel, palms, etc., is equally true and holds good in the blossoms of our orchard fruits, with this exception—that they have not separate sexual flowers. Notwithstanding this, the stamens mature, and the pollen is distributed some time (in some cases days) before the pistil, or rather the stigma, is sufficiently developed to receive it. Thus, while the male organs of some of the flowers have perfected, maturation in others is still progressing, and so with the pistil; so that the fertilization of fruit blossom by its own pollen is as impossible as if the reproductive organs were on different plants, or at least on different flowers on the same tree; therefore a foreign agent is as essential to transport the pollen from hermaphrodite flowers as from that of diœcious. The oft-quoted aphorism, "Nature abhors a vacuum," was reconstructed by Darwin into "Nature abhors perpetual self-fertilization;" and the various ways Nature has arranged the pollen-bearing organs is Nature's safeguard against what is termed in-and-in reproduction, and cross-pollination ensued. Cross-pollination has long been recognized in the economy of the reproduction of members of the vegetable kingdom. It was known as far back as the time of Herodotus. He describes the process of the transference (capriciation) of the pollen from the male tree to that of the female, by which means a crop of dates was ensured on the Egyptian palms.

Some early blossoming trees seem to burst forth suddenly, especially pears. In looking through a truss of pear blossoms that have just opened, it will be noted that the parts perfected are the calyx, the corolla, and the stamens. The pistils are still undeveloped. After the anthers have discharged their pollen, the ripening of the pistils commences; and by the time the stigma is receptive, there is no pollen from the first opening blooms where with these early-maturing blossoms can be fertilized. It is obvious that the all-important pollen must be obtained from some other flowers, or there will be failure in the crop of the tree that has so blossomed. I shall point out further on that the pollen from any source, if the bees were to convey it, will be as great a failure as if the stigma were entirely deprived of that fertilizing influence. Seeds must be fertilized by pollen from their own species. A newspaper clipping—I think from a Brisbane paper that I have now in my possession—says: "If one were to plant twenty acres with stone pippin apples, or with Cleopatras, or with Duchess pears, and no other kind of apples or pears within a half-mile, it is not at all likely that there would be any fruit. If there were not trees within the radius of half a mile, the experiment would be a failure; bees would carry pollen from other trees, two or three miles away. It is necessary to have a few of some other variety of apple or pear which bears blossoms at the same time, or about the same time, and then they will pollenate each other, so that both varieties will bear fruit. Bartlett pears are fertilized by Duchess d'Angoulene, Easter Beurre, Anjou, and by others. The thing required is to have the flowers of each variety mature at nearly the same time. There is at least one instance in this colony where a large block of apples of one kind has been planted for many years, and has never borne any fruit, although the trees are very strong and healthy, and bear perfect flowers every year. The pollen is ripe before the pistils are ready to receive it, and by the time the pistils are mature the pollen is all gone." I once read in an American paper a similar failure in connection with cherry orchards, where the bees had all been removed because they were accredited with eating holes in the ripe fruit, and thus reducing their market value. After the removal of the bees from the district the trees gave no, or at the most but a slight crop of fruit. After about three years, the bees were returned to the district, and the trees went on bearing as heretofore. With ignorant men, the poor little bees get the credit of a host of evil they never do. If all orchardists knew the value of bees, apart from that of honey-producing, no orchard would be seen without them.

Every grain of seed requires a grain of pollen to fertilize it. By removing the husks from a corn-cob whilst in a green state, a fine silken thread will be seen attached of each maturing grain. It is the organ of reception, and it is absolutely imperative for a grain of the dust from the anther (the flower on the top of the corn-cob) to fall or be conveyed to the point (stigma) of each silken thread. In a mature cob of corn, misses in the rows of grain are often observable. This is caused by the pistil not having received its necessary grain of pollen; and caused either by an injury to its stigma or an insufficiency of pollen. Deformed fruit are common occurrence, more especially with apples and pears. This is caused by imperfect fertilization. A section of an apple shows the five sections of the ovary, with four of the ovules of seeds, perfectly fertilized, and on the sides of the fruit, where the seeds are so fertilized, it is perfect in form. The unfertilized seed in the ovary has caused the deformation in the fruit. If, in four out of the five sections seen in the ovary of apples and pears, the seeds therein are perfectly fertilized, the fruit is likely to develop, although it will be a deformity; but if only three be so fertilized, the fruit seldom comes to perfection. The light seeds, those without kernels, that are frequently met with in pumpkins and other members of that family, are caused in a similar way—i.e., by the bees being prevented by some cause from supplying a sufficiency of pollen to do the whole work necessary in reproduction.—*Ag. Gazette, N. S. Wales.*

TEA.

North America.

This market yearly shows a very satisfactory increase in its consumption of Indian and Ceylon teas. From 1st January to 30th September the quantities for the three years ending 1895 were as follows, fractions of thousands omitted:—

	1897.	1896.	1895.
Indians	3,900,000	2,500,000	2,400,000
Ceylon	4,500,000	3,000,000	3,000,000

China's spasmodic struggles.

The Viceroy and Mandarins are trying their little best; after the method of English statesmen with British agriculture, to spur on the tea-growers to greater care in their preparation of tea. A similar want of success would seem likely to attend their efforts. There is one point interesting to note, and that is that the Amsterdam tea trade report pronounces most unfavourably on the new make teas lately attempted. It is declared that the really first-class Chinas have no rival, and Chinese growers are advised to revert altogether to the old methods, and confine their attention to producing the finest grades possible.

The Bengal United Company.

There is rather a run upon the word United just now. A large new Indian Tea Company has just been floated under the title of the Bengal United Tea Company, Limited. The capital is £300,000 in 15,000 Preference and 15,000 Ordinary. The properties are in Assam, Cachar, and Darjeeling. £40 per acre for the tea is asked, not a high figure, but the Preference shares need all the security that can be offered when they are given but 5 per cent. interest. That these shares are cumulative Preferential and rank in priority to the Ordinary shares in respect to capital goes without saying, but money must be very cheap for 5 per cent. for Indian tea shares to satisfy investors. There are 14,203 acres of land, which the Company acquires, unplanted.

Abolition of tea duty in Belgium.

The abrogation of the import duty on tea in Belgium ought to have a beneficial effect in the way of expanding the trade, says a contemporary. Surrounded on three sides by foreign States, each frontier town might be constituted a depôt and so many new markets opened. The Indian Tea Association has not the means to send agents to each of these places, but we think that the large companies now forming in London for amalgamating the smaller ones might devote a portion of their capital to carrying out this suggestion. Direct importation to the centre of retail consumption has been attended with success in the case of Belfast, Glasgow and Manchester, and anything tending to bring producers and consumers in touch with one another is manifestly advantageous to both. We have strongly advised exploiting of possible markets by other entrances into a country than through the capital cities.

Keep our seed pure.

It was stated the other day, says the same paper, that the formation of a large tea reserve from seed procurable from the Lusha Hills would be an excellent thing, and we are one with him in this proposal. Aljal, or the large abandoned "jhum" near where Kalkhom's village stood, are both well suited to the purpose and sufficiently far from the old Cachar gardens to guard against hybridisation from inferior *jat*. Placed in either of the positions we mention, conservation could be strictly exercised, and though opposed, as a rule to Government interfering with established industries, we

think this is a case calling for some supervision, inasmuch as the danger of the hillmen destroying the trees to get at the seed on the upper branches is imminent. In a conserved forest this practice could be prevented, and, another thing, whatever precautions may be adopted on the gardens in the plains, there is not only likelihood of degeneration by insects, but gradual deterioration from want of a change of pollen. True, we know there is a stock of seed all over Upper and East Burma, but we do not know even the approximate amount, and in the last Administration Report for Assam, it came out that the supply of seed from Muni-pore had fallen off considerably within the last few years, but from what cause is unknown, although the ruthless humer is supposed to be at the bottom of the mischief. The farther afield we go to the eastward, the more likely we are to fall in with seed originally carried from N. E. India, which would be most undesirable as it approaches in quality that brought round from China sixty years ago by Mr. Fortune. Of course all this is looking rather far ahead, and present day people will feel inclined to mutter "*Après moi le deluge*," but unless precautions are taken to preserve intact the quality of Indian tea seed, the country, as a tea producer, may drift into the same plight as China is now in, for there is no better husbandman than the Celestial, who resorts largely to manures, pursues methodical cultivation, takes every care of his crops and bushes, but has allowed himself to be swayed by ultra-conservatism in planting from the same stock year after year, recent travellers proving that that alone has been the cause of the decadence of the once flourishing China tea trade. Tastes may change in the next 300 years, and other matters may engage the attention of the planters, but our own opinion is that the taste for "the cup that cheers" will endure as long as tolerably authentic history tells it has in China, and it would be a pity that we should lose our supremacy even in the next three centuries.

Lushai seed.

Judging, he continues, by Mr. Sisson, of Aijil in the North Lushai Hills, continuing his advertisements, he would appear to have been successful in securing a much larger quantity of seed than he at first anticipated, but as most planters had provided for their requirements in the spring, it is unlikely that the gentleman will obtain the price he demands, viz., Rs. 100 per maund. The *jât* is undeniably of the best variety, and, if anything, superior to Manipurie. Though seed for the ensuing season's extensions has been arranged for from planted sources, there is always a certain amount of suspicion entertained with regard to it, especially when obtained from gardens that have large areas of thrown up tea laid down with the old style of plant in the vicinity of the more recent plantations put under Manipurie, from fear of the seed being more or less hybridised. Should there be, as seems probable, a glut of seed—though moderate one in the market—we would advise all planters to secure it for extensions of 1899. Putting out eighteen months seedlings has much to recommend it; not only is one year's cultivation in the open saved, but in case any undesirable seed may have been inadvertently introduced, such can be more readily detected in the nurseries than when planted out, and though the planting may be more expensive than the former mode of "slapping them in" in vogue in the sixties, when carefully done, it is much more satisfactory.

Tangye's Oil Engine.

The following has been sent to a Ceylon exchange:—"Cost of working half a cent per lb. of tea made: A report has recently been received by us regarding the cost of working a Tangye's patent 8 horse-power oil-engine supplied to Fairfield estate, Peermaad, South India. The trials of the engine, which extended over a period of three months, were carried out under the supervision of the Superintendent of the estate, and the figures here quoted have been authenticated by him. The engine is a Tangye's 8 horse-power engine, and the oil used is ordinary Russian 'Daylight,' the contents of one case (two tins) being about 65 lbs. oil, or say 9 gallons. This oil was purchased at Alleppey, and had to be transported to the estate for 12 miles by boat, and about 60 miles by bullock cart, a total distance of about 72 miles, the cost of which is included in the figures below. The total cost of oil consumption on the estate per lb. of made tea was as follows:—Date May, 1897; total days worked, 29; average hours worked per day, 4 hours and 58 minutes; total tea sifted, 11,013 lbs.; total tea manufactured, 9,908 lbs.; quantity of oil consumed, 14 cases; cost per lb. of tea made, 1.32 pice .67 of a cent. In a similar manner during the month of June, the cost per lb. of tea made was 1.17 pice .60 of a cent. For the three months ending 30th June 1.30 pice .67 of a cent. The oil consumption in each case includes the cost of all oil used for the factory lamps, and all wastage and loss that may have occurred in addition to the cost of transporting it for 72 miles. The actual cost of the oil required for driving the engine itself may therefore be reckoned at about $\frac{1}{2}$ a cent (Ceylon coinage) per lb. of made tea.

The consumer and the planter.

"You drink tea, I grow it," says the planter to the consumer. "Suppose we deal direct." At least this is what he ought to say, judging from the unsatisfactory state of the market. As the *Indian Planters' Gazette* points out, no reliable teas can be bought under two shillings at home, though the average price may fall as low as eight pence; auction charges, &c., say 2d., duty 4d.; these bring the price up to one shilling. Allow two pence a pound extra for warehousing and contingencies, and the margin of profit remaining to the seller is actually 10d. per pound. To do away with the middlemen, i.e., the brokers, would not be the easiest thing in the world. But it should be possible. The cost, our contemporary hazards, might run up to a million sterling, but the planting interests are so great that this sum could be raised. The many grades of tea now recognised should be done away with, only the coarse leaf and dust being separated, and the rest all blended together.

There are details many and tedious to be settled at this stage. Briefly, we suppose that the change advocated would imply the substitution of the brokers for our own distributing agents. A garden belonging to the Growers' and Sellers' Association would send a break home in the ordinary manner, but graded simply as suggested above. The Association would pay a fair market price for it, use it to make the blends required, and sell direct in packets to the grocers and the general public. The profits now enjoyed by the middlemen would go direct to our G. and S. Association. In course of time the break prices would level up to the retail price. Miucing Lane opposition would be strenuous and formidable, but could undoubt-

edly be conquered by combination amongst planters. The immediate result would be an appreciable lowering of the retail prices and a corresponding increase in consumption. The Growers' and Sellers' Association would be able to get an unequalled grip of the market, and be able to make blends for foreign markets and direct operations in a manner hitherto impossible.

The possibilities of the scheme are vast indeed, and fascinating to an extreme degree. A large capital, great combination and an exceptionally shrewd executive are needed.

Yield of blue-gum plantations.

From some interesting figures lately supplied us by a correspondent, we gather some valuable information regarding the yield of fuel from gum-plantations:—

	Age.	Elevation.	No. of trees per acre.	Stack per acre.	Annual increase per acre.	Average dimensions of trees.	Annual increase per tree.
	Years.	Feet.	No.	Cubic ft.	Cubic ft.	Cubic feet.	Cubic feet.
1	5	7,235	847	2,966	593	3.5	0.7
2	6	5,954	980	2,151	302	2.2	0.3
3	9	6,694	1,045	5,963	503	5.7	0.6
4	10	7,382	469	6,894	585	14.7	1.4

Equivalent of cubic feet in tons is 45 cubic feet=1 ton, Govt. ratio.

Taking the question of elevation first, it will be seen that the highest plantations give decidedly the best results, both in actual stock and annual increase per acre. Naturally the youngest plantation (No. 1) leads the way in annual increase per acre, while it is undoubtedly the lower elevation that make No. 2 and 3 so inferior to the others. No. 4, by the way, is the average of two plantations, very similar in age, elevation and other details. Another factor to be noted is the number of trees per acre, No. 3 containing far too many for its age, nine years. The chief influence on the yield, however, to be gathered from our figures, is that of elevation. Details as to soil, exposure, &c., are unhappily not given.

The Government ratio of 45 cubic feet to one ton seems to be far under the mark, as this gives very nearly 4,500 lbs. dry weight per the usual stack of 100 cubic feet. With timber under ten years, the average runs according to our experience to 3,500 lbs. per 100 c. ft. or 64 cubic feet per ton. Naturally the younger the trees, the lighter the stack, for it is certain that the cubic space occupied by the stack certainly does not represent 100 solid cubic feet of timber owing to the interstices between the logs. The actual weight of a cubic foot of dry blue-gum timber runs out, it is true, to the Government standard of 45 lbs. We mention this to warn planters basing the actual dry weight of the fuel they grow by such a high standard as 45 lbs. per stacked cubic foot.

A query was recently propounded as to whether it paid better to buy or grow one's fuel for firing purposes. This depends of course on the price of the outside fuel available and on the quality of the reserve land on the estate. The annual yield in lb. of fuel per acre of gums varies from 10½

thousand pounds at say 6,000 feet to 20½ thousand pound at say 7,000 feet. Or say the plantations were clean felled in successive plots each five to six years' old, the yield would vary from 70,000 lbs. to 105,000 lbs.

Any further information that our correspondents may furnish will be gladly welcomed.

THE NEW STEAM DRIER.

SOME weeks ago we gave a brief description of a new type of Drier, patented by Mr. G. W. Sutton, late of Assam. We now take the following full description from a home exchange. The principle strikes us as being both good and safe, though undoubtedly running counter to the established ideas on tea-firing:—

The chief distinguishing feature of this machine, the invention of G. W. Sutton, late of Assam, lies in the fact that superheated steam is employed as the source of heat instead of the ordinary coal or wood furnace of other tea driers. It consists essentially of a series of ten galvanised wire trays, arranged in an oblong case of sheet iron, the whole being raised about 2ft. 6in. above the ground on iron supports, and having in front below the trays a sheet-iron ledge or table to receive the trays while being filled or emptied.

Commencing from the top, and running below and above each pair of trays from one end of the machine to the other, is a single ½in. pipe, bent upon itself several times in a gridiron fashion, and terminating below the lowest trays.

Through this pipe superheated steam passes, being taken direct from a boiler at a pressure of from fifty to sixty pounds, or can be admitted to the machine at a lower pressure by regulating the reducing valve should lower temperatures than 240deg. be required, and issues from the outlet end either as steam or condensed water according to the temperature maintained. By this means the air within the drier, which enters from below at either end, and passes from a central opening at the top, the whole width of the machine is rapidly raised to a temperature of from 230 to 240deg. Fah., causing at the same time a slow upward current of 270ft. per minute, this being sufficiently rapid to remove the moisture as it evaporates from the leaf or other material. In the absence of green leaf the trial was made with used tea leaves, to which rather more than 30 per cent. of moisture had been added. Owing to its broken character and the manner in which it aggregated in masses on the trays, this was not so suitable for the purpose as tea leaf in the ordinary process of manufacture, which, as it dries, has a tendency to contract and roll up and thus allow the freer passage of air; but notwithstanding this disadvantage the results obtained were very satisfactory, the charge of moist material being thoroughly dried in about twenty to twenty-three minutes.

Mr. Sutton puts the ordinary charge per tray of half-fired leaf at four pounds, and the total outturn per hour of finished tea at eight pounds.

For re-firing before packing about two chests per hour is estimated as the tea could then be put thicker on the trays.

The steam employed per hour produced on condensation about six and one-third gallons of water, allowing one pound of coal for every eight or nine pounds of water evaporated this would represent consumption in the boiler furnace of from seven to eight pounds per hour.

The boiler supplying the steam on the occasion referred to was 3-h.p. vertical, which at the same time supplied a small engine driving the machinery of the workshop, but with the combined demand no difficulty was experienced in maintaining a pressure of from fifty to sixty pounds. This points to the fact that as in most factories there are now boilers of very considerable horse-power, steam could easily be supplied to several such driers without much extra demand either on the boilers or furnaces.

It is claimed on its behalf that the machine is strongly made and has no working parts to get out of order and occupies little space. Considerations of the greatest importance in tea-houses where breakdown in the busy season would entail serious loss. It can also be easily packed, the only removals required being the top air-shaft (8in. to 10in. high), the iron supports, and the front tray or table. The chief advantages of this machine, the inventor points out, lie

first, in the ease with which an even temperature can be maintained throughout, a most essential point for good firing; second, the impossibility of the tea being scorched or burned; third, the absence of excessive draught, which not only carries off, but oxidises a portion of the essential oil in the leaf; fourth, the much lower risk of fire in a factory, the only furnace required for heating one or several being that of the engine boiler itself; fifth, the comparatively low price, viz., £55 (in London). Mr. Kelway Bamber, who was present at a recent trial of the machine, was very favourably impressed. While primarily intended for tea-drying, the machine has a wider field for employment, being suitable for any other organic products, especially those which, on account of their proneness to discoloration or the loss of volatile constituents, require a well-regulated temperature and low draught. It is these two conditions, says the inventor, this machine fulfils without in any way prolonging the time required for the drying process.

DISTRICT ASSOCIATIONS.

SHEVAROY.

PROCEEDINGS of the Monthly Committee Meeting of the Shevaroy Planters' Association held in the Victoria Room, Yercaud, on Monday, the 6th December 1897, at 1 P.M. PRESENT:—Messrs. J. C. Large, C. G. Lechler (*Chairman*), H. W. Leeming, Rev. J. M. Kampf, Messrs. C. Rahm, W. W. Hight, and R. Gompertz (*Honorary Secretary*).

Read notice calling the Meeting.

Resolved that a copy of the publications *Produce World* and *Central African Planter* be henceforth taken in and that a list of Elementary books on Chemistry, Botany and Geology be obtained as soon as possible with a view to selecting those most suitable for the proposed Planters' Library.

Read letter from Mr. Lechler re proposed improvements of Road to Killeour village from Traveller's Bungalow.

Resolved that the Honorary Secretary be requested to forward the letter to the Collector and to state that as the Association consider the improvements very desirable, it is hoped that he will be pleased to give the permission and assistance desired.

Read letter from Mr. Large about small change.

Resolved that this letter should stand over till next Meeting, Honorary Secretary meantime sending a reminder to the Collector to reply to his letter regarding the encashment of currency notes at the Treasury in which this matter was also treated.

Read complaint of Mr. Anderson that the Tahsildar had charged him income-tax twice over and the correspondence thereon. Mr. Anderson stated that if the Collector was satisfied, he had no alternative but to bow to his decision.

Resolved that the Honorary Secretary be requested to write to the Postmaster-General suggesting that as the Mail train does not stop at Kadiampatti, either the bags for the Nagalore Post Office should be thrown out at that station or that they should be delivered at Mullapuram, instead of, as at present, going on to Salem and then coming back by slow train to Kadiampatti.

The following correspondence was read and recorded:—

Correspondence about Lady birds.

Do. do. Agricultural Chemist.

Do. do. Re-opening the Mints.

Letters from Messrs. Lambert and Sullivan accepting the appointment of Honorary Members of the S. P. A.

Mr. Quarmer's communication about Leaf-disease.

The following papers were laid on the table:—

Proceedings of the Planters' Associations of Central Travancore, Coorg, Lower Pulneys and Nelliampathy.
2 copies of Commercial circular No. 10 of 1897 on Resin, Turpentine, Tar, &c.

Planting Opinion of 6th, 13th, 20th and 27th November and of 4th December 1897.

C. G. LECHLER,
Chairman.

ROBERT GOMPERTZ,
Honorary Secretary.

WYNAAD.

PROCEEDINGS of a General Meeting held at the Meppadi Club on Wednesday, November 24th, 1897. PRESENT:—Messrs. Behr, Day, de Fonblanque, Glennie, P. Lamb, R. Lamb, C. A. Mackenzie,

D. Mackenzie, Mackinlay, B. Malcolm, J. R. Malcolm, J. S. Malcolm, S. H. Powell, Robinson, Romilly, Trollope, Winterbotham, and Hockin, *Hon. Secretary*. Mr. C. A. Mackenzie in the chair.

1. The proceedings of the last meeting were taken as read.

2. *Re-opening of the Indian Mints*.—Read letter from the Acting Secretary, U. P. A. S. I., covering draft of proposed circular from Chairman, U. P. A. S. I., to all Associations of producers, Mill owners, and Chambers of Commerce in India and Ceylon, expressing the U. P. A. S. I.'s views and inviting their opinions on the proposed policy of advocating the reopening of the Mints, the cessation of all tampering with Exchange, and the imposition of a 5% export duty to compensate the Government of India for its losses on Home charges. Proposed that this Association approves the draft of the Chairman's circular. An amendment was brought forward to the effect that the U. P. A. S. I. should await the expression of the views of others before declaring its own, especially as regards an export duty. The original proposition was carried with only two dissentients. Read letter from Mr. Gompertz of the Shevaroy Planters' Association to the Secretary, U. P. A. S. I., forwarded by the latter gentleman for favour of the Association's opinion. Resolved: This meeting approves of the opinion expressed by the Chairman, U. P. A. S. I., on Mr. Gompertz's proposal of an export duty on a sliding scale, viz., that however suitable to us it is practically unworkable and would be strongly opposed by merchants, and that therefore it should not be incorporated in the Chairman's circular.

3. *Dindigul-Palghat Railway*.—Read Memorial to H. E. the Governor of Madras urging the early construction of this line and covering letter from Mr. T. J. Ferguson. Resolved that the Honorary Secretary be instructed to sign the Memorial on behalf of the Association.

4. *Poodoopadi Hotel*.—Read Petition from Chuckieth Shangaren, the Hotel-keeper, saying that he was unable to carry on the hotel any longer at the loss he now incurred. Resolved that this Association will contribute Rs.15 a month towards the maintenance of the hotel.

5. *Non-Service of Warrants, Coimbatore District*.—Read letter from the Superintendent of Police, Coimbatore, in reply to one from the Honorary Secretary, stating that he had issued a circular that such non-service would in future be severely dealt with. Recorded with satisfaction. Read also letter from Mr. Brown, Cooly Agent at Podanur, complaining that the expense of serving warrants was not covered by the monthly subscriptions paid him. Resolved that this is a matter for Mr. Brown to arrange with those on whose behalf he incurs expense.

6. *Want of Cash at Vayitri and Meppadi Post Offices to Cash Money Orders for nine days in August last*.—Read letters from the Collector of Malabar and Post Master General in reply to letters from the Honorary Secretary complaining of this. Resolved that the Honorary Secretary be instructed to write to the Planting Member of Council requesting him to make an interpellation in Council as to whether the Post Office is not bound to cash all Money Orders granted on demand.

7. *Roads*.—Read letter from Mr. Mackinlay stating he had been unable to interview the Collector of Malabar as requested. Recorded with a vote of thanks to Mr. Mackinlay for the trouble he had taken. Mr. B. Malcolm drew the attention of the Association to the bad condition of the Ghaut Road. The road is deeply rutted and in places cut through the metal, while there is no amount of repair metal collected owing to constant diminution of promised grants. The Honorary Secretary was instructed to address the Collector of Malabar on the subject.

8. *New Form of Contract*.—The Honorary Secretary stated that he had written Messrs. Winterton and Edge, as directed on September 6th, asking for further opinion on the payment of wages clause, had received no reply, and had written to remind Messrs. Winterton and Edge that it was important the matter should be settled before the close of the year.

9. *Analytical Chemist*.—The Honorary Secretary reported that members had only guaranteed 30 analyses a year towards the support of an Analytical Chemist. Resolved that this Association is of opinion that the employment of an Analytical Chemist is a matter for private enterprise and should not be a charge on the U.P.A.S.I.

10. *Leaf-disease Remedies*.—Read letter from Mr. Quarmer forwarded by the Secretary, U. P. A. S. I., for opinion. Resolved that this also is a matter for private enterprise.

11. *Revenue Settlement*.—The Honorary Secretary stated he had written the Collector of Malabar on the sale of Mr. Boosey's land, suggesting that a list of all lands, on which Europeans pay tax to

Government direct, should be attached to the list of jemmies to avoid any chance of the sale of such lands in future for the jemmies' default. Although he had received no reply from the Collector, he had received a request from the Tahsildar that he would furnish a list of lands on which he paid tax, and doubtless other members had also received such a request. He therefore thought it well to explain the reason of the request.

12. *U. P. A. S. I. Circulars.*—Read and recorded circulars on the following subjects: Appointment of Mr. Ronaldson as Acting Secretary; Sir W. Mackworth Young's reply to the vote of thanks; Notice of the publication of an Addendum to the Proceedings of 1894 and 1897; North Wynaad Planters' Association Subscription; Deposit of Rs.5,000 of the Reserve Fund with Messrs. Arbuthnot & Co.; Audit of Reserve and Famine Funds and Accounts for 1896-97; Completed Government Cinchona; Papers placed on Editor's Table to be furnished to the U.P.A.S.I.; The Investigation of the Malarial Parasite postponed for lack of funds will not be lost sight of; Early payment of Subscriptions requested.

13. *Papers on Table:*—

Ceylon Planters' Association Proceedings to Feb. 17th, 1897.
Addendum U. P. A. S. I. Proceedings 1894 and 1897.
Nelliampathy P. A. Proceedings, September 1897.
Central Travancore P. A. " " October 1897.
Coorg " " September 1897.
Lower Pulneys " " July & October 1897.
Shevaroy " " September 1897.
Malabar District Board Proceedings, Aug., Sept., October 1897.
Rules for leasing 80 square miles on the Anamalais.
Govt. of India Commercial Circulars 1897, No. 8 India Rubber Caoutchouc or Gum Elastic, No. 9 Mahogany, No. 10 Resin, Turpentine and Tar, Department Land Records and Agriculture on Carrot Seed.

14. *The Next Meeting* will be held on January 5th at noon at the Meppadi Club.

15. *Notice of Motions to be brought forward at Next Meeting.*—Mr. Lamb gave notice that he would bring forward a motion at the next meeting to the effect that a permanent Chairman and Committee be appointed for the transaction of business as in former years. Mr. deFonblanque gave notice that he would bring forward a motion to the effect "that in future all local business affecting the welfare of Wynaad shall be discussed and receive consideration before the affairs of other Associations."

(Signed) C. A. MACKENZIE,
Chairman.
(") J. WILLIAMS HOCKIN,
Hon. Secretary.

Coffee Scale and Lady Birds:—

P.S.—Members who are willing to subscribe towards the cost of introducing Lady Birds to combat Scale Pests (especially green bug), towards which the U. P. A. S. I. voted Rs.2,000, the Lower Pulneys promised Rs.4,000, and the Government of Madras promised to pay half the cost, are requested to inform the undersigned what they will subscribe. The Secretary, U.P.A.S.I., has asked for an early reply, but his letter arrived too late for the meeting.

(Signed.) J. WILLIAMS HOCKIN,
Hon. Secy., W. P. A.

NILGIRIS.

PROCEEDINGS of a General Meeting of the Nilgiri Planters' Association, held at the Masonic Hall, Ootacamund, November 26th, 1897.
PRESENT:—The Hon'ble Mr. H. P. Hodgson, Messrs. W. Mullaly, H. T. Sinclair, J. H. Pascoe, J. T. F. Wilson, O. W. Marden, A. E. Ramsay, E. R. Kindersley, F. Bell, H. D. Wilbraham, L. C. Liebenrood, H. Wapshare, G. Nash, B. A. Marden, L. W. Grey, J. Mackenzie, W. L. Edmiston, and E. G. Windle, *Hony. Secretary*.
Hony. Member—H. Stuart, Esq., Collector of Nilgiris. *Visitor*—T. Clarke, Esq. Mr. Mullaly was voted to the chair. (1) The Proceedings of last Meeting were read and confirmed. (2) Report of the delegates to the U. P. A. S. I. Meeting was as follows:—
2. *Report of the Delegates to the U. P. A. S. I. Meeting, 1897.*—The Report of the Committee of Enquiry was the first subject taken up. The letter from the U. P. A. to the Government of Madras will be read to you, but is confidential, as far as publication is concerned. (v. Confidential Supplement to 1897 Proceedings.) The scheme adopted for raising funds was as follows:—(1) That the voting be

by elected delegates. (2) That every Association be assessed at a minimum of one anna per acre on one-fourth of the area under cultivation represented by members of the Association, and that the maximum of one anna per acre on the total area under such cultivation may be subscribed by an Association, and that a vote shall be given for every Rs.10 so subscribed. (3) Each Association shall be allowed to send five delegates. (4) The rule relating to proxies shall stand. (5) The donation list shall be kept open for the Reserve Fund. According to the above, the minimum subscription to be paid by the N. P. A. would be as follows; taking the cultivated area represented by our members as 18,000 acres, one-fourth of this, or 4,500 acres put into annas equals Rs.281, whilst our maximum subscription would be Rs.1,125. This method of raising funds is estimated to bring in Rs.5,000 to Rs.7,500 annually, the latter being the maximum, whilst the average ordinary expenditure is about Rs.3,000. The income and expenditure account for 1896-97 is laid on the table, also statement of Reserve Fund. The latter shows Rs.10,674-12-0, of which Rs.1,750 have been drawn, leaving Rs.8,924-12-0 in hand. It was settled that the U.P.A.S.I. should be registered as a Company, the Honorary Secretaries of the different Associations being the first members. This gives the U. P. A. a legal status and the liability to the Secretaries is practically nominal. The Rules were carefully revised and a copy of them is laid on the table. It was decided that the Casket and Address should be paid for out of current funds and the various sums specially subscribed were therefore refunded. Other important subjects brought forward resolved themselves into the question of the advisability of employing experts. The combating of Leaf Disease and Scale Pests, and the adulteration of manures were all considered, and it was agreed to endeavour to secure the services of Mr. Cameron, Superintendent, Government Gardens, Mysore, to advise on improving the strain of coffee, to give pecuniary assistance to Mr. Newport's scheme for getting rid of green bug, and also help towards the engagement of an Agricultural Chemist who would analyse manures and soils and advise on the best methods of cultivation. The spread of green bug on the Lower Pulneys deserves a separate reference, as it is undoubtedly one of the most serious evils which threaten the coffee planter, the destruction caused to crop and to trees, as mentioned by Mr. Newport, being more sudden and complete than that caused by any other pest. Government has recognized the gravity of this matter by its readiness to aid the planter in taking measures against the bug, and the U. P. A. has sanctioned a grant of Rs.2,000 for the same object; the Government assistance will take the practical form of half the cost of introducing lady birds which prey upon this and other scale pests, and the Lower Pulney District alone, as Mr. Newport informed us, will subscribe between four and five thousand rupees. As you are aware, we have green bug in this district, though the damage done by our species is trifling, and we also have black bug, attacks of which have ruined many a crop. The Lower Pulney green bug has been observed on the Nelliampatties, which tends to confirm Mr. Newport's opinion that it is spreading northward, and it is therefore most advisable that this district should participate in the distribution of the lady-birds which will be imported. We cannot, however, expect to do this unless we contribute toward the expenses, and your delegates recommend this subject to the consideration of this Association. Resolved that the report be adopted and method of raising funds for the U. P. A. S. I. be confirmed.

(Signed) H. PERCIVAL HODGSON.
(") E. G. WINDLE.

3. *U.P.A.S.I. Funds.*—The Honorary Secretary stated that the N. P. A. would pay as much above the minimum subscription fixed by the new scheme as the Association could conveniently afford, without increasing the subscription of its members; the amount would probably be some Rs.600 to Rs.700 per annum. As the Honorary Secretary had received an urgent appeal from the Secretary, U.P.A., for early payment of a part at least of 1897-98 subscription, Rs.400 of this had been paid in and the Honorary Secretary proposed to forward a balance after receiving the N. P. A. subscriptions for 1898. With reference to the Rs.71-4-0 subscribed by the N. P. A. towards the casket and address to H. M. Queen, the U. P. A. S. I. decided finally to meet this cost out of the U. P. A. funds and therefore returned the Rs.71-4-0 collected by the N. P. A. Resolved that this amount be, with the consent of the subscribers, paid into the Association account.

4. *Agricultural Chemist.*—The Honorary Secretary spoke to the following effect: "It was agreed at the Bangalore meeting that the

two most important points in dealing with leaf disease were to get strain of coffee, if possible, that would be disease proof and to have the coffee trees in such robust health that they would be in the best position to resist the fungus, or, having got it, to throw it off as soon as possible. Experiments have been tried in hybridizing, principally between Liberian and Arabian coffee, and the results, though apparently greatly accidental, are encouraging. Mr. Cameron, Superintendent, Government Gardens, Mysore, who takes great interest in the subject, has kindly offered to give any information or assistance in his power to those planters who wish to try experiments in hybridizing. Mr. Cameron's report on the hybrids produced on Mr. Brooke-Mockett's estates was read. With regard to an Agricultural Chemist, the Honorary Secretary reported that the amount promised by members of the N. P. A. up to date was Rs.2,100 per annum for three or five years, but that this matter must remain in abeyance until it could be seen what action would be taken by the Government of Mysore, which at present contemplated engaging an Agricultural Chemist for that province. If this were done other Associations could not expect assistance from the various Planting Associations in Mysore, and the Rs.2,000 conditionally promised by the U. P. A. would also be lost. It was pointed out by the Chairman that in Brazil experimental Agricultural Chemistry was conducted by the State for the benefit and guidance of Coffee Planters.

5. *Importation of Lady-Birds.*—The Hon. Mr. Hodgson addressed the meeting, recapitulating what this Association and kindred bodies were doing, referring to the work of Professor Koebele in Hawaii, the different species that were of value as eradicators of coffee insect pests, and what assistance the Government of Madras was prepared to give in importing lady-birds from Australia. After all this enquiry, effort and trouble, he thought the Association should not allow the matter to drop through. He said he was a great sufferer himself from the ravages of scale insects and was prepared to give a substantial donation towards the cost of the importation. Mr. Ramsay followed up this announcement and promised Rs.1,000 towards the same object on behalf of those whom he represented. On the Honorary Secretary canvassing for subscriptions among the planters present, it was found that Rs.1,675 were promised which the Honorable Member suggested should be speedily paid in, to enable immediate steps to be taken for sending a competent agent to Australia to obtain and bring a consignment of the lady-birds to this country. He thought the expenses of the importation would not, roughly speaking, exceed £500. The Honorary Secretary was asked to send round a circular to ascertain what further support the Association will give.

6. *Re-opening of the Mints.*—The Hon'ble Mr. H. P. Hodgson made the following speech:—In asking you to support the letter from the Chairman of the U. P. A. re the re-opening of the Mints, I do so knowing that you yourselves, in common with all producers in India, have already experienced the fatal effects of the artificially enhanced Rupee, which enhancement has been caused, as you know, by the closing of mints to the free coinage of silver. In speaking on this subject, I would ask your patience for a short time, as I feel that a proposal of such importance should not be accepted by us without some discussion leading to a justification of the measure. In the credit of our reputation for commonsense, I think we should make it clear that it is not the dread of an enhanced value of silver and a corresponding rise in exchange that actuate us, but the calamity which is already upon us of having to compete with other countries enjoying a natural exchange, causing a difference in the silver value of our produce already amounting to between 40 to 60 per cent. We cannot hope to survive in such a struggle, and it is this certain knowledge which is stirring us now. Could an international convention embracing all the silver countries of the world be arrived at by which the value of silver throughout the world could be reinstated, we should have little to fear beyond, perhaps, the temporary disruption which any such far-reaching financial effects would necessarily cause in trade and commerce. We should feel that with patience things would right themselves and that the unfailing power of supply and demand would rapidly step in to level prices. But the isolated action of the Government of India when by closing the mints in 1893, the foundation of our present troubles was laid, has placed us in a position of disadvantage, and with us I maintain the whole producing millions of India, which can in the end bring nothing short of ruin upon us, for we cannot hope to maintain our position in the markets of the world against countries not similarly

taxed. That a large rise in exchange would bring about results disastrous to India and its people is admitted by the Government of India in a financial despatch to the Secretary of State for India, dated the 16th September 1897. This despatch is a reply to a despatch dated the 5th August 1897, from the Secretary of State, forwarding a proposal from the Government of the United States and France that India should join them (in a transparently one-sided movement) to establish a ratio of $15\frac{1}{2}$ of silver to 1 of gold. I do not propose to go into the details of this correspondence which, though deeply interesting, is somewhat lengthy, but it is fortunate for India that the Government at once declined to have anything to do with the proposal, and in their arguments in support of this decision made the admission which I have referred to above. They write:—"In any case we are of opinion that the true interests of India demand that any measures for obtaining the stability in the rate of exchange between gold and silver should be based upon a ratio not greatly differing from 16d. the rupee, and that any measure which would raise the rupee materially higher than that level involves great dangers for which we see no adequate compensations." Now, what the nature of these "great dangers" anticipated if the rupee is pushed up beyond 16d. per rupee is, is shown later on in the same despatch. The Government revenue is largely obtained from the assessment of land, and the danger feared is the impoverishment of the ryot, through a falling away in the value of this produce, rendering him unable to pay his rents. I must quote the para. in the despatch referring to this point. It says:—"One of the factors in fixing the demand of Government for Revenue (land revenue) is the price of agricultural produce; if that price falls away materially the relation between the price that the ryot can obtain for his produce and the assessment he has to meet may be so seriously altered as to affect the agricultural prosperity of large tracts of country." Now, here is an admission from the Government of India in an important despatch to the Secretary of State, that an exchange of much over 16d. to the Rupee would bring ruin to the ryot and disaster to the Government. In this we quite agree, it is exactly our contention, but why fix the point at which such ruin threatens at 16d. per rupee? It is because the basis on which this arbitrary turning point is fixed is unsound, and the real cause of danger either not seen or left in the background. The loss and danger to the producer are not caused by a high exchange, but by the artificial means by which, it has been raised, which enables other countries producing the same product, and enjoying a natural exchange, to put their produce in the market at a profit at prices at which we cannot grow ours, with the heavy bounty we have to give. What we want, therefore, is a natural exchange; an exchange affecting all nations using silver to the same extent, putting them on an equal footing, and on those terms prices can be left to look after themselves, for they will be righted by the law of supply and demand. The only way we can have a natural exchange again is by the opening of the mints. This is why we, for ourselves, and speaking also for the voiceless millions of India's producers, who are equally interested, but are unable to represent themselves, cry aloud against the ruin which is being brought upon us by the closing of the mints. While seeking for this relief it would be hopeless and absurd to ask Government to forego the salvation brought to their finances by the rise in exchange without suggesting an alternative. We are not financiers, but we know so much that with the rupee at its natural value the Government would be at once in hopeless financial difficulties, if not Bankrupt. It behoves us, therefore, in pressing our cause, to suggest an alternative scheme by which the finance of Government might be recouped, for the loss that would follow the opening of the mints, and this we do in proposing an export duty of 5 per cent. which we believe would be cheerfully paid. Export trade and agriculture would be immensely stimulated at once by the relief from the burden they now bear of the artificially enhanced rupee, and a corresponding increase in export revenue would result. Another advantage of such a source of revenue would be its certainty for purposes of calculation, while the revenue derived by Government from exchange, for it is nothing else than revenue or taxation, can scarcely be regarded as secure, for in spite of the hopeful view of Government of the approaching attainment of stability in exchange, "there are many well versed in the mysteries of exchange who predict a collapse of the edifice erected on its artificial foundation and none can say that such a prediction is impossible." This matter of exchange is one that affects us most deeply; a little calculation will show that its artificial rate imposes on the producer taxation which

in amount is simply appalling. I will take my estate at Craigmore as an example, with a crop of 30 tons of coffee worth £100 per ton, which is the price of the day in the quotations, I am losing in the silver value of my produce (in which value I have to pay all my labour and cost of production) from Rs. 200 to 250 on every ton, or on every £100; or, taking the lesser sum, Rs. 6,000 is the amount that Government have taxed me on this one estate for the year by exercising their monopoly in silver and closing the mints. This is an actual fact that cannot be controverted; I merely mention my own case, as I happen to be the speaker and have the figures, but the same applies in like proportion if you take the case of any other planter or ryot, who grows any produce for export, whether it be the planter with his tea and coffee, or the poorest ryot with his few measures of surplus grain, or the hide of his dead goat. The producer is bearing the greater, by far the greater portion of this burden of taxation, and the goose with the golden egg is being slain. I am afraid we shall have at first to fight our battle and at great disadvantage, because the major portion of the vast number of our fellow-sufferers are uneducated and unable to understand what is hanging over them, unless indeed their elected representatives take the matter up on their behalf. The merchants of India are not affected as we are. If the silver value of any article falls, they pay a correspondingly lower price for it; but it is certain that in time the value of their business must suffer with the increasing inability of the producer to export when, in a smaller degree, they will feel the shoe pinch. The banks in turn will suffer from the falling away in trade, and in time, I firmly believe, that one and all will join in condemning a policy, which has relieved a temporary financial difficulty, but is bringing upon the country that worst of poverty, the poverty of its working millions. Gentlemen, I thank you for having listened to me so patiently, and I now propose that the Chairman's letter before the meeting be adopted with a special confirmation of the proposal set forth in para. 7.

Mr. Harold Stuart then addressed the meeting deprecating the action of the U. P. A.; he believed that the re-opening of the mints would be detrimental to the producer and to others, and said that statistics proved that a fall in silver resulted in higher wages being paid to labour. This latter statement was emphatically contradicted by several planters of over 20 years' experience, who asserted that they had paid 4 annas per man when the rupee was at 111, that this wage had never raised and was still the rate paid throughout the district. Mr. T. Clarke addressed the meeting supporting the re-opening of the mints. He quoted Sir David Barbour to the effect that the rising of the rupee to 1s. 4d. was not due to the action of Government in closing the mints, but to extraneous causes; that in spite of the mints being closed, the rupee was likely to fall to 1s. 1d., and he instanced that the fall had already begun. He strongly advised planters to collect statistics, showing the very wide area of industrial depression due to Government interference with the currency. Mr. L. W. Grey and others also spoke and the Hon'ble Mr. H. P. Hodgson briefly replied. The circular was finally approved of.

7. *The Famine Labour Experiment.*—The Honorary Secretary reported that the experiment was practically a failure, only one small gang having been brought to the Nilgiris. The failure was caused partly by the ordinary reluctance of natives to leave their homes, and partly by adverse reports circulated by coolies who had returned from Travancore, but chiefly by heavy rain having fallen in the Cuddapah District whilst the gangs were being collected. The account of funds subscribed, all letters and accounts from the Agent in the Cuddapah District, Mr. G. H. Cammiade, had been circulated amongst the supporters of the scheme and a small balance in hand distributed *pro rata*. The gang which had been imported was working well, and it was hoped would prove the nucleus of more extended future relations with Cuddapah. The cost per head amounted to Rs. 5 which was a recoverable advance.

8. *Cattle Trespass.*—Government Order, dated 19th August 1867, was read, providing that the penalty for Cattle Trespass might amount to Rs. 50 instead of Rs. 10; also that Pound Keepers shall levy fines at double the ordinary rates within a radius of three miles from the pounds specified. Read letter from District Magistrate, as follows:—"Any owner or keeper of cattle who through neglect or otherwise damages or causes, or permits to be damaged any land, or any crop, or produce of land, or any public road, by allowing such cattle to trespass thereon, shall, on conviction before a Magistrate, be punished with fine not exceeding Rs. 50." All, therefore, a

planter who suffers such damage has to do in future, is to ascertain the name of the owner or keeper of the cattle, and complain against him to a Magistrate and not to the Police. And Section 25 enacts that any fine thus imposed may be recovered by sale of all or any of the cattle by which the trespass was committed, whether they were seized in the act of trespassing or not, or whether they were the property of the person convicted of the offence or were only in his charge when the trespass was committed.

9. *Contract form applicable to Act XIII.*—Mr. Edmiston proposed that this Association take Counsel's opinion as to the suitability of the contract form, drawn up by Messrs. Winterton and Edge, with special reference to the number of witnesses, necessary or permissible, and with regard to the time clause as marked A. The Honorary Secretary seconded this and the proposal was carried.

10. *Tea Prompts and Trade Discounts on Coffee.*—Mr. Mengel's letter, dated 27th July 1897: "It was decided that any alteration in the three months' prompt would be detrimental to sellers, in so much that it would keep away small buyers and lessen competition at the auction sales. (2) As to the Trade Discounts on Coffee the question will be brought up before the Chamber of Commerce later on."

11. Letter from the Secretary of the European and Anglo-Indian Defence Association stating that the Association would be glad to receive authenticated returns of cases of failure of justice, and assistance to its revenues from the N. P. A. Recorded.

12. *Increased Police Supervision.*—The Hon'ble Mr. Hodgson read correspondence between himself, the Inspector-General of Police, and Mr. Longden, in which the latter stated the increased amount of Police supervision that would be provided during the current Coffee Season. This consisted of the appointment of three head and twenty-eight extra Constables to watch the routes along which Coffee was usually conveyed and prevent theft generally. Mr. Mullaly pointed out that no provision was made for increased supervision in the Bhowani Valley at or about Nellitoray, where thefts were frequent. The Honorary Secretary was requested to draw the attention of the Police authorities to this point, and the Association passed a hearty vote of thanks for the increased supervision granted.

13. *Madras Survey Bill.*—Read letter from the Planting Member, dated 31st October 1897, proposing that all owners of estates wishing to take advantage of the Amended Act should at once write to the Honorary Secretary giving names of their estates, particulars as to situation and area, with the subdivisions and their areas, and stating whether the property is held under the waste land rules or otherwise. The Honorary Secretary would then forward such details to the Collector of the District, with a letter asking that the necessary steps be taken to bring such estates within the operation of Clause 14 of the Act. Approved.

14. *Change of District Officials.*—Resolved that frequent changes are detrimental to the interests of the Planting Community.

15. *Cure for Leaf-Disease.*—Read letter from the Secretary of the U. P. A. forwarding copies of Mr. Edgar Quarne's letters of the 17th and 18th October, offering to submit his system of curing leaf-disease to a confidential Committee. Resolved that the Honorary Secretary communicate with Mr. Quarne on the subject.

16. A vote of thanks was passed to the Delegates of the U. P. A. S. I. A vote of thanks to the Chairman closed the Proceedings.

(Signed) W. MULLALY, Chairman.

(") E. G. WINDLE, Hon'y. Secretary.

VARIA.

BEFORE WE CAME.

A Doggerel of New Wynaad.

1. We've heard of "Songs of Araby"
And tales of "Fair Cashmere;"
We've often heard of 'Cakes and Ale,'
(For rhyme's sake, I'll say Beer;
But all the 'trav'lers tales' of old
Are simply flat and tame,
Compared with things that happened here
Before we came.

ADVERTISEMENTS.

2. In those exciting, stirring days
Folks lived quite in a whizz;
Festivities were frequent,
(And nothing drank but "Fizz");
Alas! those days are over quite,
But yet we, all the same,
Regret that they were quite played out
Before we came.

3. In those fine times, 'Before we came,'
In those gay days of yore;
They boasted quite a gallant 'corps,'
Full forty men and more;
Those warlike officers and men
Were up to any game;
They entertained their friends right well
Before we came.

4. They sat around with faces blacked
With bones and tambourines,
They sang some very funny songs
And sent us into 'screams';
'Twas quite a sight to see them drill;
They'd march till they fell lame;
But there they were disbanded long
Before we came.

5. The race-course—now half overgrown—
Saw many a festive scene.
The merry planters gathered thick
To gallop on the green!
Perhaps the *Asian* did not mention
Any horse's name,
But many a steeplechase they ran
Before we came.

6. And then, besides, they had a Club;
They'd many a ball and rout;
You'd find men down there any night
Knocking the balls about!
In fancy dress, a Minuet,
Walked many a 'Squire' and 'Dame';
They made out quite a "Week" of it
Before we came.

7. 'Tis sad that since we ventured out
To India's sunny shore,
They've given up all these jolly things
And not had any more.
The weather's been 'abnormal' quite,
Let's hope it won't remain;
We had an awful time of it
After we came.

8. Monsoon (96) was something terrible
With cyclones *two* thrown in;
It really made you feel that "language"
Wasn't any sin!
But this year let us hope we'll not
Have had abnormal rain,
And that there'll be more "go" in all things
Since we came.
"IBEX."

CENTRAL HOTEL, INFANTRY ROAD, BANGALORE.

APPRECIATION OF AN INDIAN MIXTURE.

Messrs. CHILD & CO.,

The Wholesale Tobacconists of Chowringhee, are in possession of
an autograph letter from Mark Twain.

"Indian Daily News," August 1st, 1896.

Mark Twain left a substantial memento of his visit behind
him in Calcutta in the shape of a letter addressed to Messrs.
Child & Co., and an old Mississippi pilot knows what good
tobacco is, even when he takes to literature.

MARK TWAIN.

Calcutta, February 8th, 1896.

MESSRS. CHILD & CO.

SIRS,—This is the brand I wanted. I have smoked your
Honey Dew Mixed in another part of the world, and learned to
prefer it.

Truly yours,
S. L. CLEMENS.

CHILD & CO.'S HONEY DEW MIXTURE

Is prepared from the four finest growths in the
world, viz. :—

Sun-dried Virginia (sweet and mellow), Old Kentucky (full
flavoured), Turkey Dubec (mild), Latakia (fragrant). All finely
matured in bond, and judiciously blended.

It is a faultless Pipe Tobacco, being of medium strength,

WITH DELICIOUS FLAVOUR.

THE FINEST THAT CAN BE MADE. NO EQUAL.

In $\frac{1}{4}$ lb. air-tight tins, Rs. 2-8 per lb.

CHILD & CO.,

WHOLESALE AND RETAIL TOBACCONISTS,

MESS AND CLUB CONTRACTORS,

2-22, 2-23, CHOWRINGHEE ROAD, CALCUTTA.

GENERAL PRICE LIST ON APPLICATION.

MARKET SUPPLEMENT.

SATURDAY, DECEMBER 25, 1897.

COFFEE.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending December 1st, 1897, says:—Bank rate 3%. Bombay Exchange closes at 1s 3 $\frac{1}{4}$ d. Brazil Exchange 7 $\frac{3}{4}$ d. Rupee paper 3 $\frac{1}{2}$ % 62 $\frac{1}{2}$. Silver 27 $\frac{1}{2}$ d per oz.

A slightly better tone has prevailed in this article, and occasionally steadier prices have been realized for the better qualities. The market, however, continues flat for all medium and ordinary kinds, and the bulk of the supplies at auctions have again been withdrawn. Brazil markets are steadier, owing to smaller receipts and a slightly firmer cost and freight demand.

Daily receipts averaged 13,200 bags in Rio, and 15,200 bags in Santos. Futures have been more active, and a recovery has taken place, closing prices shewing an advance of 2s to 3s 3d per cwt., viz.:—Good average Santos in Havre, March delivery, fcs. 37.25, in Hamburg pf. 31, and No. 7 low ordinary Rio in New York \$5.85.

To-day's London official quotations are:—

AT THE FALL OF THE LEAF.

WHY do the leaves fall? "Bless me, I don't know," you answer: "I suppose because it is one of nature's arrangements."

Precisely; but why did nature so arrange? Why not have summer time always, with perpetual foliage? What is the meaning of denuded branches, withered flowers, daylight fading in mid-afternoon, and winter's cold and desolation? When you find out why the leaves fall, you will have discovered one of nature's deepest secrets—*why men die.*

Suppose we try an easier problem. Why should Mr. William Steel have written such a sentence as this?—"At the fall of the leaf every year I got into such a state that I took no pleasure in anything."

No doubt there are minds so highly strung as to feel keenly the influence of outward conditions, changes of the weather and of the seasons, and so on. But they are rare, and for practical purposes they ought to be rare. Our friend Mr. Steel, happily for him, was not one of them. All the same he was a miserable man every time the leaves began to rattle to the ground.

Here's the way he puts it: "At the fall of the leaf every year I felt languid, tired and weary, and took no pleasure in anything. My appetite was poor, and after everything I ate I had pain and fullness at the chest and sides. Then there was a horrible pain at the pit of the stomach, which nothing relieved."

Now this sort of thing would spoil a man's pleasure any time of year, but the oddity in Mr. Steel's case is that it always coincided with what you may call nature's bedtime.

"After a few months," he says, "the pain and distress would be easier for a while, but as autumn approached I became as bad as ever."

In September 1890, I had an unusually bad time of it. I couldn't touch a morsel of food, and presently got so weak I was unable to stand on my legs. Every few hours I had to be poulticed, the pain was so bad. I went to bed and stayed there for a week, with a doctor attending me. He relieved me a little, but somehow he didn't succeed in getting to the bottom of my ailment."

That may be, but it doesn't quite follow that the doctor was in the dark as to Mr. Steel's ailment. He might have understood it right enough, yet failed to cure it because he had no remedy for it among his drugs. That happens all the while. Still, the reader may ask: What's the good of knowing the nature of a complaint if we possess no medicine to cure it? There you have us; no use at all, to be sure.

Well, Mr. Steel goes on to say: "For some time I continued very feeble, and was hardly able to walk across the floor. If I took a short walk I felt so tired and done up I didn't know where to put myself. This was year after year for six years."

"Finally I read about the popular medicine called Mother Seigel's Curative Syrup, and made up my mind to try it. So I began and kept on with it for some time. The result was that the pain left me, and my appetite waked up, and my food tasted good and digested well; and presently I was strong and hearty as ever. That was three years ago, and the trouble has never returned. (Signed) William Steel, Hambleton, near Oakham, Rutlandshire, Dec. 5th 1893."

Mr. Steel is grocer and postmaster at Hambleton, and his case is well known there. His complaint isn't hard to see through; it was indigestion and dyspepsia. But why did it come on only in the autumn? What had the fall of the leaf to do with it? Let the reader study on that point.

Meanwhile it is a comfort to know that Mother Seigel's Syrup will cure it, no matter when it comes on.
